Entertainment Semiconductor Almanac 1973

GENERAL ELECTRIC

GE is the oldest supplier of Universal Transistors for the replacement market, having been one of the pioneers that entered this field in 1960.

It has been our objective to add universal types to the line as they are needed to service the market, but yet refrain from adding types that duplicate each other. Duplication only adds cost to the product and necessitates the distributor carry types in his inventory that are not needed. GE feels they have an obligation to both the Service Technician and the Distributor to guard against over-duplication, but yet add types that are needed as they appear in the entertainment market.

This new Entertainment Semiconductor "Almanac" contains approximately 40,000 cross-references that will assist you in making needed repairs. We have listed in this year's "Almanac" all semiconductor products in numerical alpha order for ease in finding replacement numbers. We believe this is the fastest way to select universal replacement types.

We are confident that this new "Almanac" will serve you with speed and accuracy.

The semiconductor devices and arrangements disclosed herein may be covered by patents of General Electric Company or others. ...damage to the semiconductor.

2) CURRENT: Do not overload semiconductors, even momentarily — an "arc-over" destroys them immediately. Double check circuits, polarities, component sizes, and wiring BEFORE closing the switch.

3) HEAT SINKS: Carefully observe the recommended heat sinks for stud-mounted devices. If heat can't get out of a semiconductor, damage is likely to result. Be sure air can circulate around lead mounted devices.

The stud end of a stud-mounted unit normally forms part of the electrical circuitry. Therefore, the heat sink to which the stud is mounted is electrically "live." If a "live" heat sink presents any safety hazard or might conceivably create a short circuit, the unit should be electrically insulated from the heat sink by mica and teflon Ⓣ washers, or the heat sink itself must be electrically insulated from the chassis.

Lead-mounted devices may be secured by soldering their leads to a terminal strip. This fastening point of the lead should be no less that 1/8 inch away from the body of the device. Avoid bending the lead too near the component body. Do not try to bend the top terminals of stud-mounted devices.

...are similar to those of a device used in a given circuit, and should function adequately in the same circuits with only minor adjustments of the circuit parts values. However, the behavior of particular circuits may be dependent on parameters not available for use as the basis of selection in this Almanac, and transistors listed as close equivalents may not prove to be directly interchangeable. When making a power transistor substitution, the bias potential should be adjusted in accordance with the equipment manufacturers' directories in order to insure optimum performance. Many transistors are similar enough electrically for direct interchange, while at the same time are quite different physically. The physical difference in size usually will not present any problem, but an examination of the substitute device should always be made to see if the base is satisfactory and there are no size limitations.

Information contained in these charts is based on the latest available data and is considered to be accurate.

Although care has been taken in the preparation of this Almanac to insure the technical correctness, no responsibility is assumed by the General Electric Company for any consequences of the use of items listed.

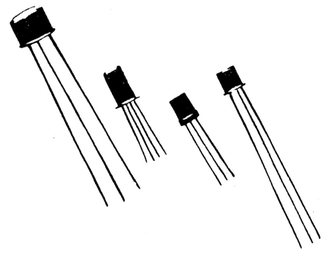
Entertainment Semiconductor Components

A FEW WILL DO

Meet your repair needs quickly and economically with . . . GE UNIVERSAL REPLACEMENT TRANSISTORS



APPLICATION: General Electric Universal Replacement Transistors are specifically designed as general replacements for most types of transistors used in radios, TV and other entertainment applications where normal voltages exist. They are not recommended for use in critical high voltage applications. If the application is such that characteristic curves or design ratings are needed on the unit, it is recommended that the exact JEDEC replacement type be used.

TECHNICAL INFORMATION: Remembering a few general rules in the care and handling of solid-state components can very often mean the difference between success and failure in completing a repair job.

1) VOLTAGES: Observe voltage specifications. Watch for stray transient voltages which might come in on the power line, or which could be induced from adjacent circuits such as an automobile ignition system. (Use a thyrector or zener diode to protect semiconductors from these stray transients.) Check power-line voltage to make sure it is neither too high (above 120 volts) nor too low (below 110 volts).

No semiconductor should ever be connected or disconnected from a circuit with the power on. High transient currents may cause permanent damage to the semiconductor.

2) CURRENT: Do not overload semiconductors, even momentarily — an "arc-over" destroys them immediately. Double check circuits, polarities, component sizes, and wiring BEFORE closing the switch.

3) HEAT SINKS: Carefully observe the recommended heat sinks for stud-mounted devices. If heat can't get out of a semiconductor, damage is likely to result. Be sure air can circulate around lead mounted devices.

The stud end of a stud-mounted unit normally forms part of the electrical circuitry. Therefore, the heat sink to which the stud is mounted is electrically "live." If a "live" heat sink presents any safety hazard or might conceivably create a short circuit, the unit should be electrically insulated from the heat sink by mica and teflon Ⓣ washers, or the heat sink itself must be electrically insulated from the chassis.

Lead-mounted devices may be secured by soldering their leads to a terminal strip. This fastening point of the lead should be no less that 1/8 inch away from the body of the device. Avoid bending the lead too near the component body. Do not try to bend the top terminals of stud-mounted devices.

4) SOLDERING: Use a small, hot soldering iron and high quality resincore solder. If a wire is tarnished or enameled, clean it with fine emery paper before soldering. Wrap the clean wire around the other wire or terminal once to hold it in place, then apply the tip of the iron and solder to the joint together.

Solder as quickly as possible, then blow on the joint to cool it quickly. If possible, with lead mounted devices, use pliers to hold the lead between the body and the joint in order to avoid overheating the device. This is particularly important when soldering germanium devices.

Do not use acid flux.

5) MODIFICATIONS: Compare the base or lead arrangement of the GE Universal Replacement Transistor with the base or lead arrangement of the unit being replaced. If these are different it will be necessary to "bend and trim" to match up to the equipment.

6) CIRCUIT CHECKS: Anytime replacement of a transistor is made in equipment (even if it is a so called "exact" replacement), it is always good practice to check out the alignment of the associated tuned circuits to insure proper operation and achieve the required gain without loss of stability. If replacements are made in high power stages, the transistor bias should always be checked and adjusted in order to protect the replacement transistor against excessive dissipation and minimize distortion.

7) GERMANIUM OR SILICON? As an aid to determining whether you are working with a germanium or a silicon unit, a good indication is the bias between base and emitter. Germanium normally has less than .5 volts bias, and silicon normally has .5 volts or more bias between base and emitter.

GENERAL INFORMATION: Interchangeability with JEDEC and manufacturers' numbers is based on published electrical specifications. Since manufacturing techniques vary, no representation is made that GE Universal Replacement Transistors are exact replacements for the types listed.

The GE universal types listed here as substitutes indicate those devices whose parameters are similar to those of a device used in a given circuit, and should function adequately in the same circuits with only minor adjustments of the circuit parts values. However, the behavior of particular circuits may be dependent on parameters not available for use as the basis of selection in this Almanac, and transistors listed as close equivalents may not prove to be directly interchangeable. When making a power transistor substitution, the bias potential should be adjusted in accordance with the equipment manufacturers' directories in order to insure optimum performance. Many transistors are similar enough electrically for direct interchange, while at the same time are quite different physically. The physical difference in size usually will not present any problem, but an examination of the substitute device should always be made to see if the base is satisfactory and there are no size limitations.

Information contained in these charts is based on the latest available data and is considered to be accurate.

SILICON AND GERMANIUM RECTIFIERS

GE-504A AND GE-509 Universal replacement types GE-504A and GE-509 with a 60 amp surge rating, are recommended as a replacement for silicon rectifiers used in radio, black and white and color TV receivers, plus many other circuits.

The GE-504A and GE-509 have dual heatsink design. The pellet is securely sandwiched between two heavy thermally-matched slugs. These slugs provide rugged mechanical support for the pellet and leads. There are no potentially troublesome "S" springs or whisker contacts to fail or to increase thermal resistance.

The temperature coefficient of the glass is carefully matched to that of silicon for stress-free operation over a wide temperature range. Due to the inherent low OHMIC resistance of the GE-504A and GE-509 package, the devices can withstand current surges up to 100 amps.

The 1N91 is a germanium rectifier in a hermetic sealed package and has low forward voltage and other characteristics normally associated with germanium rectifiers. The GEBR-800 is a silicon rectifier utilizing GE-504A type units connected in full-wave bridge configuration; the total bridge is encapsulated in plastic.

ZENER DIODES

ZENER DIODES A Zener diode is a two-layer device that above a certain reverse voltage (the zener value) has a sudden rise in current. If forward-biased, the diode is an ordinary rectifier. But when reversed-biased, the diode exhibits a typical knee, or sharp break, in its current-voltage graph. The voltage across the device remains essentially constant for any further increase of reverse current up to the allowable dissipation rating. The zener diode is a good voltage regulator, over-voltage protector, and voltage reference.

Zener diodes may be connected in a series to achieve desired zener voltage plus or minus tolerances. For best zener performance, specified IZT should be maintained during normal circuit conditions.

For those experimenters with sump pumps, water storage tanks, swimming pools, animal drinking troughs, or other liquid containers where it is desirable to keep the fluid level between two fixed points, this hybrid control is extremely useful. These loads can be either electric motors or solenoid-operated valves operating from 120-volt a-c power. Liquid level detection is accomplished by two metal probes, one measuring the high level and the other the low level. In this era of high-speed high-compression gasoline engines, the simple induction-coil ignition system fitted to virtually all U.S. and foreign automobiles imposes some severe limitations on today's sophisticated automobile engine. Adequate for the autos of 50 years ago, the so-called "Kettering" ignition limits both engine efficiency and performance and keeps them well below maximum capabilities.

Some of the projects require a 12- or 24-volt d-c power supply with good regulation. This supply will furnish both output voltages, up to a combined current of 500 milliamperes, which makes it an ideal unit for use with those twin audio amplifiers in a stereo system. It can also be used as a bench power supply for the serious experimenter who likes to "test as he builds" using a precise d-c voltage from a source other than batteries.

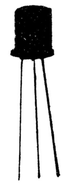
TRANSISTOR 2N5308A

The General Electric 2N5308A is a NPN, silicon, planar, epitaxial, passivated Darlington monolithic amplifier. This device is especially suited for preamplifier input stages requiring input impedances of several megohms or extremely low level, high gain, low noise amplifier applications. Additional applications include medium speed switching circuits.



A schematic is enclosed for building an Audio Amplifier (one or two watt).

For the experimenter who needs an intercom, PA system, or twin stereo amplifiers for that phonograph, tape, or FM system, this project is easy to construct and uses low-cost components. Operating from either an AC or battery supply, the output power level is determined by the applied voltage and circuit resistor selection. The one-watt output design feeds into a choice of either an eight or 16-ohm speaker load and the two-watt circuit uses a 16-ohm load only. With a typical distortion of two percent or less, this amplifier can be easily modified for a high input impedance producing good low-frequency response when used with crystal (or ceramic) microphones and phonograph cartridges.

INTEGRATED CIRCUIT GEIC-1

This is a monolithic audio amplifier designed to deliver 2 watts of continuous power to a 16-ohm load. It can, however, be operated from a wide variety of supply voltages and load impedances, thereby providing user versatility. Housed in an 8-lead plastic dual-in-line package, the GEIC-1 has an attached tab for heat transfer to a printed circuit board. In addition to many audio applications, the GEIC-1 may also be utilized for several voltage regulator and servo amplifier uses.

A schematic is enclosed for building a Two-Watt Audio Amplifier.

This project, using an integrated circuit (IC), is ideal for the experimenter who wants a two-watt audio amplifier to drive a 16-ohm speaker or earphones. The sensitivity and input impedance is suitable to be driven directly from a ratio detector (TV and FM). If a high-impedance phonograph cartridge or crystal microphone is used to drive the amplifier, suitable resistors (see Table A2) in series with the input trade sensitivity for higher input impedance. For instance, with a 330K ohm resistor in series with input capacitor, C1, the two-watt sensitivity is one volt. Accessories such as volume, tone and balance controls can be connected between the driver output and the amplifier input. With a typical distortion of less than two percent, this amplifier requires a power source of +24 volts d-c from either a battery or an a-c power supply.

Avalanche (Zener) Diode		 Constant voltage characteristic in negative quadrant	Programmable Unijunction Transistor (PUT)		 Programmed by two resistors for V_p, I_p, I_v. Function equivalent to normal UJT.
Integrated Voltage Regulator (IVR)		 Programmed to desired V_{21} by two resistors	Silicon Controlled Rectifier (SCR)		 With anode voltage (+), SCR can be triggered by I_g, remaining in conduction until anode I is reduced to zero
Tunnel Diode		 Displays negative resistance when current exceeds peak point current I_p	Complementary Silicon Controlled Rectifier (CSCR)		 Polarity complement to SCR
Back Diode		 Similar characteristics to conventional diode except very low forward voltage drop	Light Activated SCR* (LASCR)		 Operates similar to SCR, except can also be triggered into conduction by light falling on junctions
Thyrector		 Rapidly increasing current above rated voltage in either direction	Silicon Controlled Switch* (SCS)		 Operates similar to SCR except can also be triggered on by a negative signal on anode-gate. Also several other specialized modes of operation
n-p-n Transistor		 Constant collector current for given base drive	Silicon Unilateral Switch (SUS)		 Similar to SCS but zener added to anode gate to trigger device into conduction at ~ 8 volts. Can also be triggered by negative pulse at gate lead.
p-n-p Transistor		 Complement to n-p-n transistor	Silicon Bilateral Switch (SBS)		 Symmetrical bilateral version of the SUS. Breaks down in both directions as SUS does in forward.
Photo Transistor		 Incident light acts as base current of the photo transistor	Triac		 Operates similar to SCR except can be triggered into conduction in either direction by (+) or (-) gate signal
Unijunction Transistor (UJT)		 Unijunction emitter blocks until its voltage reaches V_p; then conducts	Diac Trigger		When voltage reaches trigger level (about 35 volts), abruptly switches down about 10 volts.
