1. GENERAL

Nakamichi 420 control functions are shown below.

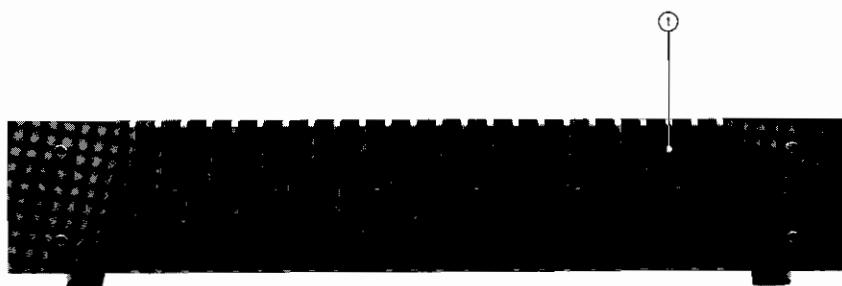

Fig. 1.1

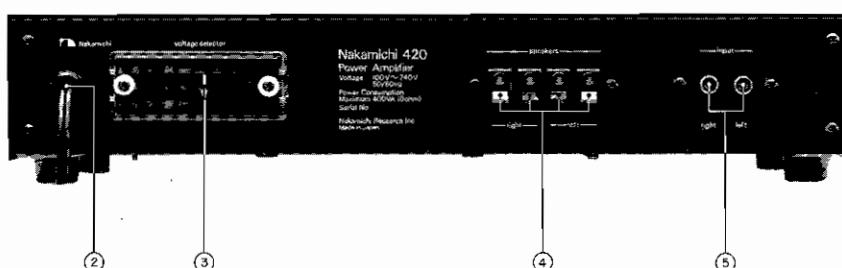

Fig. 1.2

Cautions

The Nakamichi 420 incorporates large capacitances. It is very dangerous to access the capacitor for a duration of about 3 minutes after the power switch has been turned off because of incomplete discharging. Use extreme care when accessing the capacitor for repair purposes.

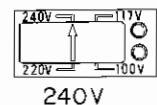

Never short the capacitor terminals with a screwdriver or a similar tool after the power switch is turned off, with an attempt to discharging the capacitor. (Shorting the terminal in such a way can melt the shorted point leading to a hole, and will give adverse effects on the capacitor itself.)

The recommended way to discharge the capacitor as quickly as possible is to turn off the power supply with sound emitting through the loudspeaker or to discharge the capacitor with resistances of $100\Omega - 300\Omega$, approx. 20W.

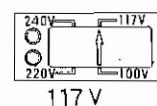

1. Power Indicator Pilot Light
2. AC Power Cord

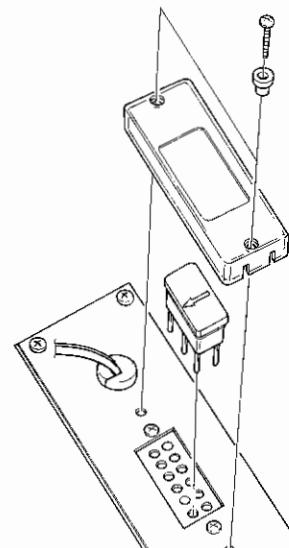

Fig. 1.3

2. PRINCIPLE OF OPERATION

2.1. Power Supply

Refer to Fig. 2.1.

The 420 has a thermostat in the power transformer primary circuit to prevent overheating of the system that may lead to a fire. If the heat sink of the 420 is heated to reach a temperature of approx. 85°C, the thermostat will open to interrupt the power supply to the system. When the temperature decreases to below approx. 65°C, the thermostat will be automatically reclosed.

Note: Keep the power cord off the system until the thermostat restores to normal.

A 147°C 2A thermal fuse is contained within the transformer and protects it from unusual heating.

If the fuse is blown, it is necessary to replace the transformer itself.

2.2. Power Block Pre-stage

Refer to Fig. 2.2.

As all the output stage consists of emitter-followers, the voltage gain is 1. Therefore, the gain required for power amplifier and NFB is obtained at the pre-stage. Generally, an increase in the number of transistor stages of an amplifier circuit increases distortion and phase shift. In large current amplification as seen with a power amplifier, a certain extent of distortion cannot be avoided and should be limited through use of NFB. However, excessive NFB is likely to cause unstable amplification as a result of phase shift in the amplifier or differences in loudspeaker impedance. This is one of the drawbacks inherent to an NFB amplifier.

The power amplifier used in the 420 employs 8 transistors, of which only two serve for voltage amplification and the remaining six are used to provide the former two with the best operating conditions. A gain of approx. 100dB is obtained through these two transistors to perform power amplification and NFB. The amplifier of this configuration assures stable NFB with low noise and low distortion and with little phase shift.

Q001 and Q007 are for voltage amplification; Q002 and Q003 form a current mirror circuit (the same current at both collectors); Q005 and Q008 provide a constant-current source; Q006 is for impedance conversion (emitter-follower); Q004 and Q001 make up a differential amplifier circuit. Thus, stable NFB is applied through a circuitry using these transistors.

C005 determines the high-band characteristic of the voltage amplifier to prevent NFB from becoming unstable because of unbalanced performance. R016 is a resistor for NFB.

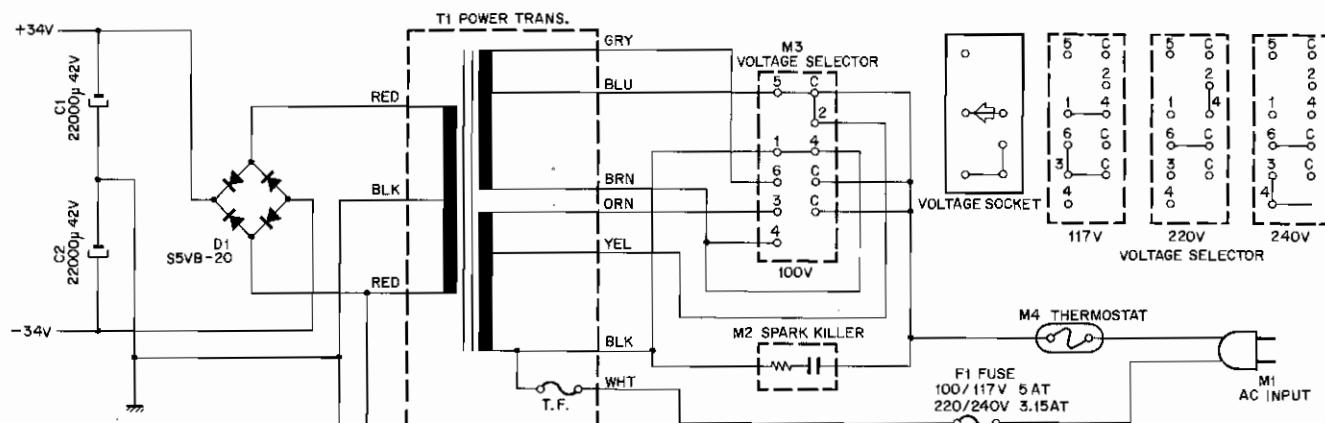

Fig. 2.1

2.3. Power Block Output Stage

In the Nakamichi 420 for making a bias voltage, varistor used in the conventional design of amplifier is replaced with transistor base-emitter so that the 420 design improves bias stability (against temperature or current changes) with lower distortion.

Especially for a class B push-pull amplifier, distortion cannot be reduced unless the positive and negative signal amplifiers are well balanced. The amplifier in the 420, however, is best balanced thanks to the vertically and horizontally symmetric configuration as shown in Fig. 2.3. This circuit allows distortion of only 0.1% at 1KHz 50 watts output even without NFB. This degree of distortion is low enough to make the amplifier used as a high-fidelity unit even if it is given no NFB.

Fig. 2.4 shows that a change in current flowing across the diode varies the terminal voltage and that E_b changes with signal current. These changes result in the generation of distortion. It is a matter of course that signal current flowing across the diode will produce distortion. See Fig. 2.3. Transistors Q009, Q011, Q010 and Q012 that generate bias voltage form an emitter-follower circuit of class A operation. Thus this circuit does not induce distorted signals.

Unless corrected perfectly against temperatures, the bias voltage of power amplifiers in the class B amplifier will increase distortion at low temperature or become unstable at high temperature. It may safely be said that temperature compensation of a transistor can be more properly and effectively carried out by the transistor of the same structure than a diode.

For an ordinary class B amplifier, crossover distortion is reduced by increasing idling current thus overlapping the operating ranges of the positive and negative transistors. The overlap portion acts as a class A amplifier. Generally, the degree of amplification decreases where a change takes place from class A to B and no linear curve is obtained as shown in Fig. 2.5 (A). However, if the circuit shown in Fig. 2.3 is current-driven, a linear curve can be obtained at the point of change from class A to B as shown in Fig. 2.5 (B).

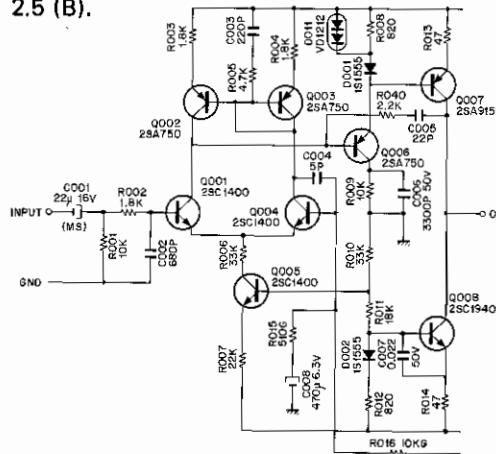

Fig. 2.2

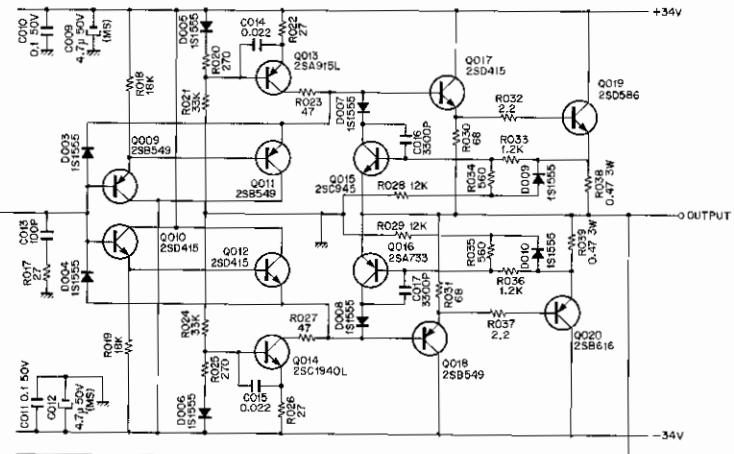

Fig. 2.3

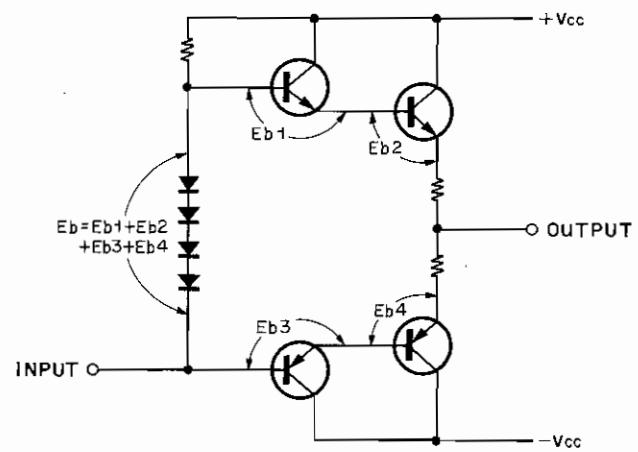

Fig. 2.4

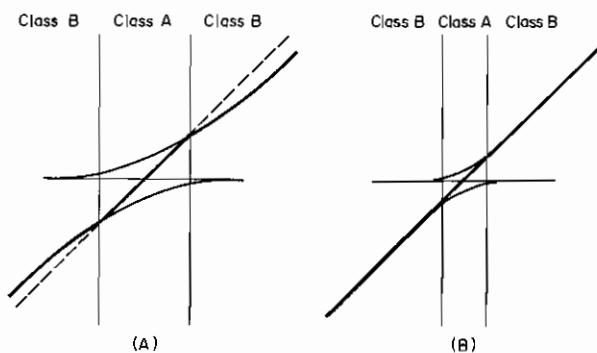

Fig. 2.5

Fig. 2.6 illustrates a simplified version of the circuit shown in Fig. 2.3.

Since the direct-coupled two-stage emitter-followers can be regarded to be one emitter-follower having greater current amplification, the Q009–Q011, Q010–Q012, Q017–Q019, and Q018–Q020 will be designated respectively to be Q1, Q2, Q3 and Q4 as shown in Fig. 2.6.

When i_d is applied with the input used as current-source, i_1 and i_2 are given as follows because of the Q1 and Q2 input impedances:

$$\text{Input impedance of Q1} \quad \beta_1 (\beta_3 r_1 + r_3)$$

$$\text{Input impedance of Q2} \quad \beta_2 (\beta_4 r_2 + r_4)$$

Therefore;

$$i_1 = \frac{\beta_2 (\beta_4 r_2 + r_4)}{\beta_1 (\beta_3 r_1 + r_3) + \beta_2 (\beta_4 r_2 + r_4)} i_d$$

$$i_2 = -\frac{\beta_1 (\beta_3 r_1 + r_3)}{\beta_1 (\beta_3 r_1 + r_3) + \beta_2 (\beta_4 r_2 + r_4)} i_d$$

$$i_o = i_3 + i_4 = \beta_1 \beta_3 i_1 + \beta_2 \beta_4 i_2$$

$$= \frac{\beta_1 \beta_2 \beta_3 (\beta_4 r_2 + r_4) + \beta_1 \beta_2 \beta_4 (\beta_3 r_1 + r_3)}{\beta_1 (\beta_3 r_1 + r_3) + \beta_2 (\beta_4 r_2 + r_4)} i_d$$

$$= \frac{\beta_1 \beta_2 \beta_3 \beta_4 \{(r_2 + r_4/\beta_4) + (r_1 + r_3/\beta_3)\}}{\beta_1 \beta_3 (r_1 + r_3/\beta_3) + \beta_2 \beta_4 (r_2 + r_4/\beta_4)} i_d$$

If β of the Q₁–Q₃ pair is equal to that of the Q₂–Q₄ pair, then $\beta_1 \beta_3 = \beta_2 \beta_4$ (assumed as β_0).

The following equation will be obtained:

$$i_o = \frac{\beta_0^2 \{(r_2 + r_4/\beta_4) + (r_1 + r_3/\beta_3)\}}{\beta_0 \{(r_1 + r_3/\beta_3) + (r_2 + r_4/\beta_4)\}} i_d$$

$$= \beta_0 i_d$$

As a result, the same gain is obtained over the entire range as shown in Fig. 2.7.

Thus, the rate of current amplification in the idling current range (Class A) is quite the same as that in the class B amplifier. It must be noted, however, that the idling current is not included in the conditions for making the equation valid. In other words, a change in idling current will neither change the linearity of curves nor produce distortion.

Q013 and Q014 form a constant-current source; D005 and D006 are for temperature compensation; D003 and D004 prevent reverse-biased voltage from being applied in abnormal state; Q015 and Q016 form a current limiter that prevents overloading on the power transistor.

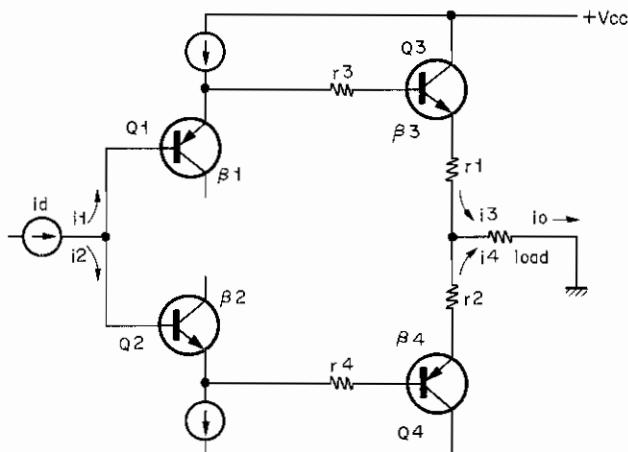

Fig. 2.6

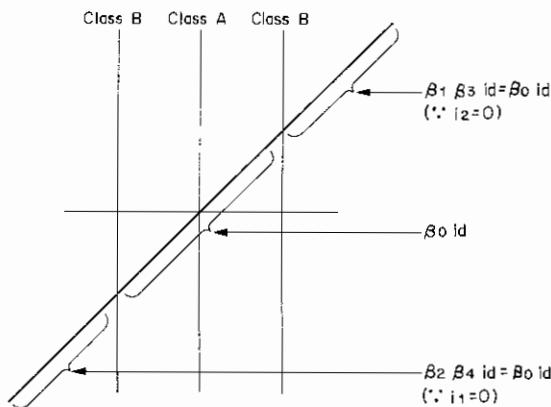

Fig. 2.7

3. REMOVAL PROCEDURES

3.1. Top Cover Ass'y

Refer to Fig. 3.1 and remove F01 then remove F02 (top cover ass'y) by sliding in the indicated direction.

3.2. Power Block Ass'y

Remove top cover ass'y (item 3.1). Refer to Fig. 3.2 and remove F01 and F03, then F02 and F04 (power block ass'y).

3.3. Front Panel Ass'y, Lamp and Thermostat

Remove top cover ass'y (3.1). Refer to Fig. 3.3 and remove F01 and F02 (front panel ass'y), F03, F04 (lamp holder) and F05 (lamp), then F06 and F07 (thermostat).

3.4. Transformer, Capacitors etc.

Remove top cover ass'y (3.1). Refer to Fig. 3.4 and remove F01 and F02 (transformer), F03, F04, F05 and F06 (capacitors), F08 and F09 (rectifier bridge), F10 (fuse), F12 and F13 (fuse holder), F14 and F15 (3P terminal), then F16 and F17 (output P.C.B. ass'y).

3.5. 2P Pin Jack and Push Terminal

Remove top cover ass'y (3.1). Refer to Fig. 3.5 and remove F01, F02, F03 (earth lug) and F04 (2P pin jack), then F05, F06 (push terminal holder) and F07 (push terminal).

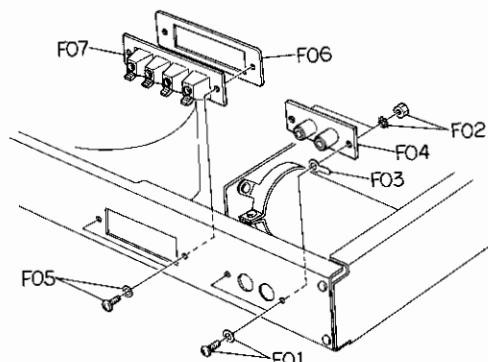

Fig. 3.5

4. READJUSTMENT OF POWER BLOCK

The 420 uses no semi-fixed parts to enhance reliability. As long as all parts meet the specification, the published characteristics can be obtained without readjustment. Generally, no readjustment is required if only defective parts are replaced at repair.

Observe the following precautions when repairing defective parts:

- 4.1. Relocating a wiring can cause larger distortion.
Do not relocate the wiring.
- 4.2. Fully tighten or retighten the screws on the chassis to decrease the resistance between GND terminals.
- 4.3. It must be noted that an incompletely soldered fuse in the output P.C.B. assembly will cause higher distortion.
- 4.4. Loudspeaker cords must be securely connected to the output terminals. A loose cord-to-terminal connection may cause poor contacting and, as a result, higher distortion.

- 4.5. If a new semiconductor is installed in the power block, a perfect balance should be held between it and the existing semiconductors in the block. An imperfect balance can cause larger distortion or unwanted oscillation.

To maintain a good balance, connect an 8Ω 50W load resistance to the output terminal, measure distortion and check that it meets the following requirements: (In this case, the residual distortion factor of the instrument should be lower than the specified value.)

- (1) Output 1 watt, 1 and 10 KHz input signals;
less than 0.008%
- (2) Output 50 watts, 1 and 10 KHz input signals;
less than 0.00B%

Note: Following semiconductors are used as a pair.

Q009·Q011 — Q010·Q012

Q017·Q019 — Q018·Q020

12. SPECIFICATIONS

Power Source	100/117/220/240V AC, 50/60 Hz
Power Consumption	30VA at idling
Power Output	400VA with both channels driven to clipping into 8 ohm loads 60 Watts per channel minimum continuous sine wave ("RMS") at 4 ohms 5-20,000 Hz, with less than 0.05% THD 50 Watts per channel minimum continuous sine wave ("RMS") at 8 ohms 5-20,000 Hz, with less than 0.02% THD 25 Watts per channel minimum continuous sine wave ("RMS") at 16 ohms 5-20,000 Hz, with less than 0.02% THD
IHF Power Bandwidth	5-100,000 Hz for less than 0.1% THD 5-25,000 Hz for less than 0.01% THD 5-10,000 Hz for less than 0.005% THD
Damping Factor	Greater than 100 (1 kHz, 8 ohms)
Total Harmonic Distortion	Less than 0.002% @ 1 kHz or below Less than 0.008% @ 10 kHz or below
Intermodulation Distortion	Less than 0.002% (60 Hz: 7 kHz, 4:1, 8 ohm load, 50 W output)
Frequency Response	5-50,000 Hz +0, -1 dB
Input Sensitivity	1V
Input Impedance	10 k ohms
Residual Noise Level	Less than 50 microvolts (IHF-A)
Signal-to-Noise Ratio	Better than 110 dB at rated output (IHF-A, input shorted)
Crosstalk	Better than -70 dB @ 1 kHz
Dimensions	16(W) x 3-5/32(H) x 8-7/8(D) inches 400(W) x 80(H) x 225(D) m/m
Weight	15.4 lbs. (approx.) 7 kg
Specifications for Nakamichi 420 power amplifier with BA-100 bridging adaptor and outputs bridged for monaural operation.	
Power Output	120 Watts minimum continuous sine wave "RMS" at 8 ohms, 5 - 20,000 Hz with less than 0.05% THD
Power Bandwidth	5 - 100,000 Hz (IHF, for under 0.05% THD)
Damping Factor	greater than 50 (at 1 kHz, 8 ohms)
Total Harmonic Distortion	less than 0.004% up to 1 kHz less than 0.025% up to 10 kHz
Intermodulation Distortion	0.003% (60 Hz: 7 kHz, 4:1)
Frequency Response	5-50,000 Hz (+0, -2 dB)
Residual Noise	100µV (IHF-A)
Signal-to-Noise Ratio	better than 110 dB (IHF-A, inputs shorted)

• Specifications and appearance design are subject to change for further improvement without notice.

Service Information

Model Nakamichi 420 (Power Amplifier)
Serial No. from 4504581
Subject Addition of Protector Circuit

No. OOD-M-0043 (1/5)
Date 1 September, 1977

I. General:

A. Purpose:

A protector circuit has been added to prevent speakers from breakage, as the breakage of transistors in 420 would induce possible breakage of speakers.

Note: When the protector circuit is activated (speaker terminals shorted with relay contacts), the power supply for 420 is required to be once switched off so as to release the protecting function. The power should again be supplied for at least 5 minutes after switching off.

B. Modification:

Current power block circuit has partly been modified in parallel with an addition of the protector circuit.

Refer to Fig. 1, assembled Protector P.C.B. Ass'y.

Modified Parts

Part No. BA03811A Power Block P.C.B. Ass'y resistors R034 and R035 (560Ω) have been shorted with a jumper wire (both channels). Rear Panel Ass'y Part No. has been changed from JA03839A to JA03839B (including Protector P.C.B. Ass'y).

Additional Parts

BA03865A Protector P.C.B. Ass'y 1 pce.
OJ03688A E.P. Stud B 2 pcs.

C. Principle of Operation:

The protector circuit aims at protecting the speaker with a shortcut from the speaker terminals to GND by operating the relay in Protector P.C.B. Ass'y when D.C. voltage is impressed between speaker terminals against any possible accident.

The time length required for protector to operate are specified as below according to D.C. voltages (either plus or minus) impressed between the speaker terminals:

Service Information

NAKAMICHI

Model Nakamichi 420 (Power Amplifier)
Serial No. from 4504581

Subject Addition of Protector Circuit

No. NR-0010 (1/5)
Date 1 September, 1977

I. General:

A. Purpose:

A protector circuit has been added to prevent speakers from breakage, as the breakage of transistors in 420 would induce possible breakage of speakers.

Note: When the protector circuit is activated (speaker terminals shorted with relay contacts), the power supply for 420 is required to be once switched off so as to release the protecting function. The power should again be supplied for at least 5 minutes after switching off.

B. Modification:

Current power block circuit has partly been modified in parallel with an addition of the protector circuit.

Refer to Fig. 1, assembled Protector P.C.B. Ass'y.

Modified Parts

Part No. BA03811A Power Block P.C.B. Ass'y resistors R034 and R035 (560Ω) have been shorted with a jumper wire (both channels). Rear Panel Ass'y Part No. has been changed from JA03839A to JA03839B (including Protector P.C.B. Ass'y).

Additional Parts

BA03865A Protector P.C.B. Ass'y 1 pce.
OJ03688A E.P. Stud B 2 pcs.

C. Principle of Operation:

The protector circuit aims at protecting the speaker with a shortcut from the speaker terminals to GND by operating the relay in Protector P.C.B. Ass'y when D.C. voltage is impressed between speaker terminals against any possible accident.

The time length required for protector to operate are specified as below according to D.C. voltages (either plus or minus) impressed between the speaker terminals:

<u>D.C. Voltage between Speaker Terminals</u>	<u>Time required till Protector operates</u>
34V DC	approx. 0.5 sec ± 30%
20V DC	approx. 1 sec ± 30%
15V DC	approx. 2 sec ± 30%
10V DC	approx. 2.5 sec ± 30%
5V DC	approx. 4 ~ 10 sec

Once the protector circuit is activated, the protecting state is retained until the power supply to 420 is disconnected to release it. The power should be supplied after power capacitors are fully discharged (for approximately 5 minutes or more).

Note: The protector circuit in 420 may occasionally be activated if a high transient D.C. voltage is delivered from the preamplifier connected with 420 at the time when the power supply for the preamplifier is turned on.

The cause is not from any trouble in 420.

For its countermeasure, the power for 420 is recommended to be supplied last of all.

II. Parts List:

Part No. BA03865A Protector P.C.B. Ass'y 1 pce.
0J03688A E.P. Stud B 2 pcs.

III. Mounting Diagram and Schematic Diagram:

Refer to Figs. 2 and 3.

IV . Modification Procedures for the Current Models:

Following shows the way how to assemble the Protector P.C.B. Ass'y in the current Models.

A. Parts to be required:

Part No. BA03865A Protector P.C.B. Ass'y 1 pce.

OJ03688A E.P. Stud B 2 pcs.

B. Modification Procedures:

Refer to Fig. 1.

1. Disassemble the Top Cover by removing five screws.
2. Remove two screws from the Output P.C.B. Ass'y and replace with E.P. Studs.
3. Assemble the Protector P.C.B. Ass'y.
4. Solder the signal wires (WHT,WHT) of the Protector P.C.B. Ass'y to the speaker terminal (output terminal) plus side of both channels.
5. Solder the RED wire of the Protector P.C.B. Ass'y to the plus terminal (RED wires are already soldered) of the capacitor C1 22,000 μ F 42V.
6. Solder the BLU wire of the Protector P.C.B. Ass'y to the minus terminal (BLU wires are already soldered) of the capacitor C2 22,000 μ F 42V.
7. Bind these wires at an appropriate point.
8. Short the resistors R034 and R035 (560 Ω) of both channels on the Power Block P.C.B. Ass'y with a jumper wire from the dip side of the printed circuit board.
9. Assemble the Top Cover.

Service Information

NAKAMICHI

Model Nakamichi 420 (Power Amplifier)
Serial No. from 4506951

Subject Modification of NF Circuit

No. NR-0027 (1/4)
Date 7/19/78

I. General:

A. Purpose:

To improve the quality of sound, NF circuit in the Power Block P.C.B. Ass'y has been modified.

Note: When above modification is adopted for the current Models, please refer to "III. Modification Procedures".

B. Modification:

Power Block P.C.B. Ass'y has been changed as follows:

(Positions of R015 and C008 have been reversed. R041 (11 kΩ F) has been added. R001,016 has been changed from 10 kΩ to 100 kΩ.)

Current Parts

BA03811A Power Block P.C.B. Ass'y 2 pcs.

including;

OB07693D Power Block P.C.B.
R001 OB01888A Carbon Resistor 10 k ERD-25T J
R016 OB05878A Metal Film Resistor 10 k ERD-25CK G

New Parts

BA03811B Power Block P.C.B. Ass'y 2 pcs.

including;

OB07693E Power Block P.C.B.
R001,016 OB01889A Carbon Resistor 100 k ERD-25T J
R041 OB09128A Metal Film Resistor 11 k ERO-25CK F

C. Compatibility (of new Power Block P.C.B. Ass'y with the Current Models):

Possible.

II. New Parts List:

BA03811B Power Block P.C.B. Ass'y 2 pcs.

III. Modification Procedures for the current Models:

A. Parts removed:

R001 OB01888A Carbon Resistor 10 k ERD-25T J 2 pcs.
 R016 OB05878A Metal Film Resistor 10 k ERO-25CK G 2 pcs.

B. Parts required:

R001,016 OB01889A Carbon Resistor 100 k ERD-25T J 4 pcs.
 R041 OB09128A Metal Film Resistor 11 k ERO-25CK F 2 pcs.

C. Modification procedures:

Refer to Fig. 1, current Power Block P.C.B. Ass'y.

1. Disassemble the Top Cover Ass'y by removing 4 screws.
2. Disassemble the 2 Power Block Assemblies by removing 3 screws for each.
3. Exchange C008 (Electrolytic Capacitor 470 μ F 6.3V) and R015 (510 Ω G) as shown in the figure.
- Mount the C008 from the dip side of the P.C.B. then bond it to the P.C.B. (pay attention to the polarity of the C008).
4. Remove R001,016 10 k and replace with 100 k.
5. Mount R041 from the dip side as shown in the figure.
6. Assemble the Power Block Assemblies by fastening 3 screws for each.
7. Check to insure the performance of the N-420.
8. Assemble the Top Cover by fastening 4 screws.

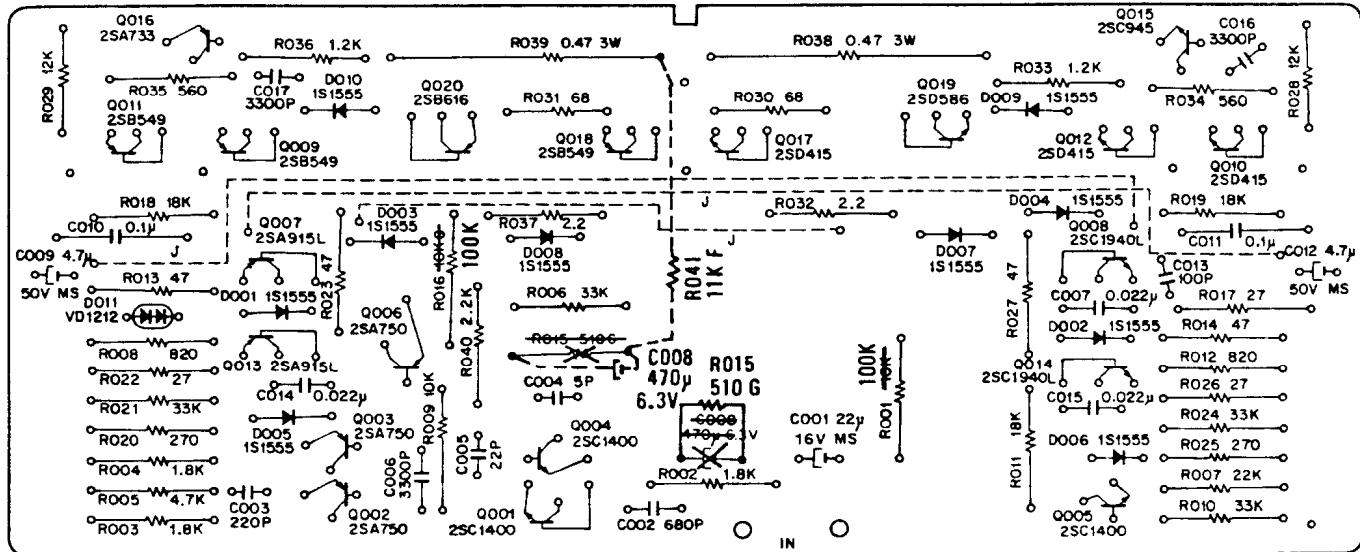

Fig. 1

IV. New Mounting Diagram (Power Block P.C.B. Ass'y):

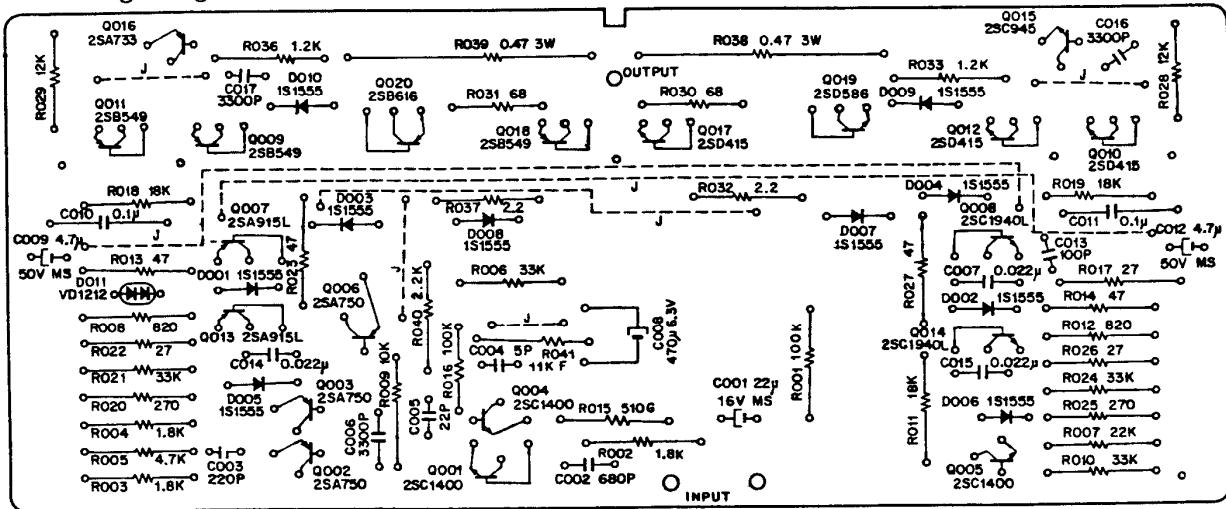

Fig. 2

V. New Schematic Diagram:

Note: [] shows the reference circuit voltage at approx. 50-watt output.

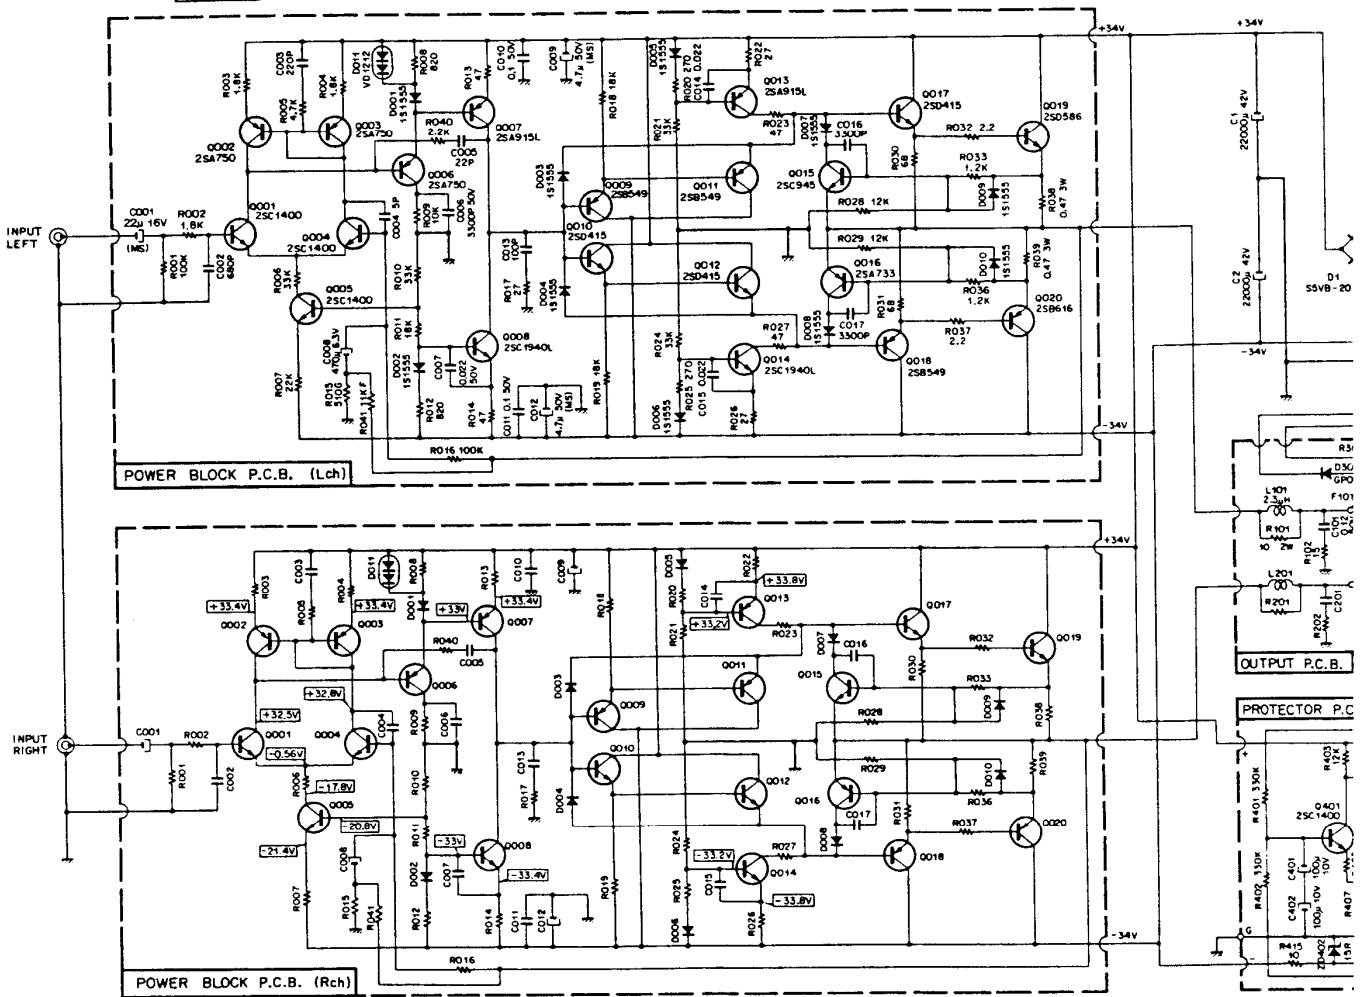

Fig. 3
