CIRCUIT DESCRIPTION

1) VHF Reception

Incoming VHF signals are passed through a low-pass filter network, antenna switching diodes D15 (UM9401F) and D26 (DAN235E), and a high-pass filer network, and on to the RF amplifier Q19 (3SK293).

The amplified RF signal is passed through another RF amplifier Q18 (2SC5226) and band-pass filtered again by varactor turned resonators L46, L49, L51 and D28, D29, D30 (all 1SV215), then applied to the 1st mixer Q21 (3SK293) along with the first local signal from the PLL circuit.

The first local signal is generated between 122.3MHz and 126.3MHz by the VHF VCO, which consists of Q9 (2SK508) and varactor diodes D10 and D11 (both 1SV282), according to the receiving frequency.

The 21.7 MHz first IF signal is applied to monolithic crystal filters XF1 and XF2 (both UM5-3P 21.7M) which strip away unwanted mixer products, and the IF signal is applied to the first IF amplifier Q20 (2SC4215). The amplified first IF signal is then delivered to the FM IF subsystem IC IC3 (TK10931V), which contains the second mixer, limiter amplifier, noise amplifier, and FM detector.

The second local signal is generated by 21.25MHz TCXO, producing the 450kHz second IF signal when mixed with the first IF signal within IC3.

The 450kHz second IF signal is applied to the ceramic filter FL1 (ALFYM450E) which strips away all but the desired signal, and then passes through the limiter amplifier within IC3 to the discriminator coil L101, which removes any amplitude variations in the 450kHz IF signal before detection of speech.

The detected audio then signal is amplified by IC9 (NJM2902V-B) passes through the de-emphasis network, a high-pass filter consisting of IC9 (NJM2902V-A) and associated circuitry, and a low-pass filter consisting and associated circuitry. The filtered audio signal is switched by IC12 (BU4052), and then passes through the audio volume control IC IC13 (M511312FP), which adjusts the audio sensitivity to compensate for audio level variations.

The audio signal is amplified by IC8 (LA4425A), and then applied to the internal loudspeaker.

2) UHF Reception

Incoming UHF signals are passed through a low-pass filter network, a high-pass filter network, antenna switching diodes D14 (UM9401F), and on to the band-pass filter network consisting of varactor diode D49 (HVU359) and L79.

The filtered UHF signal is amplified by RF amplifier Q41 (3SK293) and fed to another band-pass filter consisting of varactor diode D50 (HVU359) and L80, and then is passed through another RF amplifier Q43 (2SC5226) to another band-pass filter consisting of varactor diodes D51 and D52 (both HVU359) and L81 and L82.

The amplified and filtered UHF signal is applied to the 1st mixer Q42 (3SK293) along with the first local signal from the PLL circuit.

The first local signal is generated between 384.9MHz and 404.9MHz by the UHF VCO, which consists of Q29 (2SK508) and varactor diodes D38 and D40 (both 1SV278), according to the receiving frequency.

The 45.1MHz first IF signal is applied to monolithic crystal filters XF3A and XF3B (UM5-3P 45.1M) which strip away unwanted mixer products, and the IF signal is applied to the first IF amplifier Q44 (2SC4618).

The amplified first IF signal is then delivered to the FM IF subsystem IC IC5 (TA31136FN), which contains the second mixer, limiter amplifier, noise amplifier, and FM detector.

The second local signal is generated by 45.555MHz crystal X4, producing the 455kHz second IF signal within IC5.

The 455kHz second IF signal is applied to the ceramic filter FL4 (ALFYM455E) which strips away all but the desired signal, and then passes through the limiter amplifier within IC5 to the discriminator coil L102, which removes any amplitude variations in the 455kHz IF signal before detection of speech.

The detected audio then signal is amplified by IC9 (NJM2902V-C) passes through the de-emphasis network, a high-pass filter consisting of IC9 (NJM2902V-D) and associated circuitry, and a low-pass filter consisting and associated circuitry. The filtered audio signal is switched by IC12 (BU4052), and then passes through the audio volume control IC IC13 (M511312FP), which adjusts the audio sensitivity to compensate for audio level variations.

The audio signal is amplified by IC8 (LA4425A) then applied to the internal loudspeaker.

3) FM Reception

Incoming FM signals are passed through a low-pass filter network, antenna switching diodes D15 (UM9401F) and D26 (DAN235E), and a high-pass filter network, and on the RF amplifier Q36 (2SC5066).

The amplified RF signal is passed through band-pass filtered L, C, then applied to the 1st mixer Q33 (2SC5066) along with the first local signal from the circuit.

The first local signal is generated between 86.7MHz and 118.7MHz by the FM VCO, which consists of Q14 (2SC4808) and varactor diodes D23 and D25 (both 1SV282), according to the receiving frequency. The 10.7MHz first IF signal is applied to ceramic filters FL3 and FL6 (both SFT10.7MAS) which strip away unwanted mixer products, and the IF signal is applied to the first IF amplifier Q37 (2SC4618).

The amplified first IF signal is then delivered to the FM IF subsystem IC IC3 (TK10931V), limiter amplifier, noise amplifier, and FM detector.

The 10.7MHz first IF signal is applied to the discriminator coil L53, which removes any amplitude variations in the 10.7MHz IF signal before detection of speech.

4) V/V (VHF-VHF) Dual Reception

During V & V operation, the incoming VHF "sub" band signal is passed through a low-pass filter network, antenna switching diode D15 (UM9401F) and a high-pass filter network to the RF amplifier Q19 (3SK293).

The amplified RF signal is passed through a high-pass filter network, VHF "sub" RF amplifier Q31 (2SC5066), and a low-pass filter network, then is applied to the VHF "sub" first mixer Q32 (2SC5066) along with the 45.1MHz VHF "sub" first local signal from the VHF "sub" VCO circuit.

The VHF "sub" first local signal is generated between 189.1MHz and 193.1MHz by the VHF "sub" VCO Q38 (2SC4080).

The 45.1MHz VHF "sub" second IF signal is applied to the UHF receiving circuit.

The UHF "sub" signal is amplified, filtered, and demodulated, etc., by the VHF "main" receiving circuit, described previously.

6) VHF Squelch Control

When no VHF carrier is being received, noise at the output of the detector stage in IC3 is amplified and band-pass filtered by the noise amp section of IC3, then passes through the noise adjust VR (VR8) to CPU. The resulting DC voltage is applied to pin 88 of main CPU IC19 (M30624FGPGP), which compares the squelch threshold level to that set by the front panel VHF SQL knob.

While no carrier is received, pin 55 of IC19 remains "high" turning on the squelch switch Q108 (DTC363EK) to disable audio output from the speaker.

7) UHF Squelch Control

When no UHF carrier is being received, noise at the output of the detector stage in IC5 is amplified and band-pass filtered by the noise amp section of IC5, then passes through the noise adjust VR (VR9) to CPU.

The resulting DC voltage is applied to pin 90 of main CPU IC19, which compares the squelch threshold level to that set by the front panel UHF SQL knob.

While no carrier is received, pin 56 of IC19 remains "high" turning on the squelch switch Q109 (DTC363EK) to disable audio output from the speaker.

8) Transmit Signal Path

The speech signal from the microphone passes through the MIC jack CN601 to AF amplifier IC601 (M5218FP) on the FRONT UNIT.

The amplified speech signal is subjected to amplitude limiting by IC601 (M5218FP), then passes through the front interface jacks CN602 and CN2 to MAIN UNIT.

On the MAIN UNIT, the speech signal passes through the audio mute switch IC7 (TC4066F), MIC gain control VR5 and buffer amplifier IC1 (NJM2902V-B) and a low-pass filter network at IC1 (NJM2902V-A) to deviation control VR3 (for VHF TX audio) or VR4 (for UHF TX audio).

9) VHF Transmit Signal Path

The filtered transmit signal is applied to the Pre-Drive amplifier Q2 (2SK3074) and Drive amplifier Q1 (2SK2975), then finally is amplified by Power amplifier Q4 (RD70HV1) up to 50 Watts.

This three-stage power amplifier's gain is controlled by the APC circuit.

The 50 Watts RF signal passes through a low-pass filter network, antenna switch D1 and D71 (both UM9401F), and another low-pass filter network, and then is delivered to the ANT jack.

11) VHF Tx APC Circuit

A portion of the power amplifier output is rectified by D8 (MA4S713), D9 (MA4S713) and Q12 (2SC4081), and then delivered to APC IC1 (NJM2902V-D) as a DC voltage, which is proportional to the output level of the power amplifier.

The APC IC1 compares the rectified DC voltage from the power amplifier and the reference voltage from the main CPU IC19, producing a control voltage for the Automatic Power Controller Q8 (RN2107) and Q11 (RN1107) which regulates supply voltage to the Pre-Drive amplifier Q2, Drive amplifier Q1, and Power amplifier Q4, so as to maintain stable output power under varying antenna loading conditions.

When it receives the "PTT" command, pin72 of IC19 goes "high" to control local switch D76 (1SV306), filter switches D74 and D75, Tx switch D17 (DAN235E) and APC switches Q8 and Q11, which activates the UHF Tx circuit.

Meanwhile, pin 70 of IC19 goes "low" which disables the UHF Rx circuit.

15) VHF PLL

A portion of the output from the VHF VCO Q9 (2SK508) passes through buffer amplifiers Q7 (2SC5066) and Q5 (2SC5066) to the programmable divider section of the PLL IC IC2 (M64076AGP), which divides the frequency according to the frequency dividing data from the main CPU IC19.

It is then sent to the phase comparator.

The 21.25MHz frequency of the reference oscillator circuit, made up of TCXO X1, is divided by the reference frequency divider section of IC2 into 4250 or 3400 parts to become 5kHz or 6.25kHz comparative reference frequencies, which are utilized by the phase comparator.

The phase comparator section of IC2 compares the phase between the frequency-divided oscillations frequency of the VCO circuit and comparative frequency, and its output is a pulse corresponding to the phase difference.

This pulse is integrated by the charge pump and loop filter of IC2 into a control voltage (VCV) to control the oscillation frequency of the VHF VCO Q9.

A portion of the output from the UHF VCO Q29 (2SK508) passes through buffer amplifier Q28 (2SC5066) and Q39 (2SC5066) to the programmable divider section of the PLL IC IC2 (M64076AGP), which divides the frequency according to the frequency dividing data from the main CPU IC19.

It is then sent to the phase comparator.

The 21.25MHz frequency of the reference oscillator circuit, made up of TCXO X1, is divided by the reference frequency divider section of IC2 into 4250 or 3400 parts to become 5kHz or 6.25kHz comparative reference frequencies, which are utilized by the phase comparator.

The phase comparator section of IC2 compares the phase between the frequency-divided oscillations frequency of the VCO circuit and comparative frequency, and its output is a pulse corresponding to the phase difference.

This pulse is integrated by the charge pump and loop filter of IC2 into a control voltage (VCV) to control the oscillation frequency of the UHF VCO Q29.

ADJUSTMENT

1) Adjustment Spot

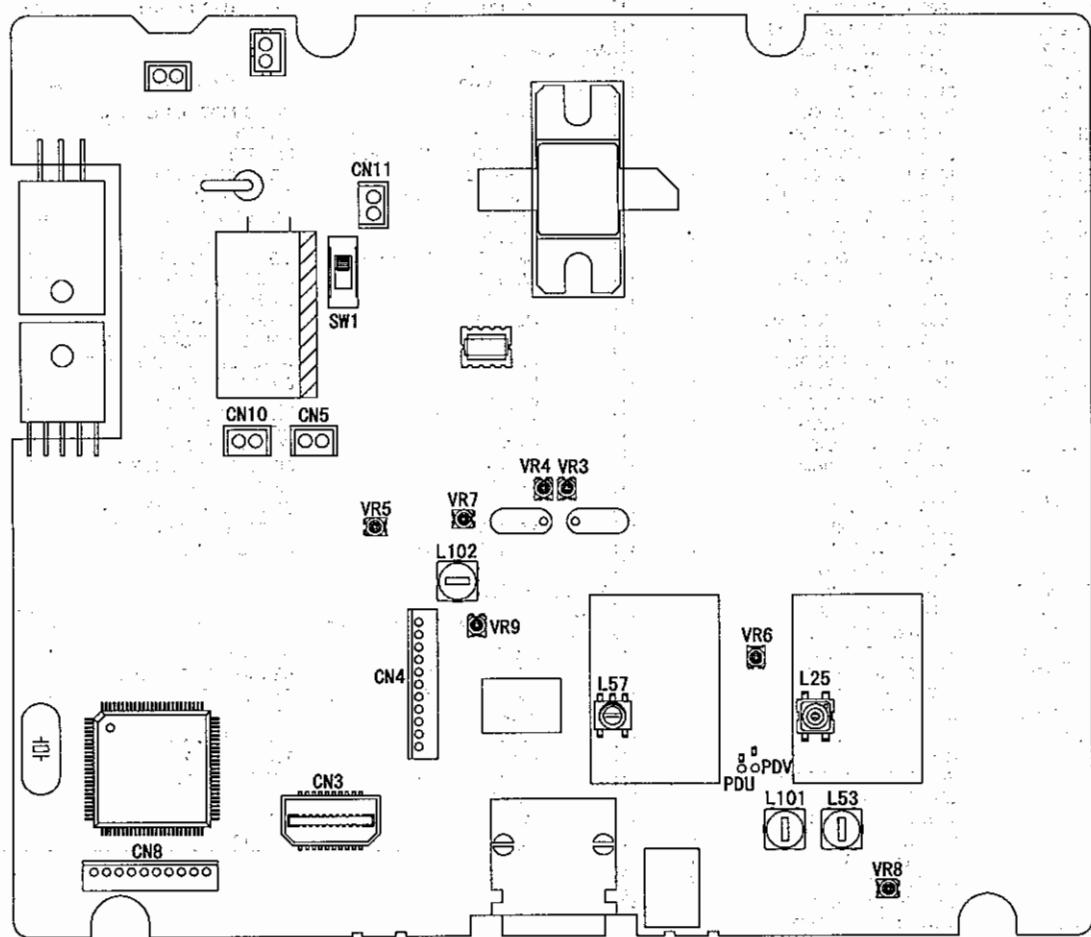

Power Supply Voltage 13.8 V

Output of SSG is all EMF indication

If without instruction, SSG output is MOD 1KHz 3.5KHz/DEV.

Standard Modulation is also based above.

Speaker load is 8Ω and Output is 50~100 mV.

Attention : Don't set the variable resistor into its open position.

2) Adjustment Mode

After the above frequency is written in the memory,
it is set on the adjustment mode by the following operation.

FUNC → TS/DCS (Key Lock)
BAND → CALL → MHz*2 → TS/DCS → H/L*2

Memory switching of VHF and UHF can be done with the BAND key.
Adjustment mode is canceled when a power switch is turned on with CALL key.

[Cautions]
In RX Sensitivity adjustment (L, M and H), the following inequality must be realized.
CH7(L)<CH8(M)<CH9(H) [Example] CH7=5A CH8=60 CH9=E0]
