SPECIFICATIONS

General			
Type	DJ-596T	DJ-596E	
Receiving Range	VHF	136.000-173.995MHz	144.000-145.995MHz
	UHF	400.000-511.995MHz	430.000-439.995MHz
Transmitter Range	VHF	144.000-147.995MHz	144.000-145.995MHz
	UHF	420.000-449.995MHz	430.000-439.995MHz
Modulation	F2, F3		
Frequency Stability	±5ppm (-10°C~+60°C) (+14° F~+140° F)		
Ant.Impedance	50Ω		
Supply Voltage	6.0~16.0VDC		
Current	Transmit	DC13.8V : VHF Approx.1.2A , UHF : Approx.1.4A 9.6V (EBP-50N) : VHF Approx.1.2A, UHF : Approx.1.5A	
	Receive	Approx.75mA	
	Battery Save	Approx.25mA	

Transmitter			
Type	DJ-596T	DJ-596E	
Power Output	External 13.8V	Approx.5W	
	EBP-50N equipped	VHF : 4.5W, UHF : 4W	
Modulation	Variable Reactance		
Max.Deviation	± 5kHz		
Spurious Emission	-60dB or less		
Mic.Impedance	Approx.2kΩ		

Receiver			
Type	DJ-596T	DJ-596E	
System	Double-conversion super heterodyne		
Intermediate Frequencies	1 st : 39.15MHz, 2 nd : 450kHz		
Sensitivity (12dB SINAD)	144.000-147.995MHz 420.000-449.995MHz -15.0dBµ or less	144.000-145.995MHz 430.000-439.995MHz -15.0dBµ or less	
AF Output	300mW or over (MAX) 200mW or over (10% Distortion factor 8Ω)		
Spurious response	60dB or over		
Squelch sensitivity	Approx.-10dBµ or less		

CIRCUIT DESCRIPTION

1) [RX]

1. RX Method: Double Super Heterodyne Method

1st IF : FM 39.15 MHz

2nd IF : 450 kHz

2. Front End

VHF

The signal input from antenna passes through the duplexer FL1 and low pass filter, then it is amplified at RF amplifier Q17. The amplified signal is led to band pass filter and band switch D19, then input to the mixer Q16.

UHF

The signal input from antenna passes through the duplexer FL1 and low pass filter, then it is amplified at RF amplifier Q20. The amplified signal is led to band pass filter and band switch D23, then input to the mixer Q16.

3. Mixer

The input signal to the mixer Q16 and the 1st local signal are added or subtracted at mixer Q16, and the crystal filter XF1 selects the signal of 39.15 MHz, then it is amplified at the 1st IF amplifier Q18 after the adjacent signal is eliminated.

The 1st local signal from VCO output is supplied to the base of mixer Q16 passing through the buffer amplifier Q15. The upper side band of the local signal is used in VHF band and the lower side band of the local signal is used in UHF band.

4. IF

The signal amplified at the 1st IF amplifier Q18 is supplied to pin 24 of IC5 for demodulation. Also the signal of 12.9 MHz from the reference buffer output of IC 2 is multiplied by 3 at Q19, then it is led to pin 1 of IC5. 2 input signals are mixed in the mixer circuit inside IC5 and converted into the 2nd IF signal of 450 kHz.

The 2nd IF signal output from pin 3 of IC5 is supplied to pin 7 of IC5 after the adjacent signal is eliminated at the ceramic filter FL3 in WFM mode, or at the ceramic filter FL2 in NFM mode. The input 2nd IF signal is demodulated at the limiter amplifier and quadrature detection circuit inside IC, then output from pin 12 of IC5 as an AF signal.

5. Squelch

Q24 determines the gain of AF signal output from pin 12 of IC5 according to the WFM/NFM of IC8. Then the signal is input to pin 19 of IC5. The input signal passes through the noise filter amplifier and rectifier circuit, then output from pin 21 of IC5. The output signal is supplied to A/D port of microprocessor IC6, then the microprocessor IC6 judges it to control ON/OFF of the audio output.

6. Audio

Q24 determines the gain of AF signal output from pin 12 of IC5 according to the WFM/NFM of IC8. Thereby amplified signal passes through AF switch IC15 and band pass active filter IC8, then controls AF signal level at the microprocessor IC6 with the electronic volume IC10. The controlled AF signal is supplied to the audio power amplifier IC9 pin 2. The input AF signal is amplified at IC9 and output from pin 6 to drive the speaker, etc.

7. VCO

VHF

VCO in VHF band consists of the Colpitts oscillator. D6, D9, L15 and L20 determine the oscillating frequency, and the signal is oscillated at the transistor Q4. L20 is passed at shift transistor Q8 when receiving. The oscillated signal is supplied to pin 2 of PLL-IC2 passing through the buffer amplifier Q7 and Q1.

UHF

VCO in UHF band consists of the Colpitts oscillator. D16, D18 and L22 determine the oscillating frequency, and the signal is oscillated at the transistor Q12. The oscillated signal is supplied to pin 19 of PLL-IC2 passing through the buffer amplifier Q7 and Q1.

8. PLL

PLL-IC2 is used to control the oscillating frequency of VCO. IC2 is controlled by the serial control signal sent from the microprocessor IC6. The reference frequency of 12.9 MHz from IC2 oscillates the crystal oscillator X1 inside the circuit.

VHF

IC2 compares the frequency gained by dividing the signal added to pin 2 of IC2 by the control signal from IC6 with the frequency gained by dividing the reference frequency of 12.9 MHz inside IC2. When the phase difference is found as a result of phase comparison, the pulse signal is output from the charge pump output of pin 8 of IC2, then the signal is converted into the DC voltage at the passive filter and added to the cathode side of VCO vari-cap D6 and D9 to make the phases equal. In result the stabilized oscillation can be done at the desired frequency.

UHF

IC2 compares the frequency gained by dividing the signal added to pin 19 of IC2 by the control signal from IC6 with the frequency gained by dividing the reference frequency of 12.9 MHz inside IC2. When the phase difference is found as a result of phase comparison, the pulse signal is output from the charge pump output of pin 13 of IC2, then the signal is converted into the DC voltage at the inside circuit for passive filter and added to the cathode side of VCO vari-cap D16 and D18 to make the phases equal. In result the stabilized oscillation can be done at the desired frequency.

2) [TX]

1. Microphone Amplifier

The microphone amplifier IC14 has 2 operational amplifiers. The voice is converted into the electric signal through the microphone, then supplied to IC14. The input signal is amplified and pre-emphasized to be output.

VHF

The signal output from microphone amplifier is adjusted the maximum frequency deviation in WFM mode at VR1, then adjusted the maximum frequency deviation in NFM mode at VR2. The adjusted signal is added to the cathode of VCO vari-cap D11 for deviation to change the capacity of the oscillation circuit resulting the FM deviation.

UHF

The signal output from microphone amplifier is adjusted the maximum frequency deviation in WFM mode at VR3, then adjusted the maximum frequency deviation in NFM mode at VR4. Then the adjusted signal is added to the cathode of VCO vari-cap D17 for deviation to change the capacity of the oscillation circuit resulting the FM deviation.

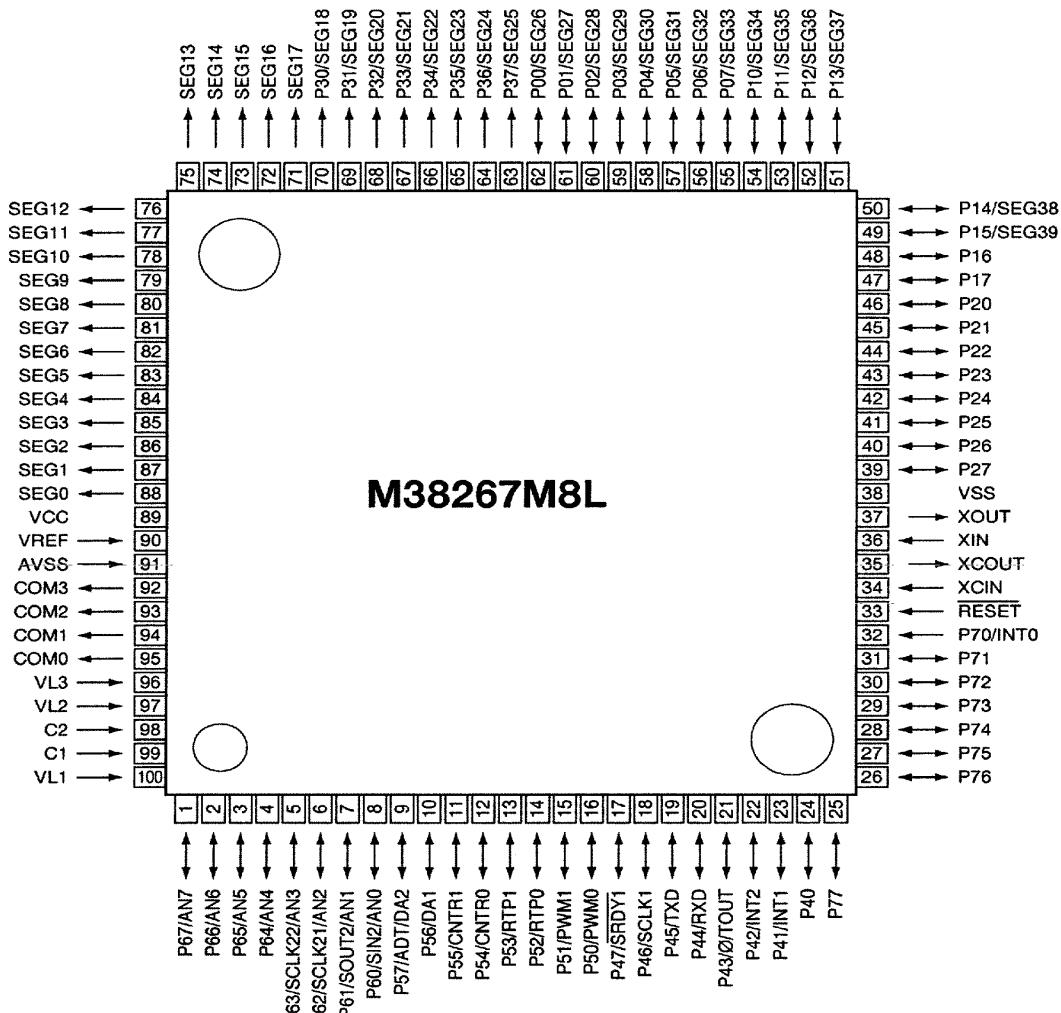

2. Power Amplifier

The oscillated signal at VCO is supplied to the power amplifier Q5, passing through buffer amplifier Q7, driver amplifier IC1 and Q6. The power-amplified signal is supplied to the antenna through the duplexer after the harmonics are attenuated enough.

	EG0043	NiMH-Battery	EBP50N	
	EW0019	Wall charger 120V	EDC-93	T
	EW0020	Wall charger 230V	EDC-94	E
	EA0098		ANTENNA	
	#G0862		BELT CLIP	
	PS0380		INSTRUCTION MANUAL	
	PH0009A		WARRANTY	T
	DS0466		SPEC.SHEET	
	PR0478		CE LABEL	E
	PK0086		CIRCUIT DIAGRAM	
	PR0452		FCC HOME USE LABEL	T
	PR0447		FCC LABEL	T
	HK0512		PACAGE	
	HU0178		INNER	
	HU0181		INNER A	
	HM0209		CARTON 10	
	HU0170		INNER 10	
	HP0006Z		PROTECTION BAG	
	PR0514		E-10x49 LABEL	

ADJUSTMENT

1) Required Test Equipment

The following items are required to adjust radio parameters.

1. Regulated Power supply

Supply voltage:	5 to 14 VDC
Current:	3A or more

2. Digital Multimeter

Voltage range:	FS = Approx. 20V
Current:	10A or more
Input resistance:	High impedance

3. Oscilloscope

Measurable frequency:	Audio Frequency
-----------------------	-----------------

4. Audio Dummy Load

Impedance:	8Ω
Dissipation:	1W or more
Jack:	3.5mmØ

5. SSG

Output frequency:	500MHz or more
Output level:	-20dBμ/0.1μV to 120dBμ/1V
Modulation:	FM

6. Spectrum Analyzer

Measuring range:	Up to 2GHz or more
------------------	--------------------

7. Power meter

Measurable frequency:	Up to 500MHz
Impedance:	50Ω, unbalanced
Measuring range:	0.1W to 10W

8. Audio Voltmeter

Measurable frequency:	Up to 100kHz
Sensitivity:	1mV to 10V

9. Audio Generator

Output frequency:	67Hz to 10kHz
Output impedance:	600Ω, unbalanced

10. Distortion Meter/SINAD Meter

Measurable frequency:	1kHz
Input level:	Up to 40dB
Distortion level:	1% to 100%

11.Frequency Counter

Measurable frequency:	Up to 500MHz
Measurable stability:	Approx. $\pm 0.1\text{ppm}$

12.Linear Detector

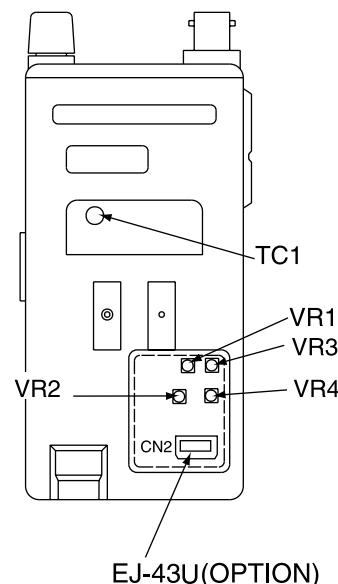

Measurable frequency:	Up to 500MHz
Characteristics:	Flat
CN:	60 dB or more

Note

- Standard modulation: $1\text{kHz} \pm 3.5\text{kHz} / \text{DEV}$
- Reference sensitivity: 12dB SINAD
- Specified audio output level: 200mW at 8Ω
- Standard audio output level: 50mW at 8Ω
- Use an RF cable (3D2W:1m) for test equipment.
- Attach a fuse to the RF indicated by EMF.
- All SSG outputs are indicated by EMF.
- Supply voltage for the transceiver: 13.8VDC

2) Entering and releasing the adjustment mode

The DJ-596 does not require a serviceperson to manipulate the components on the printed-circuit board, except the trimmer when adjusting reference frequency and deviation. Most of the adjustments for the transceiver are made by using the keys on it while the unit is in the adjustment mode. Because the adjustment mode temporarily uses the channels, frequency must be set on each channel before adjustments can be made. For instructions on how to program the channels, see the “DJ-596 INSTRUCTION MANUAL” which came with the product. In consideration of the radio environment, the frequency on each channel must be near the value (+/-1MHz) listed in the table below. To enter the adjustment mode, set key lock and input 490217. Decimal point at 100MHz and 10MHz appears in LCD. (To release the mode, same manner to enter the adjustment mode.)

Channel frequency used in the adjustment mode

Memory Channel	Channel Function	Frequency (MHz)	
		T	E
1	Reference frequency	445	435
2	UHF high-power	445	435
3	UHF low-power	445	435
4	VHF high-power	145	145
5	VHF low-power	145	145
6	VHF minimum frequency sensitivity	136	136
7	VHF medium frequency sensitivity	145	145
8	VHF maximum frequency sensitivity	173	173
9	UHF minimum frequency sensitivity	410	410
10	UHF medium frequency sensitivity	445	435
11	UHF maximum frequency sensitivity	490	490
12	VHF S-meter (1)	145	145
13	VHF S-meter (FULL)	145	145
14	UHF S-meter (1)	445	435
15	UHF S-meter (FULL)	445	435
16	VHF wide deviation	145	145
17	VHF narrow deviation	145	145
18	UHF wide deviation	445	435
19	UHF narrow deviation	445	435

Reference frequency adjustment

1. In the adjustment mode, select channel 1 by rotating the main tuning dial.
2. Press the **(PTT)** key to start transmission.
3. Rotate TC1 on the main board until the value on the frequency counter matches the one displayed on the LCD.

UHF high-power adjustment

1. In the adjustment mode, select channel 2 by rotating the main tuning dial.
2. Hold down the **(PTT)** key to start transmission.
3. While watching the reading of the TX power meter, set the output power to the value closest to 4.5W by rotating the main tuning dial.
4. When the **(PTT)** key is released, the output power at that time will be stored as the high power setting.

UHF low-power adjustment

1. In the adjustment mode, select channel 3 by rotating the main tuning dial.
2. Hold down the **(PTT)** key to start transmission.
3. While watching the reading of the TX power meter, set the output power to the value closest to 0.8W by rotating the main tuning dial.
4. When the **(PTT)** key is released, the output power at that time will be stored as the low power setting.

VHF high-power adjustment

1. In the adjustment mode, select channel 4 by rotating the main tuning dial.
2. Hold down the **(PTT)** key to start transmission.
3. While watching the reading of the TX power meter, set the output power to the value closest to 4.5W by rotating the main tuning dial.
4. When the **(PTT)** key is released, the output power at that time will be stored as the high power setting.

VHF low-power

1. In the adjustment mode, select channel 5 by rotating the main tuning dial.
2. Hold down the **(PTT)** key to start transmission.
3. While watching the reading of the TX power meter, set the output power to the value closest to 0.8W by rotating the main tuning dial.
4. When the **(PTT)** key is released, the output power at that time will be stored as the low power setting.

VHF minimum frequency sensitivity adjustment

See “Note on adjusting the sensitivity” later in this section.

1. In the adjustment mode, select channel 6 by rotating the main tuning dial.
2. Set the minimum frequency sensitivity rotating the main tuning dial, while F appears after the **(FUNC)** key is pressed.

VHF medium frequency sensitivity adjustment

See “Note on adjusting the sensitivity” later in this section.

1. In the adjustment mode, select channel 7 by rotating the main tuning dial.
2. Set the medium frequency sensitivity rotating the main tuning dial, while F appears after the **(FUNC)** key is pressed.

VHF maximum frequency sensitivity adjustment

See “Note on adjusting the sensitivity” later in this section.

1. In the adjustment mode, select channel 8 by rotating the main tuning dial.
2. Set the maximum frequency sensitivity rotating the main tuning dial, while F appears after the **(FUNC)** key is pressed.

UHF minimum frequency sensitivity adjustment

See “Note on adjusting the sensitivity” later in this section.

1. In the adjustment mode, select channel 9 by rotating the main tuning dial.
2. Set the minimum frequency sensitivity rotating the main tuning dial, while F appears after the **(FUNC)** key is pressed.

UHF medium frequency sensitivity adjustment

See “Note on adjusting the sensitivity” later in this section.

1. In the adjustment mode, select channel 10 by rotating the main tuning dial.
2. Set the medium frequency sensitivity rotating the main tuning dial, while F appears after the **(FUNC)** key is pressed.

UHF maximum frequency sensitivity adjustment

See “Note on adjusting the sensitivity” later in this section.

1. In the adjustment mode, select channel 11 by rotating the main tuning dial.
2. Set the maximum frequency sensitivity rotating the main tuning dial, while F appears after the **(FUNC)** key is pressed.

VHF S-meter (1) adjustment

1. In the adjustment mode, select channel 12 by rotating the main tuning dial.
The S-meter will show a single circle (●)
2. Enter “0” dB μ (EMF) with the transceiver tester (SSG).
3. Press the **(FUNC)** key The transceiver beeps indicating the new setting has been stored successfully.

VHF S-meter (FULL) adjustment

1. In the adjustment mode, select channel 13 by rotating the main tuning dial.
The S-meter will show all circles ()
2. Enter "+20" dB μ (EMF) with the transceiver tester (SSG).
3. Press the **(FUNC)** key. The transceiver beeps indicating the new setting has been stored successfully.

UHF S-meter (1) adjustment

1. In the adjustment mode, select channel 14 by rotating the main tuning dial.
The S-meter will show a single circle ()
2. Enter "0" dB μ (EMF) with the transceiver tester (SSG).
3. Press the **(FUNC)** key . The transceiver beeps indicating the new setting has been stored successfully.

UHF S-meter (FULL) adjustment

1. In the adjustment mode, select channel 15 by rotating the main tuning dial.
The S-meter will show all circles ()
2. Enter "+20" dB μ (EMF) with the transceiver tester (SSG).
3. Press the **(FUNC)** key. The transceiver beeps indicating the new setting has been stored successfully.

VHF wide deviation adjustment

1. In the adjustment mode, select channel 16 by rotating the main tuning dial.
2. Input a 50mVrms, 1kHz signal with your transceiver tester through the external microphone jack.
3. With the tester, put the transceiver in the transmission mode.
4. Rotate the VR1 on the printed-circuit board of the transceiver until the deviation is set to 4.5kHz.

VHF narrow deviation adjustment

1. In the adjustment mode, select channel 17 by rotating the main tuning dial.
2. Input a 50mVrms, 1kHz signal with your transceiver tester through the external microphone jack.
3. With the tester, put the transceiver in the transmission mode.
4. Rotate the VR2 on the printed-circuit board of the transceiver until the deviation is set to 2.2kHz.

UHF wide deviation adjustment

1. In the adjustment mode, select channel 18 by rotating the main tuning dial.
2. Input a 50mVrms, 1kHz signal with your transceiver tester through the external microphone jack.
3. With the tester, put the transceiver in the transmission mode.
4. Rotate the VR3 on the printed-circuit board of the transceiver until the deviation is set to 4.5kHz.

UHF narrow deviation adjustment

1. In the adjustment mode, select channel 19 by rotating the main tuning dial.
2. Input a 50mVrms, 1kHz signal with your transceiver tester through the external microphone jack.
3. With the tester, put the transceiver in the transmission mode.
4. Rotate the VR4 on the printed-circuit board of the transceiver until the deviation is set to 2.2kHz.

Channel frequency used in the test mode

Memory Channel	Channel Function	Frequency (MHz)	
		T	E
20	DTMF (1)	145	145
21	DTMF (D)	145	145
22	Tone 67Hz	145	145
23	Tone 88.5Hz	145	145
24	Tone 250.3Hz	145	145
25	DCS code 255	145	145
26	Tone Burst test	145	145
27	Digital mode deviation *	145	145

* : Required if EJ-43U is installed.

DTMF (1) test

This function is only for checking the DTMF code, not adjusting it.

1. In the adjustment mode, select channel 20 by rotating the main tuning dial.
2. Press the **(PTT)** key. DTMF code “1” is automatically sent and you will hear the monitoring tone from the speaker.
3. Check the deviation with the transceiver tester, and make sure the deviation level is within 2.1 to 3.7kHz range.

DTMF (D) test

1. In the adjustment mode, select channel 21 by rotating the main tuning dial.
2. Press the **(PTT)** key. DTMF code “D” is automatically sent and you will hear the monitoring tone from the speaker.
3. Check the deviation with the transceiver tester, and make sure the deviation level is within 2.1 to 3.7kHz range.

Tone 67Hz test

This function is only for checking the tone encoder, not adjusting it.

1. In the adjustment mode, select channel 22 by rotating the main tuning dial.
2. Press the **(PTT)** key. A 67Hz tone is automatically sent.
3. Check the deviation with the transceiver tester, and make sure the deviation level is within 0.4 to 1.2kHz range.

Tone 88.5Hz test

1. In the adjustment mode, select channel 23 by rotating the main tuning dial.
2. Press the **(PTT)** key. An 88.5Hz tone is automatically sent.
3. Check the deviation with the transceiver tester, and make sure the deviation level is within 0.4 to 1.2kHz range.

Tone 250.3Hz test

1. In the adjustment mode, select channel 24 by rotating the main tuning dial.
2. Press the **(PTT)** key. A 250.3Hz tone is automatically sent.
3. Check the deviation with the transceiver tester, and make sure the deviation level is within 0.4 to 1.2kHz range.

DCS code 255 test

- This function is only for checking the DCS code encoder, not adjusting it.
1. In the adjustment mode, select channel 25 by rotating the main tuning dial.
 2. Press the **(PTT)** key. A 255 DCS code is automatically sent.
 3. Check the deviation with the transceiver tester, and make sure the deviation level is within 0.5 to 1.5kHz range.

Tone Burst test

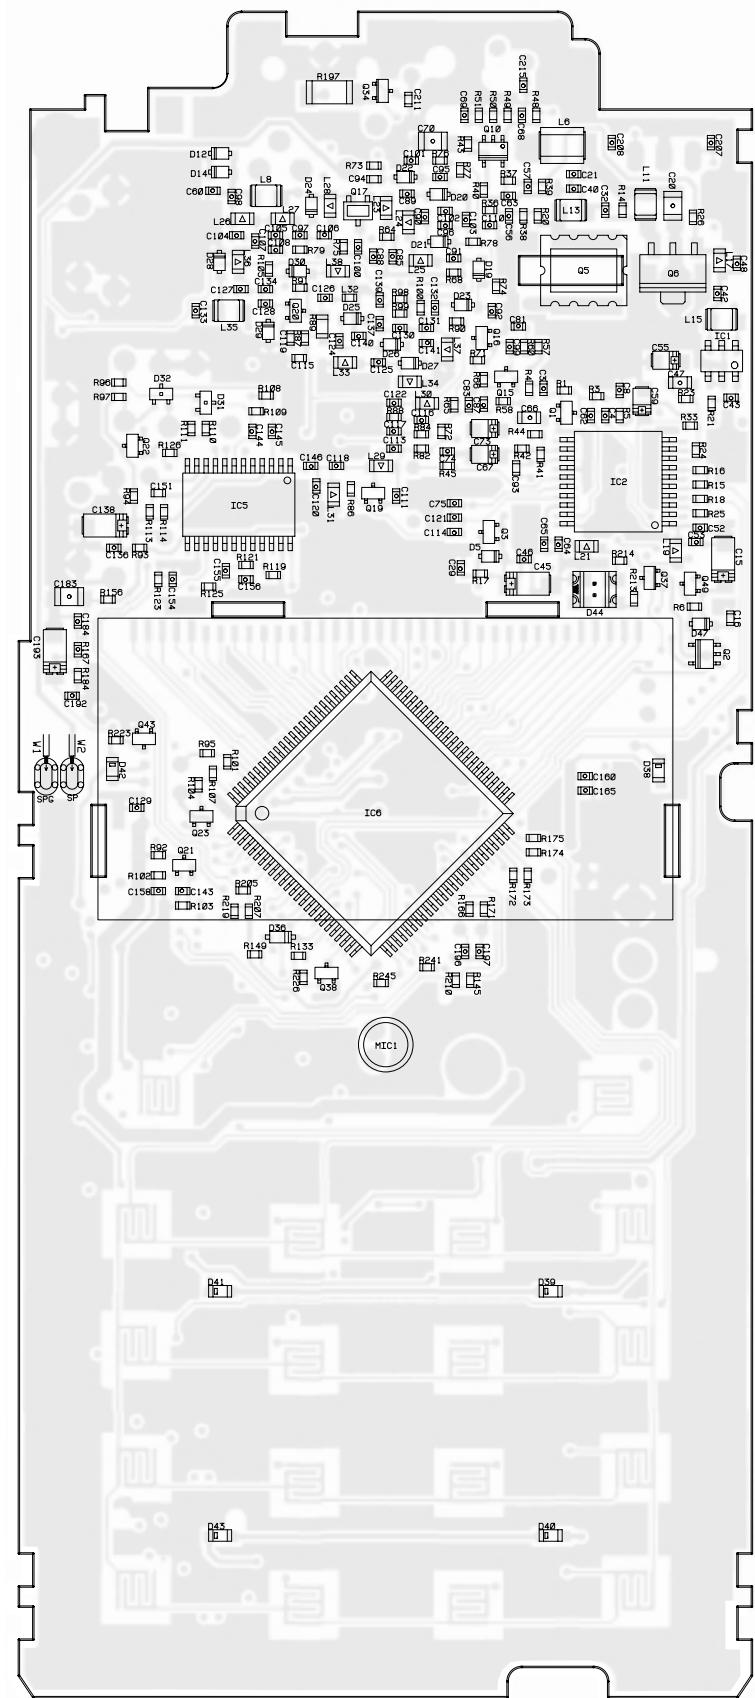

- This function is only for checking the tone burst, not adjusting it.
1. In the adjustment mode, select channel 26 by rotating the main tuning dial.
 2. Press the **(PTT)** key. A 1750Hz tone burst is automatically sent.
 3. Check the deviation with the transceiver tester, and make sure the deviation level is within 2.3 to 3.7kHz range.

Digital mode deviation test (Optional EJ-43U required)

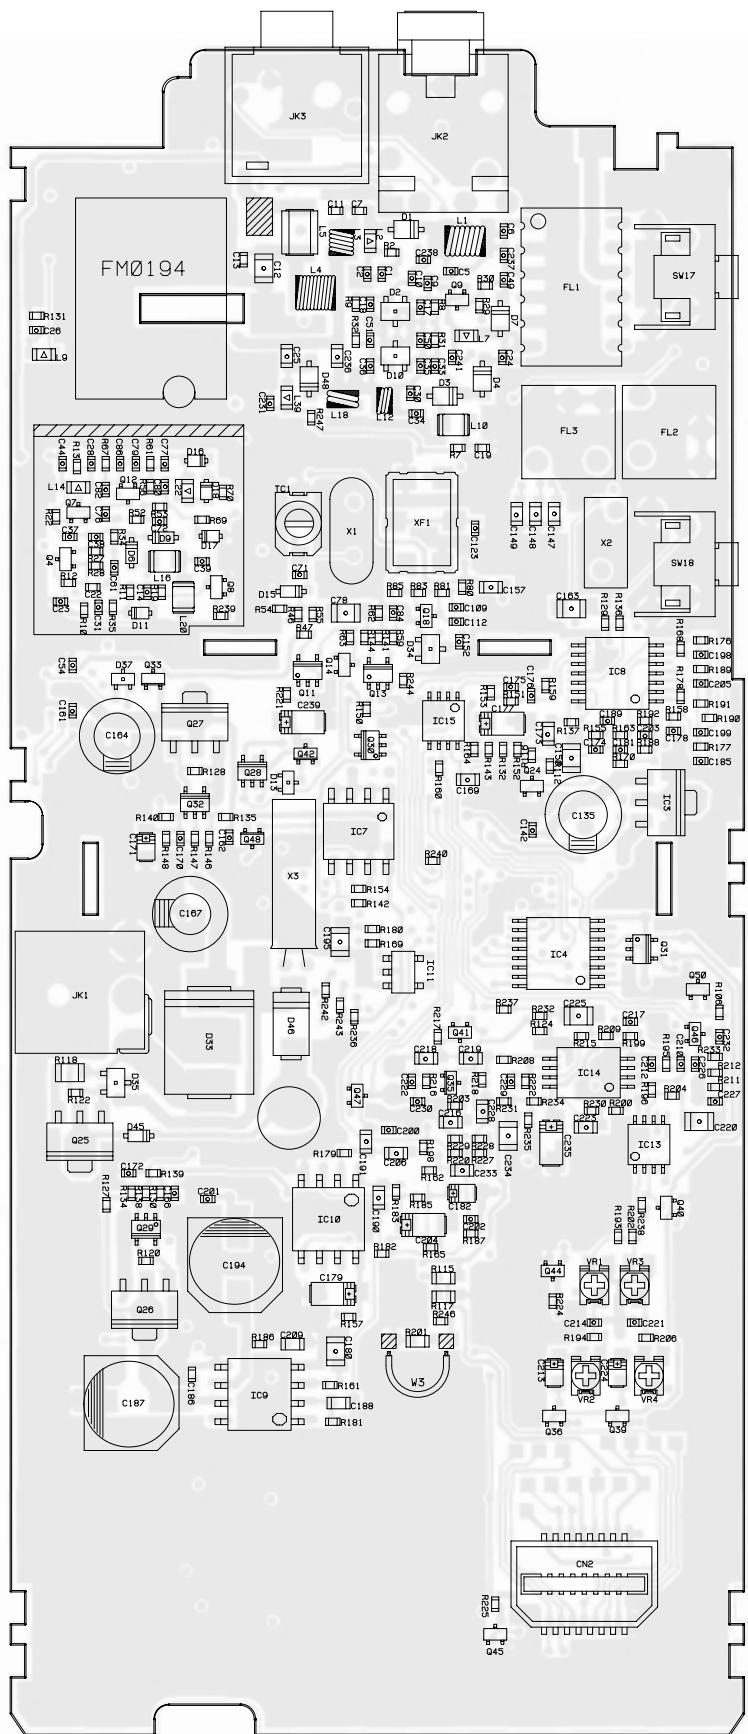

- This function is only for checking the digital mode deviation, not adjusting it.
1. In the adjustment mode, select channel 27 by rotating the main tuning dial.
 2. Press the **(PTT)** key. A digital code “000000” is automatically sent.
 3. Check the deviation with the transceiver tester, and make sure the deviation level is within 2.8 to 3.7kHz range.
