## INTRODUCTION

This service manual describes the latest service information for the **IC-P2AT/ET** 144 MHz FM TRANSCEIVER at the time of publication.

6 versions of the **IC-P2AT/ET** have been designed. This service manual covers each version.

MODEL	VERSION NO.	VERSION	SYMBOL
IC-P2ET	#22	Europe	EUR
	#23	United Kingdom	UK
	#24	Italy	ITA
IC-P2AT	#25	U.S.A.	USA
	#27	Australia	AUS
	#29	Asia	SEA

To upgrade quality, all electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

## DANGER

**NEVER** connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

**DO NOT** expose the transceiver to rain, snow or any liquids.

**DO NOT** reverse the polarities of the power supply when connecting the transceiver.

**DO NOT** apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

## ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

### <SAMPLE ORDER>

1150000730 IC SC1096 IC-P2AT/ET MAIN UNIT 5 pieces  
8810001560 Screw PH PT M2×15 ZK IC-P2AT/ET Rear panel 10 pieces

Addresses are provided on the inside back cover for your convenience.

## REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB~50 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

## SECTION 2      INSIDE VIEWS

### • MAIN UNIT

### • LOGIC UNIT

Above pictures show the  
IC-P2AT U.S.A. version

## SECTION 3 CIRCUIT DESCRIPTION

### 3-1 RECEIVER CIRCUITS

#### 3-1-1 ANTENNA SWITCHING CIRCUIT (MAIN UNIT)

The antenna switching circuit functions as a low-pass filter while receiving and a resonator circuit while transmitting. The circuit does not allow transmit signals to enter receiver circuits.

Received signals pass through a two-stage Chebyshev low-pass filter (L2~L4, C21~C25) to suppress out-of-band signals. The filtered signals are applied to the two-stage  $\lambda/4$  type antenna switching circuit (D7, D9, L5, L6, C26~C28) and then to the RF unit through the RFIN signal line.

#### 3-1-2 RF CIRCUIT (RF UNIT)

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

The signals from the antenna switching circuit pass through a bandpass filter (L1, D2) and are then applied to the RF amplifier (Q1, Q2). The amplified signals enter a two-stage bandpass filter (L2, L3, D4, D5, C7, C8, C11) to suppress unwanted signals. The filtered signals are applied to the 1st mixer circuit on the MAIN unit.

D2, D4 and D5 employ varactor diodes that track the bandpass filters and are controlled by the PLL lock voltage. The voltage is current-amplified at Q9 on the PLL unit and is then applied to the varactor diodes. These diodes tune the center frequency of an RF passband for wide bandwidth receiving and good image response rejection.

#### 3-1-3 1st MIXER AND IF CIRCUITS (MAIN AND DET UNITS)

The 1st mixer circuit converts the received signal to a fixed frequency of the 1st IF signal with a PLL output frequency. By changing the PLL frequency, only the desired frequency will be passed through a pair of crystal filters at the next stage of the 1st mixer.

The signals from the RF circuit are mixed at Q1 with a 1st LO signal coming from the PLL unit to produce a 30.875 MHz 1st IF signal. The 30.875 MHz 1st IF signal is obtained at L1 and is then applied to a pair of crystal filters (FI1) in order to obtain wide selection capability and to pass only the desired signals. The filtered signal is applied to a 1st IF amplifier (Q2) on the DET unit through the IFIN signal line and then to a 2nd mixer circuit.

#### 3-1-4 2ND IF AND DEMODULATOR CIRCUITS (DET UNIT)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double superheterodyne system (which converts receive signals twice) improves the image rejection ratio and obtains stable receiver gain.

The 1st IF signal from Q2 is applied to a 2nd mixer section of IC1 (pin 20) and is then mixed with a 2nd LO signal for conversion to a 455 kHz 2nd IF signal.

IC1 contains the 2nd mixer, local oscillator circuit, limiter amplifier, quadrature detector circuit and active filter circuit. The local oscillator section and X2 generate 30.42 MHz for the 2nd LO signal.

The 2nd IF signal from the 2nd mixer (IC1, pin 4) passes through a high-quality ceramic filter (FI1) to suppress unwanted heterodyned frequency signals. It is then amplified at the limiter amplifier section (IC1, pin 6) and applied to the quadrature detector section (IC1, pin 10 and ceramic discriminator, X1) to demodulate the 2nd IF signal into an AF signal. The AF signal is output from IC1 (pin 11).

The AF signal output from IC1 (pin 11) is applied to the squelch circuit and de-emphasis circuit (R7, C24, C25). This de-emphasis circuit is an integrated circuit with frequency characteristics of  $-6$  dB/octave. The resulting signal passes through the DETO signal line and is then applied to the AF amplifier circuit on the AF unit and the optional units (UT-50 TONE SQUELCH UNIT or UT-51 PROGRAMMABLE TONE ENCODER UNIT through J5 on the MAIN unit and UT-49 DTMF DECODER UNIT through J1 on the LOGIC unit).

#### • 2nd IF AND DEMODULATOR CIRCUITS

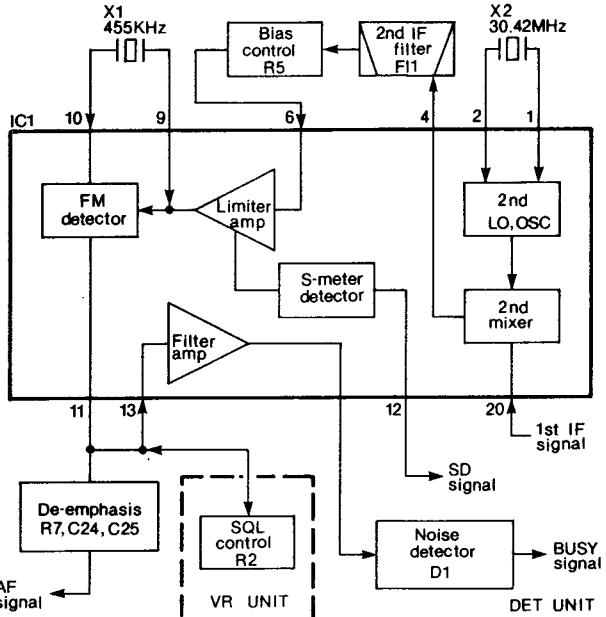

Fig. 1

### 3-1-5 AF AMPLIFIER CIRCUIT (AF AND VR UNITS)

The AF amplifier circuit amplifies the demodulated signal to drive a speaker and includes an AF mute circuit.

The AF signal is applied to Q1 and Q2 on the AF unit. Q1 is an active filter that functions as a high-pass filter to suppress tone signals for the tone squelch operation. Q2 is also an active filter but functions as a low-pass filter to suppress higher noise signals.

The filtered signal is applied to the [VOL] control (R1) on the VR unit via the AF mute circuit (Q3). When the squelch is closed, Q3 cuts the AF signal as the AF mute switch. The AF signal is power-amplified at the AF power amplifier (IC1) to drive the speaker.

The AF amplifier regulator (Q4~Q6) supplies sufficient voltage to drive the AF power amplifier. The AFS signal from the MAIN unit controls Q6 and mutes AF output while receiving no signal or no specified tone/DTMF signal.

### 3-1-6 NOISE SQUELCH CIRCUIT (DET AND VR UNITS)

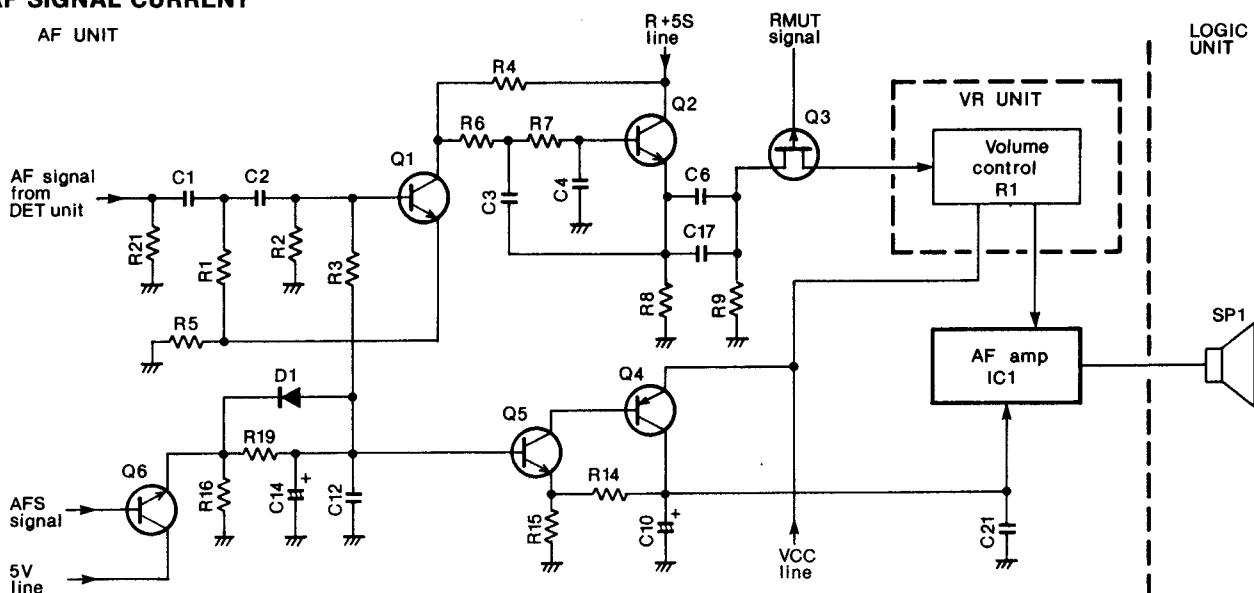

A noise squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signals, the squelch circuit switches the AF mute switches.

Some noise components in the AF signal from IC1 (pin 11) are applied to an active filter section (IC1, pin 13). The [SQL] control (R2) on the VR unit is connected in parallel to IC1 (pin 13) to adjust pin 13 input level.

The active filter section in IC1 amplifies the noise components of frequencies 20 kHz and above. The noise signals are output from IC1 (pin 14) and are then rectified by D1 for conversion to DC voltage.

#### • AF SIGNAL CURRENT

AF UNIT

The rectified voltage triggers the squelch switch (Q1). The collector of Q1 outputs the squelch signal. The signal is applied to the CPU (IC1, pin 33) on the LOGIC unit through the BUSY signal line. The CPU outputs the BUSY LED signal.

The "RMUTE" signal, decoded at the output expander (IC1, pin 6) on the IO unit, activates the AF mute circuit (Q3) on the AF unit to cut the AF signal. The BUSY LED signal is applied to Q8 on the LOGIC unit, turning OFF the receive indicator.

### 3-1-7 S-METER SQUELCH AND S/RF INDICATOR CIRCUITS (DET, MAIN AND LOGIC UNITS)

The S-meter squelch and the S/RF indicator circuits indicate the selected output power on the LCD.

The S-meter signal is output from the limiter amplifier section in IC1 and is then detected at the S-meter detector section in IC1. The detected signal is output from IC1 (pin 12) through the SD signal line. The SD signal is then rectified at an S/RF meter detector D1 to obtain an S/RF indicator signal on the MAIN unit. The detected voltage is output as the "S" signal. The signal is applied to an S/RF comparator (IC2, pin 3) on the LOGIC unit.

IC2 (pin 1) receives an S/RF indicator reference signal from the CPU (IC1, pins 20~23) using the D/A converter (R26~R29). These pins increase the reference signal level.

When the reference signal becomes greater than the S signal, IC2 (pin 4) outputs "LOW." The CPU detects the signal strength level using the outputs from IC1 (pins 20~23) and indicates the signal strength level on the LCD when receiving the "LOW" signal.

Fig. 2

## 3-2 TRANSMITTER CIRCUITS

### 3-2-1 MICROPHONE AMPLIFIER CIRCUIT (LOGIC AND MIC UNITS)

The microphone amplifier circuit amplifies audio signals with +6 dB/octave pre-emphasis from the microphone to a level needed for the modulation circuit.

The AF signals from the built-in condenser microphone or from the [MIC] jack are applied to IC1a (pin 3). IC1a functions as the microphone amplifier and the limiter with +6 dB/octave pre-emphasis characteristics.

The output signals from IC1a (pin 1) pass through a splatter filter circuit (IC1b) which eliminates signal components greater than 3 kHz. Pin 7 of IC1b outputs a "MOD" signal. The "MOD" signal is applied to the modulation circuit on the PLL unit.

### 3-2-2 MODULATION CIRCUIT (PLL UNIT)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signals.

The "MOD" signal changes the reactance of a diode (D1) to modulate the oscillated signal at the VCO circuit (Q5, Q6, L2, D2). The oscillated signal is buffer-amplified at Q7 and Q11. The buffer-amplified signal passes through the transmit/receive switching circuit (D14) on the MAIN unit and is then applied to the drive amplifier circuit.

### 3-2-3 DRIVE AMPLIFIER CIRCUIT (MAIN UNIT)

The drive amplifier circuit amplifies the VCO oscillating signal to the needed level at the power amplifier.

The signal from the transmit/receive switching circuit (D14) is amplified at the pre-drive amplifier (Q7) and is then re-amplified at a drive amplifier (Q6) to obtain 20 mW.

#### • MICROPHONE AMPLIFIER CIRCUIT

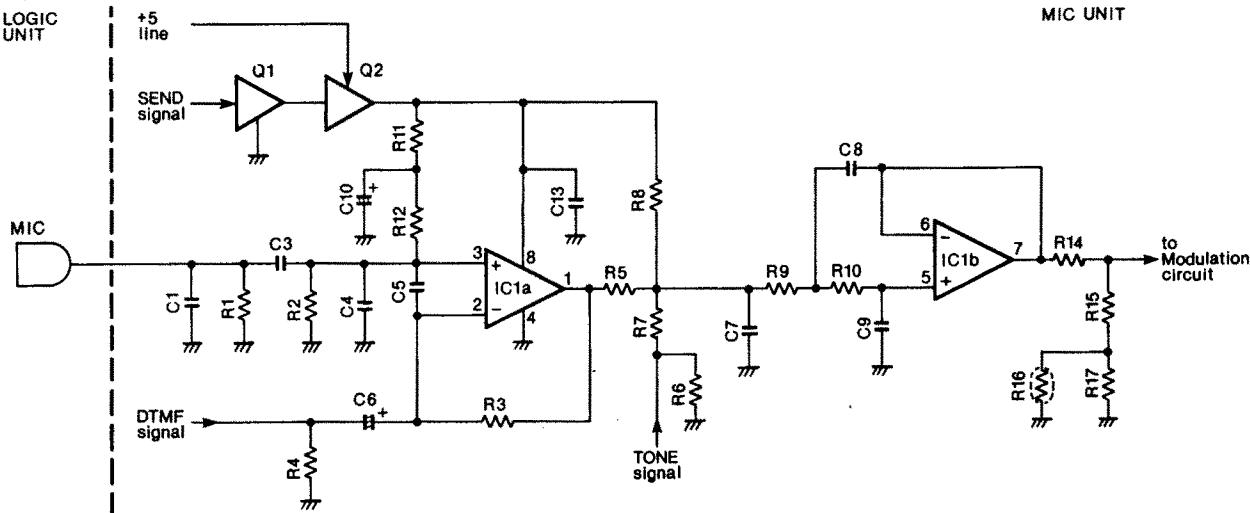

Fig. 3

The control voltage from the APC circuit is applied to the collector of Q6 and Q7 for stable RF output power from a power amplifier (IC1).

### 3-2-4 RF POWER AMPLIFIER (MAIN UNIT)

IC1 is a power module which provides a stable 5 W (at DC 13.8 V) of output power.

The RF signal from the drive amplifier (Q6) is applied to the power amplifier (IC1, pin 1). The amplified signal is output from IC1 (pin 4). The output signal is applied to the antenna connector through the APC detector circuit, the antenna switching circuit and the low-pass filter circuit.

### 3-2-5 APC CIRCUIT (MAIN, APC AND IO UNITS)

The APC circuit protects the power module (IC1) from a mismatched output load and selects HIGH and LOW output power.

The output power from the power module (IC1, pin 4) is applied to the APC detector circuit (L10, D10, D11) to obtain mismatched voltage. When the antenna impedance is matched at  $50\ \Omega$ , the detected level is at its minimum. However, when antenna impedance is mismatched, the detected voltage is higher than when it is matched.

The detected voltage is applied to a differential amplifier circuit (Q3b) on the APC unit. The APC reference voltage is determined by the power output control circuit (R2~R6) on the IO unit and is then applied to the base of Q3a on the APC unit through the PCON signal line.

When the antenna impedance is mismatched, the base voltage of Q3b exceeds the reference voltage. The collector voltage of Q3b decreases.

The current from the differential amplifier circuit (Q3a, Q3b) is amplified at Q2 to control Q1. The control voltage changes the supply voltage to IC1, Q6 and Q7 on the MAIN unit. This decreases the output power from the drive amplifier (Q6) and power module (IC1) until the base voltage of Q3b reaches the same level as the voltage of Q3a.

### 3-2-6 POWER OUTPUT CONTROL CIRCUIT (IO UNIT)

The power output control circuit (R2~R6) selects the output levels (HIGH, LOW 1~LOW 3) and controls the RF output power with the APC reference voltage.

The output signals from IC2 (pins 13 and 14) are converted from digital to analog at the power output control circuit (R2~R6) to select the four output levels (HIGH, LOW 1~LOW 3).

### 3-2-7 TX MUTE CIRCUIT (IO, APC AND MAIN UNITS)

The TX mute circuit interrupts the transmission by controlling the TMUTE signal.

The "TMUTE" signal is output from IC3 and controlled by the outputs from IC1 (pin 7) and Q2 on the IO unit. When Q4 and Q5 on the APC unit are turned OFF to interrupt the transmission by the "TMUTE" signal, the bias voltages are prevented from entering Q6, Q7 and IC1 on the MAIN unit.

## 3-2-8 ANTENNA SWITCHING CIRCUIT (MAIN UNIT)

The antenna switching circuit applies the received signal to the receiver circuit and the transmitter signal to the antenna connector.

When transmitting, D7 and D9 are turned ON. The RF output signal is not permitted to enter the receiver circuit. The signal passes through D9, C60 and the low-pass filter (L2~L4, C21~C25). The filtered signal is applied to the antenna connector. The low-pass filter suppresses high harmonic components.

## 3-3 PLL CIRCUITS

### 3-3-1 GENERAL

PLL circuits provide steady oscillation of the transmit frequency and the receive 1st LO frequency. The PLL output frequency is controlled by the divided ratio (N-data) of the programmable divider.

### 3-3-2 PLL CIRCUIT (PLL UNIT)

The PLL circuit, using a one-chip modulus prescaler (IC1), directly generates the transmit frequency and the receive 1st LO frequency with the VCO (Q5, Q6, L2, D2). The modulus prescaler (IC1) sets the dividing ratio based on serial data from the CPU (IC1) on the LOGIC unit and compares the phase of the VCO signal with the reference oscillator frequency. The PLL IC (IC1) detects the out-of-step phase and outputs it from IC1 (pin 13). A reference frequency is oscillated at X1.

#### • PLL CIRCUIT

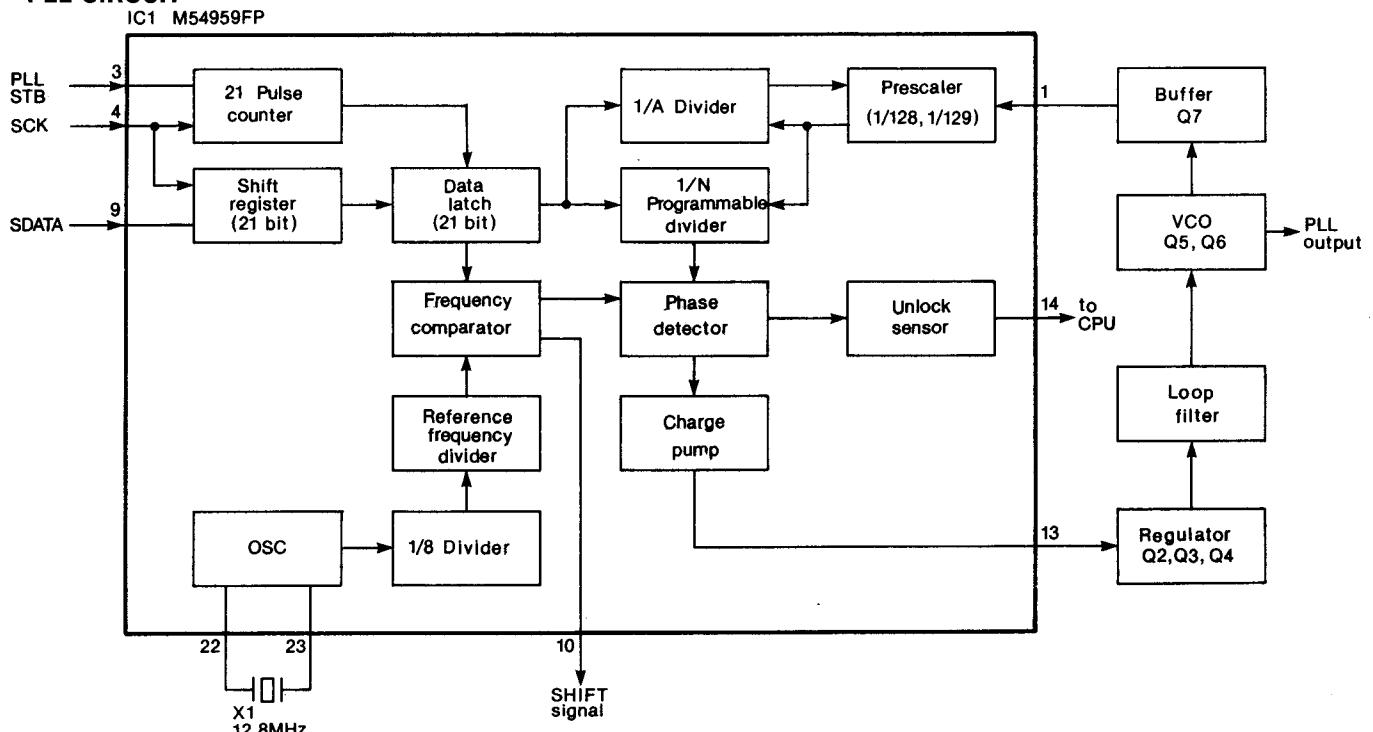

Fig. 4

### **3-3-3 REFERENCE OSCILLATOR CIRCUIT (PLL UNIT)**

A 12.8 MHz reference frequency is produced by X1. The frequency is adjusted with C22. The reference frequency is divided by 2560 to obtain 5 kHz.

### **3-3-4 VCO CIRCUIT (PLL UNIT)**

The VCO circuit (Q5, Q6, L2, D2) generates the transmit frequency and the receive 1st LO frequency. The varactor diode (D2) provides frequency control. While transmitting, IC1 (pin 10) becomes "HIGH" to turn D1 OFF. Hence, C5 is added for oscillation. At this time, the microphone signal is applied to D1 cathode for modulation. While receiving, IC1 (pin 10) becomes "LOW" to turn D1 ON. Hence, C5 is ignored for oscillation. The output signal from the VCO circuit is applied to buffer amplifiers (Q7, Q11) which amplify VCO oscillation and do not permit the latter circuit to affect the VCO oscillation. The amplified signal at Q7 is applied to PLL IC (IC1, pin 1). On the other hand, the amplified signal at Q11 is applied to the transmit/receive switching circuit (D14) on the MAIN unit as the PLL output signal.

### **3-3-5 PROGRAMMABLE DIVIDER AND PHASE DETECTOR CIRCUITS (PLL UNIT)**

The programmable divider shifts the dividing ratio, depending on the operating frequency, with a prescaler and determines the VCO oscillating frequency.

The phase detector circuit detects the off-phase components of the VCO frequency using a stable reference frequency.

IC1 is a one-chip PLL IC that contains a two-modulus prescaler, a pulse counter, a programmable divider and a phase detector. IC1 accepts up to 500 MHz inputs.

The input signal from the PLL IC (IC1, pin 1) passes through the two-modulus prescaler and the programmable counter sections of IC1. A 12.8 MHz reference frequency from X1 is applied to IC1 (pin 23) and passes through a programmable reference counter section of IC1. Both of the divided signals are compared at a phase detector section of IC1. The phase-detected signal (pulse signal) is output from IC1 (pin 13).

### **3-3-6 LOOP FILTER CIRCUIT (PLL UNIT)**

The phase-detected signal (pulse signal) from IC1 (pin 13) passes through the current mirror regulator circuit (Q2~Q4) and is then applied to a lag-lead loop filter (R4, R5, C1~C3). The pulse signal is converted to DC voltage (PLL voltage) to control the oscillation from the VCO circuit. The regulator (Q2~Q4) is used to expand the range of the PLL lock voltage. The PLL lock voltage changes the reactance of a varactor diode (D2).

### **3-3-7 UNLOCK SENSOR CIRCUIT (PLL UNIT)**

When the PLL circuit is unlocked, IC1 (pin 14) becomes "HIGH." The "HIGH" signal is applied to the CPU (IC1, pin 31) as an unlock signal.

## **3-4 POWER SUPPLY CIRCUITS**

### **3-4-1 VOLTAGE LINES**

LINE	DESCRIPTION
HV	The external DC power from the DC power connector.
VCC	This voltage passes through [VOL] control (R1) on the VR unit and is then applied to the 5 V regulator circuit (IC1) on the REG unit. This voltage line changes depending on the battery pack type: 7.2 V (BP-111~BP-113), 12.0 V (BP-114)
+5	Common 5 V converted from the VCC line at the 5 V regulator circuit (Q1, Q2, D3) using IC1 output as the reference voltage on the REG unit. This regulator circuit is composed of a complementary connection to ensure high current amplification and supplies stable output voltage continuously with good temperature characteristics in all modes.
+5S	5 V controlled by the power saver function. When the power saver is turned ON, a "PSC" signal from the output expander (IC1, pin 13) on the IO unit interrupts the "+5S" line intermittently to save power. This voltage is converted from the VCC line at Q3, Q4 and D1 using IC2 output as the reference voltage on the REG unit. This regulator circuit forms a complementary circuit.
R+5S	Receive 5 V controlled by the power saver function and a "SEND" signal from the output expander (IC1, pin 14) on the IO unit. This voltage is converted from the VCC line at Q5, Q6 and D2 using IC3 output as the reference voltage on the REG unit. This regulator circuit forms a complementary circuit.
T+5	Transmit 5 V controlled by a "TMUT" signal from the output expander (IC2, pins 13 and 14) on the IO unit. This voltage is converted from the VCC line at Q4, Q5 and D2 on the APC unit. The power output control circuit (R2~R6) on the IO unit provides the reference voltage. This regulator circuit forms a complementary circuit.

### **3-4-2 CPU POWER SUPPLY CIRCUIT (LOGIC UNIT)**

When the power switch is turned OFF and the external battery pack is discharged, DC voltage is applied to the CPU (IC1, pin 97) via R2 from the lithium backup battery (BT1) installed in the transceiver to provide backup for the memory contents.

When the attached battery pack voltage or external DC power is applied to the transceiver, BT1 is charged by the current regulator (Q1).

### **3-4-3 +5S AND R+5S SWITCHING CIRCUITS (REG UNIT)**

The IC-P2AT/ET has a power saver function to reduce current consumption to approx. 1/4.

The PSC (Power Saver Control) signal is applied to IC2. IC2 controls the +5S regulator (Q3, Q4, D1) to turn ON and OFF the +5S voltage.

PSC and SEND signals are applied to IC3. IC3 controls the R+5S regulator (Q5, Q6, D2). R+5S turns OFF during the power save period or transmitting.

### **3-4-4 CHARGING CIRCUIT (PRT UNIT)**

The DC voltage from the [DC 13.8V] jack is applied to the current control circuit (Q1~Q3, D1, D2) to charge an attached battery pack.

When the external battery pack is attached, the current from D1 charges the attached battery pack.

The mechanical switch (MP2) selects the battery packs. This circuit charges one of the battery packs in approx. 15 hours.

## **3-5 OTHER CIRCUITS**

### **3-5-1 AF 7 V REGULATOR CIRCUIT (AF UNIT)**

The AF 7 V regulator circuit (Q4~Q6) produces a regulated 7 V to the AF amplifier (IC1) when the squelch is open or the [MONI/DSEL] switch is pushed. This circuit is controlled by the AFS signal line. R14 and R15 provide the reference voltage.

### **3-5-2 DIMMER CIRCUIT (LOGIC UNIT)**

The dimmer circuit consists of a regulator circuit (Q3, Q4, D4) and the backlight LEDs (DS3~DS6 on the LOGIC unit, DS1~DS4 on the TENKEY unit). This circuit drives the backlight LEDs and ensures that brightness does not change even with a change of power supply.

When the [LIGHT] switch is pushed, the CPU (IC1, pin 30) outputs a "HIGH" signal. The signal is applied to the regulator circuit (Q3, Q4, D4) to light up the backlight LEDs (DS3~DS6 on the LOGIC unit, DS1~DS4 on the TENKEY unit).

### **3-5-3 1750 Hz TONE CALL CIRCUIT (LOGIC UNIT)**

A 1750 Hz tone call is provided for IC-P2ET (Europe version only).

When the [PTT] switch is quickly pushed and then briefly held down a second time or when the [PTT] switch is

pushed with the [LIGHT] switch, the CPU (IC1, pin 15) outputs a 1750 Hz tone signal. R45 adjusts the 1750 Hz tone deviation. The signal passes through R46 and is then applied to the AF unit and VR unit through the AF1 signal line.

### **3-5-4 CPU RESET CIRCUIT (LOGIC UNIT)**

This circuit resets the CPU (IC1) with a three-terminal voltage regulator IC (IC4). The three-terminal voltage regulator IC (IC4) detects the increase and decrease of the +5 voltage line to control the RST port of the CPU (IC1, pin 26) when the [PWR/VOL] control is turned ON and OFF.

When the [PWR/VOL] control is turned ON, the RST port of the CPU (IC1, pin 26) becomes "HIGH." The CPU (IC1) starts operation.

When the [PWR/VOL] control is turned OFF, the RST port of the CPU (IC1, pin 26) becomes "LOW." The CPU (IC1) stops operation.

CPU initialization requires a pulse input via pin 10 and the [CLR] key operation. While turning the power ON and holding the [FUNC] switch, the AND gate IC (IC3) outputs the pulse signal.

### **3-5-5 TRANSMIT/RECEIVE INDICATOR CIRCUIT (LOGIC UNIT)**

The transmit/receive indicator (DS2) uses a 2-input LED and lights up in red or green.

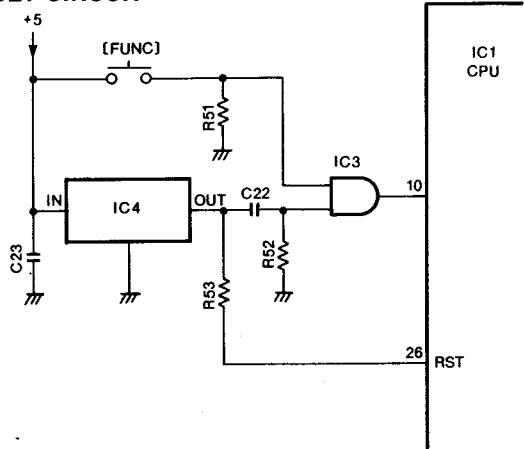

The transmit indicator lights up in red when transmitting with the T+5 voltage.

The receive indicator lights up in green when the squelch opens with the "BUSY LED" signal from the CPU (IC1, pin 14) through the inverter (Q8).

### **3-5-6 CLOCK OSCILLATOR CIRCUIT (LOGIC UNIT)**

IC1 oscillates the 798.642 kHz system clock signal with X1. IC1 oscillates the 32.768 kHz clock signal for the built-in clock with X2.

#### **• RESET CIRCUIT**

## 3-6 PORT ALLOCATIONS

### • IC1 CPU (LOGIC UNIT)

PORT NAME	PIN NUMBER	DESCRIPTION
OSC1	8	Input port for the CPU system clock signal.
OSC2	9	Output port for the CPU system clock signal.
RESET	10	When a "HIGH" signal is applied to this port, either the CPU is initialized or changes to stand-by mode.
X1	11	Input port for the CPU clock signal.
X2	12	Output port for the CPU clock signal.
BUSY LED	14	Output port for the transmit/receive indicator. This port becomes "LOW" when the squelch opens. The transmit/receive indicator lights up in green.
TONE OUT	15	Outputs a 1750 Hz tone signal. (IC-P2ET Europe version only)
PTT	16	The CPU detects that the [PTT] switch has been pushed when this port becomes "LOW."
DIAL UP	17	Input port for the up signal of the main dial.
DIAL DN	18	Input port for the down signal of the main dial.
TOE	19	Outputs an enable signal for the UT-49 DTMF DECODER UNIT.
KEYS0~KEYS3	20~23	Output strobe signals for the key board, initial and key matrix and D/A converter counting signal alternately in an interval.
SIN	24	Inputs a resulting signal from the S/RF meter comparator (IC2) to indicate the CPU counting level on the function display.
RST	26	Detects a signal for the standby mode of the CPU. The CPU enters the standby mode when the port becomes "LOW."
STD	27	Becomes "LOW" when the CPU decodes the received DTMF code.
FUNC	28	Input port for the [FUNC] switch.
LAMP	29	Input port for the [LIGHT] switch.
LAMPO	30	Becomes "HIGH" when the backlight LEDs (DS3~DS6 on the LOGIC unit; DS1~DS4 on the TENKEY unit) light up.
UL	31	Detects a PLL unlock signal. This port becomes "HIGH" when the PLL is unlocked.
TSQL	32	Input port for an optional unit. This port becomes "HIGH" when the tone squelch opens. (UT-50 TONE SQUELCH UNIT) This port becomes "LOW" when the UT-51 PROGRAMMABLE TONE ENCODER UNIT is installed.
BUSY	33	Detects a squelch signal. This port becomes "HIGH" when the squelch opens.
IOSTB	34	Outputs strobe signals for serial data to the I/O expander ICs (IC1, IC2) on the IO unit.

PORT NAME	PIN NUMBER	DESCRIPTION
SCK	35	Outputs clock signals for serial data.
PLL STB	36	Outputs strobe signals for serial data to the PLL IC (IC1) on the PLL unit.
SDATA	37	Outputs serial data synchronized with the SCK signal.
R30~R33	38~41	Input ports for the initial and key matrix.
R42~R45	42~45	Input ports for the keyboard and DTMF code from UT-49 DTMF DECODER UNIT.
H/L	48	Input port for the [H/L/DTMF] switch.
TONEC, TONER	98, 99	Outputs a DTMF code signal.

### • IC1 OUTPUT EXPANDER (IO UNIT)

PORT NAME	PIN NUMBER	DESCRIPTION
AF ON	4	Output port for the AF muting signal which mutes the AF power amplifier (IC1) on the AF unit.
MIC	5	Output port for the microphone muting signal. When transmitting a tone signal, this signal line goes to ground.
RMUTE	6	Output port for the receive muting signal which mutes audio power. When emitting a beep tone, this port outputs the muting signal and the AF ON port does not output it.
TMUTE	7	Output port for the transmit muting signal which mutes RF power.
MODE	11	Output port for a mode signal.
CPC	12	Outputs a control signal to cut off the loop filter while the power saver function is activated.
PSC	13	This port becomes "HIGH" while the power saver function is activated.
SEND	14	Output for the transmit/receive signals. This port becomes "HIGH" while transmitting.

### • IC2 OUTPUT EXPANDER (IO UNIT)

PORT NAME	PIN NUMBER	DESCRIPTION
BA2, BA3	5, 6	Outputs the control signals for the RF bandpass filter.
+5, PCON	13, 14	Outputs the control signals for the output power selecting circuit. These signals are converted into the APC reference voltage with the D/A converter (R2~R6).

## 3-7 OPTIONAL UNITS

### 3-7-1 UT-49 DTMF ENCODER UNIT

The UT-49 DTMF ENCODER UNIT provides pager and code squelch functions.

The "DETO" signal from the DET unit passes through J1 on the LOGIC unit and is then applied to the DTMF decoder IC (IC1, pin 2). The input signal passes through the filter circuit in IC1 and is then applied to the signal detector circuit in IC1. When the double tone signal is detected, pin 15 of IC1 becomes "HIGH." Therefore, the CPU (IC1, pin 27) on the LOGIC unit becomes "LOW" and then decodes the received DTMF code. The CPU (IC1, pin 19) outputs an enable signal to read out the 4-bit binary outputs (Q1~Q4) from the UT-49 DTMF ENCODER UNIT.

The CPU (IC1, pins 98 and 99) on the LOGIC unit outputs a DTMF code signal. The output signal is applied to R35 for the DTMF deviation adjustment. The signal is applied to the MIC unit through the "DTMF" signal line.

### 3-7-2 UT-50 TONE SQUELCH UNIT

The UT-50 TONE SQUELCH UNIT provides pocket beep, tone squelch and programmable tone encoder functions.

IC1 encodes and decodes the subaudible tone frequency signals of 67.0 Hz~250.3 Hz. The serial data from the CPU (IC1) on the LOGIC unit passes through J5 on the MAIN unit and is then applied to a serial/parallel converter (IC2) to set the tone signals.

When IC1 (pin 12) becomes "LOW," IC1 (pin 26) outputs the tone signal programmed in IC2. The output signal from IC1 (pin 26) is applied to R10 for the tone deviation adjustment. The signal passes through the tone signal output buffer amplifier (Q4) and is then applied to the MIC unit through the "TONE" signal line.

The "DETO" signal from the DET unit passes through J5 on the MAIN unit and is then applied to IC1 (pin 29). The input signal is compared with the tone signal programmed in IC2. Pin 23 of IC1 becomes "HIGH" during the successful decode.

### 3-7-3 UT-51 PROGRAMMABLE TONE ENCODER UNIT

The UT-51 PROGRAMMABLE TONE ENCODER UNIT accesses a repeater requiring a subaudible tone.

IC1 encodes the subaudible tone frequency signals of 67.0 Hz~250.3 Hz. The serial data from the CPU (IC1) on the LOGIC unit passes through J5 on the MAIN unit and is then applied to a serial/parallel converter (IC2) to set the tone signals. IC2 supplies the 6-bit parallel data to pins 8~13 of IC1.

The 6-bit parallel data from IC2 passes through the programmable counter section of IC1. A 3.579545 MHz reference frequency from X1 is applied to a programmable counter section of IC1. The divided signal is output from IC1 (pin 1) and is then applied to R5 for the tone deviation adjustment. The signal passes through the tone signal output buffer amplifier (Q1) and is then applied to the MIC unit through the "TONE" signal line.

## SECTION 6 ADJUSTMENT PROCEDURES

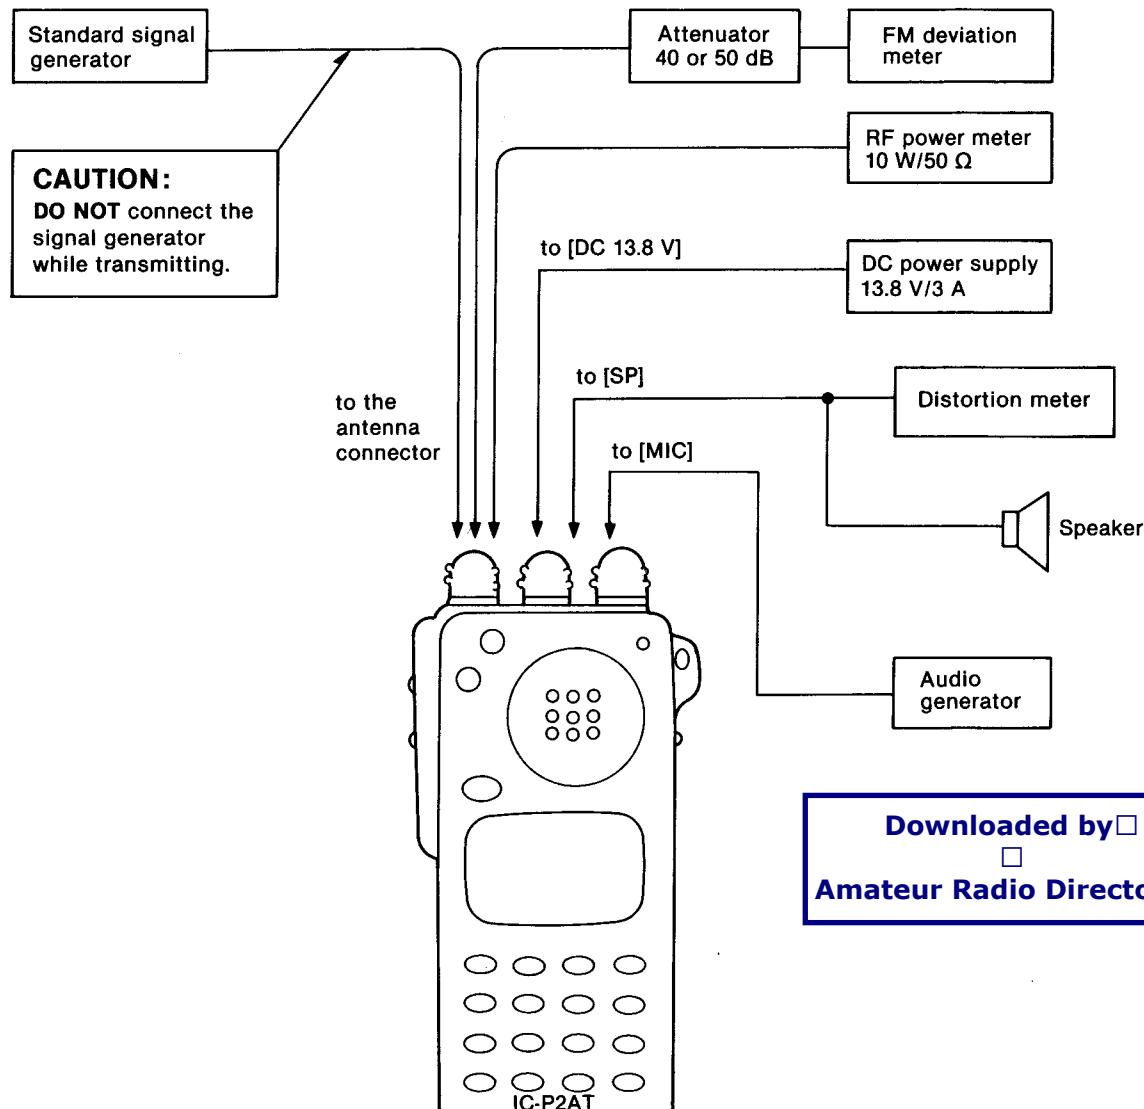

### 6-1 PREPARATION BEFORE SERVICING

#### ■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 13.8 V DC Current capacity : 3 A or more	Audio generator	Frequency range : 300~3000 Hz Output level : 1~500 mV
RF power meter (terminated type)	Measuring range : 1~10 W Frequency range : 120~160 MHz Impedance : 50 Ω SWR : Less than 1.2:1	Attenuator	Power attenuation : 40 or 50 dB Capacity : 10 W or more
Frequency counter	Frequency range : 0.1~160 MHz Frequency accuracy : ±1 ppm or better Sensitivity : 100 mV or better	DC voltmeter	Input impedance : 50 kΩ/DC or better
Distortion meter	Frequency range : 1 kHz±10 Hz Measuring range : 1~100 %	AC milli-voltmeter	Measuring range : 10 mV~10 V
Standard signal generator (SSG)	Frequency range : 0.1~160 MHz Output level : -127~- -17 dBm (0.1 μV~32 mV)	External speaker	Impedance : 8 Ω
		FM deviation meter	Frequency minimum : 160 MHz Measuring range : 0~±5 kHz
		Digital multimeter or oscilloscope	Input impedance : 1 MΩ/DC or better

CCW: counterclockwise

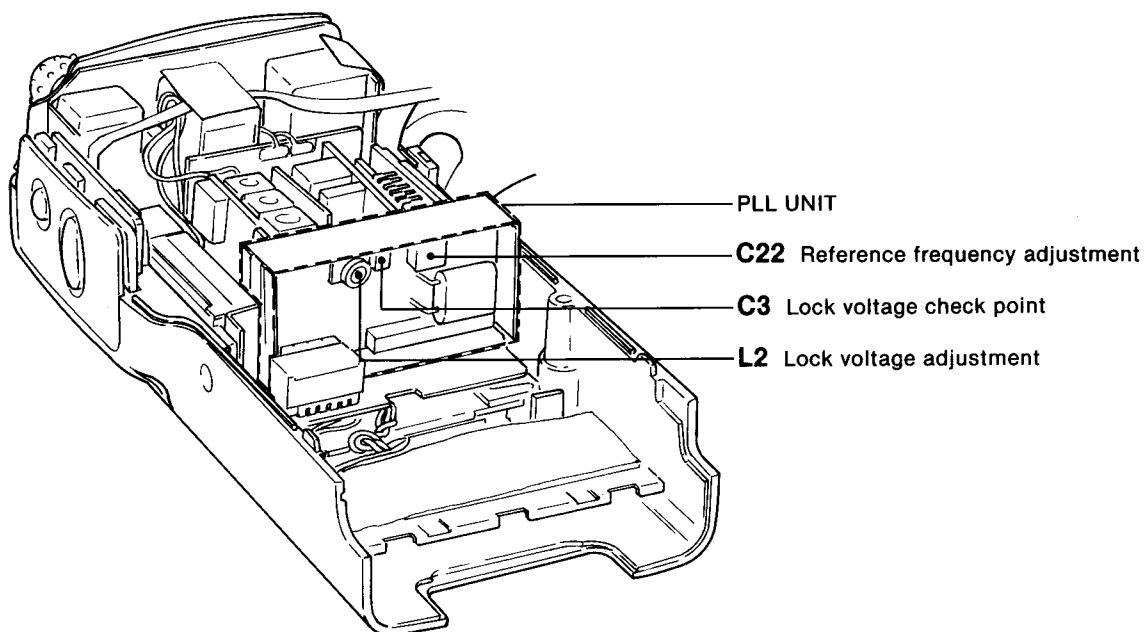

#### ■ CONNECTION

## 6-2 PLL ADJUSTMENT

ADJUSTMENT		ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
			UNIT	LOCATION		UNIT	ADJUST
LOCK VOLTAGE	1	<ul style="list-style-type: none"> <li>• Displayed frequency: 145.00 MHz</li> <li>• Simplex</li> <li>• Receiving</li> </ul>	PLL	Connect the digital multimeter or oscilloscope to C3.	1.6 V	PLL	L2
	2	• Transmitting			1.6 V±0.2 V		Verify
	3	Repeat steps 1 and 2 several times when the lock voltage is changed.					
REFERENCE FREQUENCY	1	<ul style="list-style-type: none"> <li>• Displayed frequency: 146.00 MHz</li> <li>• Connect the RF power meter or a 50 Ω dummy load to the antenna connector.</li> <li>• Transmitting</li> </ul>	Top panel	Loosely couple the frequency counter to the antenna connector.	146.0000 MHz	PLL	C22

### • PLL UNIT

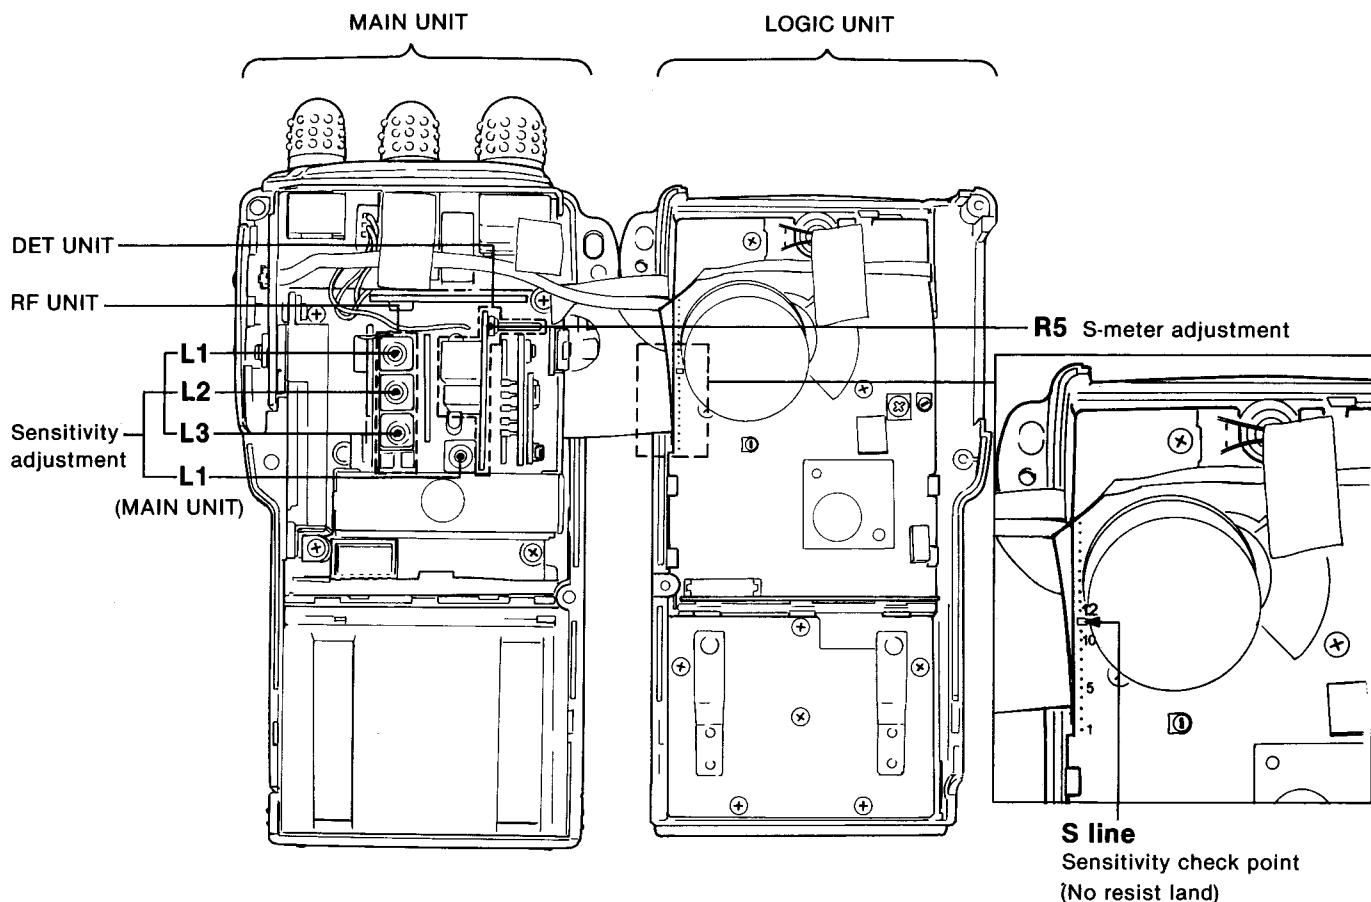

Although the above diagram has no shield cover on the VCO unit, adjustment may be performed without removing the shield cover.

## 6-3 RECEIVER ADJUSTMENT

ADJUSTMENT		ADJUSTMENT CONDITIONS		MEASUREMENT		VALUE	ADJUSTMENT POINT	
				UNIT	LOCATION		UNIT	ADJUST
SENSITIVITY	1	<ul style="list-style-type: none"> <li>Displayed frequency: 145.00 MHz</li> <li>[SQL] control : Max. CCW</li> <li>Connect the SSG to the antenna connector and set as:           <ul style="list-style-type: none"> <li>Level : 0.32 <math>\mu</math>V* (-117 dBm)</li> <li>Modulation: 1 kHz</li> <li>Deviation : <math>\pm 3.5</math> kHz</li> </ul> </li> <li>Receiving</li> </ul>	LOGIC	<p>Connect the distortion meter to the [SP] jack with an 8 <math>\Omega</math> load.</p> <p>S line with DC voltmeter can also be adjusted.</p>	Minimum distortion level	Adjust in sequence	RF	L1, L2, L3
							MAIN	L1
S-METER	1	<ul style="list-style-type: none"> <li>Displayed frequency: 145.00 MHz</li> <li>Connect the SSG to the antenna connector and set as:           <ul style="list-style-type: none"> <li>Level : 0.32 <math>\mu</math>V* (-117 dBm)</li> <li>Modulation: 1 kHz</li> <li>Deviation : <math>\pm 3.5</math> kHz</li> </ul> </li> <li>Receiving</li> </ul>	Function display	S/RF indicator	3 dots (S3) 	DET	R5	

\*This output level of the standard signal generator (SSG) is indicated as the SSG's open circuit.

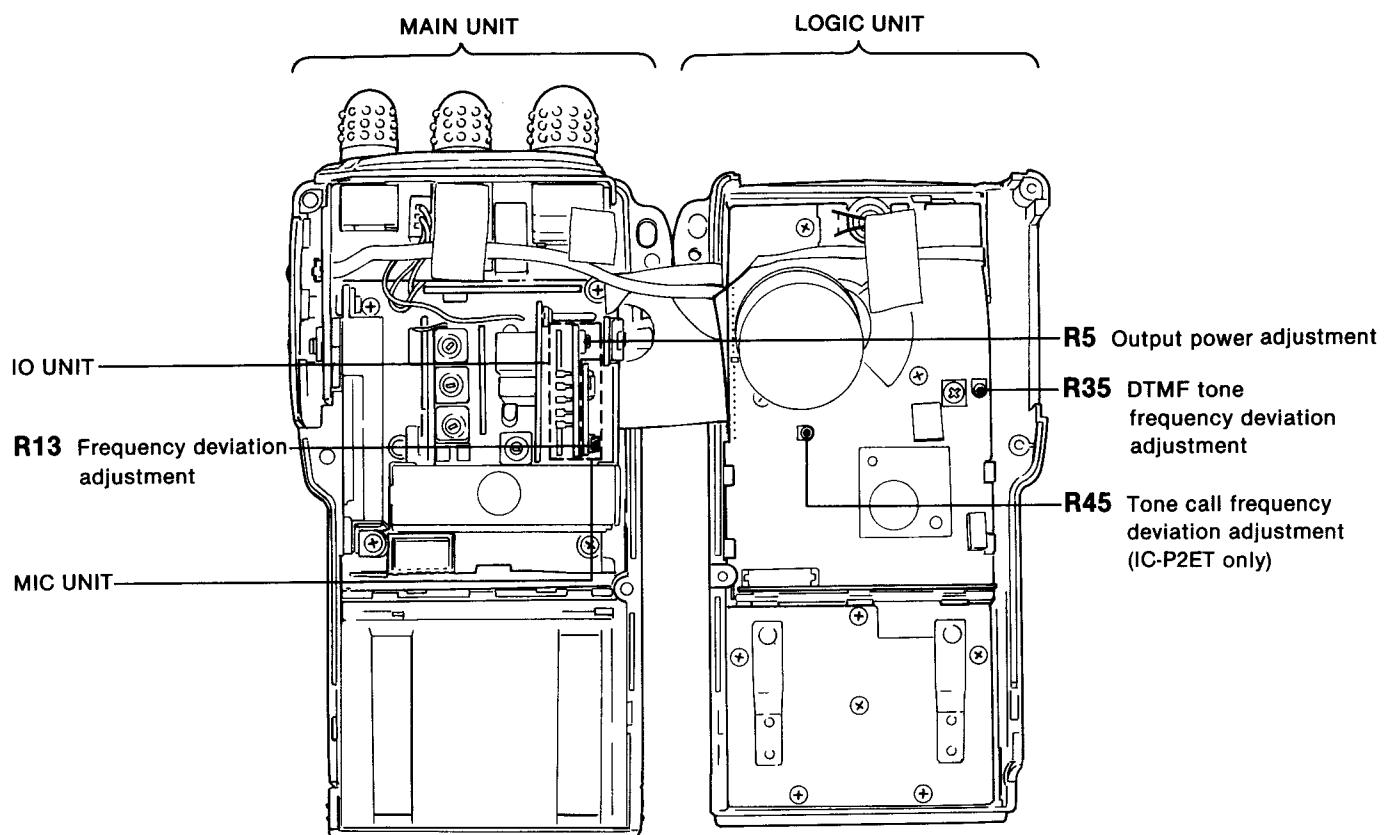

### • MAIN, RF AND DET UNITS

## 6-4 TRANSMITTER ADJUSTMENT

ADJUSTMENT		ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
			UNIT	LOCATION		UNIT	ADJUST
OUTPUT POWER	1	<ul style="list-style-type: none"> <li>• Displayed frequency: 145.00 MHz</li> <li>• Output power : HIGH</li> <li>• Simplex</li> <li>• Transmitting</li> </ul>	Top panel	Connect the RF power meter to the antenna connector.	5.0 W	IO	R5
	2	<ul style="list-style-type: none"> <li>• Output power : LOW 1</li> </ul>			0.25~1.0 W		Verify
	3	<ul style="list-style-type: none"> <li>• Output power : LOW 2</li> </ul>			Approx. 1.5 W		Verify
	4	<ul style="list-style-type: none"> <li>• Output power : LOW 3</li> </ul>			Approx. 3.5 W		Verify
FREQUENCY DEVIATION	1	<ul style="list-style-type: none"> <li>• Displayed frequency: 145.00 MHz</li> <li>• Output power : HIGH</li> <li>• Connect the audio generator to the [MIC] jack and set as: 210 mV/1.0 kHz (USA version) 95 mV/1.0 kHz (All other versions)</li> <li>• Set the FM deviation meter as: HPF : 50 kHz LPF : 20 kHz De-emphasis: OFF Detector : (P-P)/2</li> <li>• Transmitting</li> </ul>	Top panel	Connect the FM deviation meter to the antenna connector via the attenuator.	±4.8 kHz	MIC	R13
DTMF TONE FREQUENCY DEVIATION	1	<ul style="list-style-type: none"> <li>• Displayed frequency: 145.00 MHz</li> <li>• Push and hold the [PTT] switch and then push the [D] key.</li> </ul>	Top panel	Connect the FM deviation meter to the antenna connector via the attenuator.	±3.5 kHz	LOGIC	R35
TONE CALL FREQUENCY DEVIATION (IC-P2ET only)	1	<ul style="list-style-type: none"> <li>• Displayed frequency: 145.00 MHz</li> <li>• Push and hold the [LIGHT] switch and then push the [PTT] switch.</li> </ul>	Top panel	Connect the FM deviation meter to the antenna connector via the attenuator.	±3.5 kHz	LOGIC	R45
