INTRODUCTION

This service manual describes the latest service information for the **IC-V85**, **IC-V85E** and **IC-V85-T** FM TRANSCEIVERS at the time of publication.

MODEL	VERSION	SYMBOL
IC-V85	U.S.A.	[USA]
		[USA-2]
	Export	[EXP]
		[EXP-2]
		[EXP-3]
	Taiwan	[TPE]
		[TPE-2]
IC-V85E	Korea	[KOR]
	Europe	[EUR]
		[EUR-1]
IC-V85-T	U.K.	[UK]
	Thailand	[THA]

To upgrade quality, any electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

CAUTION

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 8 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit Icom parts numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1110003491 S.IC	TA31136FNG	IC-V85	RF UNIT	5 pieces
8820001210 Screw	2438 screw	IC-V85	Top cover	10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 50 dB to 60 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

SPECIFICATIONS

■ GENERAL

• Frequency coverage	: TX: 144–148 MHz/RX: 136–174 MHz ^{*1} (USA) TX: 144–146 MHz/RX: 136–174 MHz ^{*2} (Europe, UK) TX/RX: 144–146 MHz (Taiwan, Thailand, Korea) TX/RX: 136–174 MHz* (General; LM)
	* ¹ ; Guaranteed: 144–148 MHz range only
	* ² ; Guaranteed: 144–146 MHz range only
• Type of emission	: FM
• Number of memory channels	: 107 (incl. 6 scan edges and 1 call)
• Frequency resolution	: 5, 10, 12.5, 15, 20, 25, 30, 50 kHz
• Antenna connector	: BNC (50 Ω)
• Operating temperature range	: -10°C to +60°C; +14°F to +140°F
• Frequency stability	: ±2.5 ppm (-10°C to +60°C; +14°F to +140°F)
• Power supply requirement (negative ground)	: Specified Icom's battery pack or 11.0 V ±15% external DC power
• Current drain (at 7.2 V DC ; approx.)	: Receiving 80 mA (standby) 30 mA (power save) 250 mA (max. audio) Transmitting 2.6 A (at 7 W) 2.0 A (at 4 W) 1.0 A (at 0.5 W)
• Dimensions (Projections not included)	: 56(W)×110(H)×34.4(D) mm; 2 7/32(W)×4 11/32(H)×1 11/32(D) in. (with BP-227)
• Weight (approx.)	: 310 g; 12.5 oz. (with BP-227 and antenna) 165 g; 5.8 oz (without battery pack and antenna)

■ TRANSMITTER

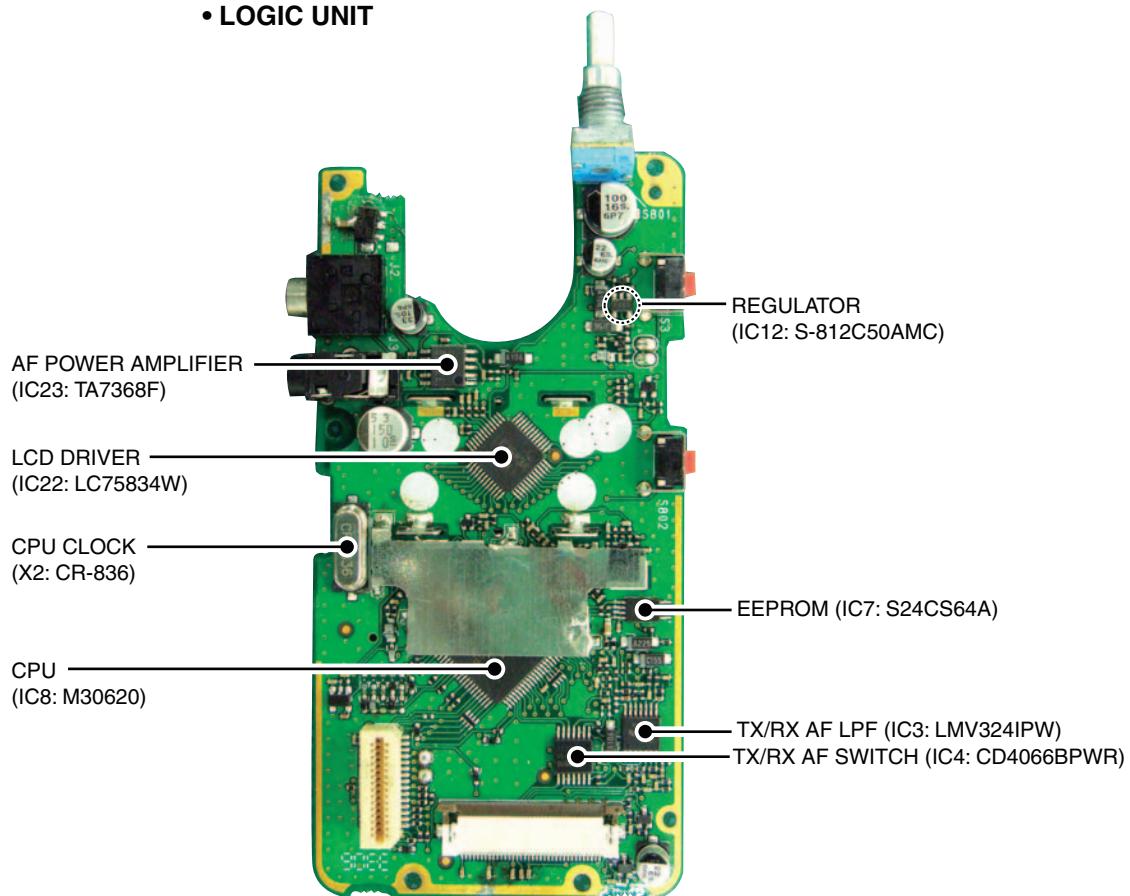

• Output power (at 7.2 V DC)	: 5.5 W (High)/4 W (Middle)/0.5 W (Low) [Thailand] 7 W (High)/4 W (Middle)/0.5 W (Low) [Others]
• Modulation system	: Variable reactance frequency modulation
• Maximum frequency deviation	: ±5.0 kHz
• Spurious emissions	: Less than -60 dBc
• Microphone connector	: 3-conductor 2.5 (d) mm (1/10")/2.2 kΩ

■ RECEIVER

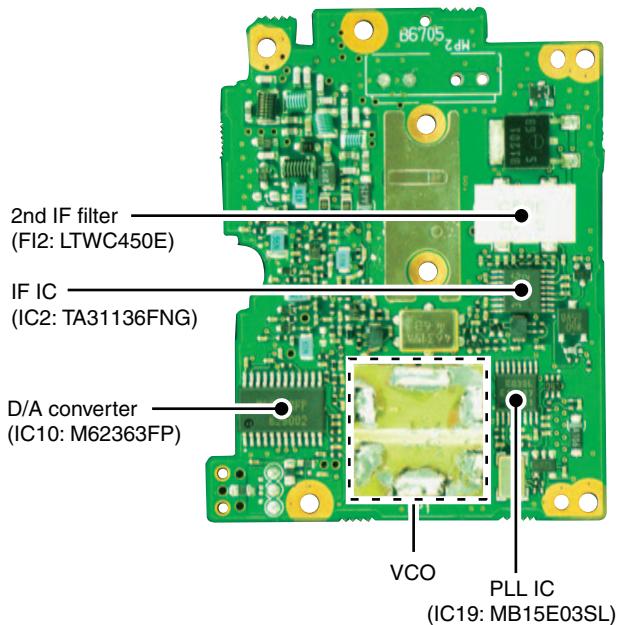

• Receive system	: Double conversion superheterodyne
• Intermediate frequencies	: 1st: 46.35 MHz, 2nd: 450 kHz
• Sensitivity	: Less than 0.2 μV (at 12 dB SINAD)
• Squelch sensitivity	: Less than 0.16 μV (at threshold)
• Selectivity	: More than 55 dB
• Spurious and image rejection	: More than 60 dB
• Intermodulation	: More than 55 dB
• Audio output power (at 7.2 V DC)	: More than 0.3 W at 10% distortion with an 8 Ω load
• External speaker connector	: 3-conductor 3.5 (d) mm (1/8")/8 Ω

All stated specifications are subject to change without notice or obligation.

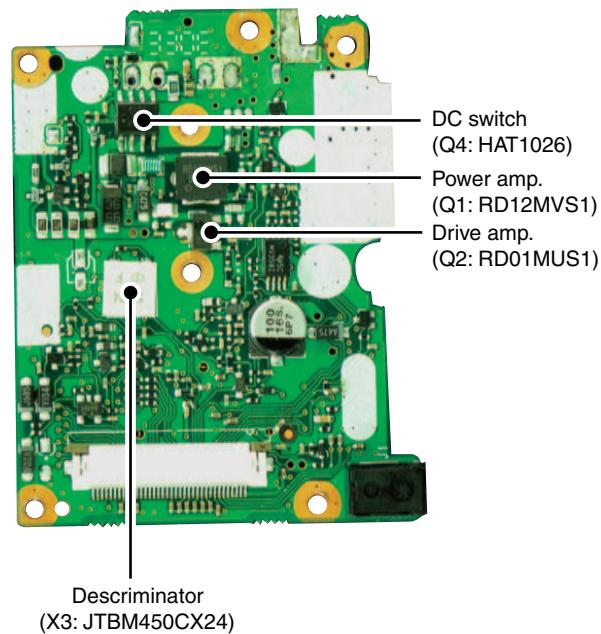

• LOGIC UNIT

• RF UNIT (TOP VIEW)

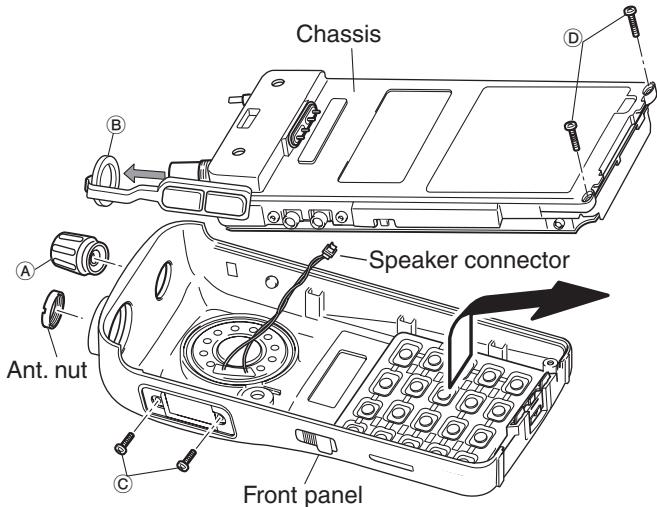

• RF UNIT (BOTTOM VIEW)

SECTION 3 DISASSEMBLY INSTRUCTION

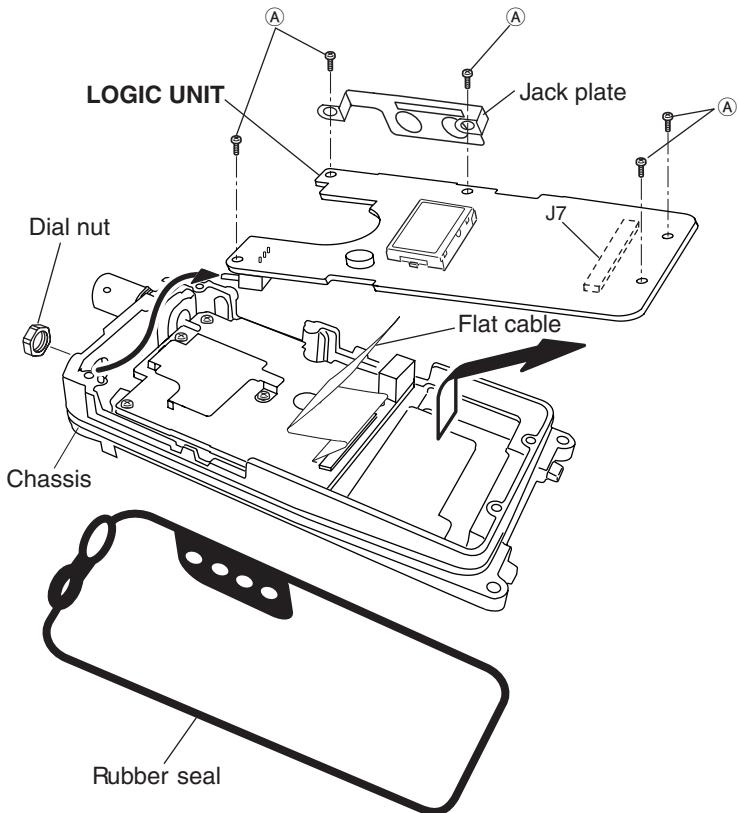

1. Removing the front panel

- ① Remove the knob **A** and jack cap **B**.
- ② Unscrew the Antenna nut and 4 screws **C** and **D**.
- ③ Disconnect the speaker connector.
- ④ Take off the chassis in the direction of the arrow.

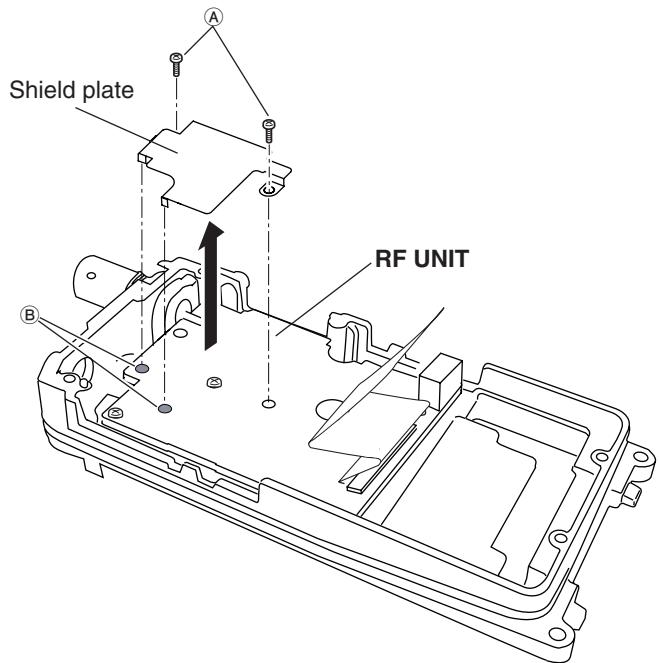

2. Removing the LOGIC UNIT

- ① Remove the rubber seal and dial nut.
- ② Unscrew 5 screws **A**.
- ③ Disconnect the flat cable from J7.
- ④ Remove the LOGIC UNIT from the chassis in the direction of the arrow.

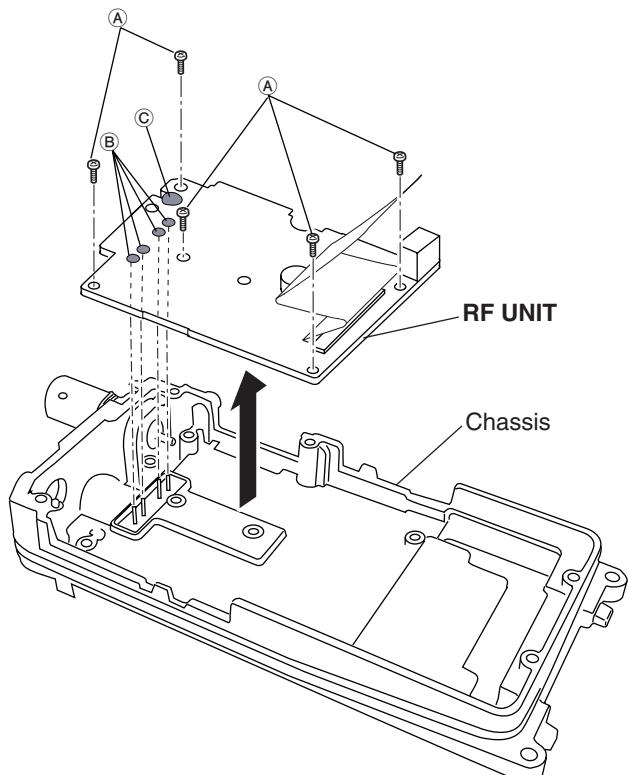

3. Removing shield plate

- ① Unscrew 2 screws **A**.
- ② Unsolder 2 points **B**, and remove the shield plate from the RF UNT.

4. Removing the RF UNIT

- ① Unscrew 5 screws **A**.
- ② Unsolder 4 points **B** (contact spring).
- ③ Unsolder 1 point **C** (antenna connector), and remove the RF UNIT from the chassis.

SECTION 4

CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

• ANTENNA SWITCHING

The antenna switching circuit toggles the receive (RX) line and transmit (TX) line.

The received signals from the antenna are passed through a two-staged Low-Loss Filter (LPF; L1, L2, C1–C5) and then applied to the antenna switch (D1, D2, D8, L15, L58, C52, C76, C516).

While transmitting, the voltage on the T5V line is applied to D1, D2 and D8, and these are ON. Thus the TX line is connected to the antenna. Simultaneously, the RX line is connected to the GND to prevent transmit signal entering.

While receiving, no voltage is applied to the D1, D2 and D8, and these are OFF. Thus the TX line and the antenna is disconnected to prevent received signals entering. Simultaneously, the RX line is disconnected from the GND and the received signals are passed through the LPF (L15, L58, C52, C76, C516).

The filtered signals are applied to the RF circuits.

• RF CIRCUITS (RF UNIT)

RF circuits filter and amplify the received signals within the frequency coverage.

The received signals from the antenna switch are passed through a tuned Bandpass filter (BPF; D9, L16, C81) and applied to the RF amplifier (Q12) that received signals are amplified in low NF rate.

The pass band frequency of the tuned BPF (D9, L16, C81) is adjusted by the tuning voltage "T1" from the D/A converter (IC10, pin 2), to suppress unwanted signals for high selectivity.

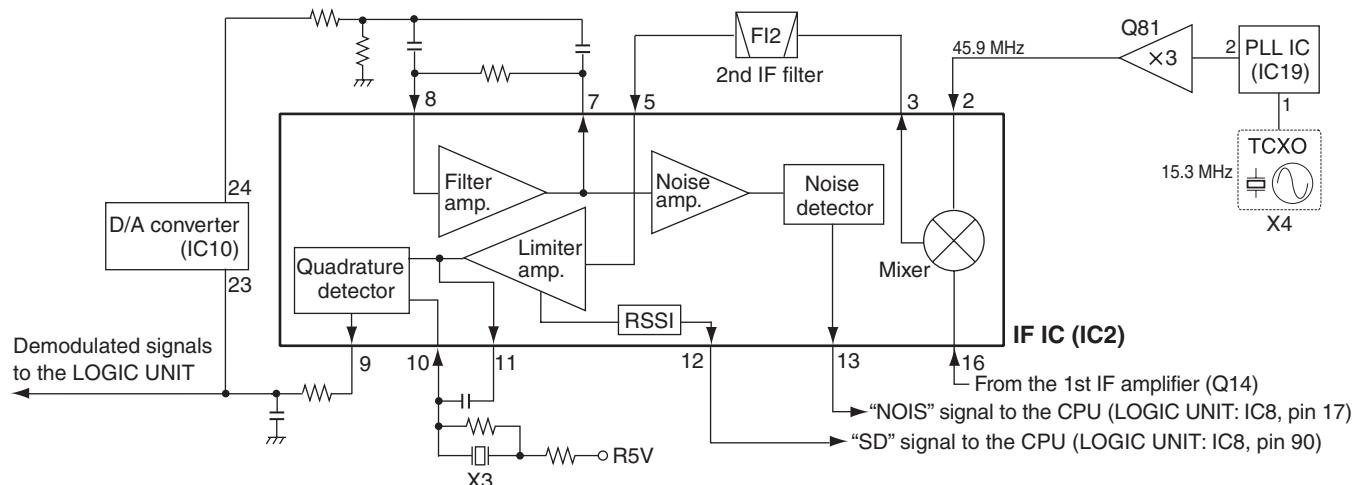

The amplified received signals are passed through the tuned BPF (D11, D12, L18, C92, C94, C96, C502), limiter (D72) and the tuned BPF (D65, L57, C505, C507), then applied to the 1st mixer (Q13).

• 1ST IF CIRCUITS (RF UNIT)

The received signals are converted into the 1st IF signal, filtered and amplified at the 1st IF circuits.

The signals from the RF circuits are applied to the 1st mixer

• 2nd IF AND DEMODULATOR CIRCUITS

(Q13) and converted into the fixed frequency of 1st IF signal by mixing with the 1st Local Oscillator (LO) signals from the VCO (Q76, D59–D61). By changing the 1st LO frequency, only the desired frequency will pass through a pair of crystal filters at the next stage of the mixer. By changing LO frequency, the frequency of the 1st IF signal is fixed one for the receiving frequency.

The converted 1st IF signal is passed through the BPF (FI1) and limiter (D63), then amplified by the 1st IF amplifier (Q14). The amplified 1st IF signal is applied to the IF IC (IC2, pin 16).

• 2ND IF CIRCUITS (RF UNIT)

The 1st IF signal is converted into the 2nd IF signal and demodulated.

The 1st IF signal from the 1st IF circuits are converted into the 2nd IF signal at the 2nd mixer section of the IF IC (IC2), by mixing with the 2nd LO signal which is generated at the reference frequency oscillator (X4) after being passed through the PLL IC (IC19, pins 1, 2) and the tripler (Q81).

The converted 2nd IF signal is output from pin 3 and passed through the BPF (FI2) to remove the sideband noise, then applied to the 2nd IF amplifier section in IC2 (pin 5). The amplified 2nd IF signal is then applied to the FM-detector section. The demodulated AF signals are output from pin 9 and applied to the AF circuits.

• AF CIRCUITS (LOGIC UNIT)

The demodulated AF signals from the IF IC are amplified and filtered at the AF circuits.

AF signals from the 2nd IF circuits are passed through the HPF (IC3, pins 6, 7), and LPF (IC3, pins 13, 14) via the TX/RX AF switches (IC4, pins 1, 2; 10, 11). The switched AF signals are passed through the D/A converter (RF UNIT; IC10, pins 11, 12) for audio level adjustment.

The D/A converter is a level controller IC which adjusts AF signal level according to the control signals ("DATA," "STROBE," "CLOCK") from the CPU (IC8).

The level adjusted AF signals are then applied to the AF power amplifier (IC23, pin 4) to be amplified to obtain rated audio output power. The power-amplified AF signals are output from pin 10, and then drive internal or external speaker.

• SQUELCH CIRCUIT (RF AND LOGIC UNITS)

- NOISE SQUELCH -

The noise squelch mutes the AF output when no RF signals are received. By detecting noise components (around 30 kHz signals) in the demodulated AF signals, the squelch circuit toggles the mute switch and AF power amplifier ON and OFF.

A portion of the AF signals from the IF IC (RF UNIT; IC2, pin 9) are passed through the D/A converter (RF UNIT; IC10, pins 23, 24) for level adjustment. The level adjusted AF signals are applied to the noise filter section (RF UNIT; IC2, pins 7, 8; R86–R88, C121, C122) which allows only noise components to pass. The filtered noise components are amplified at the noise amplifier section, and rectified into the DC voltage which is proportional to the noise signal level, at the noise detector section, then output from pin 13 as the “NOIS” signal.

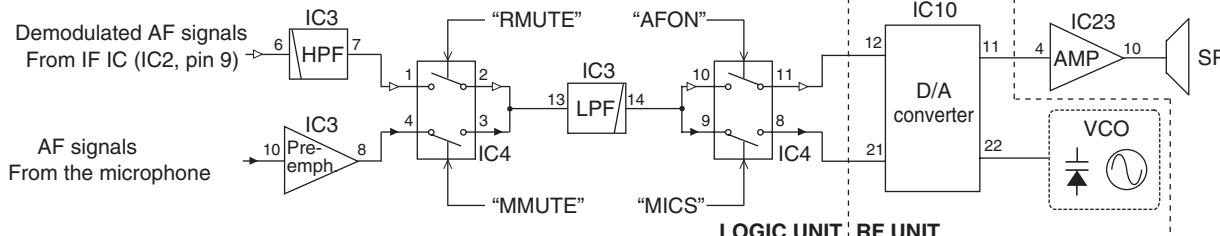

The “NOIS” signal is applied to the CPU (LOGIC UNIT; IC8, pin 17), and the CPU compares the “NOISE” signal and set reference level (squelch threshold level). When the input “NOIS” signal is higher than reference level, the CPU cuts off “AFON” signal (from pin 4) to the AF power amplifier control circuit (LOGIC UNIT; Q14–Q16) to deactivate the AF power amplifier (LOGIC UNIT; IC23).

- TONE SQUELCH -

The tone squelch circuit detects tone signals and opens the squelch only when receiving a signal containing a matched sub audible tone. When the tone squelch is in use, and a signal with a mismatched or no subaudible tone is received, the tone squelch circuit mutes the AF signals even when the noise squelch is open.

A portion of the demodulated AF signals is passed through the LPF (LOGIC UNIT; Q53) to filters CTCSS/DTCS signal. The filtered signal is applied to the CPU (LOGIC UNIT; IC8, pin 93). The CPU compares the applied signal and the set CTCSS/DTCS, then the CPU controls the status (“Low” or “High”) of “AFON” signal as • NOISE SQUELCH.”

• AF and MIC amp. CIRCUITS

4-2 TRANSMITTER CIRCUITS

• MICROPHONE AMPLIFIER CIRCUITS (LOGIC UNIT)

The AF signals from the microphone (MIC signals) are filtered and level-adjusted at microphone amplifier circuits.

Audio signals from the microphone (MC1) are applied to IC3 (pin 10) which combines a microphone amplifier and pre-emphasis circuit. The MIC signals are amplified and filtered to obtain +6 dB/oct of frequency characteristic by IC3.

The amplified and emphasized MIC signals are output from the pin 8, and passed through the splatter filter (IC3, pins 13, 14) which suppresses 3 kHz and higher audio components, via the TX/RX switch (IC4, pins 3, 4; 8, 9). The filtered MIC signals are then applied to the modulation circuit.

• MODULATION CIRCUITS (RF UNIT)

- MIC SIGNALS -

The modulation circuits modulates the VCO oscillating signal using the modulation signals.

The MIC signals from AF circuits are passed through the D/A converter (IC10, pins 21, 22) for level (deviation) adjustment. The level adjusted MIC signals are applied to the variable capacitor (D61) in the VCO (Q76, D59–D61), and modulate the VCO oscillating signal by changing the reactance of D61. The modulated VCO output are buffer-amplified by Q75 and Q74, then applied to the transmit amplifier as a transmit signal.

- TONE SIGNALS -

CTCSS/DTCS signals are output from CPU (LOGIC UNIT; IC8, pin 2) and passed through the LPF (R224, R227, C219), then applied to the LPF (as the AF mixeRF UNIT; IC3, pin 13) to be mixed with MIC signals. The mixed CTCSS/DTCS signals are applied to modulation circuits as • MIC SIGNALS.”

• TRANSMIT AMPLIFIERS (RF UNIT)

The transmit signal from the buffer amplifier (Q74) is amplified to the transmit output level by the transmit amplifiers.

The buffer-amplified VCO output signal is amplified by transmit amplifiers; pre-drive (Q3), drive (Q2) and power (Q1) amplifiers in sequence, after being passed through the TX/RX switch (D3).

The power-amplified transmit signal is passed through the power detector (D32, D33), antenna switch (D1) and LPF (as a harmonic filter ; L1, L2, C1–C5), before being emitted from the antenna.

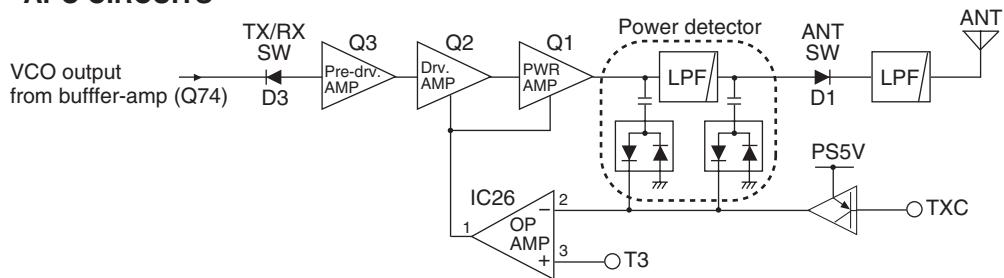

• APC (Automatic Power Control) CIRCUIT (RF UNIT)

The APC (Automatic Power Control) circuit prevents the transition of the transmit output power level which is caused by load mismatching or heat effect, etc.

At the power detector (D32, D33), a portion of the transmit signal is rectified into DC voltage which is proportional to the transmit power level.

The rectified voltage is applied to the inverted input terminal of the operational amplifier (IC26, pin 2). The voltage "T3" from the D/A converter (IC10, pin 10) is applied to the non-inverted input terminal as the reference.

• APC CIRCUITS

The operational amplifier compares the rectified voltage and reference voltage "T3," and the difference of the voltage is output from the operational amplifier pin 1. The output voltage controls the bias of drive (Q2) and power (Q1) amplifiers for stable transmit output power.

The change of transmit power is carried out by changing the reference voltage "T3", and transmit muting (deactivation of drive and power amplifiers) is carried out by TX switch (Q37) controlled by "TXC" signal from CPU (LOGIC UNIT; IC8, pin 59).

4-3 FREQUENCY SYNTHESIZER CIRCUITS

• VCO (RF UNIT)

VCO (Voltage Controlled Oscillator) is a oscillator whose oscillating frequency is controlled by adding voltage (lock voltage).

VCO oscillates the both of transmit and 1st LO signals. The VCO output signals are buffer-amplified by Q74 and Q75.

While receiving, the VCO output is passed through the TX/RX switch (D4) and the LPF (L29, L38, L59, C102, C435, C437, C539), then applied to the 1st mixer (Q13) to be mixed with the received signals to produce the 46.35 MHz 1st IF signal.

While transmitting, the buffer-amplified VCO output is passed through the TX/RX switch (D3) and applied to the transmit amplifiers.

• PLL (Phase Locked Loop) CIRCUIT (RF UNIT)

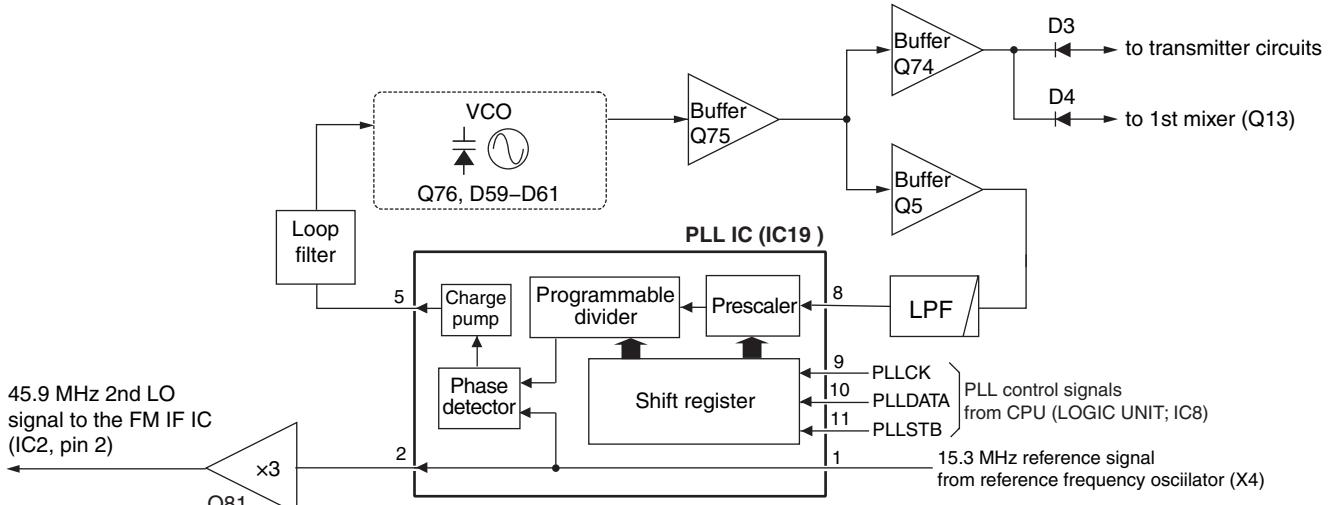

The PLL circuit provides stable oscillation of the transmit frequency and receive 1st LO frequency. The PLL output frequency is controlled by the divided ratio (N-data) from the CPU.

A portion of VCO output is applied to the PLL IC (IC19, pin 8) via buffer amplifiers (Q5, Q75). The applied signal is divided at the pre-scaler and programmable counter according to the control signals "PLLSTB," "PLLDATA" and "PLLCK" from the CPU (L; IC8, pins 63, 65 and 66). The divided signal is phase-compared with the reference frequency signal from the reference frequency oscillator (X4), at the phase detector.

The phase difference is output from pin 5 as a pulse type signal after being passed through the internal charge pump. The output signal is converted into the DC voltage (lock voltage) by passing through the loop filter (R445–R448, C472–C475, C519). The lock voltage is applied to the variable capacitors (D59 and D60) of VCO (Q76, D59–D61) and locked to keep the VCO oscillating frequency constant.

If the oscillated signal drifts, its phase changes from that of the reference frequency, causing a lock voltage change to compensate for the drift in the VCO oscillating frequency.

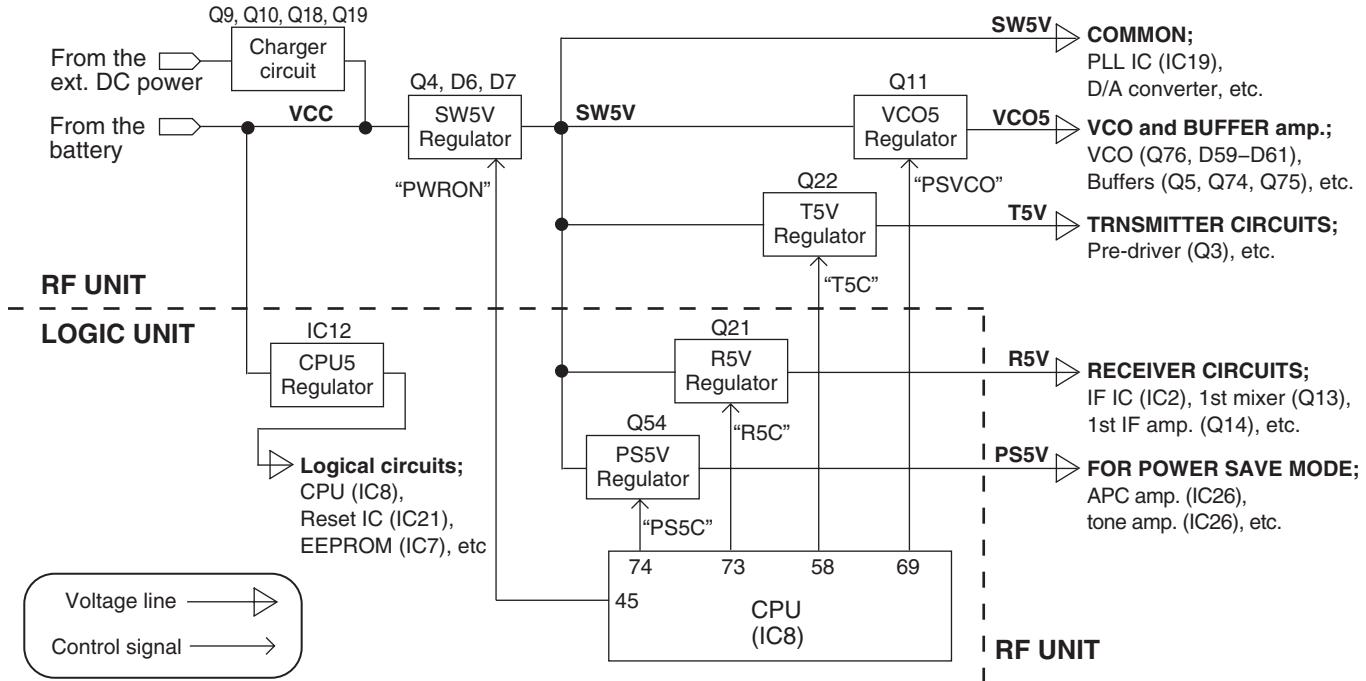

• PLL CIRCUITS

4-4 POWER SUPPLY CIRCUITS

DC voltage from the battery or external DC power supply is routed to whole circuit of the transciever via regulators.

• POWER SUPPLY CIRCUITS

4-5 CPU PORT ALLOCATION

Pin No.	Pin Name	Description	I/O
1	TONE	Tone signals (DTMF/BEEP/1750Hz).	OUT
2	CTCSS	Tone signals (CTCSS/DTCSS).	OUT
4	AFON	AF power amplifier control signal. "High"=While the AF poer amp. is activated.	OUT
5	RMUTE	AF line mute signal to the AF switch. "Low"=While muting.	OUT
9	CSHIFT	Clock frequency shift control signal to the clock oscillator.	OUT
10	RESET	CPU reset signal. "Low"=CPU reset.	IN
16	PWRSW	[PWR] Key. "Low"=When the key is pushed.	IN
17	NOIS	"NOIS" signal.	IN
18	DCC	External power supply connection detect. "Low"=Powered by external DC.	IN
19	HOUT	Power supply detect. "Low"=Powered by battery.	IN
20	PTT	Input signal from [PTT] key. "High"=While the key is pushed.	IN
21–24	KR0–KR3	Input signal from Key pads. "Low"=When the key is pushed.	IN
25	LEDC	Backlight control signal to the LED driver.	OUT
33	DISDA	Serial data to the LCD driver.	IN
34	DISST	Chip-enable signal to the LCD driver.	IN
35	DISCK	Serial clock signal to the LCD driver.	IN
36	DISEN	Disable signal to the LCD driver.	IN
40	DICK	Pulse signal from [CONTROL DIAL].	IN
41	DIUD		IN
42	MONISW	[MONI] key. "Low"=When the key is pushed.	IN
45	PWRON	Control signal to the power regulator.	OUT
48–52	KS0–KS4	Input signal from Key pads. "Low"=When the key is pushed.	OUT
53	MICS	AF filter switching signal.	OUT
54	MMUTE	MIC line mute signal to the AF switch. "low"=While muting.	OUT
55	DADATA	Data signal to the D/A converter.	OUT
56	DACK	Clock signal to the D/A converter.	OUT

Pin No.	Pin Name	Description	I/O
57	DASTB	Strobe signal to the D/A converter.	OUT
58	T5C	T5 line control signal to the T5 regulator. "Low"=While transmitting.	OUT
59	TXC	Transmit mute signal to the TX switch. "Low"=While TX muting.	OUT
61	UNLK	PLL unlock signal. "Low"=PLL is unlocked.	IN
63	PLLSTB	Strobe signal to the PLL IC.	OUT
64	PLPS	PLL IC power save mode switching signal. "Low"=While in power save mode.	OUT
65	PLLDATA	Data signal to the PLL IC.	OUT
66	PLLCK	Clock signal to the PLL IC.	OUT
68	PLLSW	PLL loop filter characteristic toggle signal. "High"=While the PLL is kicked-up.	OUT
69	PSVCO	VCO regulator control signal. "Low"=While Vco is activated."	OUT
70	CHGIH	Charger circuit (High) control signal. "High"=While charging.	OUT
71	CHGC	Charger circuit control signal. "High"=While charging.	OUT
74	PS5C	Power save line control signal to the PS5V regulator. "Low"=While power save mode.	OUT
77	SI	External MIC key (A/D) input. "High"=While the key is pushed.	IN
78	OPSD	Data signal to the attached optional unit.	OUT
79	ESCK	Clock signal to the EEPROM.	OUT
81	OPV1	Scramble unit detection signal. "Low"=DTMF unit is attached.	IN
82	OPV2	Optional unit attachment detection signal. "Low"=DTMF unit is attached.	IN
83	OPV3	DTMF unit detection signal. "Low"=DTMF unit is attached.	IN
87	DCIN	External power supply's voltage detection.	IN
88	LVIN	Lock voltage.	IN
90	SD	"SD" signal (RSSI signal).	IN
91	VIN	Remining battery voltage detection.	IN
93	CTCIN	DTCS and CTCSS signals.	IN

SECTION 5 ADJUSTMENT PROCEDURE

■ REQUIRED TEST EQUIPMENTS

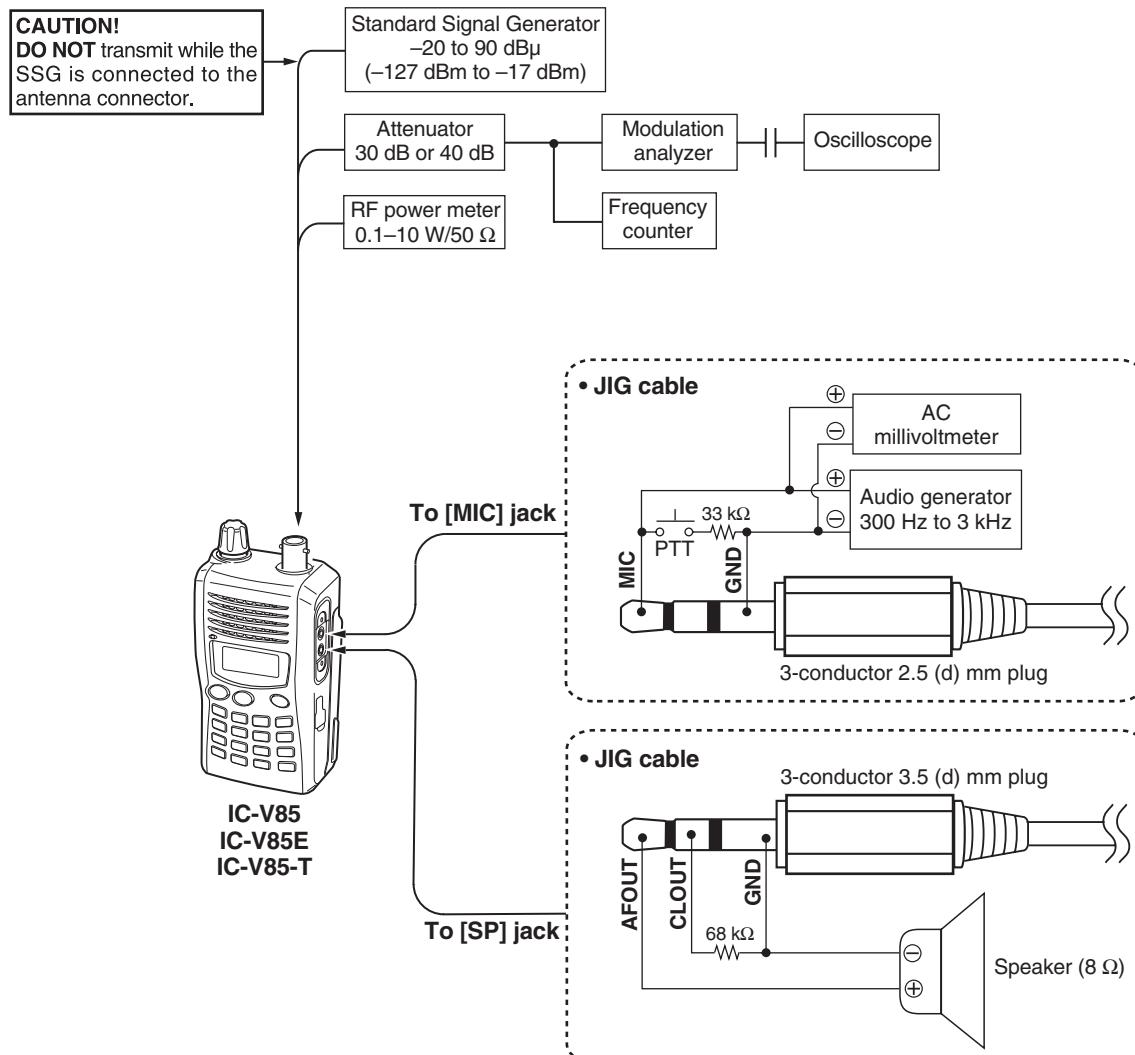

When adjusting IC-V85/V85E/V85-T, following test equipments and JIG cables (see the illust below) are required.

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
RF power meter (terminated type)	Measuring range : 0.1–10 W Frequency range : 100–300 MHz Impedance : 50 Ω SWR : Less than 1.2 : 1	Standard signal generator (SSG)	Frequency range : 0.1–300 MHz Output level : -20 to 90 dBμ (-127 to -17 dBm)
Frequency counter	Frequency range : 0.1–300 MHz	AC millivoltmeter	Measuring range : 10 mV to 10 V
	Frequency accuracy : ±1 ppm or better Sensitivity : 100 mV or better	Oscilloscope	Frequency range : DC–20 MHz Measuring range : 0.01–20 MHz
Modulation analyzer	Frequency range : 30–300 MHz Measuring range : 0 to ±10 kHz	External speaker	Input impedance : 8 Ω Capacity : More than 1 W
Audio generator	Frequency range : 300–3000 Hz Output level : 1–500 mV	Attenuator	Power attenuation : 30 or 40 dB Capacity : More than 10 W

CAUTION!: BACK UP originally programmed contents (Memory channels, Common settings, etc.) in the transceiver using optional CS-V85 CLONING SOFTWARE before starting adjustment.

When all adjustments are completed, these contents in the transceiver may be cleared.

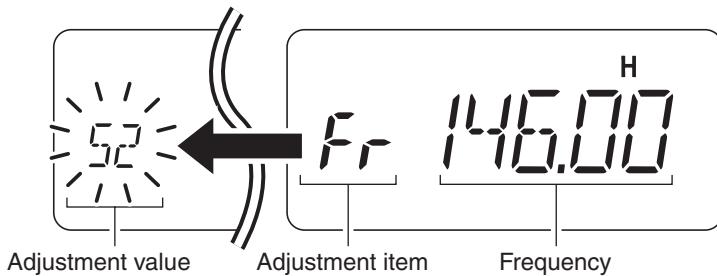

■ CONNECTION

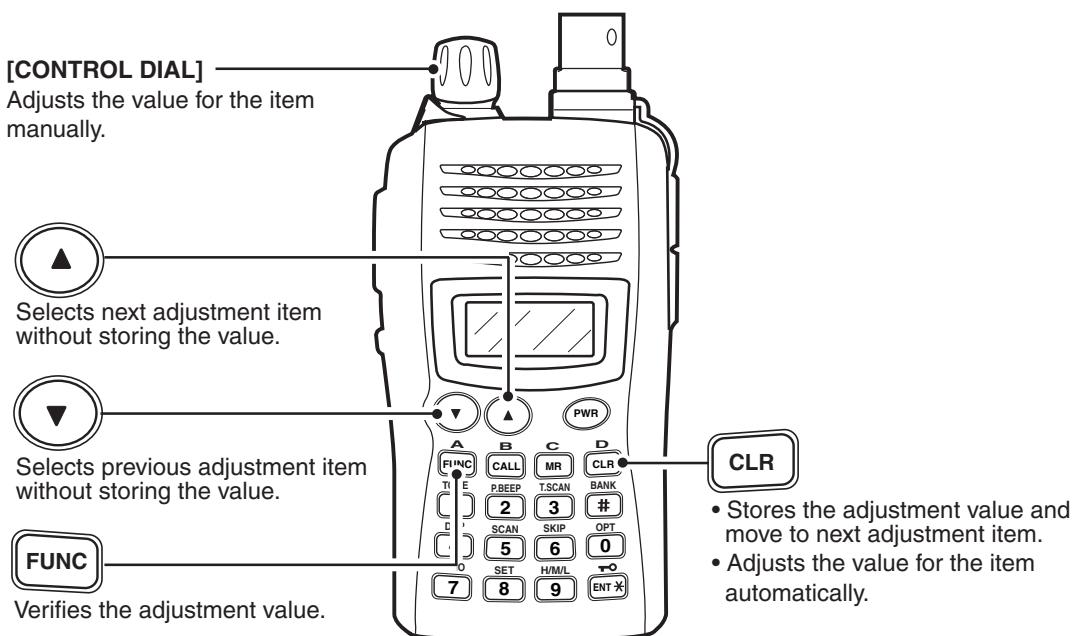

■ ENTERING ADJUSTMENT MODE

- ① Turn the power OFF.
- ② Connect the JIG cable to the [SP] jack (see page 5-1).
- ③ While pushing [**▲**], [**▼**] and [**CLR**] keys, turn the power ON.

During adjustment mode, the function display shows adjustment item and frequency as below.
(While rotating [**CONTROL DIAL**], adjustment value is displayed instead of adjustment item.)

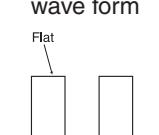

■ KEY ASSIGNMENTS FOR THE ADJUSTMENT MODE

■ QUITTING ADJUSTMENT MODE

- Turn the power OFF.

■ ADJUSTMENT

ADJUSTMENT	ADJUSTMENT CONDITION	OPERATION	VALUE
REFERENCE FREQUENCY [Fr]	1 • Connect a RF Power Meter or a dummy load to the antenna connector. • Loosely couple a Frequency Counter to the antenna connector. • Transmitting	Rotate [CONTROL DIAL] during transmit to adjust the frequency, then release the [PTT] and push [CLR] key to store the adjustment value and select the next adjustment item.	146.00000 MHz
LOCK VOLTAGE [LU]	1 • Connect an RF Power Meter to the antenna connector. • Transmitting	Push [CLR] key during transmit, then push [Δ] to select the next adjustment item.	(automatic adjustment)
TRANSMIT OUTPUT POWER [Po] (H; High)	1 • Connect an RF Power Meter to the antenna connector. • Transmitting	Rotate [CONTROL DIAL] during transmit to adjust the output power, then release the [PTT] and push [CLR] key during transmit to store the adjustment value and select the next adjustment item.	7.0 W except [THA] 5.5 W [THA]
(M; Middle)	2 • Transmitting		4.0 W
(L; Low)	3 • Transmitting		0.5 W
DEVIATION [dE]	NOTE: "REFERENCE FREQUENCY" should be adjusted before "DEVIATION." Otherwise, "DEVIATION" will not be adjusted properly.		
	1 • Connect an Audio Generator and AC millivoltmeter to the MIC line (see page 5-1) and set as; Frequency : 1 kHz Level : 90 mVrms • Connect a Modulation Analyzer to the antenna connector through an attenuator, and set as; HPF : OFF LPF : 20 kHz De-emphasis : OFF • Detector : (P-P)/2 Transmitting	Rotate [CONTROL DIAL] during transmit to adjust the deviation, then release the [PTT] and push [CLR] key to store the adjustment value and select the next adjustment item.	± 4.2 kHz
[dP]*	Push [Δ] to skip this item.		-
DTCS MODULATION BALANCE [dt]	NOTE: "DEVIATION" should be adjusted before "DTCS MODULATION BALANCE." Otherwise, "DTCS MODULATION BALANCE" will not be adjusted properly.		
	1 • Set the Modulation Analyzer same as "DEVIATION." • Connect an Oscilloscope to the detector output terminal of the Modulation Analyzer. • No audio signal is applied to the MIC line. • Transmitting	Rotate [CONTROL DIAL] during transmit to arrange the wave form, then release the [PTT] and push [CLR] key during transmit to store the adjustment value and select the next adjustment item.	Set to square wave form  Flat
[bP]*	Push [Δ] to skip this item.		-
RECEIVE SENSITIVITY [tr] (Band low)	NOTE: "REFERENCE FREQUENCY" should be adjusted before "RECEIVE SENSITIVITY." Otherwise, "RECEIVE SENSITIVITY" will not be adjusted properly.		
	1 • Connect an SSG to the antenna connector and set as; Frequency : Displayed frequency Level : 0 dB μ (-107 dBm) Modulation : 1 kHz Deviation : ± 3.5 kHz • Receiving	Push [CLR] key to store the adjustment value and select the next adjustment item.	(automatic adjustment)
(Band center)	2 • Set the SSG as; Frequency : Displayed frequency • Receiving	Push [CLR] key to store the adjustment value and select the next adjustment item.	
(Band high)	3 • Set the SSG as; Frequency : Displayed frequency • Receiving	Push [CLR] key to store the adjustment value and select the next adjustment item.	
SQUELCH [Sq]	1 • Connect an 8 Ω speaker to the AFOUT line (see page 5-1). • Set the SSG as; Level : -19 dB μ (-126 dBm) • Receiving	Rotate [CONTROL DIAL] to close the squelch once, then rotate [CONTROL DIAL] to set the squelch level at the point where the audio signals just appear. Push [CLR] key to store the adjustment value and select the next adjustment item.	Squelch open

*; These items MUST NOT be modified. Otherwise, the transceiver will not perform properly.

■ ADJUSTMENT (continued)

ADJUSTMENT	ADJUSTMENT CONDITION	OPERATION	VALUE
S-meter [Sr]	NOTE: "RECEIVE SENSITIVITY" should be adjusted before "S-meter." Otherwise, "S-meter" will not be adjusted properly.		
	1 • Set the SSG as; Frequency : Displayed frequency Level : -6 dBu (-113 dBm) • Receiving	Push [CLR] key to store the adjustment value and select the next adjustment item.	(automatic adjustment)
[dF]*	Push [▲] to skip this item.		
[Et]*	Push [▲] to skip this item.		
CTCSS AMPLITUDE (f=5.00 kHz) [C5]	NOTE: "DTCS MODULATION BALANCE" (page 5-3) should be adjusted before "CTCSS AMPLITUDE." Otherwise, "CTCSS AMPLITUDE" will not be adjusted properly.		
(f=6.25 kHz) [C6]	1 • Set the Modulation Analyzer same as "DEVIATION." 2 • No audio signal is applied to the MIC line. • Transmitting	Rotate [CONTROL DIAL] during transmit to adjust the deviation, then release the [PTT] and push [CLR] key to store the adjustment value.	±0.75 kHz
[dt]* to [D6]*	Skip these items. (The adjustment is completed. Turn the power OFF.)		

*; These items MUST NOT be modified. Otherwise, the transceiver will not perform properly.
