SERVICE MANUAL

DUAL BAND FM TRANSCEIVER

IC-2350H

Downloaded by
RadioAmateur.EU

INTRODUCTION

This service manual describes the latest information for the IC-2350H at the time of publication.

MODEL	VERSION NO.	VERSION	SYMBOL
IC-2350H	#02	Europe	EUR
	#03	Italy	ITA
	#05	U.S.A.	USA
	#06	Korea	KOR
	#07	Australia	AUS
	#08	Asia	SEA

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. Such a connection could cause a fire hazard and/or electric shock.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1110002750 S.I.C TA75S01F IC-2350H MAIN UNIT 1 piece
8810004430 Screw PH M3 x 6 ZK IC-2350H Bottom cover 6 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB to 50 dB attenuator between the transceiver and a deviation meter or spectrum analyser when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

SECTION 3 CIRCUIT DESCRIPTION

3-1 RECEIVER CIRCUITS

3-1-1 DUPLEXER CIRCUIT

The transceiver has a duplexer (low-pass and high-pass filter) on the first stage from the antenna connector to separate the received signals into VHF and UHF signals. The low-pass filter (L39-L41, C160-C162) is for VHF signals and the high-pass filter (C1-C3, L1, L2) is for UHF signals. The separated signals are applied to each RF circuit.

3-1-2 VHF ANTENNA SWITCHING CIRCUIT

The antenna switching circuit functions as a low-pass filter while receiving. However, its impedance becomes very high while transmitting by turning ON diodes (D34, D35). Thus transmit signals are blocked from entering the receiver circuits. The antenna switching circuit employs a $1/4 \lambda$ type diode switching system. The passed signals are then applied to the RF amplifier circuit.

3-1-3 VHF RF CIRCUIT

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

The signals from the antenna switching circuit pass through a bandpass filter (D38, L60), and are applied to the RF amplifier (Q53). The amplified signals are passed through the next stage bandpass filter (D40, D41, D44) to suppress unwanted signals. The filtered signals are then applied to the 1st mixer circuit (Q54).

Varactor diodes (D38, D40, D41, D44) are used for the bandpass filters to tune the center frequency for wide bandwidth receiving and good image response rejection. PLL lock voltages are applied to these diodes for tuning.

FM DETECTOR AND SQUELCH CIRCUITS

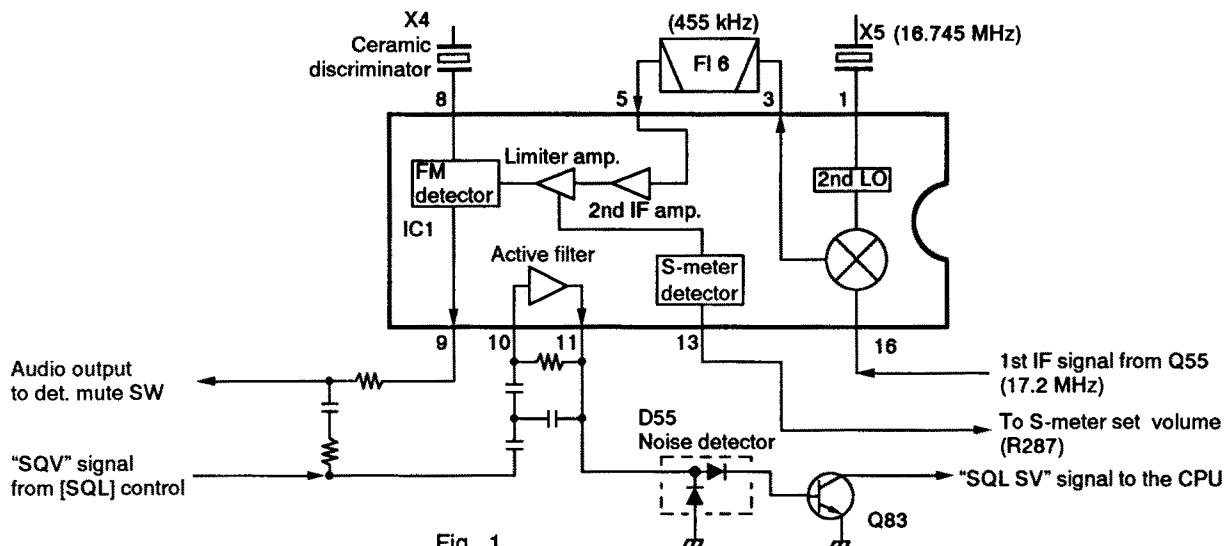

Fig. 1

3-1-4 VHF 1ST MIXER AND 1ST IF CIRCUITS

The 1st mixer circuit converts the received signals to a fixed frequency of the 1st IF signal with a PLL output frequency. By changing the PLL frequency, only the desired frequency will be passed through a pair of crystal filters at the next stage of the 1st mixer.

The signals are mixed with a 1st LO signal at the mixer circuit (Q54) to produce a 17.2 MHz 1st IF signal. The 1st LO signal is the PLL output frequency which comes from the VHF-VCO circuit (Q46).

The 1st IF signal is passed through a pair of crystal filters (F14) to suppress out-of-band signals and then amplified at the IF amplifier (Q55). The amplified signal is applied to the 2nd mixer circuit (IC17).

3-1-5 VHF 2ND IF AND DETECTOR CIRCUIT

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double superheterodyne system (which converts receive signals twice) improves the image rejection ratio and obtains stable receiver gain.

IC17 contains the 2nd mixer circuit, 2nd LO circuit, limiter amplifier circuit, quadrature detector circuit and squelch trigger circuit.

The 1st signal from F14 is applied to the 2nd mixer section of IC17 (pin 16), and mixed with a 16.745 MHz 2nd LO signal generated by X5 to produce a 455 kHz 2nd IF signal.

The FM detector circuit employs the quadrature detection method (linear phase detection), which uses a ceramic discriminator (X4) for phase delay to obtain a non-adjusting circuit. The detected signals from IC17 (pin 9) are applied to the AF circuit.

3-1-6 AF AMPLIFIER CIRCUIT

The AF amplifier circuit amplifies the detected signals to drive a speaker. For the separate speaker function, a stereo power amplifier is used.

AF signals are passed through the detector switch (Q82), then the analog switch (IC18 pins 2, 1). AF signals from IC18 (pin 1) are applied to the active filter (Q85, Q86) which functions as a high-pass filter to suppress subaudible tone signals for tone squelch operation.

The filtered signals pass through the [VOL] control (R332) and are then applied to the AF power amplifier (IC19 pin 2). The output signals are applied to an external speaker jack. When no plug is connected to the jack the signals are fed back to the UHF audio input (IC19 pin 8) and combined with the UHF audio. The mixed audio is applied to the other external speaker jack and then to the internal speaker.

3-1-7 VHF NOISE SQUELCH

A noise squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signal, the squelch circuit switches the AF mute switches.

Some of the noise components in the AF signals from IC17 (pin 9) are passed through the active filter section (IC17 pins 10, 11), and then applied to the noise detector circuit (D55). The [SQL] control adjusts the input level of the active filter.

The rectified voltage triggers the squelch switch (Q83). The squelch switch sets the "SQL SV" line "LOW" to apply the signal to the CPU (IC2 pin 15). Then the CPU controls AF mute switches (IC18, Q89) via the "VA MUTE" line and the I/O expander (IC21).

3-1-8 VHF SQUELCH ATTENUATOR CIRCUIT

The current flow of the antenna switching circuit (D34, D35) is controlled by the [SQL] control and the DC amplifier (IC25). When the [SQL] control is set too deep, the current of D34 and D35 is increased. In this case, D34 and D35 act as attenuators.

3-1-9 UHF RF CIRCUIT

The UHF RF signals are passed through part of a duplexer (high-pass filter; C1–C3, L1, L2). The signals are again passed through the low-pass filter (C5, C6, L3, L4), antenna switching circuit (D1, D12, D13), and then amplified at the RF amplifiers (Q16, Q17). Bandpass filters (FI1, FI2) are used at the last stage of these amplifiers.

3-1-10 UHF 1ST MIXER AND 1ST IF CIRCUIT

The filtered signals from the bandpass filter (FI2) are mixed with a 1st LO signal at the mixer circuit (Q18) to produce a 30.85 MHz 1st IF signal. The 1st LO signal is the PLL output frequency which comes from the UHF-VCO circuit (Q11). The 1st IF signal is passed through a pair of crystal filters (FI3) to suppress out-of-band signals and then amplified at the IF amplifier (Q20).

3-1-11 UHF 2ND IF AND DETECTOR CIRCUIT

The IC16 incorporates the 2nd mixer, 2nd local oscillator, limiter amplifier, quadrature detector and S-meter detector circuit. The 2nd local oscillator section and X3 generate 30.395 MHz for the 2nd LO signal.

The amplified 1st IF signal is fed to the FM IF IC (IC16 pin 16) where the signal is converted into a 2nd IF signal, then AF signals.

The AF signals output from IC16 (pin 9) pass through the detector switch (Q72), analog switch (IC18 pins 10, 11) and then active filters (Q75, Q76).

3-1-12 UHF NOISE SQUELCH CIRCUIT

A portion of the AF signals from IC16 (pin 9) are passed through the noise amplifier (IC16 pins 10, 11), detected at D52, and then trigger the squelch switch (Q73). The trigger signal is applied to the CPU via the "SQL SU" line to control AF mute switches (IC18, Q87).

3-2 TRANSMITTER CIRCUIT

3-2-1 MICROPHONE AMPLIFIER CIRCUIT

The microphone amplifier circuit amplifies audio signals from the microphone to a level needed for the modulation circuit. The microphone amplifier circuit is commonly used for the both VHF and UHF bands.

The AF signals from the microphone are amplified at the IDC amplifier (IC23b pin 6) and then applied to the low-pass filter (IC23a pin 3). The output signals from IC23a (pin 1) are then separately applied to the VHF-VCO or UHF-VCO circuit as an "MOD" signal.

3-2-2 VHF MODULATION CIRCUIT

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signals.

The "MOD" signal changes the reactance of a diode (D32) to modulate the oscillated signal at the VHF-VCO circuit (Q46, D31). The VCO output is buffer-amplified at Q45 and is then applied to the transmit/receive switching circuit (D71).

3-2-3 VHF DRIVE AMPLIFIER CIRCUIT

The drive amplifier circuit amplifies the VCO oscillated signal to the needed level at the power amplifier.

The signal from the transmit/receive switching circuit (D71) is amplified at the buffer amplifier (Q65, Q39). The amplified signal is amplified again at drive amplifiers (Q35, Q38) to obtain approx. 26 dBm.

3-2-4 VHF POWER AMPLIFIER CIRCUIT

IC9 is a power module which provides more than 50 W of output power with a 13.8 V DC power source.

An RF signal from the drive amplifier (Q35) is applied to IC9. The amplified signal is then applied to the antenna connector via the transmit/receive switching circuit (D24) and low-pass filter.

3-2-5 VHF APC CIRCUIT

The APC circuit protects the power module (IC9) from a mismatched output load.

The APC detector circuit (D25, D26) detects forward signals and rectified signals at D26 and D25 respectively. The combined voltage is at a minimum level when the antenna is matched at $50\ \Omega$ and increases when it is mismatched. The combined voltage is applied to the inverting amplifier (IC8) to control the base of Q1 and input current of Q2. Thus the bias voltage of IC 9 is decreased via Q2.

3-2-6 UHF MODULATION CIRCUIT

The audio signals from the microphone amplifier circuit (described in Section 4-2-1) are applied to the UHF-VCO circuit.

The audio signals change the reactance of the oscillator (Q11) to modulate the oscillated signal directly. The oscillated signal is amplified at the buffer amplifiers (Q8–Q10) and is then applied to the drive amplifier circuit (Q106, Q3, Q4) through the LO switch circuit (D6, D79).

3-2-7 UHF POWER AMPLIFIER CIRCUIT

IC2 is a power module which provides a stable 35 W (at 13.8 V DC) of output power.

The drive amplifier (Q3, Q4) and power amplifier (IC2) amplify the VCO oscillating signal to an output level. The output signal passes through the APC detector circuit (D2, D3) and bandpass filter, and is applied to the antenna connector.

3-2-8 UHF APC CIRCUIT

The APC circuit detects the output signals from the power module. IC1 compares the voltages detected by the APC detector with the reference voltages. When the detected voltage exceeds a reference voltage, IC1 reduces the bias current of IC2 (pin 4) using Q1 and Q2 to decrease the RF output power.

3-3 PLL CIRCUIT

3-3-1 GENERAL

A PLL circuit provides stable oscillation of the transmit frequency and the receive local frequency. The PLL circuit compares the phase of the divided VCO frequency to the reference frequency. The PLL output frequency is controlled by a crystal oscillator and the divided ratio of the programmable divider. IC6 is a dual PLL IC which controls both VCO circuits for VHF and UHF.

The PLL circuit, using a one chip PLL IC (IC6), directly generates the transmit frequency and receive 1st IF frequency with VCOs. The PLL sets the divided ratio based on serial data from the CPU on the LOGIC unit and compares the phases of VCO signals with the reference oscillator frequency. The PLL IC detects the out-of-step phase and output from pins 8 and 13 for VHF and UHF, respectively. The reference frequency (12.8 MHz) is oscillated at X1.

APC CIRCUIT

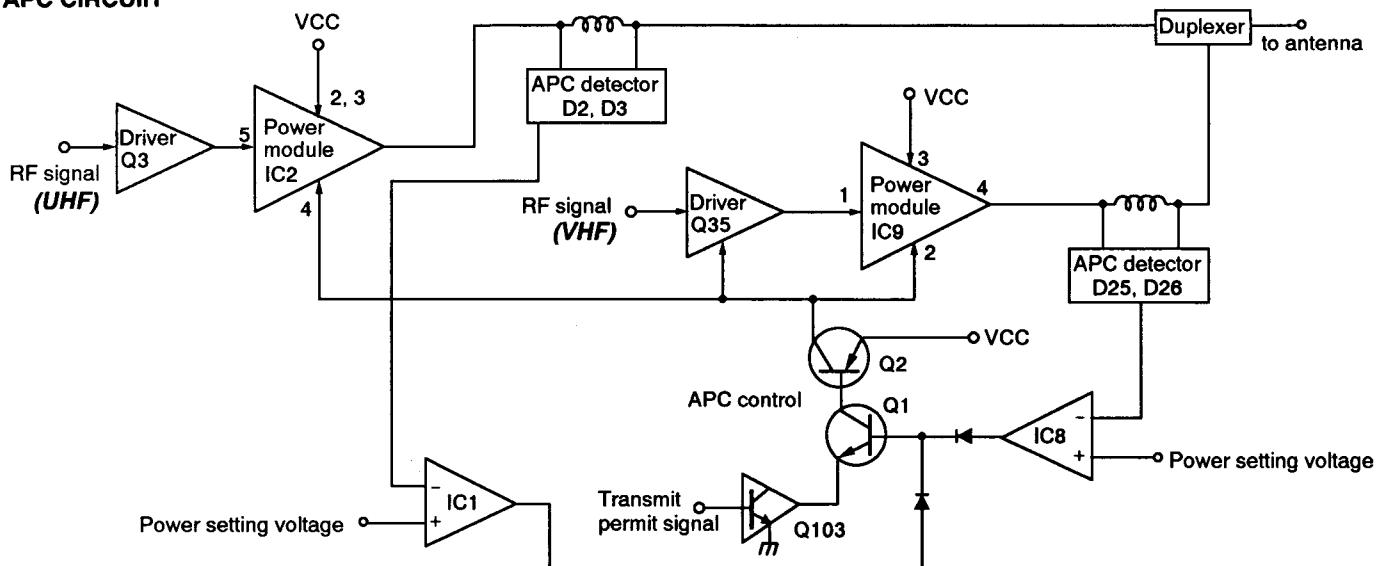

Fig. 2

3-3-2 VHF LOOP

The generated signal at the VHF-VCO (Q46, D31, D32) enters the PLL IC (IC6 pin 6) and is divided at the programmable divider section and is then applied to the phase detector section.

The phase detector compares the input signal with a reference frequency, and then outputs the out-of-phase signal (pulse-type signal) from pin 8.

The pulse-type signal is converted into DC voltage (lock voltage) at the active loop filter (Q43, Q44), and then applied to varactor diodes (D31, D32) of the VHF-VCO to stabilize the oscillated frequency.

The lock voltage is also used for the receiver circuit for the bandpass filter center frequency. The lock voltage from Q43 is amplified at buffer amplifiers (Q41, Q40) and then applied to the RF circuit.

3-3-3 UHF LOOP

The generated signal at the UHF-VCO (Q11, D9, D10) enters the PLL IC (IC6 pin 15) and is divided at the programmable divider section and is then applied to the phase detector section.

The phase detector compares the input signal and a reference frequency, and then outputs the out-of-phase signal (pulse-type signal) from pin 13.

The pulse-type signal is converted into DC voltage (lock voltage) at the active loop filter (Q12, Q13), and then applied to varactor diodes (D9, D10) of the UHF-VCO to stabilize the oscillated frequency.

3-4 POWER SUPPLY CIRCUIT

3-4-1 VOLTAGE LINES (MAIN UNIT)

LINE	DESCRIPTION
13 V	13 V controlled by the power switching circuit (Q56, Q57). When the [POWER] switch is pushed, the CPU outputs the control signal to the power switching circuit to turn the circuit ON.
8 V	Common 8 V is converted from 13 V line by the 8 V regulator (IC12).
+L5 V	Common 5 V for the CPU on the LOGIC unit. +L5 V is produced at IC11 of the MAIN unit from external DC input directly regardless of the power ON/OFF condition.
+S5 V	Common 5 V for the LCD driver IC (IC 2, LOGIC) and optional tone squelch unit (UT-89). +S5 V is converted from the 13 V line by the +S5 V regulator IC (IC14).
VR8 V	VR8 V is produced from 8 V at Q49 and Q50 using a control signal from the shift register (IC22 pin 4).
VT8 V	VT8 V is produced from 8 V at Q47, Q48 and D33. Shift register (IC22 pin 14) controls Q47 and Q48.
UR8 V	UR8 V is produced from 8 V at Q29 and Q30 using a control signal from the shift register (IC21 pin 4).
UT8 V	UT8 V is produced from 8 V at Q14, Q15 and D11. Shift register (IC21 pin 14) controls Q14 and Q15.

3-4-2 DC-DC CONVERTOR CIRCUIT

The DC-DC convertor circuit (IC13, Q58, Q59) has a variable output type switching regulator, which makes a wider frequency band coverage VCO. Approx. 30 V of output voltage is produced from 8 V.

PLL CIRCUIT

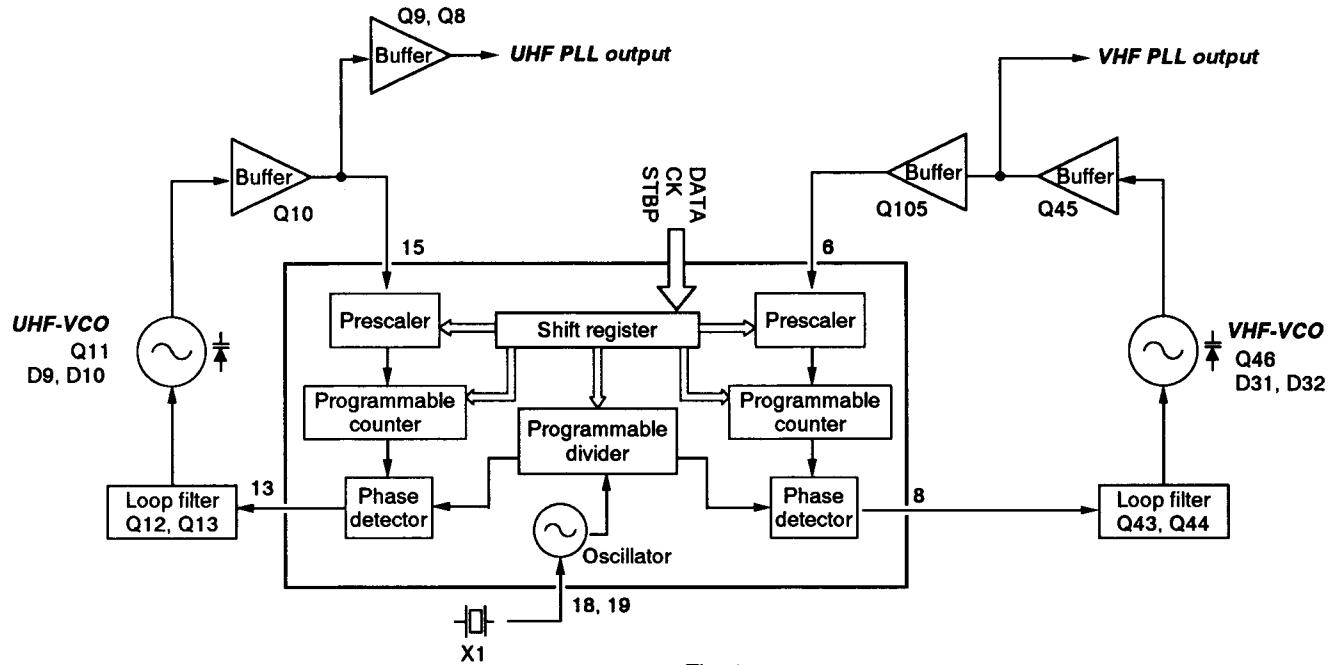

Fig. 3

3-5 OTHER CIRCUITS

3-5-1 TONE SQUELCH UNIT (OPTIONAL UNIT UT-89)

The receive signal from the DET V (DET U) signal line is applied to pin 1 of IC1 (IC2). The signal is compared with the programmed tone signal. Pin 14 of IC1 (IC2) becomes "LOW" when the matched tone is decoded.

3-5-2 DTMF ENCODER/DECODER UNIT (OPTIONAL UNIT UT-101)

ENCODER CIRCUIT

The programmed DTMF code signals are output from the pin 20 of IC2. DTMF code data is supplied from the CPU directly.

DECODER CIRCUIT

The received DTMF signals from the DET signal line are applied to pin 2 of IC1. The signals are compared with the programmed DTMF code signals, and un-muted data is applied to the CPU (IC2) directly when a matched DTMF code is received.

The IC3 is a data convertor IC for the DTMF encoder IC (IC2) and X1 is a reference oscillator for IC1 and IC2.

3-6 PORT ALLOCATIONS

3-6-1 CPU (LOGIC UNIT)

Pin number	Port name	Description
1	MU/D	Inputs a mic up/down signal.
7	RESET	Input port for a reset signal.
12	STB1	Outputs a strobe signal to I/O expander ICs (IC21, IC22).
13	STBP	Outputs a strobe signal to the PLL IC (IC6).
14	UNLKV	Input port for the VHF PLL unlocking signal from the PLL IC (IC6). "HIGH" : When PLL is unlocked.
15	SQLSV	Input port for the VHF noise squelch condition. "HIGH" : Squelch open "LOW" : Squelch close
16	VAMUTE	Outputs VHF AF mute signal to the mute control circuits (IC20, Q89). "HIGH" : AF mute "LOW" : AF un-mute
17	UAMUTE	Outputs UHF AF mute signal to the mute control circuits (IC20, Q88). "HIGH" : AF mute "LOW" : AF un-mute
18	UNLKU	Input port for the UHF PLL unlocking signal from the PLL IC (IC6). "HIGH" : When PLL is unlocked.
19	SQLSU	Input port for the UHF noise squelch condition. "HIGH" : Squelch open "LOW" : Squelch close
20	POWER	Outputs "HIGH" or "LOW" signal to the power switch control circuit (Q56, Q57). "HIGH" : Power ON
25	MREMO	Outputs "HIGH" or "LOW" signal to the DTMF selector circuit. "HIGH" : Select received signal. "LOW" : Select microphone signal.
27	MMUTE	Outputs microphone mute signal. "HIGH" : Mic mute
28	OPTD	Inputs "LOW" level signal when optional DTMF unit is installed.
33	VUP	Input port for the VHF dial up signal.
34	VDN	Input port for the VHF dial down signal.
35	VCK	Input port for the VHF dial clock signals.
36	PTT	Input port for the [PTT] switch. "HIGH" : [PTT] is pushed.
37	BEEP	Beep output port.
39	EECK	Outputs the clock signals for the EEPROM (LOGIC IC3).

3-6-2 I/O EXPANDERS

• MAIN UNIT (IC21)

Pin number	Port name	Description
40	EEDATA	Outputs the serial data for the EEPROM (LOGIC IC3).
42	CK	Outputs the clock signals.
43	FANC	Cooling fan control signal output. "HIGH" : Cooling fan is active.
44	DATA	Outputs serial data.
45	UUP	Input port for the UHF dial up signal.
46	UDN	Input port for the UHF dial down signal
47	UCK	Input port for the UHF dial clock signals.
48	POWER	Input port for the [POWER] switch. "HIGH" : [POWER] is pushed.
49, 50	DIM0, DIM1	Output ports for LCD backlight dimmer control signals.
51–53	INIS0 –INIS2	Output ports for initial matrix strobe signal.
54–56	KEYS0 –KEYS2	Output ports for switch matrix strobe signal.
57–60	KEYI0 –KEYI3	Input ports for matrix signals.
61	SET	Input port for [SET/LOCK] switch. "LOW" : [SET/LOCK] switch is pushed.
62	TSQLV	Input port for the VHF tone squelch conditions. "LOW" : When matched tone is received.
63	TSQLU	Input port for the UHF tone squelch conditions. "LOW" : When matched tone is received.
64	UNIT T	Inputs "HIGH" level signal when the tone squelch unit is installed.
65–68	Q1–Q4	Input ports for the DTMF decode data signal.
69–72	TONE0 –TONE3	Output ports for the CTCSS tone signal data.
73	STD	Input port for the DTMF decoder, detects Q0–Q3 when "HIGH" level signal is applied.
74	STBOD	Outputs the strobe data to optional DTMF unit.
75	STBTM	Outputs the strobe signal to an optional tone squelch unit on VHF band.
76	STBTU	Outputs the strobe signal to an optional tone squelch unit on UHF band.
79	SMV	Input port for the VHF S-meter.
80	SMU	Input port for the UHF S-meter.

Pin number	Port name	Description
7	CONT.D	Output for UHF detected AF signal mute control. "HIGH" : AF signal go to AF amp.
12, 13	ULP2, ULP1	Outputs for UHF RF output power control.
14	UTX	Output for UHF transmitter control. "HIGH" : Transmit "LOW" : Receive (and transmit mute)

• MAIN UNIT (IC22)

Pin number	Port name	Description
7	CONT.A	Output for VHF detected AF signal mute control. "HIGH" : AF signal go to AF amp.
12, 13	VPL2, VLP1	Outputs for VHF RF output power control.
14	VTX	Output for VHF transmitter control. "HIGH" : Transmit "LOW" : Receive (and transmit mute)

SECTION 4 DISASSEMBLY INSTRUCTIONS

● Preparation for the disassembly

- ① Turn power OFF, then disconnect the DC cable.
- ② Unscrew 1 screw Ⓐ as shown Fig 1, then remove the bottom cover.
- ③ Disconnect the speaker cable from "J4".
- ④ Lift up the clip part of the SP plate (at IC19) then remove the SP plate.
- ⑤ Remove the bush of DC cable from the chassis.
- ⑥ Unsolder jumper leads from the antenna connector (3 points).

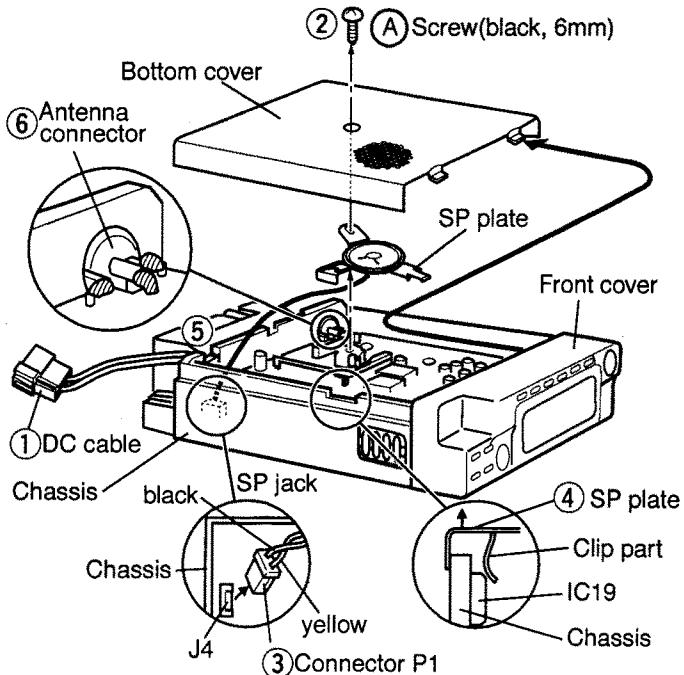

Fig 1

● Removing the front cover

- ⑦ Remove each the [DIAL], [VOL], [SQL] knobs and the 2 nuts Ⓑ, 2 hexagonal nuts Ⓒ and 2 sheets Ⓓ on the [SQL] knobs.
- ⑧ The front panel is hooked at 5 spots (↓) through the chassis. Push a part of the hook with tweezers to separate the front cover from the chassis.

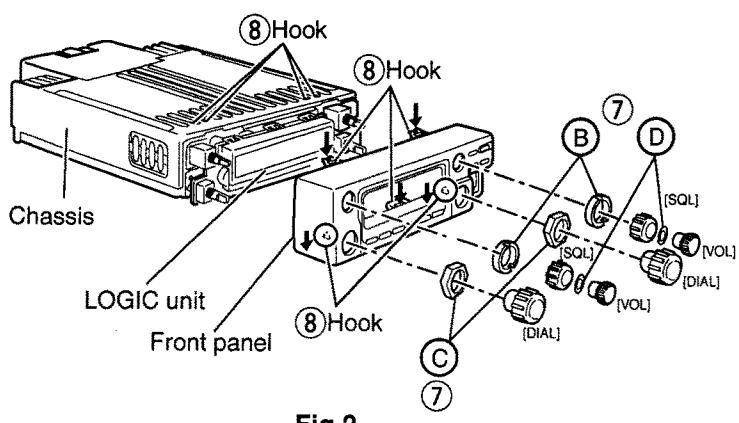

Fig 2

● Removing the LOGIC unit

- ⑨ Remove the LOGIC unit in the direction of the arrow.
- NOTE: The connectors (J7, J8) disconnect from the chassis.

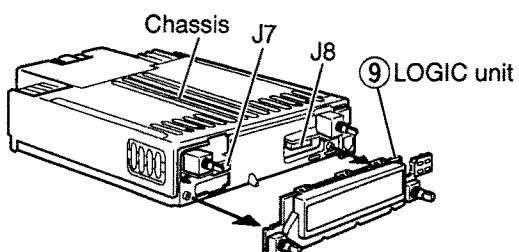

Fig 3

● Removing the MAIN unit

- ⑩ Remove the TR clip in the direction of the arrow, then unscrew 4 screws Ⓔ and 6 screws Ⓕ.
- ⑪ Disconnect J5 on the MAIN unit, to separate the MAIN unit from the chassis.

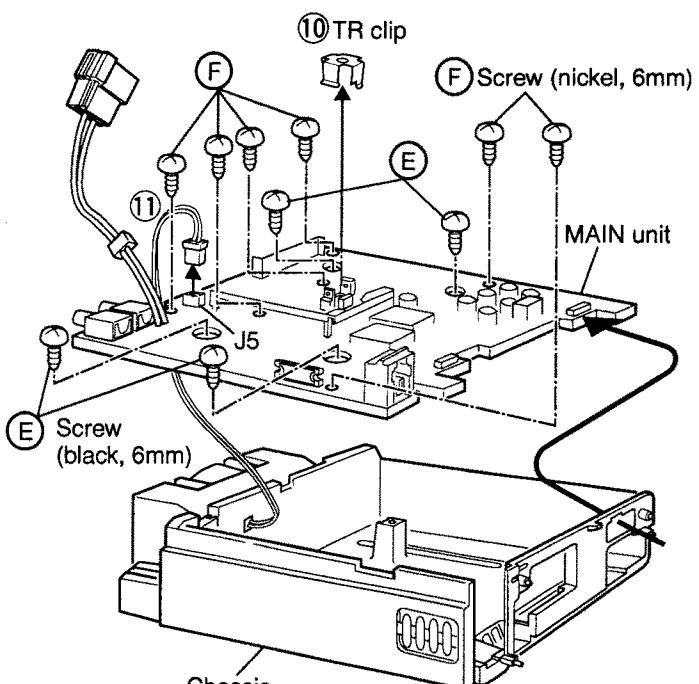

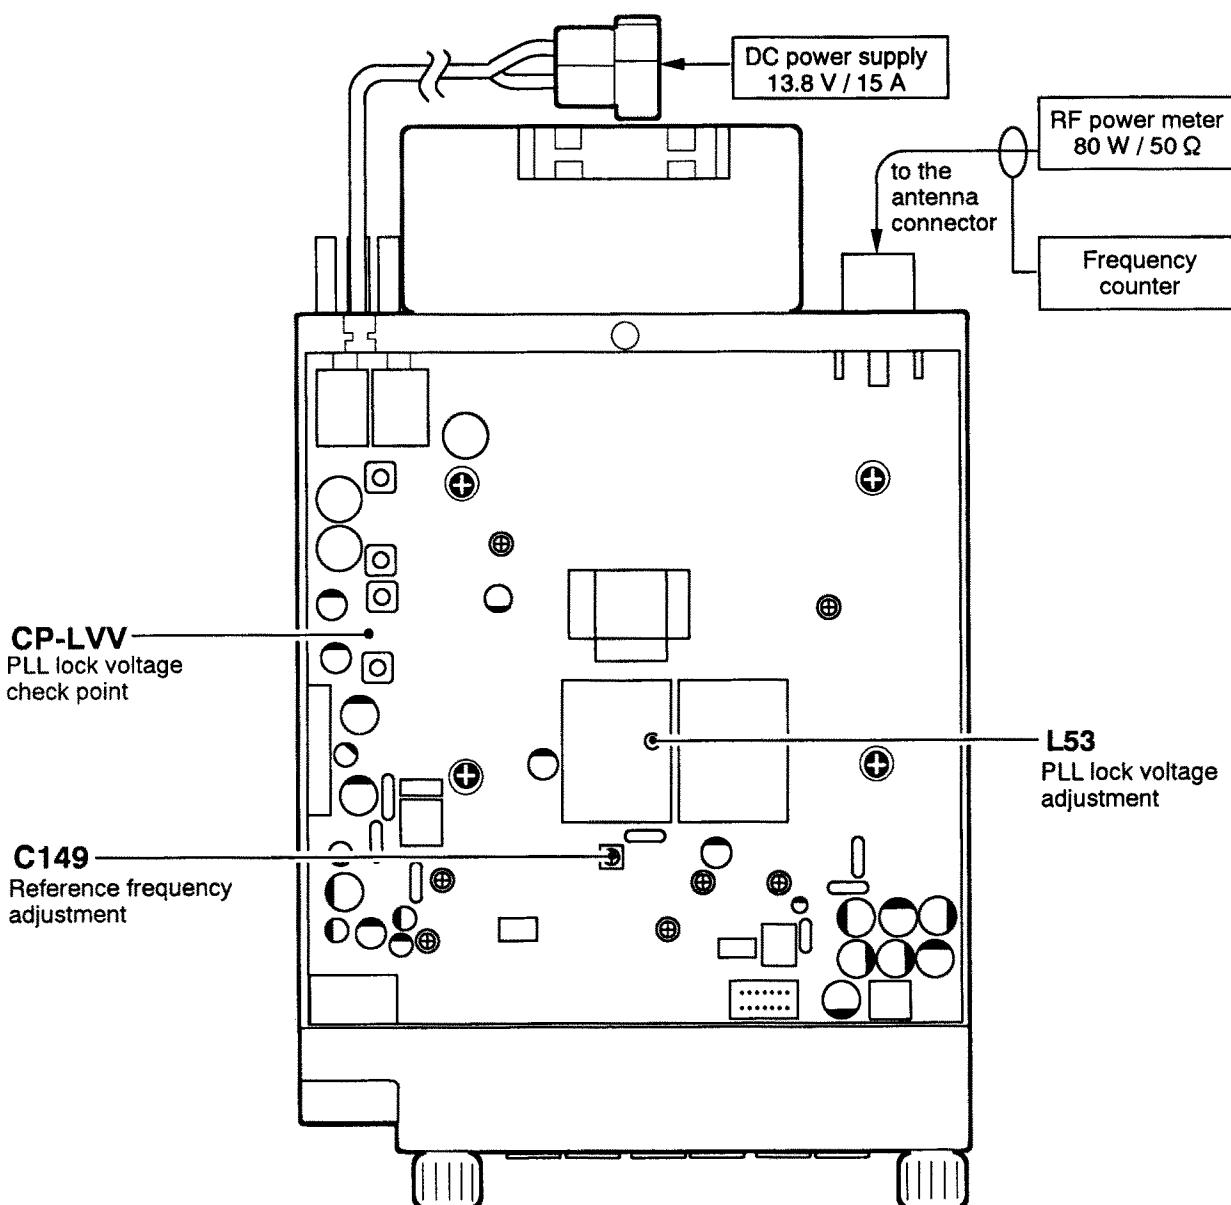

Fig 4

SECTION 5 ADJUSTMENT PROCEDURES

5-1 PLL ADJUSTMENT

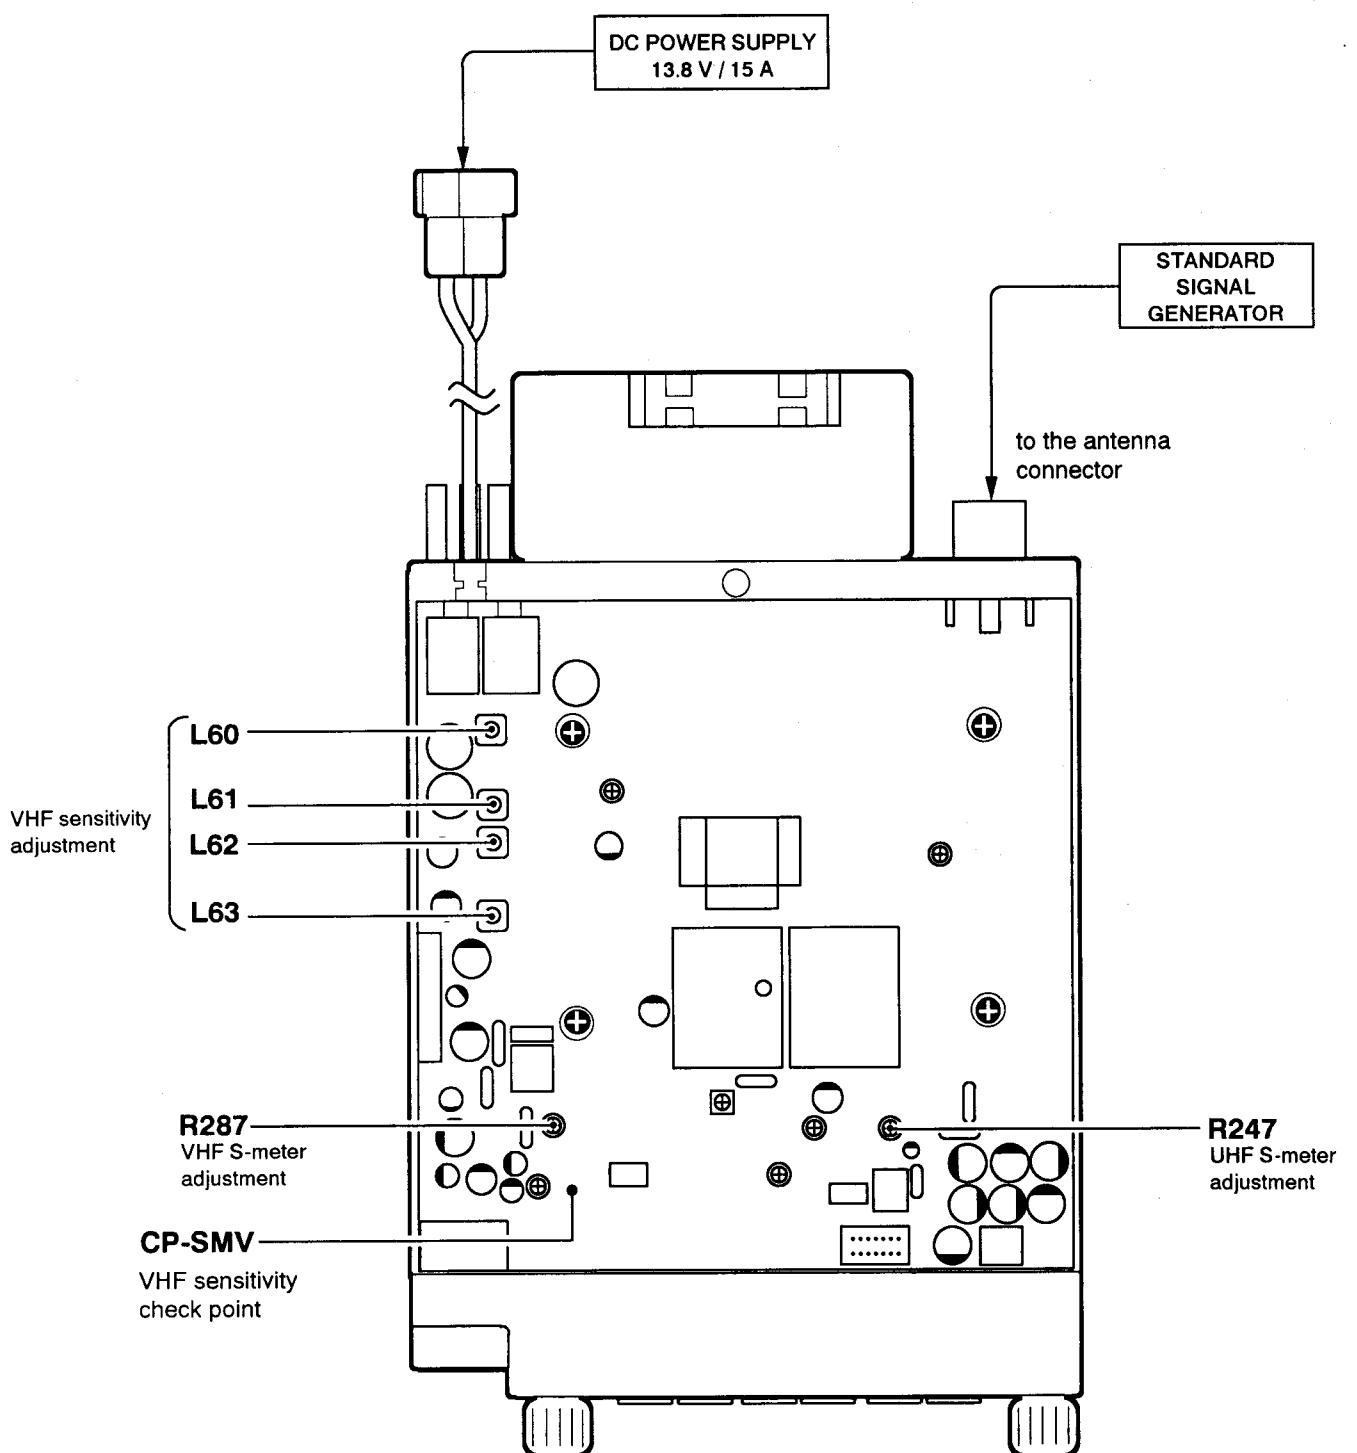

ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT	
		UNIT	LOCATION		UNIT	ADJUST
PLL REFERENCE FREQUENCY	1 <ul style="list-style-type: none"> • UHF display: 440.000 MHz • Connect the RF power meter or a 50 Ω dummy load to the antenna connector. • Simplex • Transmitting 	Rear panel	Loosely couple the frequency counter to the antenna connector.	440.000 MHz	MAIN	C149
PLL LOCK VOLTAGE	1 <ul style="list-style-type: none"> • VHF display: 145.000 MHz • Receiving 	MAIN	Connect the DC voltmeter to CP-LVV	9.5 V	MAIN	L53
