Icom Inc.

INTRODUCTION

This service manual describes the latest service information for the **IC-R5 COMMUNICATIONS RECEIVER** at the time of publication.

MODEL	Version	SYMBOL	AC ADAPTER
IC-R5	Europe	EUR	BC-149D
	U.K.	UK	—
	Italy	ITA	—
	U.S.A.	USA	BC-149A
	France	FRA	BC-149D
	Spain	ESP	BC-149D
	Export-01	EXP-01	BC-136A
	Export-02	EXP-02	BC-136D
	Canada	CAN	BC-149A

To upgrade quality, all electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

DANGER

NEVER connect the receiver to an AC outlet or to a DC power supply that uses more than 6.5 V. Such a connection could cause a fire hazard and/or electric.

DO NOT expose the receiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the receiver.

DO NOT apply an RF signal of more than 20 dBm (100mW) to the antenna connector. This could damage the receiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

8930058920 LCD contact IC-R5 LOGIC UNIT 5 pieces
8810009560 Screw PH BO M2x6 ZK IC-R5 CHASSIS 10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the receiver.
2. **DO NOT** open the receiver until the receiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated turning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the receiver is defective.
6. **READ** the instructions of test equipment thoroughly before connecting equipment to the receiver.

SECTION 1 SPECIFICATIONS

■ GENERAL

- Frequency range :

Version	Receive Frequencies (MHz)
EUR, U.K., ITA, ESP, CAN EXP-01, EXP-02	0.495 – 1309.995
U.S.A.	0.150–823.995, 849.000–868.995, 894.000–1309.995
FRA	0.150–29.995, 50.200–51.200, 87.500–108.000, 144.000–146.000 430.000–440.000, 1240.000–1300.000

- Mode : FM, WFM, AM
- No. of memory channel : 1250 channel
(incl. scan edge and auto memory right ch.)
- Frequency stability : ± 6 ppm max.
(-10°C to $+60^{\circ}$)
- Tuning steps : 5, 6.25, 10, 12.5, 15, 20,
25, 30, 50, and 100 kHz
- Antenna Impedance : 50 Ω
- Power supply requirement : 2 \times AA(R6) Ni-Cd, alkaline
cells or external power
supply (BC-136, CP-17)
- Polarity : Negative ground
- Frequency resolution : 5 kHz, 6.25 kHz
- Current drain (at 3.0 V) :
Rated audio 170 mA typical
Standby 100 mA typical
Power saved 41 mA typical
(Power save ratio is 1 : 4)
- Usable temperature range : -10°C to $+60^{\circ}\text{C}$
(-14°F to $+140^{\circ}\text{F}$)
- Dimensions : 58(W) \times 86(H) \times 27(D) mm;
(projections not included) $2\frac{3}{32}$ (W) \times $3\frac{3}{8}$ (H) \times $1\frac{1}{16}$ (D) in
- Weight (with antenna and battery) : 185 (g); 6.5 (oz)
- External SP connector : 3-conductor 3.5(d) mm
($\frac{1}{8}$ ") / 8 Ω

■ RECEIVER

- Receiver system : Triple super heterodyne
- Intermediate frequency : 1st 266.7 MHz
2nd 19.65 MHz
3rd 450 kHz
- Sensitivity* : (except spurious points)

Frequency (MHz)	FM	WFM	AM
0.495 – 1.625	—	—	1.3 μV
1.625 – 4.995	0.32 μV		0.71 μV
5.000 – 29.995	0.2 μV	—	—
30.000 – 75.995			
76.000 – 108.000		0.89 μV	—
108.000 – 117.995		—	0.56 μV
118.000 – 136.000	0.18 μV	—	—
136.000 – 175.000			
175.000 – 221.995		0.71 μV	—
222.000 – 246.995	0.2 μV	—	0.56 μV
247.000 – 329.995			0.61 μV
330.000 – 469.995	0.18 μV	1.0 μV	—
470.000 – 770.000	0.28 μV		
770.000 – 999.995	0.35 μV	—	—
1000.000 – 1309.995			

* FM and WFM are measured at 12 dB SINAD; AM is measured at 10 dB S/N.

- Squelch Sensitivity :

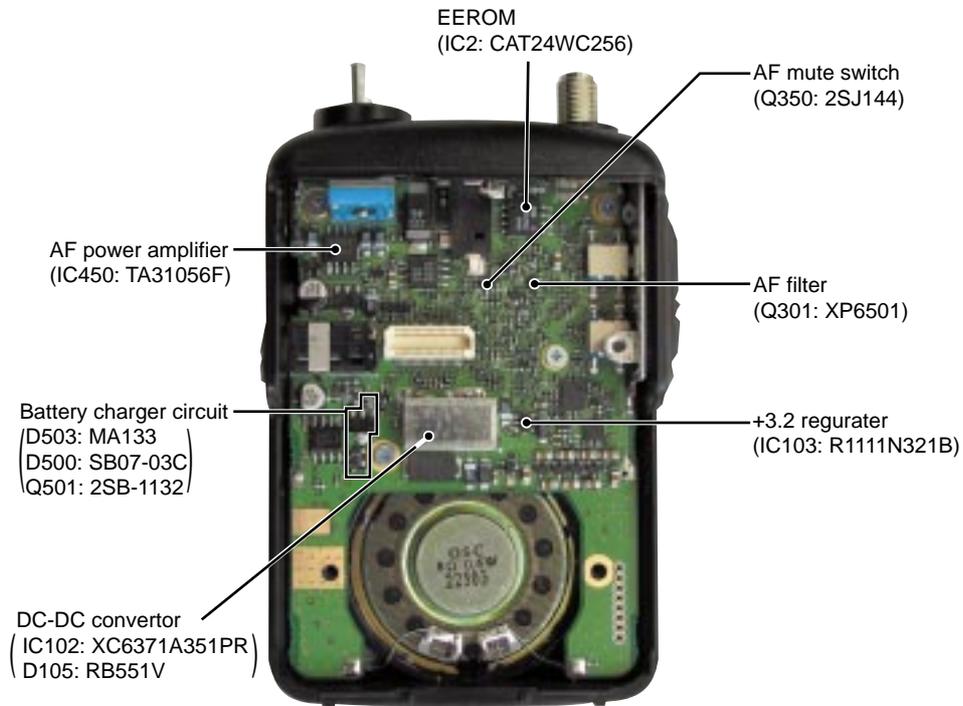

Frequency (MHz)	FM	WFM	AM
0.495 – 1.625	—	—	2.5 μV
1.625 – 5.0	0.56 μV		1.8 μV
5.0 – 30.0	0.4 μV		5.6 μV
30.0 – 76.0			
76.0 – 108.0		—	1.8 μV
108.0 – 118.0		5.6 μV	—
118.0 – 136.0			
136.0 – 175.0			
175.0 – 222.0		0.56 μV	—
222.0 – 247.0			
247.0 – 330.0	5.6 μV		—
330.0 – 470.0			
470.0 – 770.0	0.79 μV	—	—
770.0 – 833.0			
833.0 – 1309.995			

- Selectivity :
AM / FM : more than 15 kHz / -6 dB
less than 30 kHz / -60 dB
WFM : more than 150 kHz / -6 dB
- Audio output power : 100 mW typical at 10 %
distortion with an 8 Ω load

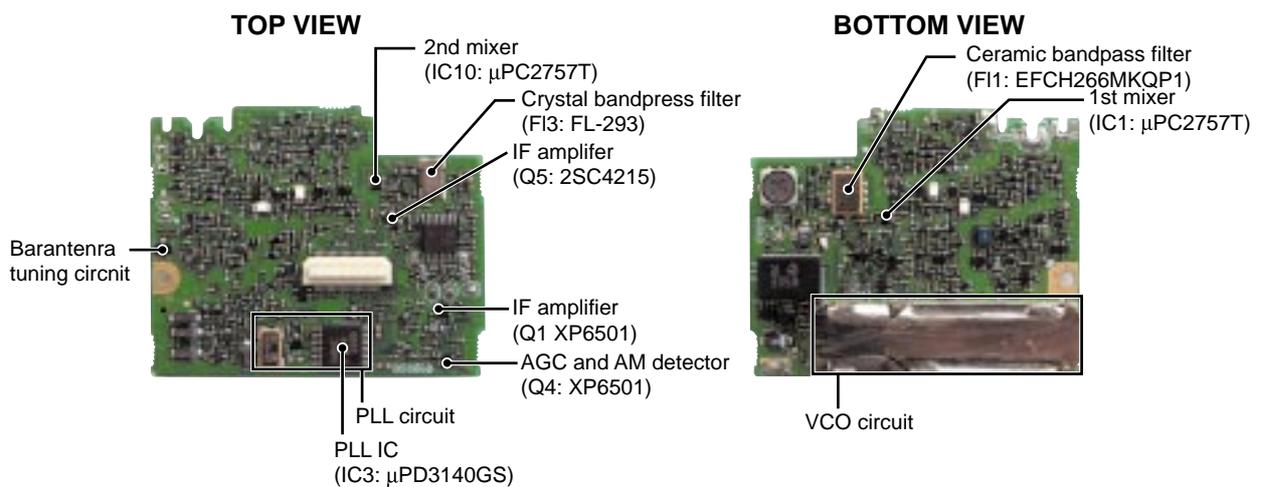

All stated specifications are subject to change without notice or obligation.

SECTION 2 INSIDE VIEWS

• LOGIC UNIT

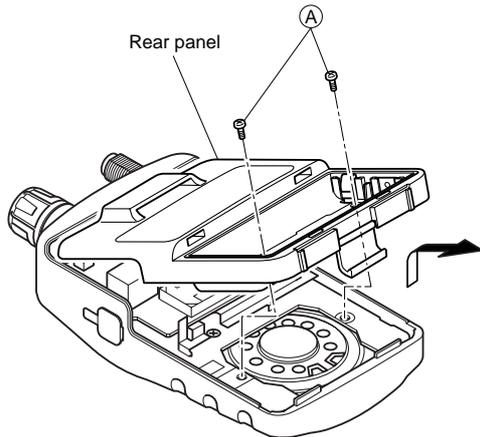

• RF UNIT

SECTION 3 DISASSEMBLY INSTRUCTIONS

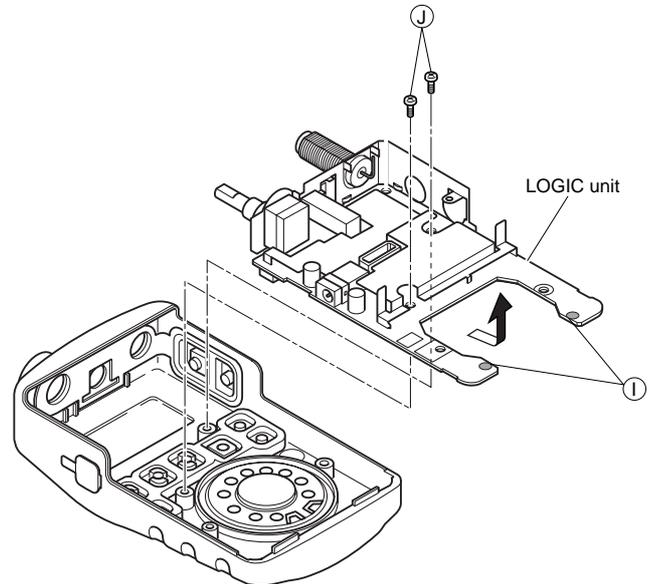

● REMOVING THE REAR PANEL

- ① Unscrew 2 screws, (A).
- ② Remove the rear panel in the direction of the arrow.

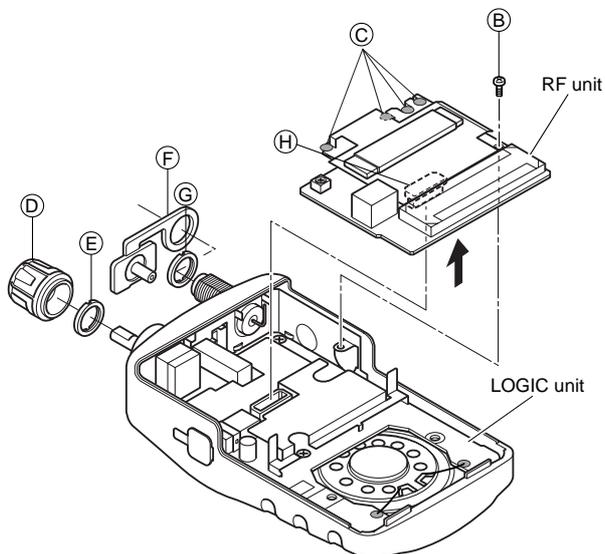

● REMOVING THE LOGIC UNIT

- ① Unsolder 2 points, (I).
- ② Unscrew 2 screws, (J), and then remove the LOGIC unit.
- ③ Remove the LOGIC unit in the direction of the arrow.

● REMOVING THE RF UNIT

- ① Unscrew 1 screw, (B).
- ② Unsolder 4 points, (C).
- ③ Remove 1 knob, and 1 cap (G).
Unscrew 2 nuts, (E) and (F).
- ④ Unplug, (H), to separate the LOGIC unit, and then remove the RF unit.

SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 BAND SWITCHING CIRCUIT (RF UNIT)

The RF signals from the antenna connector pass through the limiter (D68) and an attenuator (D69). The signals are then applied to the antenna switching circuit (D13, D31, D73, D75) which suppress out-of-band signals.

4-1-2 RF CIRCUIT (RF UNIT)

The RF circuit amplifies the received signals within the range of frequency coverage and filters out-of-band signals.

(1) 0.150 MHz–29.999 MHz

RF signals (0.150–29.999MHz) from an antenna switching circuit (D73) pass through a low-pass filter (C511–C515, L81, L82). The filtered signals are amplified at an RF amplifier (Q505) passing through each filters depending on the receiving frequency. The amplified signals are then applied to the 1st mixer circuit (IC1, pin 1) after being amplified at another RF amplifier (IC11) via the band switching diode (D71).

The signals below 1.9 MHz pass through a low-pass filter (C534, C535, C657, C658, L88, L89) via the band switching diode (D66), and are then applied to the RF amplifier circuit (Q505) via the band switching diode (D67).

The 1.9 MHz–14.995 MHz signals pass through the band switching diode (D65) and bandpass filter (C522–C531, L85–L87, L91), and are then applied to the RF amplifier circuit (Q505) via the band switching diode (D70).

The 15 MHz–29.995 MHz signals pass through the band switching diode (D63) and high-pass filter (C516–C520, L83, L84) and are then applied to the RF amplifier circuit (Q505) via the band switching diode (D64).

(2) 118 MHz–174.995 MHz, 330 MHz–832.995 MHz

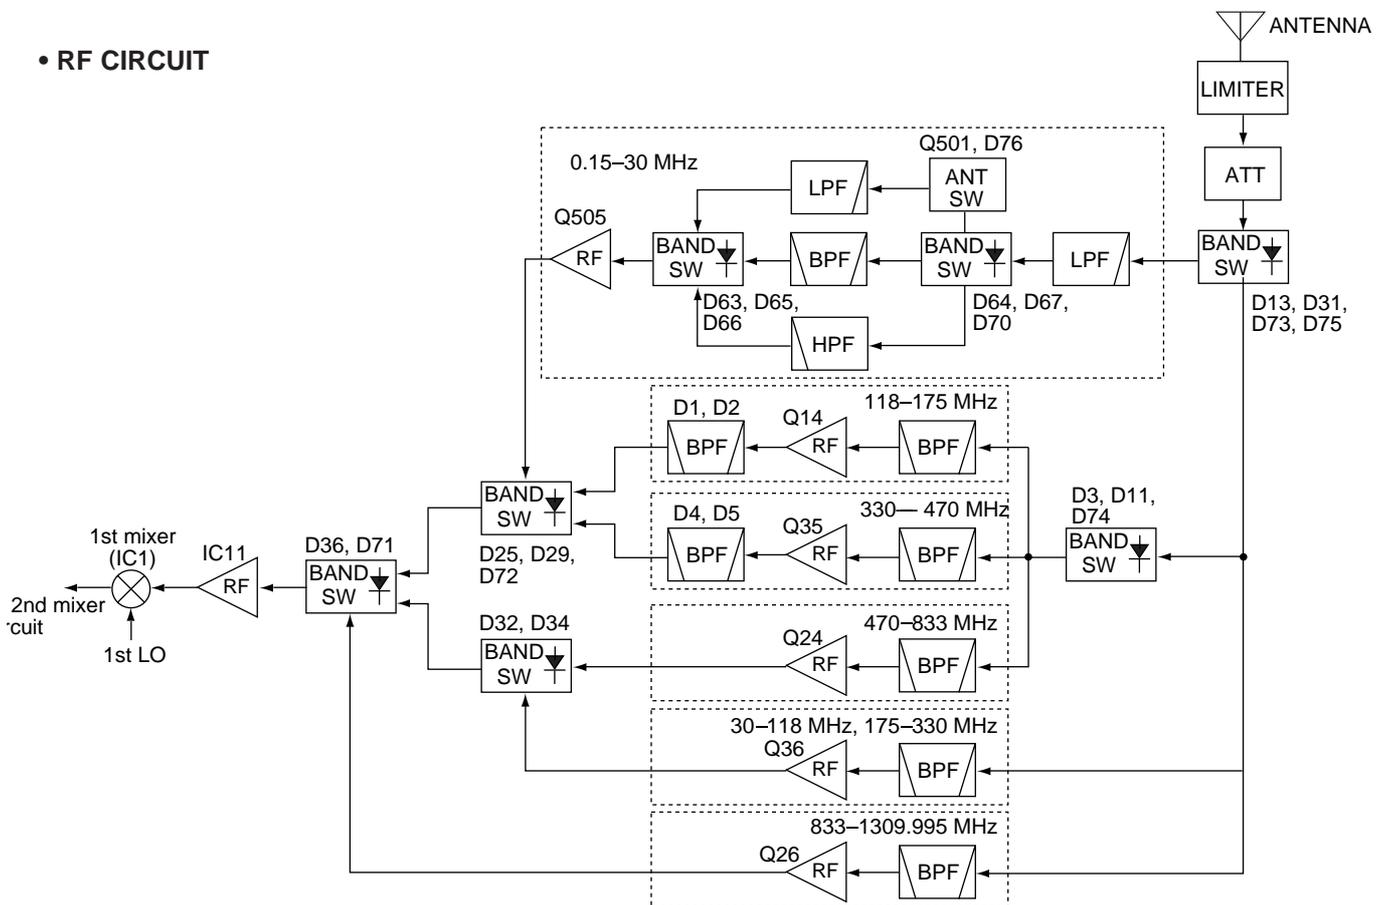

RF signals (118 MHz–174.995 MHz, 330 MHz–832.995 MHz) from an antenna switching diode (D75) are passed through each bandpass filter and RF amplifier, and are then applied to the 1st mixer circuit (IC1) via the band switching diode (D71) and RF amplifier (IC11).

The 118 MHz–174.995 MHz signals pass through the band switching diode (D74) and low-pass filter (C8–C13, C67, C416, L14, L57–L59, L70), and are then amplified at RF amplifier (Q14). The amplified signal passes through the tunable band-pass filters (D1, D2) and band switching diode (D25).

The 330 MHz–469.995 MHz signals are amplified at RF amplifier (Q35) via the band switching diode (D3) and band-pass filter (C19–C23, C216, L2–L5). The amplified signal passes through the tunable band-pass filters (D4, D5) and band switching diode (D29).

The 470 MHz–832.995 MHz signals are amplified at RF amplifier (Q24) via the band-pass filter (C32, C33, C35–C37, C39, C145), between the band switching diode (D11, D32).

• RF CIRCUIT

(3) 30–117.995 MHz, 175–329.995 MHz

The 30 MHz–117.95 MHz, 175 MHz–329.995 MHz signals pass through the band switching circuit and low-pass filter (C40–C43, C665, C666, L9, L10, L92), and are then applied to the RF amplifier (Q36). The amplified signals are amplified at the RF amplifier (IC11, pin 1) via band switching diodes (D34, D71). The amplified signals are applied to the 1st mixer circuit (IC1, pin 1).

(4) 833 MHz–1309.995 MHz

The 833 MHz–1309.995 MHz signals pass through the band switching diode (D13) and bandpass filter (C5, C45–51, L11–L13, L43), and are then applied to the RF amplifier (Q26). The amplified signals are amplified at the RF amplifier (IC11, pin 1) via band switching diodes (D36). The amplified signals are applied to 1st mixer circuit (IC1, pin 1).

4-1-3 1ST MIXER CIRCUIT (RF UNIT)

The 1st mixer circuit converts the received RF signals to a fixed frequency of the 1st IF signal with a PLL output frequency. By changing the PLL frequency, only the desired frequency will pass through the bandpass filters at the next stage of the 1st mixer.

The filtered RF signals are mixed with 1st LO signals at the 1st mixer circuit (IC1) to produce a 266.7 MHz 1st IF signal. The 1st IF signal is output from pin 6, and passed through the bandpass filter (F11) to suppress unwanted harmonic components. The filtered 1st IF signal is applied to the 2nd mixer circuit.

The 1st LO signals are generated at the 1st VCO (Q28, Q30, D54) and are applied to the 1st mixer (IC1, pin 3) directly or passing through the doubler circuit (Q31) after being amplified at the buffer amplifiers (IC4, Q40).

4-1-4 1ST IF AND 2ND MIXER CIRCUITS (RF UNIT)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal.

The filtered 266.7 MHz 1st IF signal from the bandpass filter is mixed with the 2nd LO signal at the 2nd mixer circuit (IC10, pin 1) to produce a 19.65 MHz 2nd IF signal. The 2nd IF signal pass through (except WFM mode) or bypass (WFM mode) the bandpass filter (F13), and is then amplified at the 2nd IF amplifier (Q5). The amplified signal is applied to the demodulator circuit.

4-1-5 DEMODULATOR CIRCUITS (RF UNIT)

The demodulator circuit converts the 2nd IF signal into AF signals.

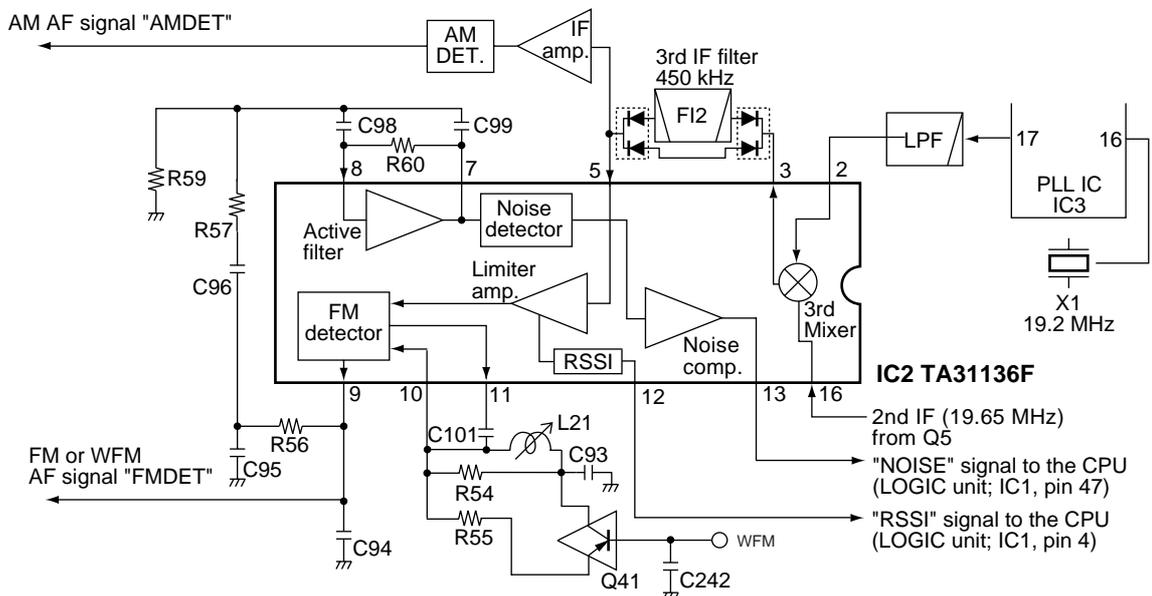

The 19.65 MHz 2nd IF signal from the 2nd IF amplifier (Q5) is applied to the 3rd mixer section of the FM IF IC (IC2, pin 16) and is then mixed with the 3rd LO signal for conversion into a 450 kHz 3rd IF signal.

IC2 contains the 3rd mixer, limiter amplifier, quadrature detector and S-meter detector, etc. A frequency from the PLL reference oscillator is used for the 3rd LO signal (19.20 MHz).

(1) FM mode

The 3rd IF signal is output from the FM IF IC (IC2, pin 3) and passes through the ceramic bandpass filter (F12). The filtered signal is fed back and amplified at the limiter amplifier section (pin 5), then demodulated AF signals at the quadrature detector section (pins 10, 11) and detector coil (L21). The demodulated AF signals are output from pin 9 and are applied to the AF circuit (LOGIC unit) via the "FMDET" signal.

• DEMODULATOR CIRCUIT

(2) WFM mode

The 3rd IF signal from the 3rd mixer bypasses the ceramic filter (FI2) and fed back to the limiter amplifier section (pin 5). The amplified signal is demodulated at the quadrature detector section (pins 10, 11) and detector coil (L21). The AF signals are output from pin 9 and are applied to the AF circuit (LOGIC unit) via the "FMDET" signal.

By connecting R55 to R54 in parallel, the output characteristics of pin 12, "RSSI", change gradually. Therefore, the FM IF IC can detect WFM components.

(3) AM mode

The filtered 3rd IF signal from the bandpass filter (FI2) is amplified at the 3rd IF amplifier (Q1). The amplified IF signal is applied to the AM detector circuit (Q4) to converted into AF signals, and the signals are applied to the AF circuit (LOGIC unit) via the "AMDET" signal.

4-1-6 AF AMPLIFIER CIRCUIT (LOGIC UNIT)

The AF amplifier circuit amplifies the demodulated AF signals to drive a speaker.

While in FM mode, AF signals from the demodulator circuit (RF unit) are passed through the de-emphasis circuit (R323, C316, C318) with frequency characteristics of -6 dB/octave, and are then applied to the pre-amplifier (Q300) via the high-pass filter (Q301).

While in AM mode, AF signals are pass through the high-pass filter (Q301) and are then applied to the pre-amplifier (Q300).

While in WFM mode, AF signals are applied to the pre-amplifier (Q300) directly via the mode switch (Q302).

The pre-amplified AF signals pass through the AF mute circuit (Q350) and are then applied to the electronic volume control circuit (IC400, pin 6). The level controlled AF signals are output from pin 7 and applied to the AF power amplifier (Q452 and IC450, pin 1) via the buffer amplifier (Q400). The power amplified AF signals are applied to the internal speaker via the [EXT SP] jack.

The electronic volume control circuit controls AF gain, therefore, the AF output level is according to the [VOL] setting and also the squelch conditions.

4-1-7 SQUELCH CIRCUIT (LOGIC AND RF UNITS)

• NOISE SQUELCH

The noise squelch circuit cuts out AF signals when no RF signals are received. By detecting noise components in the AF signals, the squelch circuit switches the AF mute switch.

A portion of the "NOISE" signals from the FM IF IC (RF unit; IC2, pin 13) are applied to the CPU (LOGIC unit; IC1, pin 47). The CPU analyzes the noise condition and outputs the "AMUTE" signal (from pin 50) to the AF mute switch (LOGIC unit; Q350).

• TONE SQUELCH

The tone squelch circuit detects AF signals and opens the squelch only when receiving a signal containing a matching subaudible tone (CTCSS). When tone squelch is in use, and a signal with a mismatched or no subaudible tone is received, the tone squelch circuit mutes the AF signals even when noise squelch is open.

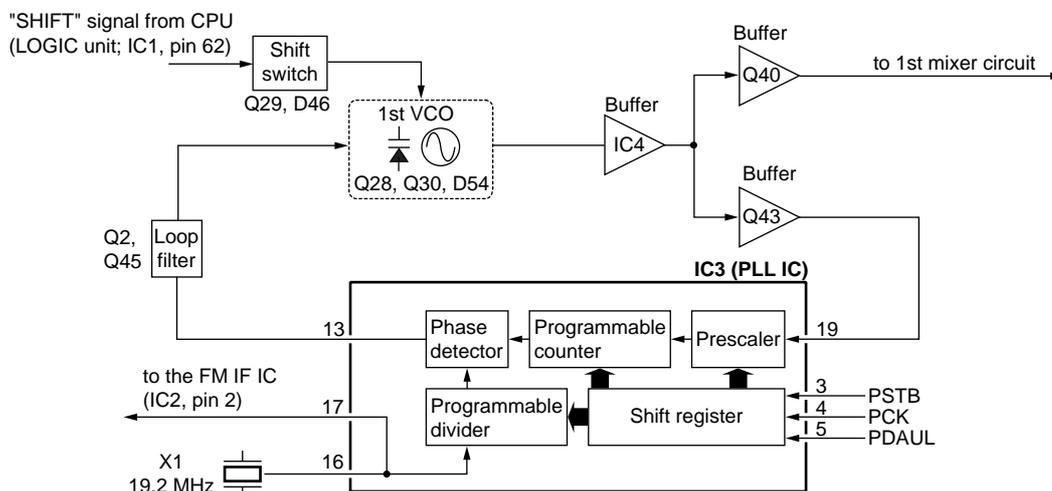

A portion of the AF signals from the FM IF IC (IC2, pin 9) passes through the low-pass filter (LOGIC unit; IC200, pin 5) via the "FMDET" line to remove AF (voice) signals and is applied to the CTCSS decoder inside the CPU (LOGIC unit; IC1, pin 7) via the "RTONE" line to control the AF mute switch.

4-2 PLL CIRCUITS

4-2-1 PLL CIRCUIT (RF UNIT)

A PLL circuit provides stable oscillation of the receive 1st/2nd LO frequencies. The PLL circuit compares the phase of the divided VCO frequency to the reference frequency. The PLL output frequency is controlled by the divided ratio (N-data) of a programmable divider.

• PLL CIRCUIT

An oscillated signal from the 1st VCO passes through the buffer amplifiers (IC4, Q43) is applied to the PLL IC (IC3, pin 19) and is prescaled in the PLL IC based on the divided ratio (N-data). The PLL IC detects the out-of-step phase using the reference frequency and outputs it from pin 13. The output signal is passed through the loop filter (Q2, Q45) and is then applied to the 1ST VCO circuit as the lock voltage.

4-2-2 REFERENCE OSCILLATOR CIRCUIT (RF UNIT)

The reference oscillator circuit (X1, D18) generates a 19.2 MHz reference frequency which is stabilized within the temperature range -10°C ($+14^{\circ}\text{F}$) to $+60^{\circ}\text{C}$ ($+140^{\circ}\text{F}$). The reference frequency is applied to the PLL IC (IC3, pin 16) and the signal is output from the pin 17, and is then applied to the FM IF IC (IC2, pin 2) via the low-pass filter.

4-2-3 1ST VCO CIRCUIT (RF UNIT)

The oscillated signal is applied to the buffer amplifiers (IC4, Q40). The amplified signal is applied to the 1st mixer circuit (IC1) via the RX LO switch circuit (D42–D44) and doubler circuit (Q31).

The 1st VCO circuit (Q28, Q30, D54) oscillates 266.85 MHz–380 MHz (normal) and 380 MHz–550 MHz (shifted) by switching the SHIFT switch (Q29, D46) “High” and “Low” respectively.

A portion of the signal from IC4 is amplified at the buffer amplifier (Q43) and is then fed back to the PLL IC (IC3, pin 19) as the comparison signal.

4-2-4 DOUBLER CIRCUIT (RF UNIT)

The doubler circuit composes doubler1, doubler2 and bypass circuits.

• DOUBLER1 CIRCUIT

The oscillated signal at the VCO circuit is amplified at the buffer amplifier (IC4), and then applied to the other buffer amplifier (Q40). The amplified 266.85–400 MHz signal passes through the LO switch (D43), and is then applied to the doubler circuit (Q31, pin 5). The signal is applied to the 1st mixer circuit (IC1, pin 3) via the LO switch (D50).

• DOUBLER2 CIRCUIT

The oscillated signal at the VCO circuit is amplified at the buffer amplifier (IC4), and then applied to the other buffer amplifier (Q40). The amplified 380.45–549.85 MHz signal passes through the LO switch (D44), and is then applied to the doubler circuit (Q31, pin 6). The signal is applied to the 1st mixer circuit (IC1, pin 3) via the LO switch (D47).

• BYPASS CIRCUIT

The oscillated signal at the VCO circuit is amplified at the buffer amplifier (IC4), and then applied to the other buffer amplifier (Q40). The amplified 266.85–550 MHz signal bypasses doubler circuit via the LO switch (D42, D52), and is then applied to the 1st mixer circuit (IC1, pin 3).

4-2-5 2ND VCO CIRCUIT (RF UNIT)

The 2nd LO circuit generates the 2nd LO frequencies, and the signals are applied to the 2nd mixer circuit.

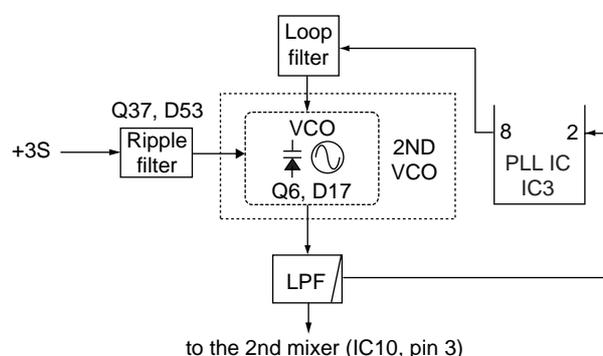

The 2nd VCO circuit (Q6, D17, L45, C80, C207, C208) oscillates 247.05 MHz and 286.35 MHz. The oscillated signal is applied to the 2nd mixer (IC10, pin 3), and is then mixed with the 1st IF signal.

An oscillated signal from the 2nd VCO passes through the low-pass filter (C154, C250–C252, L69), and is applied to the PLL IC (IC3, pin 2), and is then output from pin 8.

4-2-6 3RD LO CIRCUIT (RF UNIT)

The PLL IC (IC3) and X1 oscillate the 19.2 MHz LO signal. The signal is applied to the PLL IC (pin 16), and is then applied to the buffer amplifier section of the IC. The amplified signal is output from pin 17, and is then applied to the 3rd mixer section of the FM IF IC (IC2, pin 2) as 3rd LO signal.

• 2ND VCO CIRCUIT

4-3 OTHER CIRCUITS

4-3-1 BATTERY CHARGER CIRCUIT (LOGIC UNIT)

When the battery charger function is switched ON, the battery charger control signal becomes high, and is then output from the CPU (IC1, pin 48) as “CHGC” signal. The signal is applied to the battery charger controller (Q502), and its output controls the battery charger circuit (Q501, D500, D503) to output 120 mA charging current.

4-3-2 BAR ANTENNA TUNING CIRCUIT (LOGIC AND RF UNITS)

When switching to the AM bar antenna while AM band receiving, the AM bar antenna switching signal is output from the CPU (LOGIC unit; IC1, pin 44) as “ANTSW” signal. The signal is applied to the antenna switching circuit (Q510, D76), and then switches to the AM bar antenna.

The CPU (LOGIC unit; IC1) outputs the “TRAC” bar antenna control signal from pin 141. The signal is applied to the level convertor (RF unit Q513), and is then applied to the AM bar antenna tune circuit (D100). The circuit tunes to the desire frequency to change the D100’s capacity.

Downloaded by
RadioAmateur.EU

**4-3-3 EAR PHONE ANTENNA CIRCUIT
(LOGIC AND RF UNITS)**

When switching to the ear phone antenna while WFM band receiving, the received RF signal passes through the external speaker jack (LOGIC unit; J2). The signal is applied to the D101's anode side (RF unit), and is then applied to the RF circuit.

4-3-4 RESET CIRCUIT (LOGIC UNIT)

When power switch is ON, +3CPU signal from the +3.2 regulator (IC103) is applied to the reset IC (IC3, pin 2). The IC outputs reset signal via the "RESET" line, and the signal is applied to the CPU (IC1, pin 19) to reset it.

4-3-5 LCD BACK LIGHT CIRCUIT (LOGIC UNIT)

When the LCD back lights ON, the LCD back light control signal becomes high, and is output from the CPU (IC1, pin 69) as "LIGHT" signal. The signal is applied to the light switch (Q5), and is then applied to the LCD light LED (EP3).

**4-4 POWER SUPPLY CIRCUITS
VOLTAGE LINE**

LINE	DESCRIPTION
HV	The voltage from the external power supply or attached battery.
VCC	The same voltage as the "HV" line (external power supply or battery pack).
VP	Common 14 V converted from the clock signal (LOGIC unit; IC1, pin 40) by the DC-DC converters (LOGIC unit; IC100, D100-D103). The output voltage is applied to the PLL circuit, etc (RF unit).
+3CPU	Common 3 V converted from the "VCC" line by the +3.2 regulator IC (LOGIC unit; IC103). The output voltage is supplied to the CPU, reset IC (LOGIC unit; IC3), EEPROM (LOGIC unit; IC2), etc.
+3V	Common 3 V converted by the +3 controller (LOGIC unit; Q103) using the "PCON" signal from the CPU. The output voltage is supplied to the PLL IC (RF unit; IC3), etc.
+3S	Common 3 V converted by the +3S controller (LOGIC unit; Q101, Q102) using the "PCON" and "+3SC" signals from the CPU. The output voltage is supplied to the ripple filter (RF unit, Q37), etc.
R3V	Common 3 V converted by the R3V controller (LOGIC unit; Q104) using the "+3SC" signal from the CPU. The output voltage is supplied to the buffer amplifier (LOGIC unit, Q400), AM detector (RF unit; Q4), etc.

4-5 PORT ALLOCATIONS

4-5-1 CPU (LOGIC UNIT; IC1)

Pin number	Port name	Description
2	K2	Input port for the [▲], [▼] switches.
3	K1	Input port for the [BAND], [V/M], [MODE] switches.
4	RSSI	Input port for the RSSI signal from the FM IF IC (RF unit; IC2, pin 12) to detect receiving signal strength.
5	VIN	Input port for the power supply voltage.
6	CTONE	<ul style="list-style-type: none"> • Input port for the antenna canceller signal. • Input port for the WX alert signal.
7	RTONE	Input port for the CTCSS decode signal (67–254.1 Hz).
14	ESIO	I/O port for the data signals from/to the EEPROM (LOGIC unit; IC2, pin 5).
15	ECK	Outputs clock signal to the EEPROM IC (LOGIC unit; IC2, pin 6).
19	RESET	Outputs reset signal to the CPU (LOGIC unit; IC1, pin 19). High: The CPU is reset.
25	POWER	Input port for the [POWER] switch. Low: [POWER] switch is pushed.
26	HVDET	Input port for the external power supply detecting signal. Low: While external power supply is connected.
28	CLS	Outputs clock shift control signal. High: While clock is shifting.
30	CLIN	Input port for the cloning data.
31	CLOUT	Outputs the cloning data.
32	PDAUL	Outputs data signal to the PLL IC.
33	PSTB	Outputs strobe signals to the PLL IC (RF unit; IC3, pin 3).
34	PCK	Outputs clock signal to the PLL IC (RF unit; IC3, pin 4).
43	UHFC	Outputs control signal for the UHF band receiving. Low: While receiving UHF band.
44	ANTSW	Outputs the AM bar antenna control signal. High: The AM bar ant. is selected.
45	WFM	Outputs control signal for the WFM circuit. Low: While receiving WFM mode.
46	AM	Outputs control signal for the AM circuit. Low: While receiving AM mode.
47	NOISE	Input port for the SQL detection noise signal.

Pin number	Port name	Description
48	CHGC	Outputs the battery charger circuit control signal. High: While the battery is charging.
49	TCON	Outputs control signal for the CTCSS regulator circuit. Low: While CTCSS is ON.
50	AMUTE	Outputs control signal for the AF mute circuit. High: While muting.
51	VHFC	Outputs control signal for the VHF band receiving. Low: While receiving VHF band.
52	PCON	Outputs the power switch control signal. Low: IC-R5 is power ON.
53	+3SC	Outputs control signal for +3S and R3V regulator circuits. Low: Receiving.
54	B3C	Outputs control signal for the 15–30 MHz receiving. Low: While receiving 15–30 MHz band.
55	BEEP	Outputs beep audio signals.
58	B2C	Outputs control signal for the 1.9–15 MHz receiving. Low: While receiving 1.9–15 MHz band.
59 60	DBL2 DBL1	Outputs control signal for the LO doubler circuits.
61	ATT	Outputs the attenuator control signal. Low: While attenuator is ON.
62	SHIFT	Outputs control signal for the VCO shift circuit.
63	HFC	Outputs control signal for the 1.9–30 MHz receiving. Low: While receiving 1.9–30 MHz band.
64	B1C	Outputs control signal for the 0.5–1.9 MHz receiving. Low: While receiving 0.5–1.9 MHz band.
65	800MC	Outputs control signal for the 800 MHz receiving. Low: While receiving 800 MHz band.
66	300MC	Outputs control signal for the 300 MHz receiving. Low: While receiving 300 MHz band.
67	GC	Outputs control signal for the 1200 MHz receiving. Low: While receiving 1200 MHz band.
68	AFON	Outputs control signal for the AF amplifier regulator.

CPU (Continued)

Pin number	Port name	Description
69	LIGHT	Outputs LCD back light control signal. High: Lights ON.
73	DCK	Input port for the clock signal from the [DIAL].
74	DUD	Input port for the up, down signals from the [DIAL].
75	SQL	Input port for the [SQL] switch. Low: [SQL] switch is pushed.
76	FUNC	Input port for the [FUNC] switch. Low: [FUNC] switch is pushed.
77	MODE	Input port for the [MODE] switch. Low: [MODE] switch is pushed.
80–85	RXF1, RXF0, B3–B0	Input port for the band matrix.
88–90, 92, 94–96	SEC37–35, SEG34, SEC33–31	Outputs LCD segment data.
97 98	CONT1 CONT0	Outputs LCD contrast control signal.
99–127	SEG28–0	Outputs LCD segment data.
138	VRC	Outputs audio volume level control signal.
139	FSET	Outputs frequency control signal.
141	TRAC	<ul style="list-style-type: none">• Outputs vari-cap tuning control signal.• Outputs bar antenna tuning control signal.

SECTION 5 ADJUSTMENT PROCEDURES

5-1 PREPARATION

Some adjustments must be adjusted on the adjustment mode. When entering the adjustment mode, the 68 kΩ terminator is required.

■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 3.0 V DC Current capacity : 1 A or more	Frequency counter	Frequency range : 0.1–1000 MHz Frequency accuracy : ±1 ppm or better Sensitivity : 100 mV or better
DC voltmeter	Input impedance : 50 kΩ/V DC or better		Standard signal generator (SSG)
Digital multimeter	Input impedance : 10 kΩ/V DC or better		

■ ENTERING THE ADJUSTMENT MODE

- ① Connect a 68 kΩ terminator to the [SP] jack.
- ② Push and hold the [FUNC] key, and then turn power ON.

NOTE: Entering adjustment mode, keep on entering adjustment mode until dis-connect the 68 kΩ terminator and turn power OFF.

■ OPERATION ON THE ADJUSTMENT MODE

- Change the adjustment channel or item [UP] : [BAND] key
- Change the adjustment channel or item [DOWN] : [TS] key
- Change the adjustment value : [DIAL]
- Verify the adjustment value : Push and hold [FUNC] key, and then push [BAND] key.

When entering adjustment mode, some adjustments need to push [V/M] or [FUNC] and [V/M] keys to write the adjustment value to the CPU.

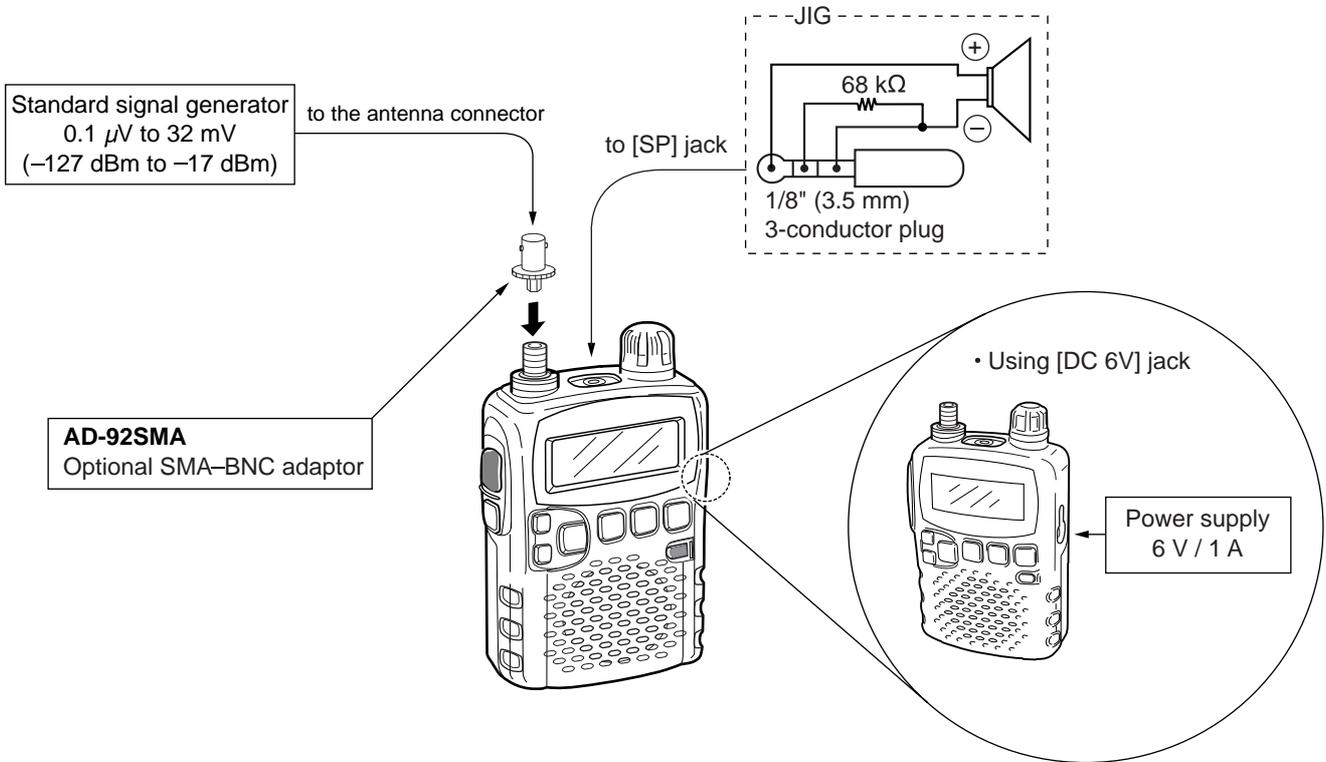

Pushing key	Operation
[V/M]	Start VHF and UHF SENSITIVITY ADJUSTMENTS automatically.
	Set the REFERENCE FREQUENCY ADJUSTMENT value.
	Set the S-METER ADJUSTMENT value.

Pushing key	Operation
Push and hold the [FUNC] key, and then push the [V/M] key.	Set the VHF and UHF SENSITIVITY ADJUSTMENTS value when manual adustment.

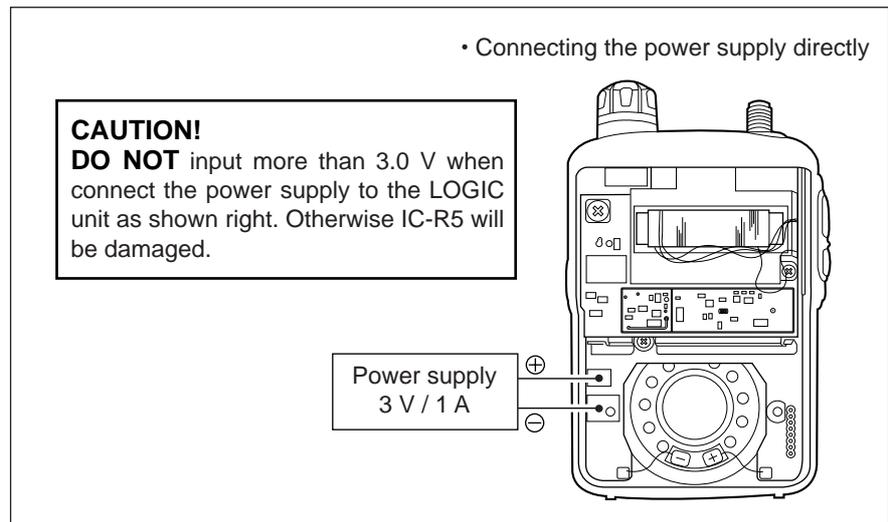

■ CONVENIENT!–AUTOMATICALLY ADJUSTMENT

BAR ANTENNA, VHF SENSITIVITY and UHF SENSITIVITY ADJUSTMENTS can be ajusted automatically. The detail shows at page 5-8.

• CONNECTION

POWER SUPPLY CONNECTION
(IC-R5 has two pattern.)

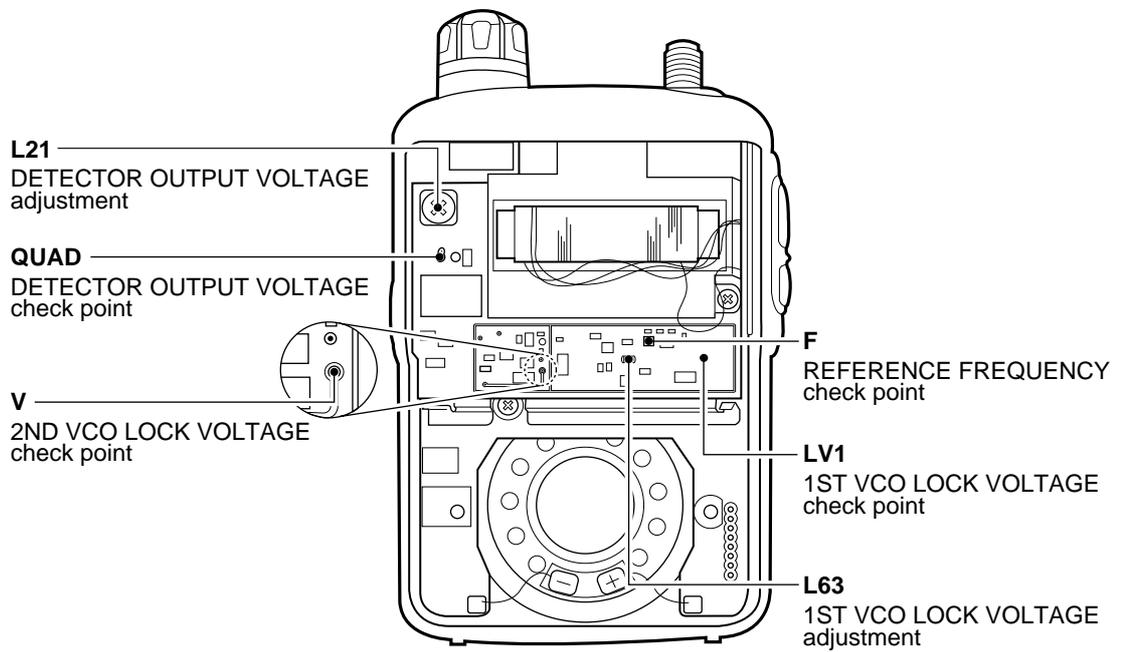

5-2 PLL ADJUSTMENT

“REFERENCE FREQUENCY” adjustment must be performed at “ADJUSTMENT MODE”.

ADJUSTMENT	ADJUSTMENT CONDITION	MEASUREMENT		VALUE	ADJUSTMENT POINT		
		UNIT	LOCATION		UNIT	ADJUST	
1ST VCO LOCK VOLTAGE	1	<ul style="list-style-type: none"> Displayed frequency : 493.300 MHz Receiving 	RF	Connect the digital multi-meter to the check point LV1.	1.8 V – 2.8 V	RF	L63
