## SECTION 3 CIRCUIT DESCRIPTION

### 3-1 HAM BAND RECEIVER CIRCUITS

#### 3-1-1 ANTENNA SWITCHING CIRCUIT (VHF RF UNIT)

The received signals enter the CONNECTOR UNIT. The VHF RF signals are applied to the bandpass filter (L10, L11, L14, C56~60) and then to the antenna switching circuit.

The antenna switching circuit employs a  $\lambda/4$ -type diode switching system. While receiving, D23 turns OFF. The received signals which are applied to the VRFA UNIT pass through a low-pass filter (L8, L9, C52~54, D9).

#### 3-1-2 RF AND 1st MIXER CIRCUITS (VRFA AND VHF RF UNITS)

The RF circuit amplifies the received signals up to the level needed at the 1st mixer circuit. The 1st mixer circuit converts the received signals to a fixed frequency of the 1st IF signal with a PLL output frequency. By changing the PLL frequency, only the desired frequency can pass through a pair of crystal filters at the next stage of the 1st mixer.

The VHF RF signals from the antenna switching circuit are amplified at Q1 and Q2 and are then converted to a 1st IF signal at Q6. The frequency of the 1st IF signal is 30.85 MHz. Q6 converts the RF signal using the PLL output signal from D16.

The VHF RF circuit adopts a tuned bandpass filter circuit that tunes the filters to the center frequency of the receiving signal using varactor diodes (D2, D4, D5). A PLL lock voltage is used for the filter tuned signal.

#### 3-1-3 IF CIRCUIT (VHF RF UNIT)

The 1st IF signal passes through the crystal filter (F12) to suppress out-of-band signals. The signal is then amplified at Q5 and is applied to the FM IF IC (IC1, pin 16).

IC1 contains the 2nd mixer, local oscillator, limiter amplifier, quadrature detector, active filter and S-meter detector circuits. The local oscillator section and X2 generate 30.395 MHz for the 2nd LO signal.

The 1st IF signal is applied to a 2nd mixer section of IC1 (pin 16) and is then mixed with a 2nd LO signal for conversion to a 455 kHz 2nd IF signal.

The 2nd IF signal from the 2nd mixer (IC1, pin 3) passes through a ceramic filter (F11) where unwanted signals are suppressed. It is then amplified at the limiter amplifier section (IC1, pin 5) and applied to the quadrature detector section (IC1, pin 8 and ceramic discriminator, X1) to demodulate the 2nd IF signal into an AF signal. The AF signal is output from IC1 (pin 9).

#### 3-1-4 AF CIRCUIT (AF FIL AND AF UNITS)

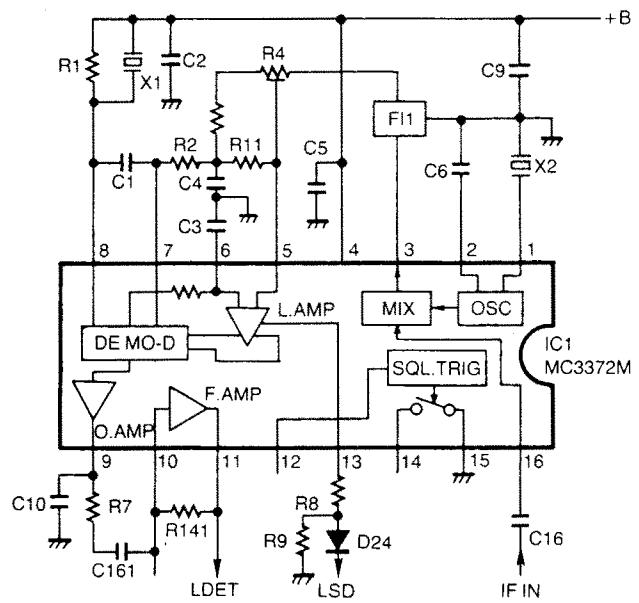

The AF signals from the VHF RF UNIT are applied to the band-pass filter (Q6) and are passed through the [HAM] VOL control and are then amplified at the power amplifier (IC1), on the AF UNIT, to obtain the speaker driving level.

#### 3-1-5 SQUELCH CIRCUIT (VHF RF AND LOGIC UNITS)

In an FM receiver, noise signals are automatically suppressed while a signal with voice components is received. The noise squelch circuit acts in accordance with this phenomenon.

Noise components in the AF signal (20 kHz and higher) from IC1 (pin 11) are applied to the LOGIC UNIT. The noise signal passes through the [HAM] SQL control (R1) and is amplified at the active filter (IC7). This signal is rectified at D29 and is converted to DC voltage. This voltage is applied to Q30 or to IC16. Thus, while receiving no signal, the "LOW" signal is output from Q30 as the "L BUSY" signal.

While IC16 is turning over the rectified DC voltage, the "L MUT" signal is controlling the AF MUTE circuit (Q4, Q5). When the "L MUT" signal is "LOW," the AF MUTE circuit turns ON.

VHF IF CIRCUIT

### **3-2 HAM BAND TRANSMITTER CIRCUITS**

### **3-2-1 MIC CONTROL CIRCUIT (LOGIC UNIT)**

The mic control circuit controls the external or internal audio, DTMF tone and TONE CALL signals.

An audio signal from the external microphone is applied to the microphone control circuit (IC17, IC18, Q1, Q2). The audio signal passes through the attenuator (R19~R21) and is connected to the internal microphone. The audio signal amplified at IC20 is applied to the VHF RF UNIT. When the DTMF tone or TONE CALL signal outputs to the mic amp circuit, Q5 turns OFF the audio signal to prevent malfunctioning.

### **3-2-2 MIC AMP CIRCUIT (VHF RF UNIT)**

The mic amplifier circuit amplifies audio signals with 6 dB/oct. pre-emphasis from the microphone to a level needed for the modulation circuit.

The mic amplifier circuit has a low level amplifier with pre-emphasis (IC9a) and a limiter amplifier (IC9b).

### **3-2-3 MODULATION CIRCUIT (VHF RF UNIT)**

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signal.

The audio signal from IC9 (pin 1) changes the reactance of a varactor diode (D10) to modulate the oscillated signal at the TX VCO (Q23, Q24). The oscillated signal is buffer-amplified at Q25 and Q26 and is then applied to the drive amplifier circuit.

### **3-2-4 DRIVE AND POWER AMPLIFIER CIRCUITS (VHF RF UNIT)**

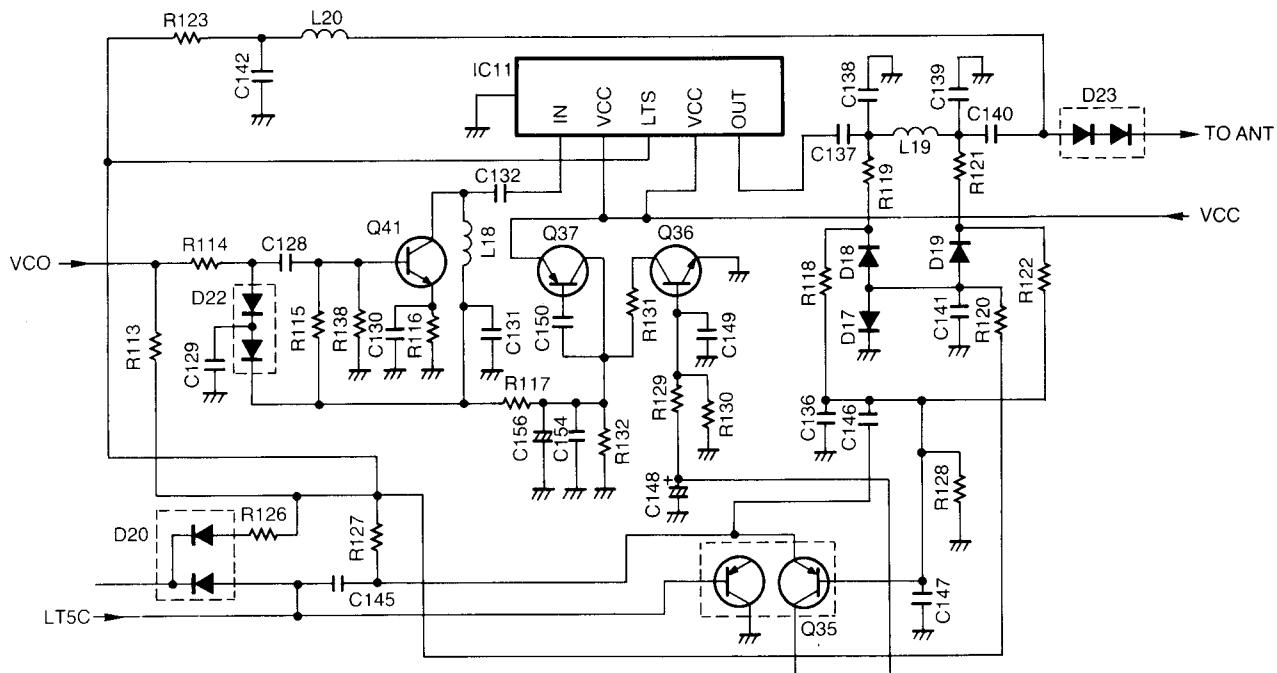

IC11 is a power module which provides a stable 5 W (DC 13.5 V) of output power.

The drive amplifier (Q41) and power amplifier (IC11) amplify the VCO oscillating signal to an output level. The output signal passes through the APC circuit (D17~19) and bandpass circuit and is applied to the antenna connector. Collector voltage for the drive amplifier is controlled by the APC circuit.

### **3-2-5 APC CIRCUIT (VHF RF UNIT)**

An APC circuit protects the power module (IC11) from a mismatched output load and selects HIGH or LOW output power.

The APC circuit (D17~19, L19, R119, R121, C138, C139) detects the output signal from the power module (IC11, pin 5). Q35 compares the APC detected voltages and reference voltages. When the APC detected voltages are higher than the reference voltages, Q35 reduces the collector voltages of Q36 and Q37. This voltage is applied to the drive amplifier (Q41) to reduce the RF output power.

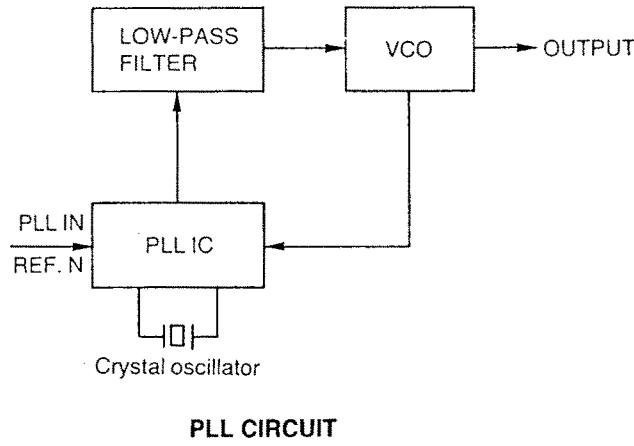

### VHF APC CIRCUIT

### 3-3 HAM BAND PLL CIRCUITS

#### 3-3-1 GENERAL (VHF RF UNIT)

A PLL circuit provides stable oscillation of the transmit frequency and the receive local frequency. The PLL circuit compares the phase of the divided VCO frequency to the reference frequency. The PLL output frequency is controlled by a crystal oscillator and the divided ratio of a programmed divider.

The PLL circuit, using a one chip PLL IC (IC8), directly generates the transmit and 1st LO frequency with a VCO. The PLL IC sets the divided ratio based on serial data from the CPU (HAM BAND: IC2, RECEIVER BAND: IC1) on the LOGIC UNIT and compares the phases of a VCO signal and the reference oscillator frequency. The PLL IC detects the out-of-step phase and output from pin 12. The reference frequency is oscillated at X3.

#### 3-3-2 VHF CHARGE PUMP AND LOOP FILTER CIRCUITS (VHF RF UNIT)

Phase-detected signals from IC8 are converted to DC voltage by a constant-current circuit (Q17~19) and a lag-loop filter to control the VCO oscillating signals. The PLL lock voltage changes the reactance of varactor diodes in the VCO circuit.

The DC voltage of the VHF PLL is also used for the receiver tuning circuit on the VRFA UNIT.

#### 3-3-3 VHF VCO CIRCUIT (VHF RF UNIT)

The VCO circuit oscillates the PLL output frequency controlling varactor diodes.

D10, a varactor diode, provides the frequency control. The control signal from IC8 (pin 6) turns Q42 ON or OFF to switch the VCO frequency between transmission and reception.

### 3-4 RECEIVER BAND CIRCUITS

#### 3-4-1 GENERAL

The IC-2SRA/E's wideband receiver circuit is designed for the following bands (25~905 MHz) and modes (AM, FM, WFM).

#### 3-4-2 BANDPASS FILTER CIRCUITS (RX UNIT AND BPF A UNITS)

The received signal enters the receiver unit and passes through a limiter diode (D1) and then passes to a bandpass filter. The received signal is applied to the BPF A UNIT (25~534.190 MHz) or RF UNIT (534.200~950.000 MHz) which suppress out-of-band signals.

##### (1) 25~267.795 MHz (BA1)

RF signals from the band switch (D2) pass through the low-pass filter (C4~C12, L1~L3). The signals are applied to the RF amplifier (Q1) on the RX UNIT via the band switch (D3).

##### (2) 267.800~534.190 MHz (BA2)

RF signals from the band switch (D4) pass through the bandpass filter (C15~C25, L6~L10, L29). The signals are applied to the RF amplifier (Q1) on the RX UNIT via the band switch (D5).

##### (3) 534.200~800.895 MHz (BA3)

RF signals from the band switch (D1) pass through the bandpass filter (C1~C10, L1~L5). The signals are applied to the RF amplifier (Q1) on the RX UNIT via the band switch (D2).

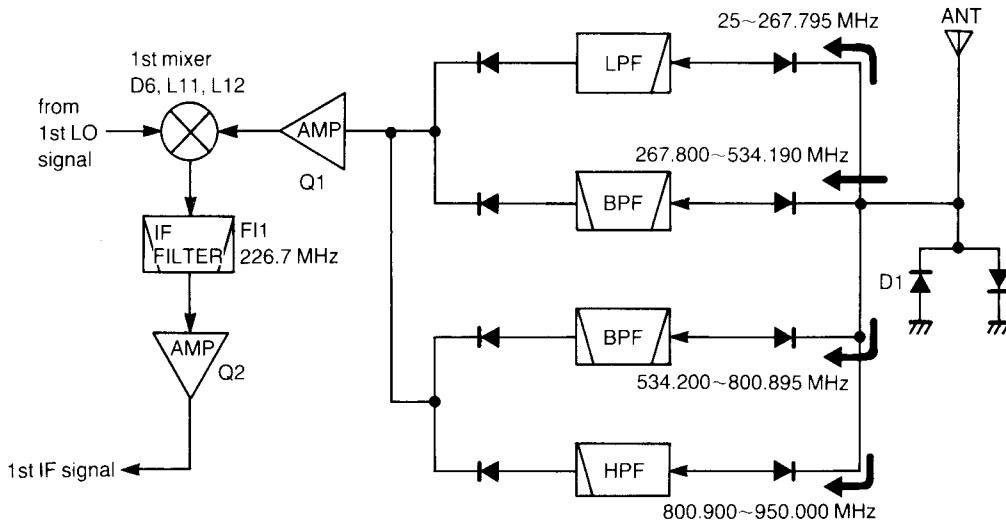

##### (4) 800.900~950.000 MHz (BA4)

RF signals from the band switch (D3) pass through the bandpass filter (C14~C19, L6~L8). The signals are applied to the RF amplifier (Q1) on the RX UNIT via the band switch (D4).

#### 3-4-3 1ST MIXER AND 1ST IF CIRCUITS (RX UNIT)

The signals from the bandpass filter circuit are amplified at the RF amplifier (Q1, IC1). The amplified signals are mixed with the 1st LO signal from the RX VCO UNIT at the 1st mixer (double balanced mixer, D6, L11, L12) to produce a 226.7 MHz 1st IF signal.

The 1st IF signal is applied to an IF filter (F11) to suppress out-of-band signals. The 1st IF signal is amplified at an IF amplifier (Q2) and then applied to the 2nd mixer (Q3).

**RECEIVER RF CIRCUIT**

#### 3-4-4 2ND MIXER AND 2ND IF CIRCUITS (RX AND BPF B UNITS)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal.

The 1st IF signal from the IF amplifier (Q2) is applied to the 2nd mixer (Q3) and mixed with a 256 MHz 2nd LO signal from the BPF B UNIT to be converted to a 10.7 MHz 2nd IF signal. The 2nd IF signal passes through the crystal filter (FI2) to suppress out-of-band signals. The signal is then amplified at (Q4) and is applied to the IF IC (IC2, pin16).

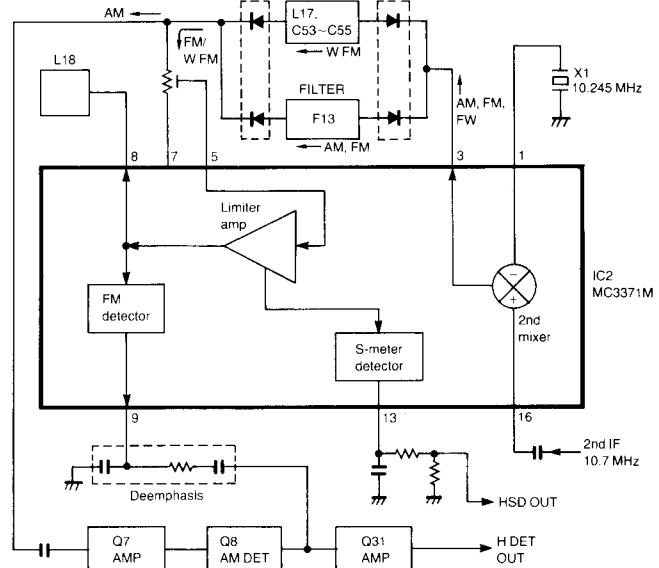

#### 3-4-5 3RD IF AND DEMODULATOR CIRCUITS (RX UNIT)

The 3rd mixer circuit converts the 2nd IF signal to a 3rd IF signal.

IC2 contains the 3rd mixer, 3rd local oscillator, limiter, amplifier, quadrature detector, and S-meter detector circuit. The 3rd local oscillator section and X1 generate 10.245 MHz for the 3rd local oscillator signal.

The 2nd IF signal from the IF amplifier (Q4) is applied to the 3rd mixer section of IC2 and is mixed with a 3rd LO signal to be converted to a 455 kHz 3rd IF signal.

In AM/FM mode, the 3rd IF signal from IC2 (pin 3) passes through the ceramic filter (FI3), where unwanted signals are suppressed. In WFM mode, the 3rd IF signal passes through the filter circuit (L17, C53~C55). After passing each filter, the WFM or FM signal is applied to the limiter amplifier section IC2 (pin 5), and the quadrature detector section (IC2, pin 10 and L18) to demodulate the 3rd IF signal to an AF signals. The AM signal is amplified at Q7 and is converted to an AF signal at Q8. The AF signals are applied to Q31 and to the LOGIC UNIT.

**3RD IF AND DEMODULATOR CIRCUIT**

#### 3-4-6 AF AND SQUELCH CIRCUITS (LOGIC UNIT)

These circuits are nearly same as the HAM BAND circuit. Refer to section 3-1-4~3-1-5.

### 3-5 RECEIVER BAND PLL CIRCUITS

#### 3-5-1 GENERAL (RF UNIT)

The PLL circuit, using a one chip PLL IC (IC6), directly generates the 1st local frequency with a VCO. The PLL IC sets the divided ratio based on serial data from the CPU on the LOGIC UNIT and compares the phases of VCO signals to the reference oscillator frequency. The PLL IC detects the out-of-step phase and output from IC6 (pin 12). The reference frequency is oscillated at X3.

### 3-5-2 VCO CIRCUIT (RX AND RX VCO UNITS)

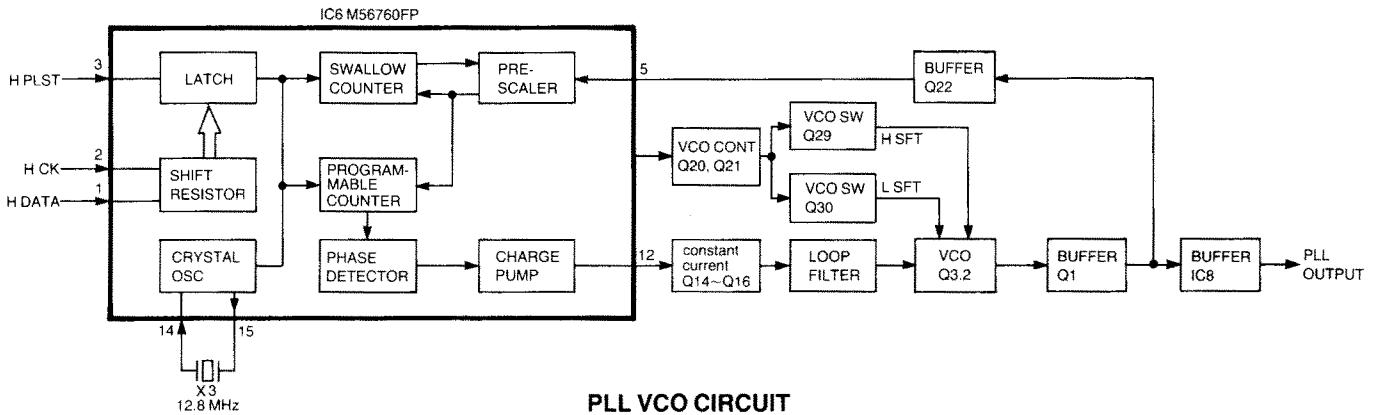

The VCO circuit oscillates the PLL output frequency controlling varactor diodes.

The varactor diodes (D1, D2) provide the frequency control. The control signal from IC6 (pin 6) controls the VCO control circuits (Q20, Q21, Q29, Q30) to switch the VCO frequency.

### 3-5-3 LOOP FILTER CIRCUIT (RF AND RX VCO UNITS)

Phase-detected signals from IC6 (pin 12) are converted to DC voltage by a constant-current circuit (Q14~Q16) and a lag-loop filter (C82, C83, C85, R62, R63) to control the VCO oscillating signal. The PLL lock voltage changes the reactance of varactor diodes in the RX VCO circuit.

The RX VCO output signal is applied to the buffer amplifiers (IC8 and Q22). The PLL output signal passes through the LO filter switches (D14, D15) and then to a 1st mixer circuit.

Pin 1 is "HIGH" when a reference signal is lower than the S-meter signal and becomes "LOW" when a reference signal is higher than the S-meter signal. Pin 1 is applied to the CPU (IC1 or IC2).

### 3-6-2 BATTERY CHARGING CIRCUIT (PRT UNIT)

The transceiver has a constant-current regulated circuit for charging the connected battery pack. This circuit charges the battery pack in about 15 hours.

The voltage from the external power supply is divided at D6, R6 and R8. This voltage is then applied to Q2. Q2 controls Q1, and the external power supply charges the battery pack.
