SERVICE MANUAL

430 MHz FM TRANSCEIVER

IC-449A
IC-449E

INTRODUCTION

This service manual describes the latest information for the following transceivers at the time of publication.

MODEL	VERSION NO.	VERSION	SYMBOL
IC-449A	#05	U.S.A.	USA
	#07	Australia	AUS
IC-449E	#02	Europe	EUR

To upgrade quality, all electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1150000010 IC SC1019 IC-449A/E MAIN UNIT 5 pieces
8810006010 Screw FH M3×5 ZK BS IC-449A/E Top cover 10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB ~ 50 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

SECTION 1 SPECIFICATIONS

■ GENERAL

- Frequency coverage

MODEL	VERSION	RECEIVER	TRANSMITTER
IC-449A	U.S.A.	440.000~450.000 MHz	440.000~450.000 MHz
	Australia	430.000~440.000 MHz	430.000~440.000 MHz
IC-449E	Europe	430.000~440.000 MHz	430.000~440.000 MHz

- Mode : F3 (FM)
- Selectable tuning step (Initial) : 5, 10, 12.5, 15, 20, 25 kHz or 1 MHz
- Memory channels : 20 plus 1 call channel
- Antenna impedance : 50 Ω (unbalanced)
- Power supply requirement : 13.8 V DC ±15% (negative ground)
- Current drain : Receive 500 mA (squelched)
800 mA (max. audio output)
- Usable temperature range : Transmit 4.0 A (LOW 1), 5.0 A (LOW 2), 7.0 A (LOW 3), 9.5 A (HIGH)
- Frequency stability : -10°C~+60°C (+14°F~+140°F)
- Dimensions : ±10 ppm (-10°C~+60°C; +14°F~+140°F)
- Weight : 140 (W)×40 (H)×155 (D) mm; 5.5 (W)×1.6 (H)×6.1 (D) in
(Projections not included)
- Weight : 1.0 kg (2.2 lb)

■ TRANSMITTER

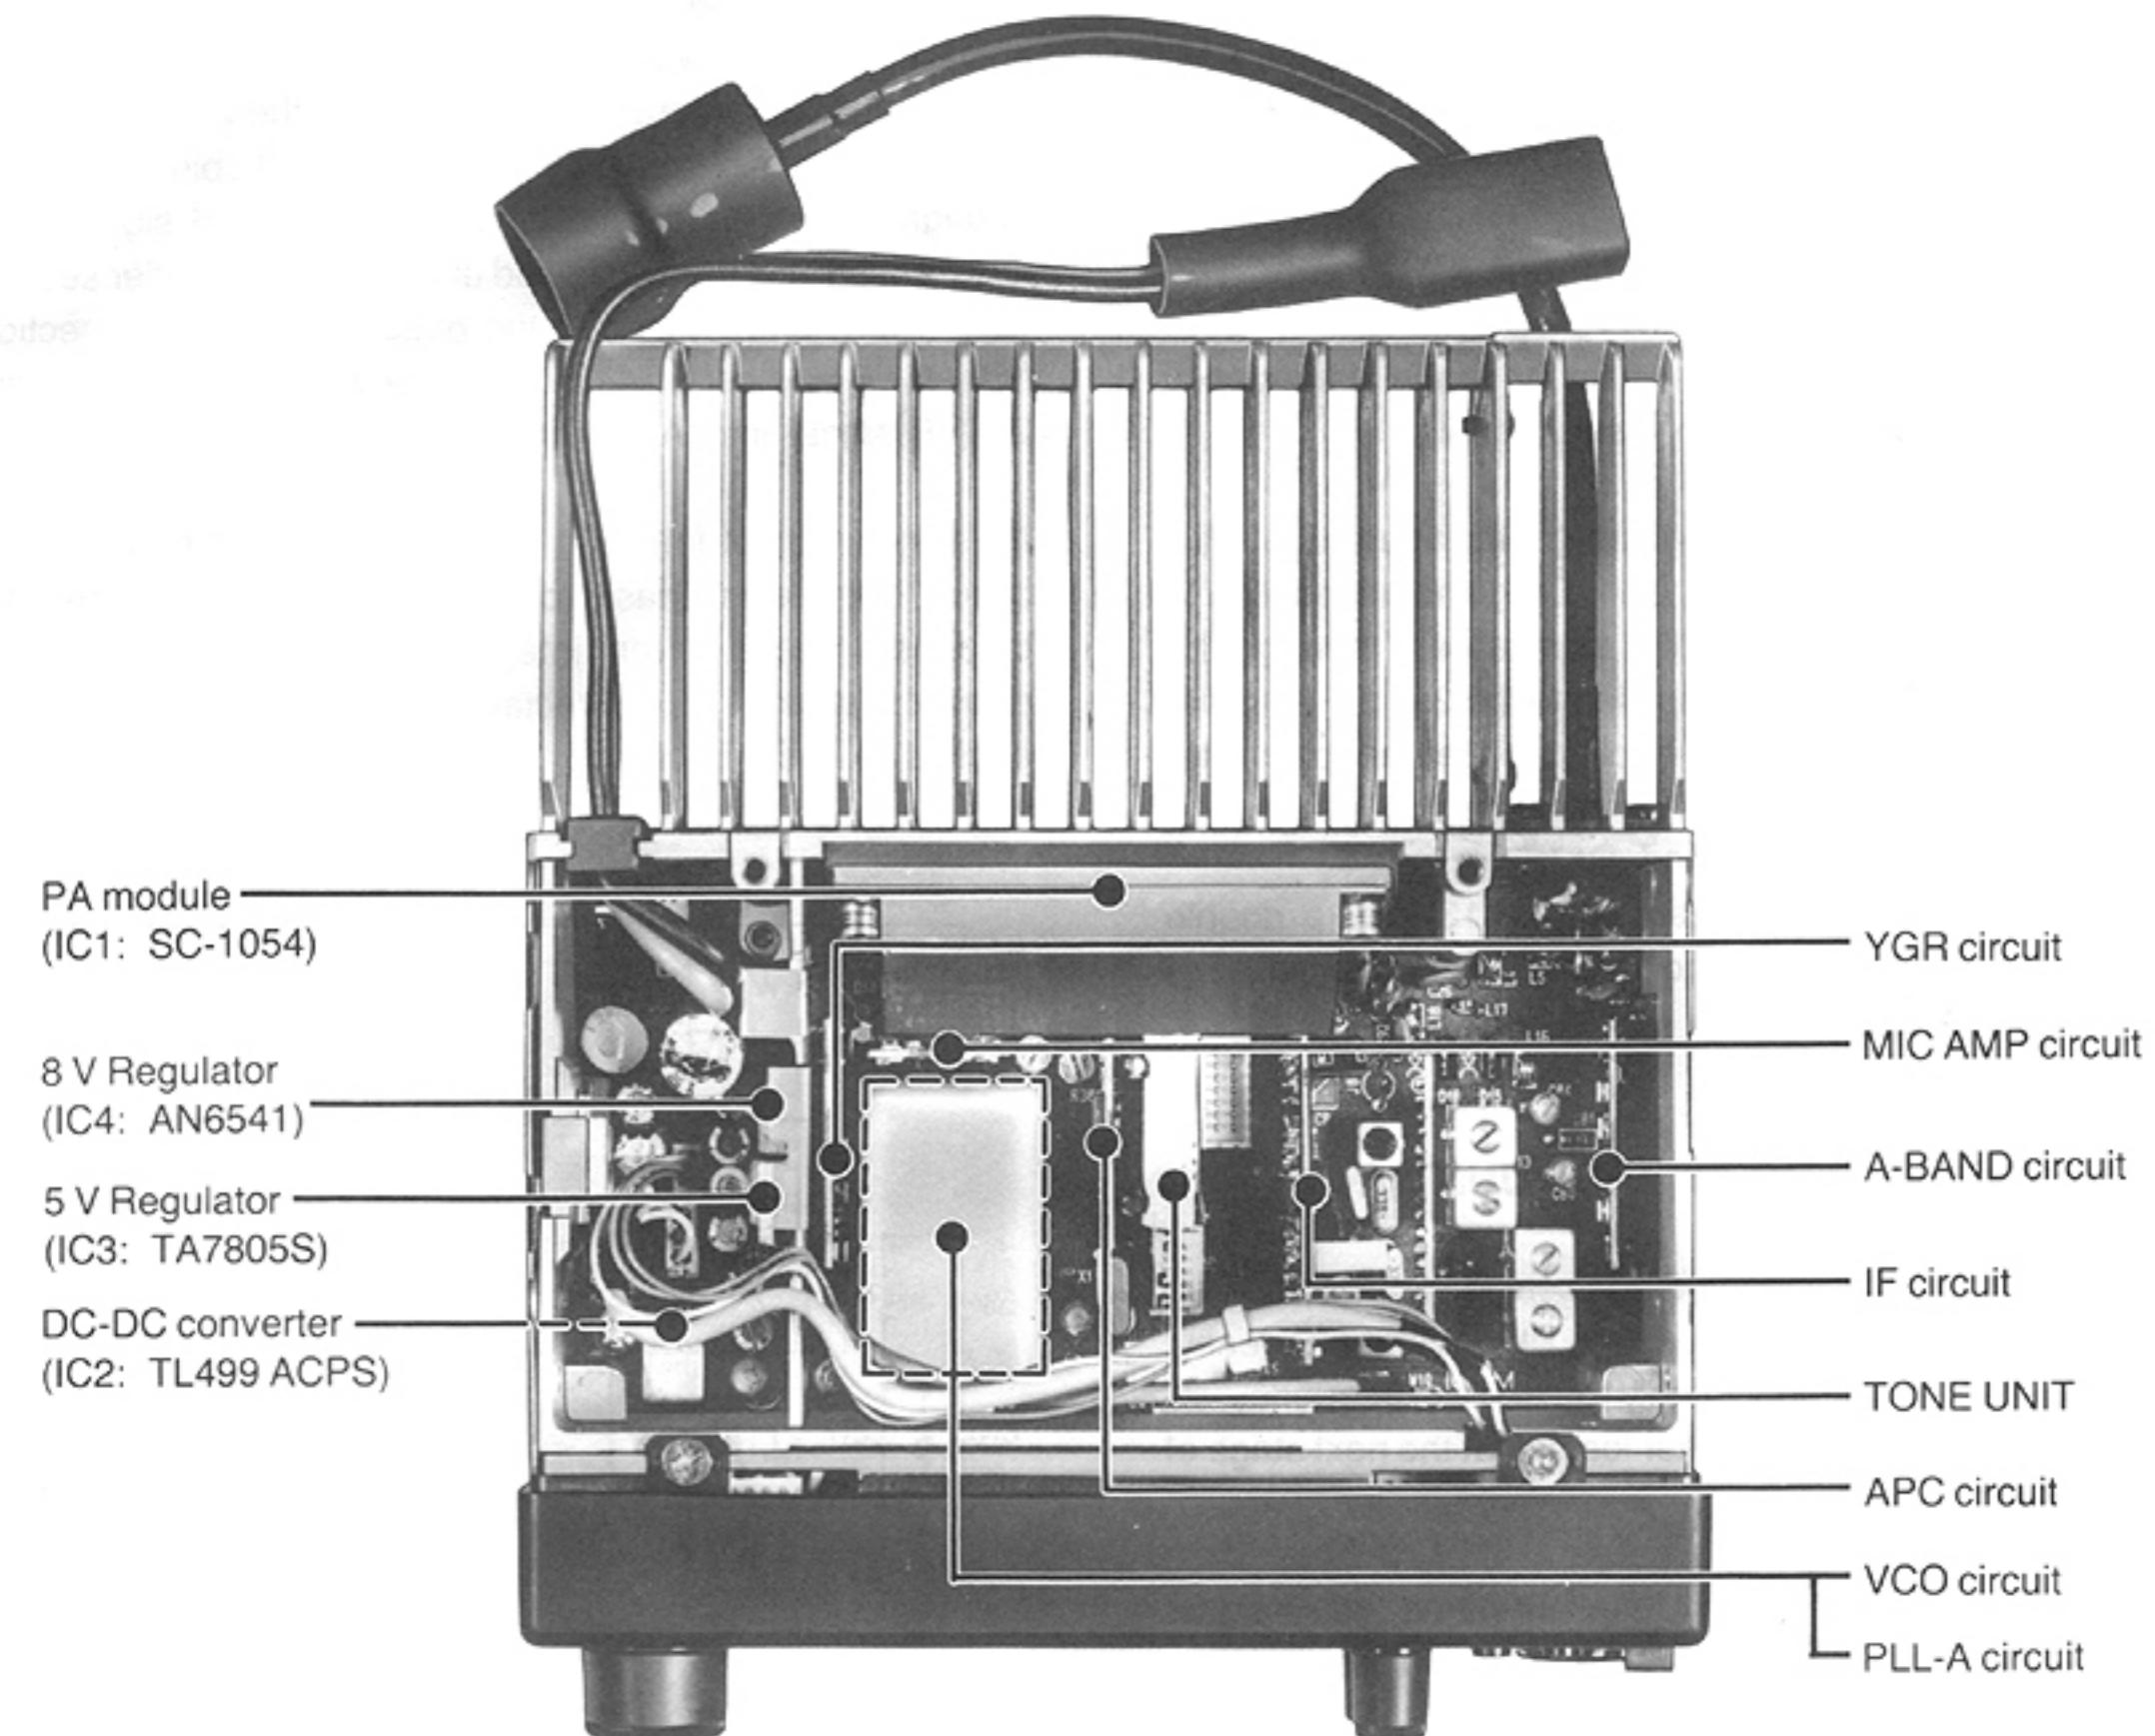

- Output power : 35 W (HIGH), 20 W (LOW 3), 10 W (LOW 2), 5 W (LOW 1)
- Modulation system : Variable reactance frequency modulation
- Max. frequency deviation : ±5 kHz
- Spurious emissions : Less than -60 dB
- Microphone impedance : 600 Ω

■ RECEIVER

- Receive system : Double-conversion superheterodyne
- Intermediate frequencies : 1st 30.875 MHz
2nd 455 kHz
- Sensitivity : Less than 0.16 μV for 12 dB SINAD
- Selectivity : More than 15 kHz/-6 dB
Less than 30 kHz/-60 dB
- Audio output power : More than 2.4 W at 10% distortion with an 8Ω load
- Audio output impedance : 4~8 Ω

All stated specifications are subject to change without notice or obligation.

SECTION 2 INSIDE VIEWS

SECTION 3 CIRCUIT DESCRIPTION

3-1 RECEIVER CIRCUITS

3-1-1 ANTENNA SWITCHING CIRCUIT (MAIN UNIT)

The antenna switching circuit switches the transmit/receive circuit and functions as a low-pass filter while receiving and as a resonator circuit while transmitting.

Received signals enter the antenna connector and pass through a low-pass filter (L4, L5, C27, C28, C31). The signals are applied to an antenna switching circuit (D2, D15, D16) and then to an RF circuit via the bandpass filter (L16~L18, C86~C90, C92).

3-1-2 RF CIRCUIT (MAIN UNIT)

The RF circuit amplifies signals within the range of frequency coverage and filters out out-of-band signals.

The signals from the antenna switching circuit pass through a one-stage bandpass filter (L15, C84, C85) and are applied to an RF amplifier (Q20). Then, the signals pass through the bandpass filter (L13), and are applied to the 2nd RF amplifier (Q19). Amplified signals are re-applied to the bandpass filter (L12) and are applied to the 1st mixer (Q17).

The coils in the bandpass filters (L12, L13) use a double tuned helical coil. They have good bandpass characteristics and eliminate signals outside of the range.

3-1-3 1ST MIXER CIRCUIT (MAIN UNIT)

The 1st mixer circuit converts the received signal to a fixed frequency of the 1st IF signal using a PLL output frequency. By varying the PLL frequency, only the desired frequency will be passed through the crystal filter located at the next stage of the 1st mixer.

The signals from the RF circuit are mixed with a 1st LO signal from the VCO circuit to produce a 30.875 MHz 1st IF signal.

3-1-4 1ST IF CIRCUIT (MAIN UNIT)

The 1st IF circuit amplifies a signal which is converted in the 1st mixer circuit.

After passing through a matching circuit (L8, C63), the 1st IF signal is applied to a pair of crystal filters (F11) to suppress out-of-band signals. The 1st IF signal is amplified at an IF amplifier (Q22) and then enters a demodulator circuit.

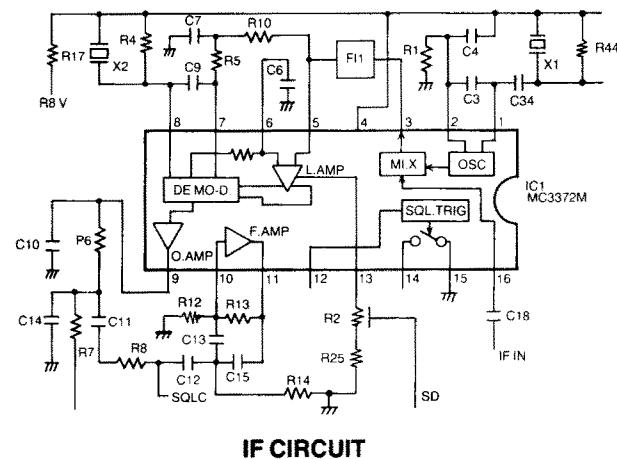

3-1-5 2ND IF CIRCUIT (IF UNIT)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double superheterodyne system (which converts the receive signal twice) improves the image rejection ratio and obtains stable receiver gain.

The 1st IF signal from Q22 is applied to a 2nd mixer section of IC1 (pin 16), is mixed with a 2nd LO signal using X1 and is converted to a 455 kHz 2nd IF signal.

IC1 contains the 2nd mixer, the local oscillator, the limiter amplifier and quadrature detector circuits. The local oscillator section and X1 generates 30.42 MHz for the 2nd LO signal. The 2nd IF signal from the 2nd mixer (IC1, pin 3) passes through a ceramic filter (F11) where unwanted signals are suppressed. It is then amplified at the limiter amplifier section (IC1, pin 5) and applied to the quadrature detector section (IC1, pin 8 and ceramic discriminator X2) to demodulate the 2nd IF signal into AF signals.

AF signals output from IC1 (pin 9) are applied to a squelch circuit and de-emphasis circuit (Q6, Q7, etc.). The de-emphasis circuit is an integrated circuit with frequency characteristics of -6 dB/octave. The resulting signals are applied to the AF circuit.

3-1-6 SQUELCH CIRCUIT (IF UNIT)

The squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signals, the squelch circuit switches the AF control circuits.

Some of the noise components in the AF signals from IC1 (pin 11) are applied to IC1 (pin 13). The [SQL] control (R41) on the LOGIC UNIT adjusts the IC1 (pin 13) input level.

The active filter section in IC1 amplifies noise components of frequencies of 20 KHz and above and outputs the resulting signal from IC1 (pin 14). Output signals are rectified by D2 and are converted to DC voltage.

The DC voltage triggers the squelch switch (Q1). The signal is applied to the CPU (IC4, pin 18) on the LOGIC UNIT through the SQLS signal line.

3-1-7 AF CIRCUIT (MAIN UNIT)

The AF circuit amplifies the signals to drive a speaker. The AF circuit includes a mute circuit to mute a signal with a noise squelch.

The [VOL] control on the LOGIC UNIT adjusts the signals which pass through the detector mute switch (Q23), the BEEP signal and the DTMF monitor signal. The AF signals, the BEEP signal and the DTMF monitor signal are then amplified at the AF amplifier (IC8) to obtain the speaker driving level.

The AF mute transistor (Q24) cuts the input signal of the AF amplifier (IC8) when the transceiver is transmitting or the squelch is closed. If an external speaker is connected, the internal speaker is automatically disconnected.

3-2 TRANSMITTER CIRCUITS

3-2-1 MICROPHONE AMPLIFIER (MIC AMP AND VCO UNITS)

The microphone amplifier circuit amplifies audio signals with +6 dB/octave pre-emphasis from the microphone to a level needed at the modulation circuit.

AF signals from the microphone passes through the mute switch (Q27) and are amplified at the microphone preamplifier (Q1) through the "MIC IN" line. IC1a includes a low level amplifier with pre-emphasis and a limiter amplifier. The amplified signals from IC1a passes through a low-pass filter (IC1b) and are then applied to the VCO circuit.

3-2-2 MODULATION CIRCUIT (MIC AMP AND VCO UNIT)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signals.

Audio signals from the MIC AMP UNIT (MIC OUT signal) change the reactance of varactor diodes (D1, D2) to modulate the oscillated signal at Q1. The oscillated signal is buffer-amplified at Q2 and is then applied to the drive amplifier circuit.

3-2-3 DRIVE AMPLIFIER CIRCUIT (YGR UNIT)

The drive amplifier circuit amplifies the VCO oscillating signal.

The VCO output (OUT1) is buffer-amplified at Q1 on the MAIN UNIT and is applied to the receive/transmit switching circuit (D1, D12). Then, the VCO output is amplified at the predriver (Q1) and the drive amplifier (Q2). Q2 is controlled by a collector current of Q2 on the MAIN UNIT.

3-2-4 POWER AMPLIFIER CIRCUIT (MAIN UNIT)

The power amplifier circuit amplifies the drive signal.

RF signals from the driver amplifier (Q2) are applied to IC1 (pin 1). IC1 is a power module and amplifies the signals to approximately 35 W. The output signal from IC1 (pin 5) is applied to a switching diode (D2) and then to a low-pass filter (L4, L5, C27, C28, C31). The low-pass filter attenuates unwanted harmonic signals.

3-2-5 ANTENNA SWITCHING CIRCUIT (MAIN UNIT)

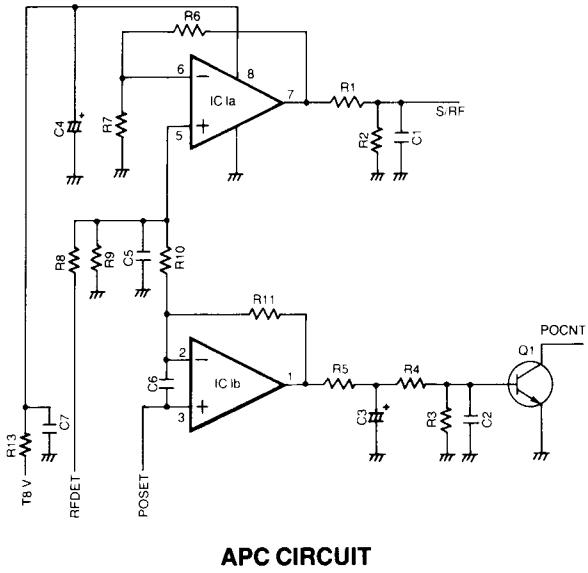

An antenna switching circuit applies the received signal to a receiver circuit and the transmitter signal to the antenna connector.

When transmitting, the switching diodes (D2, D15, D16) are turned ON by a signal from T8V. RF signals from IC1 which are not applied to the receiver circuit are applied to the antenna connector through the low-pass filter.

3-2-6 APC CIRCUIT (APC UNIT)

An APC circuit protects the power module from a mismatched output load and selects HIGH or LOW output power. The "RFDET" voltage, generated in the APC detector (D3, D4, L5, R17, R18, R20, R22, C28, C31) on the MAIN UNIT, is applied to the APC amplifiers (IC1a, IC1b).

The amplified voltage from IC1b is applied to Q1. IC1a is an RF meter amplifier. The output voltage (POCNT line) from Q1 is applied to Q11 to control the RF output power.

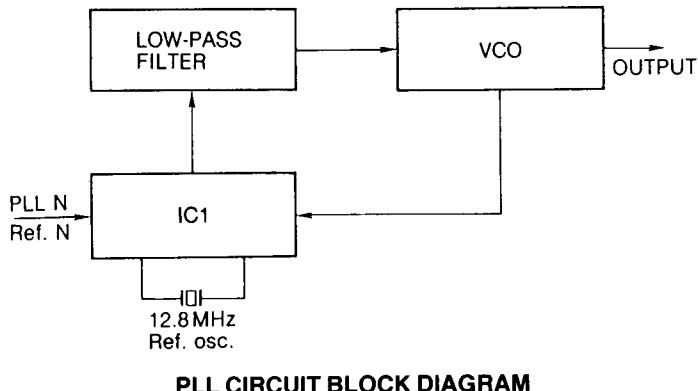

3-2-7 POWER CONTROL CIRCUIT (MAIN UNIT)

The power control circuit (Q10, Q11) selects one of three output power levels (HIGH, LOW-2, LOW-1, LOW-0) and controls output voltage from the APC circuit (POSET line).

3-3 PLL CIRCUITS

3-3-1 GENERAL

The PLL circuit steadily oscillates the transmit frequency and the receive local frequency. The PLL output frequency is controlled by the divided ratio of the programmable divider.

3-3-2 REFERENCE OSCILLATOR (MAIN UNIT)

The reference oscillator circuit oscillates the PLL reference frequency.

A reference frequency (12.8 MHz) is produced by X1. The reference frequency is adjusted by C7.

3-3-3 VCO CIRCUIT (VCO UNIT)

A VCO circuit generates receive and transmit frequencies and produces FM modulation.

The VCO circuit forms a Colpitts oscillator circuit (Q1). Strip lines are used for stable oscillation over a wide frequency range. Varactor diodes (D1, D2) provide frequency control. The buffer-amplifier (Q2) is unaffected by VCO oscillation and is applied to the PLL IC (IC1, pin 1) on the PLL-A UNIT.

3-3-4 PROGRAMMED DIVIDER AND PHASE DETECTOR CIRCUITS (PLL-A UNIT)

The programmable divider shifts the dividing ratio with a prescaler depending on the operating frequency and determines the VCO oscillating frequency. The phase detector circuit detects the off-phase components of the VCO frequency using a stable reference frequency.

IC1 is a one-chip PLL IC that contains a dual modulus prescaler, a swallow counter, a programmable divider and a phase detector.

In IC1, the entered signal is divided at a prescaler and at programmable divider sections. A reference frequency is also divided at a divider section. Both of the divided signals are compared at a phase detector section to output their differential components.

3-3-5 CHARGE PUMP AND LOOP FILTER CIRCUIT (PLL UNIT)

These circuits convert the phase-detected signal to DC voltage.

An active loop filter (Q1, Q2) converts the phase-detected signal (pulse signal) to DC voltage (PLL lock voltage) to control the VCO oscillating signal. The PLL lock voltage changes the reactance of varactor diodes in the VCO circuit.

3-4 LOGIC CIRCUITS

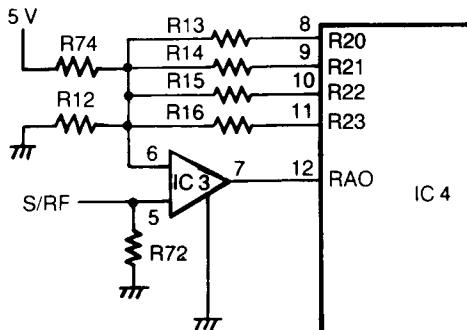

3-4-1 S/RF INDICATOR CIRCUIT

The "S/RF" signal coming from the MAIN UNIT is applied to the meter comparator (IC3, pin 5). IC3 (pin 6) receives a counting signal from the CPU (IC4, pins 8~11).

IC3 (pin 7) becomes "HIGH" when the counting signal is lower than the "S/RF" signal and becomes "LOW" when the counting signal is higher than the "S/RF" signal.

When IC3 (pin 7) becomes "LOW," the CPU detects that the signal strength level is the same as the counting signal level and displays the counting signal on the LCD.

When transmitting, the LCD displays the selected RF power level regardless of the input signal strength.

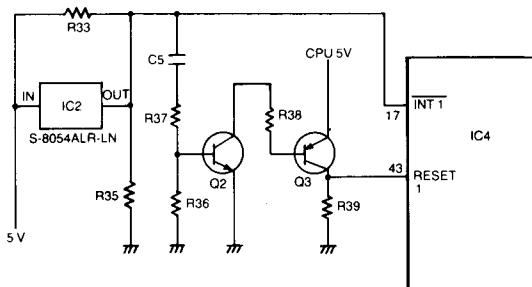

S/RF INDICATOR CIRCUIT

3-4-2 CPU RESET CIRCUIT (LOGIC UNIT)

IC2 detects voltage in the 5 V line. When the 5 V line becomes higher than the threshold voltage of IC2, the CPU reset circuit outputs "HIGH" as the interrupt signal.

While holding the [SET] and [MW] switches and turning ON the power, the reset port of the CPU (IC4, pin 43) becomes "HIGH". When the port receives "HIGH," the CPU is initialized.

When the 5 V line becomes lower than the threshold voltage of IC2, the INT1 port of the CPU (pin 17) becomes "LOW", and the CPU enters the standby condition.

RESET CIRCUIT

3-4-3 SUBAUDIBLE TONE CIRCUIT (LOGIC UNIT)

IC4 encodes subaudible tone frequency signals of 88.5 MHz. This signal is output from IC4 (pin 50) and passes through a low-pass filter (Q7, R67~R69, C19~C21). Then, the signal is applied to the MAIN UNIT.

3-4-4 CPU PORT ALLOCATIONS (LOGIC UNIT)

PORT NO.	PIN NO.	TERMINAL NAME	DESCRIPTION
D1	49	STBPL	Outputs a PLL strobe signal.
D2	50	S TONE	Outputs a signal for 88.5 Hz tone.
D3	51	BEEP	Outputs a signal for beep tone.
R01 ~ R03	1 ~ 3	KEYS0 ~ KEYS2	Output a strobe signal for the initial matrix.
R10 ~ R13	4 ~ 7	KEYI0 ~ KEYI3	Input ports for the initial matrix.
R20 ~ R23	8 ~ 11	SRFO0 ~ SRFO3	Output counting signals for the S-indicator.
R30	14	DIAL UP	Input port for the up signal of the main dial.
R31	15	DIAL DN	Input port for the down signal of the main dial.
R32	16	INT0/DIAL CK	Input port for the main dial up/down clock.
R33	17	INT1 / BACKUP	Input port for the signal of memory backup.
R40	27	SCK	Outputs clock signals for the serial data (SO).
R41	28	SI	Inputs serial data.
R42	29	SO	Outputs serial data.
R43	30	P/S	Outputs a strobe signal for the data expander (IC6 on the MAIN UNIT).
R50	18	SQLS	Detects a squelch signal. When the signal is "HIGH," the squelch opens.
R52	20	UNLK	Detects a PLL unlock signal. When the signal is "HIGH," the PLL is unlocked. Normally, the port is "LOW."
R60 ~ R62	22 ~ 24	STBCC STBOT STBOD	Output signals for controlling the STB selector (IC7, J6 and J7 on the MAIN UNIT.)
R63	25	CE(LCD)	Outputs a signal for LCD driver selection.
R70	31	MIC U/D	Input port for the microphone up/down signal.
R71	32	MIC CK	Input port for the microphone clock.
R72	33	MW	This port becomes low when the [MW] switch is pushed.
R73	34	MONI	This port becomes low when the [MONI] switch is pushed.
R80	35	SET	This port becomes low when the [SET] switch is pushed.
R81	36	HI/LOW	This port becomes low when the [HI/LOW] switch is pushed.
R82	37	PGR/CS	This port becomes low when the [PGR/CS] switch is pushed.
R83	38	T/TSQL	This port becomes low when the [T/TSQL] switch is pushed.
R90	39	DUP	This port becomes low when the [DUP] switch is pushed.
R91	40	PRIOR	This port becomes low when the [PRIOR] switch is pushed.
R92	41	M/CALL	This port becomes low when the [M/CALL] switch is pushed.
R93	42	V/M	This port becomes low when the [V/M] switch is pushed.

IC6 P/S SHIFT REGISTER (MAIN UNIT)

PORT NO.	PIN NO.	TERMINAL NAME	DESCRIPTION
RA0	12	SRFI	Inputs a signal from the meter comparator.
RA1	13	PTT	Inputs a signal on the PTT line. This port becomes "HIGH" when the PTT switch is pushed.
RESET	43	RESET INPUT	When a "HIGH" signal is applied here, the CPU either is initialized or changes to standby mode.
OSC1	45		Input port for the oscillator of the CPU clock.
OSC2	46		Output port for the oscillator of the CPU clock.
GND	47		Ground.
VCC	26		Input port for the power source of the CPU.

3-4-5 I/O EXPANDER IC PORT ALLOCATIONS

IC7 SHIFT REGISTER (MAIN UNIT)

PORT NO.	PIN NO.	TERMINAL NAME	DESCRIPTION																				
Q1	4	DETMUTE	Becomes "HIGH" when the detector signal is muted.																				
Q2	5	AFMUTE	Becomes "HIGH" when the AF amplifier input is muted.																				
Q3	6	MICMUTE	Becomes "HIGH" when the mic amplifier input is muted.																				
Q4	7	AF SW	Becomes "LOW" when the SET MODE display is "AF-H."																				
Q5	14	RXATT	Becomes "LOW" when the SET MODE display is "Att.oFF."																				
Q6~Q8	11~13	Low0~Low2	For setting RF output power. <table border="1"> <tr> <td></td> <td>LPo-1</td> <td>LPo-2</td> <td>LPo-3</td> <td>HI</td> </tr> <tr> <td>Low 0</td> <td>H</td> <td>L</td> <td>L</td> <td>L</td> </tr> <tr> <td>Low 1</td> <td>L</td> <td>H</td> <td>L</td> <td>L</td> </tr> <tr> <td>Low 2</td> <td>L</td> <td>L</td> <td>H</td> <td>L</td> </tr> </table>		LPo-1	LPo-2	LPo-3	HI	Low 0	H	L	L	L	Low 1	L	H	L	L	Low 2	L	L	H	L
	LPo-1	LPo-2	LPo-3	HI																			
Low 0	H	L	L	L																			
Low 1	L	H	L	L																			
Low 2	L	L	H	L																			

IC5 SHIFT REGISTER (MAIN UNIT)

PORT NO.	PIN NO.	TERMINAL NAME	DESCRIPTION															
Q1	4	TX	Becomes "HIGH" when transmitting.															
Q3~Q4	6~7	DM1~DM2	For setting the LCD dimmer. (Level 3 is brightest.) <table border="1"> <tr> <td>Level</td> <td>0</td> <td>1</td> <td>2</td> <td>3</td> </tr> <tr> <td>DM1</td> <td>L</td> <td>H</td> <td>L</td> <td>H</td> </tr> <tr> <td>DM2</td> <td>L</td> <td>L</td> <td>H</td> <td>H</td> </tr> </table>	Level	0	1	2	3	DM1	L	H	L	H	DM2	L	L	H	H
Level	0	1	2	3														
DM1	L	H	L	H														
DM2	L	L	H	H														

PORT NO.	PIN NO.	TERMINAL NAME	DESCRIPTION
QA	7	TSQLS	Becomes "HIGH" when an optional tone squelch is open.
QB	6	UNIT.T	Becomes "LOW" when an optional UT-50 TONE SQUELCH UNIT is connected.
QC	5	UNIT.D	Becomes "LOW" when an optional UT-55 DTMF ENCODER/DECODER UNIT is connected.
QD	4	STD	Stands up while DTMF is decoding.
QE	13	D0	DTMF decode data. (4 bits)
QF	14	D1	DTMF decode data. (4 bits)
QG	15	D2	DTMF decode data. (4 bits)
QH	1	D3	DTMF decode data. (4 bits)

3-5 OTHER CIRCUITS

3-5-1 REGULATOR CIRCUIT (MAIN UNIT)

IC4 is a 3-terminal voltage regulator IC chip. +13.8 V is applied to the input terminal. The output terminal outputs a regulated +9 V (8 V line) to each unit.

IC3 is a 3-terminal voltage regulator IC chip. +13.8 V is applied to an input terminal and the output terminal outputs +5.5 V (5 V line) using D7.

3-5-2 DC-DC CONVERTER (MAIN UNIT)

A DC-DC converter consisting of IC2, Q4 and D5 creates approximately 20 V DC from 5 V DC to obtain wide range lock voltage for the PLL circuits.

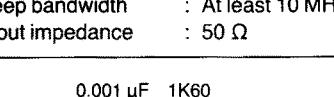

3-5-3 CPU POWER SUPPLY CIRCUIT (LOGIC UNIT)

When the power switch is turned OFF, voltage is applied to the CPU (IC4, pin 26) via D11 from the lithium backup battery installed in the transceiver to provide backup power for the memory contents.

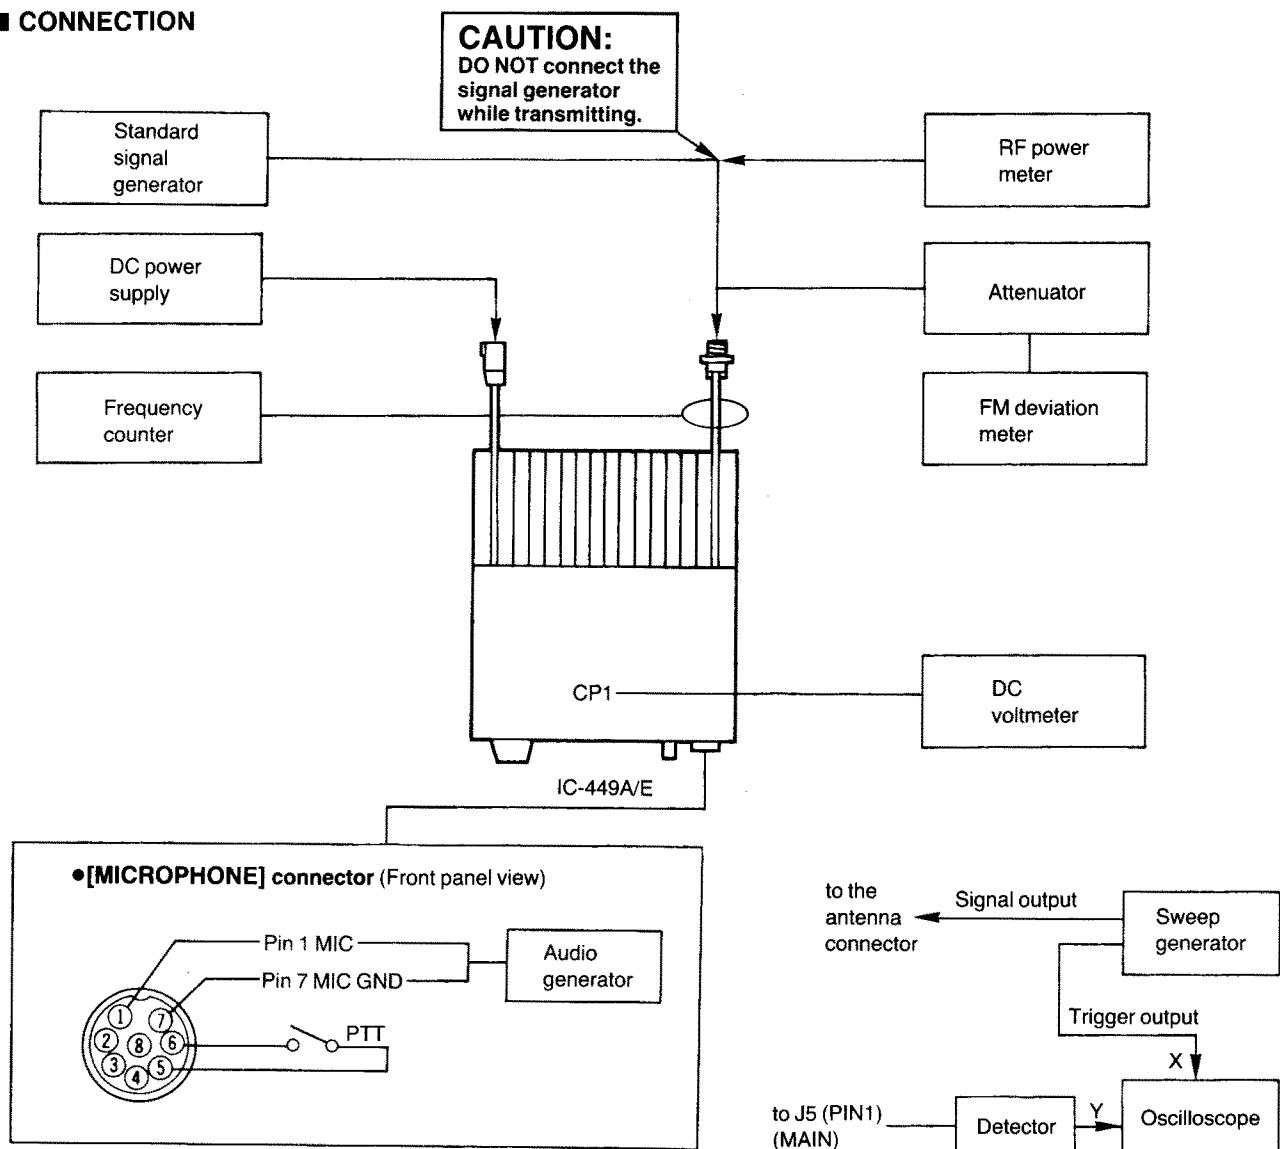

SECTION 4 ADJUSTMENT PROCEDURES

4-1 PREPARATION BEFORE SERVICING

■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE		EQUIPMENT	GRADE AND RANGE	
DC power supply	Output voltage : 13.8 V DC±15%	Current capacity : 15 A or more	Audio generator (AG)	Frequency range : 300~3000 Hz	Output range : 2~200 mV
RF power meter (terminated type)	Measuring range : 1~60 W	Frequency range : 120~450 MHz	FM deviation meter	Frequency range : 0.1~460 MHz	Measuring range : 0~±10 kHz
	Input impedance : 50 Ω	SWR : 1.2 : 1 or better	Sweep generator	Frqency range : 0.1~460 MHz	Sweep bandwidth : At least 10 MHz
Frequency counter	Frequency range : 0.1~460 MHz	Frequency accuracy : 1 ppm or better		Output impedance : 50 Ω	
Attenuator	Attenuation : 40 dB or 50 dB	Capacity : At least 60 W	Detector		
Standard signal generator (SSG)	Frequency range : 0.1~460 MHz	Output level : -127~-17 dBm (0.1 μV~32 mV)	DC voltmeter	Input impedance	: 50 kΩ/V DC or better

The diagram illustrates the IMD6 integrated circuit package. It features a central vertical column of three pins labeled 4, 5, and 6, representing the Emitter, Base, and Collector terminals. On either side of this central column are two groups of three pins each, labeled 3, 2, and 1 from top to bottom. The top group of pins (3, 2, 1) is labeled 'COLLECTOR' at the top, 'BASE' in the middle, and 'EMITTER' at the bottom. The bottom group of pins (3, 2, 1) is labeled 'EMITTER' at the top, 'BASE' in the middle, and 'COLLECTOR' at the bottom. The internal circuitry is shown as a complex network of resistors, capacitors, and transistors connecting these pins.
