## CIRCUIT DESCRIPTION

## GENERAL

The RZ-1 is equipped with a digital VFO capable of tuning 500kHz to 905MHz **M**, **W**, 500kHz to 824MHz **K** in 5kHz, 12.5kHz, and 20 or 25kHz steps. It is capable of receiving in the AM, FM-Narrow and FM-Wide modes. Additionally the Auto Mode will automatically select the proper mode for those frequency bands in which the mode/channel steps are fixed, such as the broadcast bands, etc.

In the FM-Wide mode the unit is capable of receiving stereophonic broadcasts. An output terminal is provided so that the unit can be easily integrated with our home audio component stereo equipment. A terminal is also provided to allow connection to a television monitor for video signal reception. The major features of this unit are :

- Continuous reception from 500kHz to 905MHz **M**, **W**, 500kHz to 824MHz **K**.
- 100 Memory Channels.
- 100 Message Channels that correspond to the normal Memory channels.
- Direct keyboard entry of frequency.
- Frequency selection via the Main Tuning control, UP/DOWN push buttons or numeric keypad.
- Perfect scanning.
- Built-in FM MPX.
- Built-in video output terminal **K**.

# CIRCUIT DESCRIPTION

## FREQUENCY CONFIGURATION

The RZ-1 utilizes triple conversion in the AM and FM-Narrow modes and double conversion in the FM-Wide mode. The incoming signal is mixed with the 1st local oscillator frequency of 46.25MHz to 950.75MHz **M, W**, 46.25MHz to 869.75MHz **K** to become the 1st IF of 45.75

MHz. The signal is then processed by the 2nd local oscillator frequency of 35.05MHz, to become the 2nd IF of 10.7 MHz. In the AM and FM-Narrow modes this signal is mixed with the 3rd local oscillator frequency of 10.245MHz, to become the 3rd IF of 455kHz. 5kHz shifts are performed at 35.05MHz.

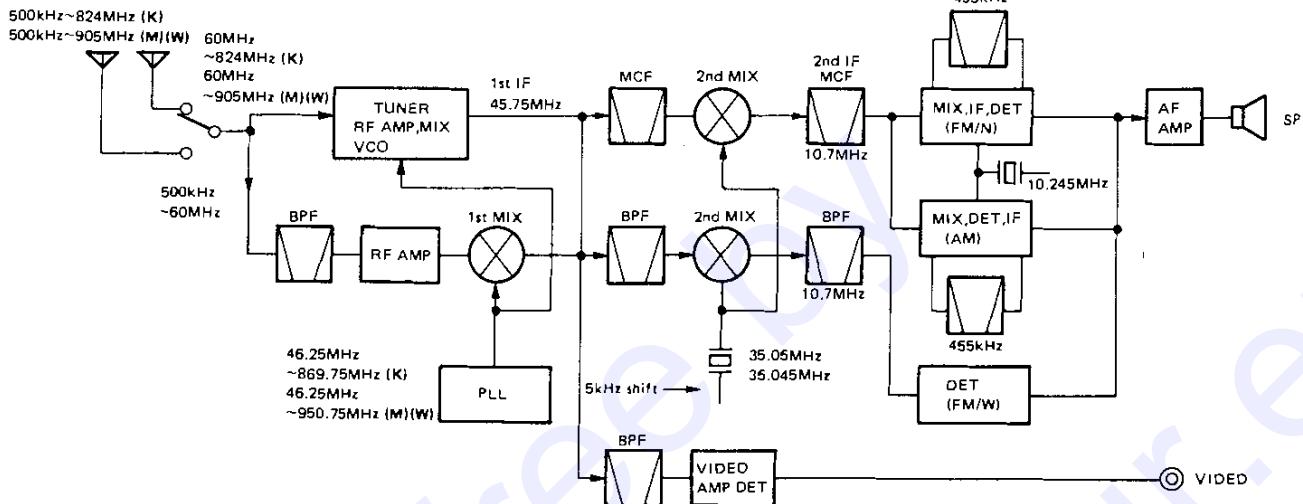

Fig. 2 Frequency configuration

## CIRCUIT CONFIGURATION

### • General

The incoming signal from the antenna is applied to one of 6 Band Pass Filters (BPF) in the RF unit, for frequencies in the 500kHz to 60MHz range. Signals above this range are applied to the tuner pack directly, bypassing the BPF section. Signals below 60MHz are then directly applied to the PLL unit where they are amplified by the 1st and 2nd

RF amplifiers. The amplified signal is then applied to the 1st mixer. There the signal is mixed with the 1st local oscillator signal from the VCO (Voltage Controlled Oscillator) to from the 1st IF of 45.75MHz.

Signals in the 60MHz to 905MHz range and 60MHz to 824MHz range that enter the tuner pack are filtered, amplified and converted to the 1st IF signal of 45.75MHz. This 1st IF signal is distributed among the various video IF, FM-Narrow and FM-Wide circuits. The video IF signal is sent to the video detection circuit where it is converted into a video signal. The 1st IF signal for the FM-Narrow mode is applied to a Monolithic Crystal Filter (MCF) where undesirable components are eliminated, before it is fed to the 2nd mixer. This mixer combines the signal with the 2nd local oscillator signal of 35.05MHz to obtain the 2nd IF of 10.7MHz. 5kHz shifts are performed in the 2nd local oscillator. Additionally a switch between 35.05MHz

and 35.045MHz is performed at this stage.

The 2nd IF signal then passes through a 2 stage MCF, amplified, and applied to the TA7761F. This IC is used in the FM-Narrow mode. The signal is mixed with the 2nd local oscillator signal of 10.245MHz to become the 3rd IF of 455kHz. This signal passes through a 6 pole ceramic filter to obtain increased selectivity. Then the signal is amplified by a 5 stage limiting amplifier and then quadrature detected.

The 2nd IF signal used in the AM mode is amplified and applied to the LA1135M which is used for AM tuning. There it is mixed with the 2nd local oscillator frequency of 10.245MHz to become the 3rd IF of 455kHz. This signal is filtered and then detected.

The 1st IF signal in the FM-Wide mode is applied to the 2nd mixer after passing through a BPF. It is then mixed with the 2nd local oscillator frequency of 35.05MHz to become the 2nd IF signal of 10.7MHz. After additional amplification the signal passes through a ceramic filter and enters the LA1140. It is then amplified by 6 stage amplifier and is quadrature detected.

The various detector signals pass through an audio level control and are then amplified by an audio power amplifier and finally delivered to the loudspeaker.

# CIRCUIT DESCRIPTION

## • 5kHz Shift Circuit

If UHF signals in the 800MHz range are compared with a 5kHz reference the frequency devision ratio would become so large as to exceed the capabilities of most PLL circuits.

For this reason the RZ-1 adopts 10kHz as the minimum comparison frequency. This means that movement of one PLL signal translates into a frequency shift of 10kHz. This results in difficulty in tuning signals in 5kHz steps. In order to allow tuning stations that use an intermediate step of 5kHz the 30.050MHz is shifted 5kHz while PLL data is kept constant, thereby achieving an apparent 5kHz tuning step.

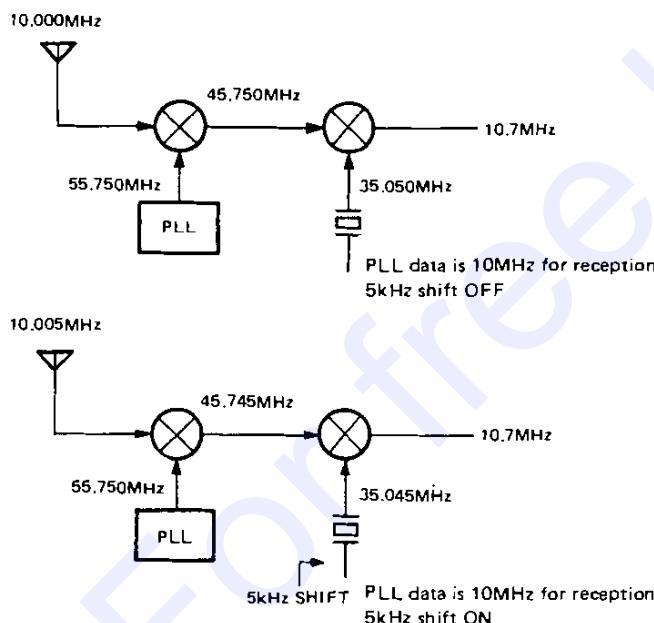

Fig. 3 5kHz shift circuit

## • AM AGC Switchover Circuit (ATT SW)

The RZ-1 is equipped with an ATT SW which allows selectable AGC levels to increase sensitivity when listening to weak AM signals. This ATT SW controls the AGC voltages by varying the detection level of the LM1135M which is used in AM. In the presence of strong radio waves, such as those transmitted by local AM broadcast stations, distortion is likely to take place. Therefore, the receiver should be operated with the ATT SW turned ON normal listening.

## • Squelch Control (FM-Narrow)

The noise component from the detector passes through a filter that is provided for the removal of the 2nd IF component (455kHz). The signal is then amplified twice and enters the detector. The resulting DC signal now passes through the squelch control which controls the audio muting circuit.

## • S Meter Circuit

The S meter signals for AM, FM-Narrow and FM-Wide pass through the Contol unit and are applied to the analog input of the LCD driver to cause the LCD bar graph to deflect.

### 1) FM-Narrow

The S meter voltage from the TA7761F which is used in the FM-Narrow mode is subjected to inverse amplification.

### 2) FM-Wide and AM

The S meter voltages from the LA1140 (FM-Wide) and the LA1135M (AM) are amplified twice. Loss of S meter control voltages is prevented by the use of this complementary amplifier.

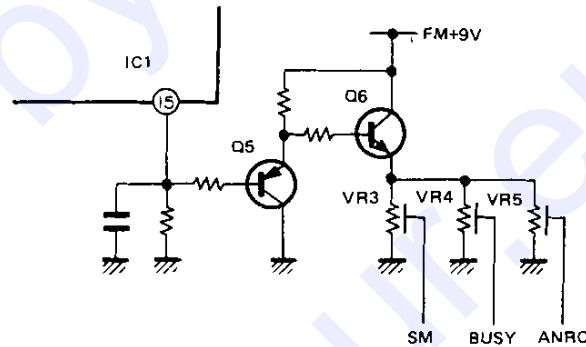

Fig. 4 S-meter circuit (FM-Wide)

## • Audio Scan

The Audio Scan circuit captures modulated signals only in the FM-Narrow mode. The signal is amplified by an operational amplifier, detected, and sent to the microprocessor on the Control unit. The microprocessor stops scanning through the use of the AF BUSY signal approximately 50ms after the signal has been detected.

# CIRCUIT DESCRIPTION

## • ANRC (Automatic Noise Reduction Circuit)

Deterioration of the S/N ratio in a weak electric field is greater than 20dB worse than in the stereophonic mode with respect to the S/N ratio in monaural reception, as can be seen in Fig. 5. Generally, when a S/N ratio is less than 30dB to 40dB, the resultant noise sounds fairly bothersome. With this range of figures taken as a guideline, three domains, classified as A, B and C, according to the field

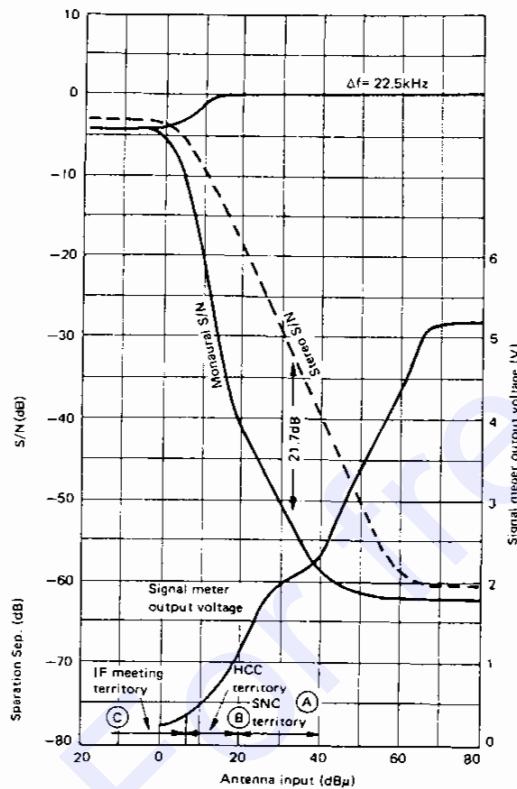

Fig. 5 SNC and HCC operative territory

## 1) SNC (Stereo Noise Control) : Domain A

The pin 8 (SNC) of the LA3430 on the FM MPX sub-unit is designed to improve the S/N ratio in a weak electric field by changing the separation. A portion of the S meter output voltage from the LA1140 is used for control of this circuit. A shift, made by 2 diodes (D5 and D6) and a bleeder resistor is used to smoothly vary the separation in domain A in stereo and monaural signals. A time constant circuit (R24, C46 and diode D4) is used to obtain rapid response for blending and a slower response for separation when the electric field becomes weaker.

The output pin (11) of the KC-820A is applied to Q10 and thus to pin 8 of IC3, so that a momentary blending may occur to obtain monaural audio effect in the case of multipath signal reception.

intensities have been taken into account, as shown in Fig. 5. SNC (Stereo Noise Control) is performed in domain A, likewise, HCC (High Cut Control) in domain B, and soft muting in domain C.

Figure 6 shows and example of the improvement in the S/N ratio this system in a weak electric field. Note that this function is only valid for the LINE OUT signal.

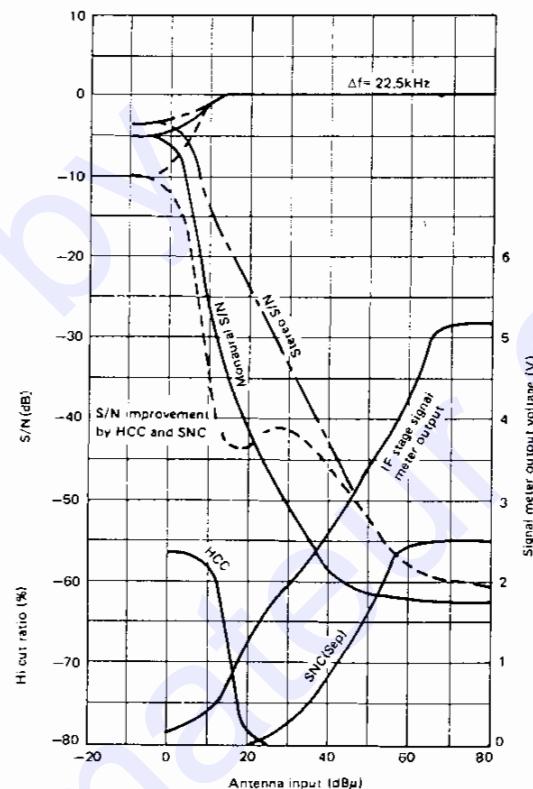

Fig. 6 Example of the improvement in the S/N ratio this system in a weak electric field

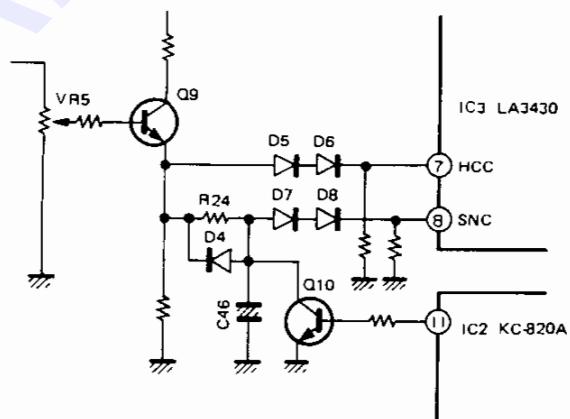

Fig. 7 SNC and HCC circuit

# CIRCUIT DESCRIPTION

## 2) HCC (High Cut Control) : Domain B

In domain B it is possible that the S/N ratio may fall below 40dB even in the monaural mode. We can improve the S/N ratio, as perceived by the ear, by lowering the level of the frequencies above 7kHz. A smooth high-cut control is achieved for different ANT inputs by applying a portion of the S meter output voltage that is equal to pin 8 to pin 7 (HCC) of IC3. This high-cut control has no time constraint circuit.

## 3) Soft Muting : Domain C

As the S/N ratio tends to deteriorate further in this domain, its improvement is accomplished by IF muting. The maximum attenuation for muting is set by VR1 (47k ohms) which is connected to pin 15 of IC1.

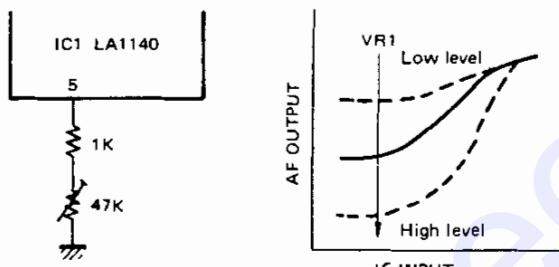

Fig. 8 Soft mute circuit

## ● MPX Demodulation Circuit

The signal detected by IC1 in the FM-Wide mode enters IC2, which is used for noise canceling, after passing through a buffer amplifier. It then goes through a gate circuit and enters IC3, the MPX demodulator. From there, the output emerges as the L and R audio signals.

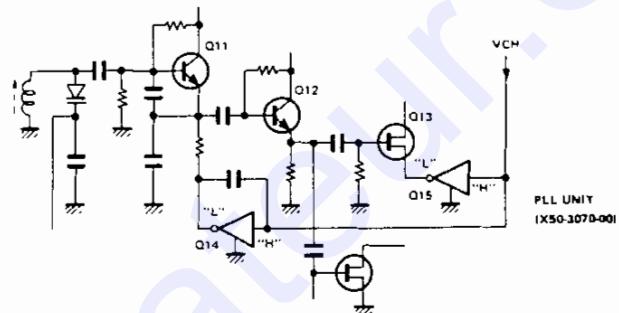

## ● Band Information

Turning the rotary encoder causes band information (normally "H") corresponding to the selected frequency, to be sent from IC3 of the Control unit.

Band information on B1 to B6 which is normally a logic "H" is applied to inverters Q1 to Q6, become a logic "L" which is then used to control the HF BPF circuits.

When a "H" is applied to the inverters, an active "H" is supplied to the tuner pack, through 2 inverters, for Band information lines B7 to B10. (Refer to Fig. 9.)

The data for Band information lines B1 to B6 passes through diodes D12 to D14 to become VCH and VCL (normal "H"), which enters the VCOH and VCOL circuits of the PLL unit. The emitter of Q11 and the source of Q13, the VCOH oscillator circuit, usually remain open allowing no oscillation to take place. When a "H" is applied to these two transistor junctions from the VCH inverters Q14 and Q15, of the PLL unit, become "L", which connects the emitter of Q11 and the source of Q13 to ground. This causes the VCOH oscillator circuit to begin operating. (Refer to Fig. 10.)

VCO will operate, when "H" level of Q14, 15

### • Voltage Changeover Circuit by Mode

This is a circuit that switches the +8V bias voltage depending upon the selected mode. IC4 of the Control unit causes PB1, PB2, PB4 and PB5 to become "H" when the

MODE SW is switched from AM to FM-N to FM-W. Q9 to Q16 of the IF unit perform switching among the different modes supplying +8V to the proper circuits.

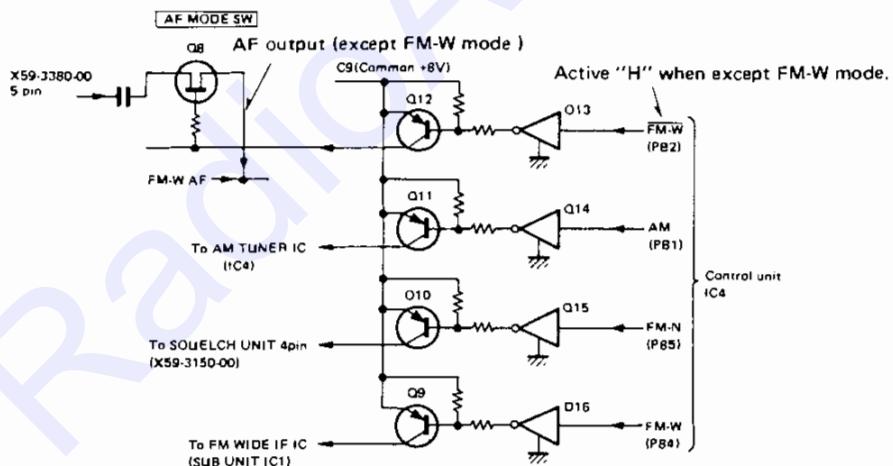

Fig. 11 Voltage changeover circuit by mode

# CIRCUIT DESCRIPTION

## PLL SYNTHESIZER SECTION

Fig. 12 represents a block diagram of the PLL section. The RZ-1 PLL uses two VCO's for frequencies below 60 MHz, and a CATV TV tuner for frequencies above 60MHz. Additionally four bands are obtained inside the tuner pack. The comparison frequencies are selected to correspond with the desired tuning step of 5kHz, 10kHz, 12.5kHz, 20kHz, 25kHz, 100kHz, 4MHz, and 6MHz (including Auto Step) as listed in Table 1. The 100kHz, 4MHz and 6MHz steps are referenced to a 25kHz reference and the 9kHz step to 3kHz.

The MB87006APF allows external section of both the reference frequency-division ratio and the comparison frequency-division ratio via a serial data string. This IC has a modulus control function that is used to create a pulse swallow counter in conjunction with an external pre-scaler. The PLL IC is fed with a 12.6MHz signal from the reference oscillator circuit so that it may generate a comparison frequency at 5 different frequency division ratios corresponding to the various frequency step widths (Refer to Table 2).

The local oscillator signal from the tuner pack enters the pulse swallow counter after passing through wide band amplifier  $\mu$ PC1651G. VCO signals below 60MHz pass

through buffer amplifier Q16 before entering the counter. In the counter the signals are frequency divided at a rate determined by the frequency-division ratio shown in the table 2, phase detected, and controlled by the resulting error correction voltage. To obtain a wide frequency coverage in the VCO the LPF is fed with +33V and -1.2V.

For example, at a dial frequency of 83MHz, the fvco and the various frequency-division ratios have the following relationships :

$$fvco = 83.00 + 45.75 = [n \times M + A] \times fosc / R$$

where,

$fvco$  = Output frequency of the VCO

$n$  = Set value of the binary 10 bit programmable counter

$M$  = Set value of the dual modulus pre-scaler module to be connected to other circuits

$$460 > f : 64, 460 \leq f : 128$$

$A$  = Set value of the binary 7 bit swallow counter

$fosc$  = Reference oscillator frequency, 12.6MHz

$R$  = Set value of the binary 14 bit programmable counter, 504 for 25kHz (Refer to table 2)

In this example  $n = 80$  and  $A = 30$

$$\text{Therefore, } fvco = [(80 \times 64) + 30] \times 12600 / 504 \\ = 128.75\text{MHz.}$$

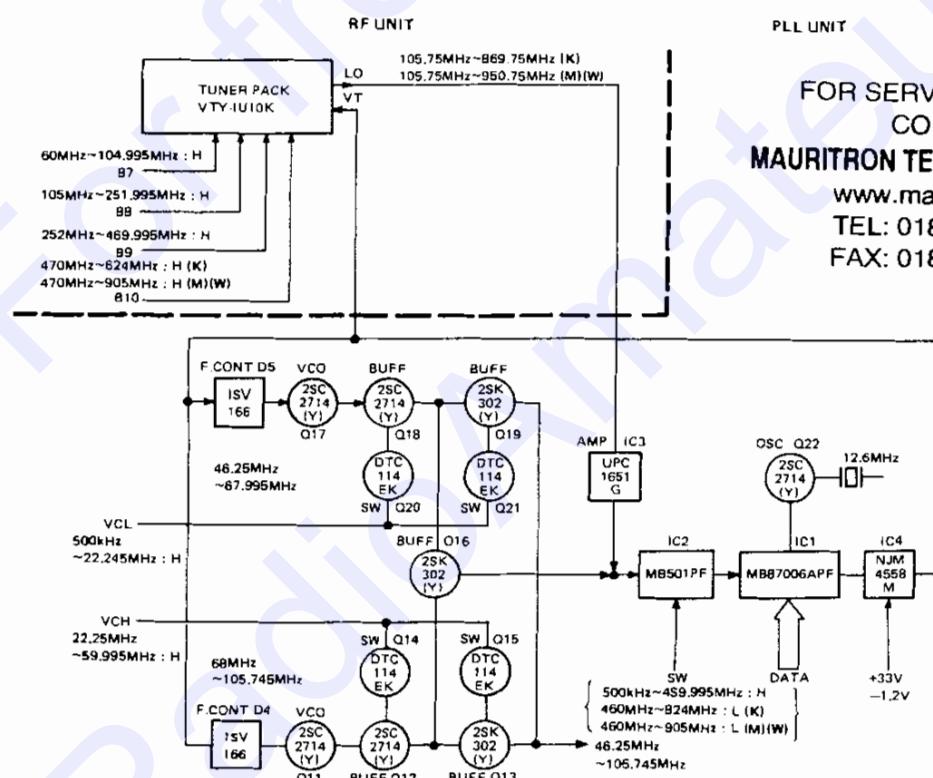

Fig. 12 PLL block diagram

# CIRCUIT DESCRIPTION

## DIGITAL CONTROL SECTION

### ● General

The digital control section is composed of Control unit and a display section. All the functions is controlled by a single microprocessor.

The terminal functions of the microprocessor, IC1, IC3 and IC4 are shown in tables 3,4 and 5.

| Terminal No. | Name               | I/O | Logic | Function                                | Terminal No. | Name            | I/O | Logic | Function                      |
|--------------|--------------------|-----|-------|---|--------------|-----------------|-----|-------|-------------------------------|
| 1            | P62                | O   | L     | Key scan output. KS2                    | 37           | P50             | I   | L     | Key return input. KR0         |
| 2            | P61                | O   | L     | Key scan output. KS1                    | 38           | NC              | —   | —     | Not connected.                |
| 3            | P60                | O   | H     | Key scan output. KS0                    | 39           | P17             | O   | —     | Address bus. AB15             |
| 4            | P47                | O   | L     | LCD display inhibit. "L" : OFF          | 40           | P16             | O   | —     | Address bus. AB14             |
| 5            | P46                | O   | —     | Not used.                               | 41           | P15             | O   | —     | Address bus. AB13             |
| 6            | P45                | O   | H     | LCD driver enable. EN1                  | 42           | P14             | O   | —     | Address bus. AB12 (Not used.) |
| 7            | P44                | O   | H     | LCD driver enable. EN2                  | 43           | P13             | O   | —     | Address bus. AB11 (Not used.) |

Table 5 M5M82C-55Afp-5 terminal function (Control unit IC4)

# CIRCUIT DESCRIPTION

## • Reset and Backup Circuits

Approximately 5.3V (5C) is supplied by voltage regulator IC8, and diode D1 when power is turned on. IC7 provides a "L" level from the time 5C rises until it reaches approximately 4.5V, but delivers a "H" level once the voltage exceeds 4.5V. This is used as a reset pulse. The pulse is designed so as to release the reset voltage only when the peripheral circuits have received a stabilized voltage. This is accomplished thru the use of a delay circuit composed of R7 and C35.

The pulse coming out of the time constant circuit is applied to the inverter of the schmitt trigger input, where it is shaped, simultaneously it becomes the reset signal for IC3, IC4 and IC1.

When power is turned off the 5C line starts to drop. When it has fallen below approximately 4.45V IC7 will send a logic "L". This forces the inverter input to become "L" causing the reset signal for IC3 and IC4 to become a source voltage, while the reset signal for IC1 assumes a "L" level in order to reset IC1.

The memory backup circuit backs up the RAM of IC2. When the reset pulse for IC1 becomes "L", CE1 of IC2 goes "H" out to a control signal from Q1, thereby placing IC2 in a low power backup mode. This condition is maintained by a lithium battery. The backup current (current that flows out of the lithium battery) under normal conditions is approximately  $0.012\mu A$ .

Fig. 14 Measurement circuit of the backup current

$$V_R = 1.2 \text{ [mV]} \\ R = 100.4 \text{ [kΩ]} \\ I_{BU} = 1.2 \times 10^{-3} / 100.4 \times 10^3 = 1.2 \times 10^{-8} \text{ [A]}$$

## CIRCUIT DESCRIPTION

- **Display Circuit**

The display circuit is contained on the display switch printed circuit board. It is composed of an LCD driver and its associated peripheral circuits and the LCD itself. The LCD lights using a 50% duty, dynamic lighting method, with the display contents, except those of the S-Meter circuit, transferred in a serial data format from the micro-processor to the LCD driver.

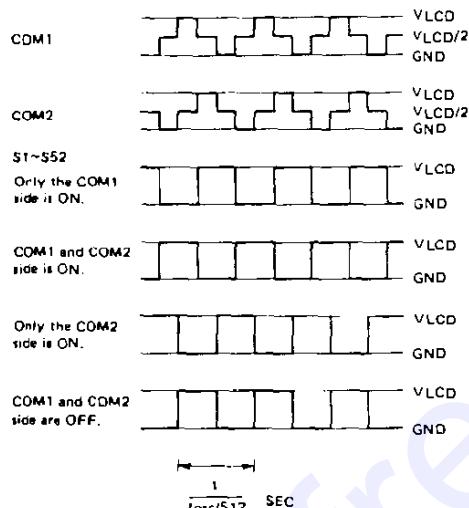

Fig. 15 LCD driver common and segment signals

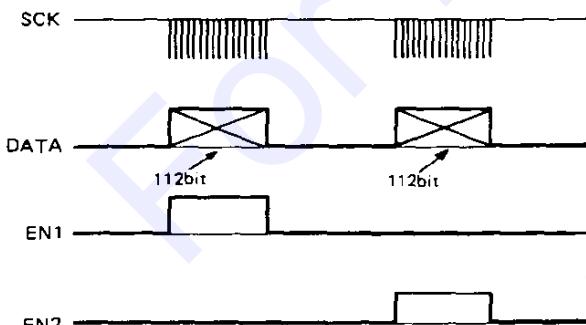

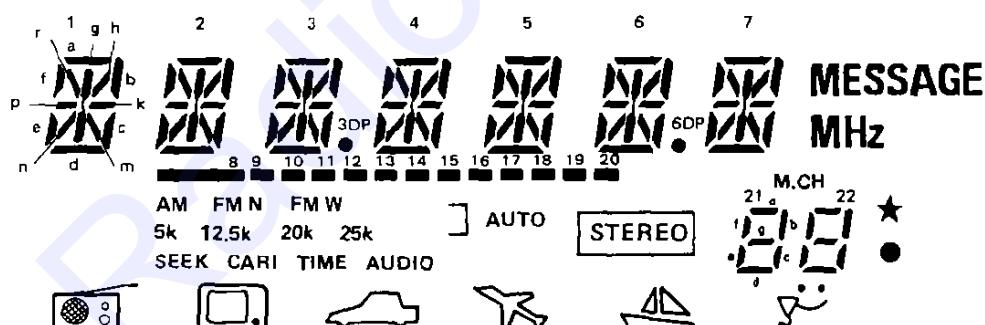

Fig. 16 Data transfer format

**Fig. 17 LCD lighting conditions**

- PLL Data Output and Band Information

The CLK signal from the PLL is sent from the CLK of IC1, DAT from TXD of IC1 and EN from PA2 of IC3. Besides the PLL data, the unit switches the pre-scaler frequency-division ratio according to the selected dial frequency. (Refer to Table 2.)

Band information is delivered from PB0 to PB7, PC2 and PC3 of IC3. (Refer to Table 4.)

## CIRCUIT DESCRIPTION

- Key Input, Switches and Rotary Encoder

The keys located on the front panel are arranged in a key matrix consisting of lines P60 to P65 and P50 to P53, and the UP/DOWN keys. The signal from the rotary encoder passes through the inverter at the schmitt trigger input and enters lines P40 and P41.

# CIRCUIT DESCRIPTION/SEMICONDUCTOR DATA

- Other Inputs and Outputs

## 1) ST1

Inputs for stereo indicators. If a stereo signal is detected in the FM broadcast band, ST1 switches "H". This "H" signal causes the stereo indicator to turn on.

## 2) BUSY and AF BUSY

Inputs for indication of scan and BUSY. Both the scan and busy indicators operate when a "H" is applied. AF BUSY is applied only during Audio Scan in the FM-N mode.

## 3) FM-W, AM, FM-N and FM-W

Outputs for reception modes.

## 4) MUTE

Terminal for audio muting. The signal is muted when power is turned on for an external audio signal (pin jacks L/R), when frequency is changed, when the operating mode is changed, or when muting is activated by the C key.

## 5) BZ

Buzzer output. A square wave is generated by a divider in the microprocessor.

## 6) 5K

Provides 5kHz shift data for the PLL. This unit delivers 5kHz shift data even when the 5kHz step is selected because the PLL comparison reference frequency is 10kHz.

|       |    |
|-------|----|
| Shift | 5K |
| 0kHz  | L  |
| +5kHz | H  |

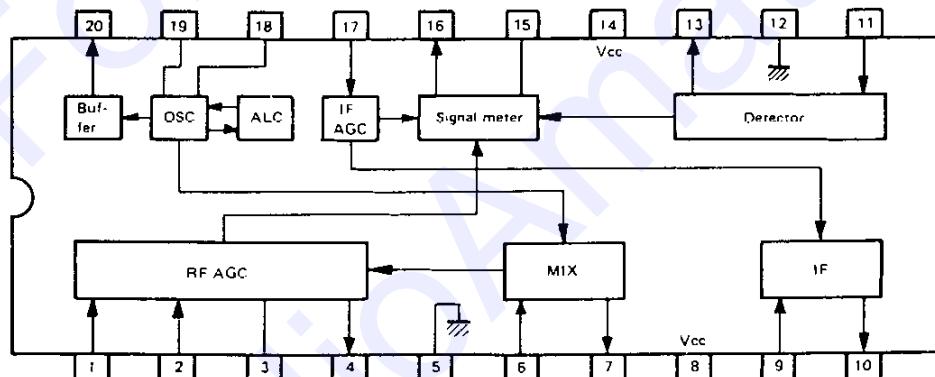

## 7) ANTC

Signal data terminal for antenna changeover. A "H" is provided in the AM broadcast band and in the FM broadcast band. This function is effective when the antenna changeover switch located on the back panel is placed in AUTO.

| Band   | Antenna                         |
|--------|---------------------------------|
| AM, FM | Antenna connector for car audio |
| Other  | M type connector                |

# DESCRIPTION OF COMPONENTS

| Component | Use/Function       | Operation/Condition/Compatibility   |
|-----------|--------------------|---|
| IC4       | PLL LPF            | Operational amp. will operate within +30V, -1.2V for wide-band VCO.                 |
|           |                    |  |
| Q1        | RF amp.            | Amp. for less than 60MHz.   |
| Q2        | Buffer amp.        | Less than 60MHz.  |
| Q3        | 1st mixer          | Less than 60MHz.  |
| Q4        | Buffer amp.        | Less than 60MHz.  |
| Q5        | Buffer amp.        | More than 60MHz.  |
| Q6        | 2nd mixer          | For FM-N mode.  |
| Q7        | 5kHz shift switch  | Level "H" when -5kHz.   |
| Q8        | 2nd QSC            | 35.05MHz.   |
| Q9        | 2nd OSC buffer     |   |
| Q10       | 2nd mixer          | For FM-W mode.  |
| Q11       | VCO                | Osc. for 68MHz ~ 105.75MHz.   |
| Q12, 13   | Buffer             |   |
| Q14, 15   | VCO switch         | VCH : Q11 will oscillating when level "H".  |
| Q16       | VCO output buffer  |   |
| Q17       | VCO                | 46.25MHz ~ 68MHz OSC.   |
| Q18, 19   | Buffer             |   |
| Q20, 21   | VCO switch         | VCL : Q17 will oscillating when level "H".  |
| Q22       | PLL reference OSC. | 12.6MHz   |
| Q23       | Q4 switch          | Level "H" when frequency less than 60MHz.   |

## CONTROL UNIT (X53-3110-XX)

| Component | Use/Function                | Operation/Condition/Compatibility  |
|-----------|-----------------------------|--|
| IC1       | Microprocessor              | Control the entire setting, mainly frequency control   |
| IC2       | Static RAM                  | VFO, memory data making  |
| IC3       | I/O port                    | Band information, PLL input/output.  |
| IC4       | I/O port                    | Mode control input/output.   |
| IC5       | Address decoder             | RAM I/Q chip select, RD, WR making.  |
| IC6       | Schmitt trigger inverter    | Encoder pulse wave shaping.  |
| IC7       | System reset                | Reset signal output when the power switch turned on, low-voltage detection when the power switch turned off. |
| IC8       | AVR                         | Input : 13.8V, Output : 6V.  |
| Q1        | RAM backup control          | RAM will keep to backup condition when the power switch turned off. (Opened collector output)                |
| D1        | Diode for voltage dropping  | 5C (5V) making.  |
| D2        | Diode for voltage dropping  |  |
| D3        | Current reversal prevention | From lithium battery.  |
| D5        | Zener diode                 | For VCO +33V.  |
| D6        | Sub diode of zener diode    | For VCO -1.4V.   |

# PARTS LIST

**CAPACITORS** CC-45 TH-1H 220 J  
 1 2 3 4 5 6

1 = Type ..... ceramic, electrolytic, etc.  
 2 = Shape ..... round, square, etc.  
 3 = Temp. coefficient  
 4 = Voltage rating  
 5 = Value  
 6 = Tolerance

• Temperature Coefficient

| 1st Word                | C     | L   | P      | R      | S     | T    | U      |
|-------------------------|-------|-----|--------|--------|-------|------|--------|
| Color*                  | Black | Red | Orange | Yellow | Green | Blue | Violet |
| ppm/ $^{\circ}\text{C}$ | 0     | -80 | -150   | -220   | -330  | -470 | -750   |

• Capacitor value

0 1 0 = 1pF  
 1 0 0 = 10pF  
 1 0 1 = 100pF

1 0 3 = 0.01 $\mu\text{F}$

2 2 0 = 22pF  
 1st number Multiplier  
 2nd number

1 0 2 = 1000pF = 0.001 $\mu\text{F}$

Example CC45TH = -470±60 ppm/ $^{\circ}\text{C}$

• Tolerance

| Code | C      | D     | G   | J   | K    | M    | X    | Z    | P     | No code                        |
|------|--------|-------|-----|-----|------|------|------|------|-------|--------------------------------|
| (%)  | ± 0.25 | ± 0.5 | ± 2 | ± 5 | ± 10 | ± 20 | + 40 | + 80 | + 100 | More than<br>Less than<br>than |

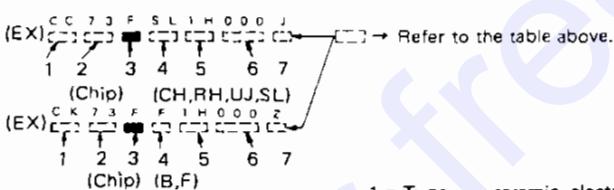

| Code | B     | C      | D     | F   | G   |
|------|-------|--------|-------|-----|-----|
| (pF) | ± 0.1 | ± 0.25 | ± 0.5 | ± 1 | ± 2 |

Less than 10 pF

• Rating voltage

| 2nd word | A    | B    | C    | D    | E    | F    | G    | H    | J    | K    | V  |
|----------|------|------|------|------|------|------|------|------|------|------|----|
| 0        | 1.0  | 1.25 | 1.6  | 2.0  | 2.5  | 3.15 | 4.0  | 5.0  | 6.3  | 8.0  | -  |

# ADJUSTMENT

## REQUIRED TEST EQUIPMENT

- 1. DC V.M**  
High input impedance.
- 2. RF VTVM (RF V.M)**  
Input impedance :  $1M\Omega$  min.,  $2pF$  max.  
Voltage range : F.S = 100mV to 300V.  
Frequency range : Up to 450MHz.
- 3. Frequency counter (f. counter)**  
Input sensitivity : Approx. 50mV.  
Frequency range : Up to 450MHz.
- 4. DC power supply**  
Voltage : 10V to 17V, variable.  
Current : 3A max.
- 5. AF VTVM (AF V.M)**  
Input impedance :  $1M\Omega$  min.  
Voltage range : F.S = 1mV to 30V.  
Frequency range : 50Hz to 10kHz.
- 6. Oscilloscope**  
High sensitivity oscilloscope with horizontal terminal.
- 7. SSG**  
Frequency range : 950MHz.  
Modulation : AM and FM MOD.  
Output level : -20dB to 100dB.
- 8. Dummy load**  
 $8\Omega$ , 5W.
- 9. Sweep generator**  
Sweep range : 500kHz to 950MHz bands.

## 10. FM-MPX stereo modulator (FM-MPX)

Adjust for FM-W mode.

## 11. Distortion meter

Adjust for FM-W mode.

## 12. Pattern generator

Adjust for Video.

## 13. Monitor television

Adjust for Video.

## PREPARATION

- Unless otherwise specified, knobs and switches should be set as follows Table 6.

| Front panel |          | Rear panel |       |
|-------------|----------|------------|-------|
| POWER SW    | OFF      | ANT SW     | 'AUTO |
| SQL VOL     | CCW MAX. | ATT SW     | OFF   |

**Table 6**

- Use an insulated adjusting rod to adjust trimmers and coils.
- Be sure to turn the POWER SW OFF, before connecting the power cable to a power source.
- SSG output level are those at the time the output terminal is open (E.M.F.).
