DISASSEMBLY FOR REPAIR

How to remove the case assembly from the chassis

1. Remove two screws (1) holding the chassis.
2. Pull out two knobs (2) and remove two round nuts (3).
3. Pull out the SP and MIC parts of the cap from jacks (4).
4. Turn the unit over with the bottom of the chassis facing upwards, and remove the chassis (6) from the case assembly (5).
5. Remove the speaker lead (7) from the connector (CN2) of the TX-RX PC board (TX-RX unit A/3).

How to remove the PC board

■ Numeric key PC board (TX-RX unit B/3)

1. Remove three screws (8) on the numeric key PC board.
2. Lift the numeric key PC board and remove it from the connector (CN9) of the TX-RX PC board (9).

■ PTT PC board (TX-RX unit C/3)

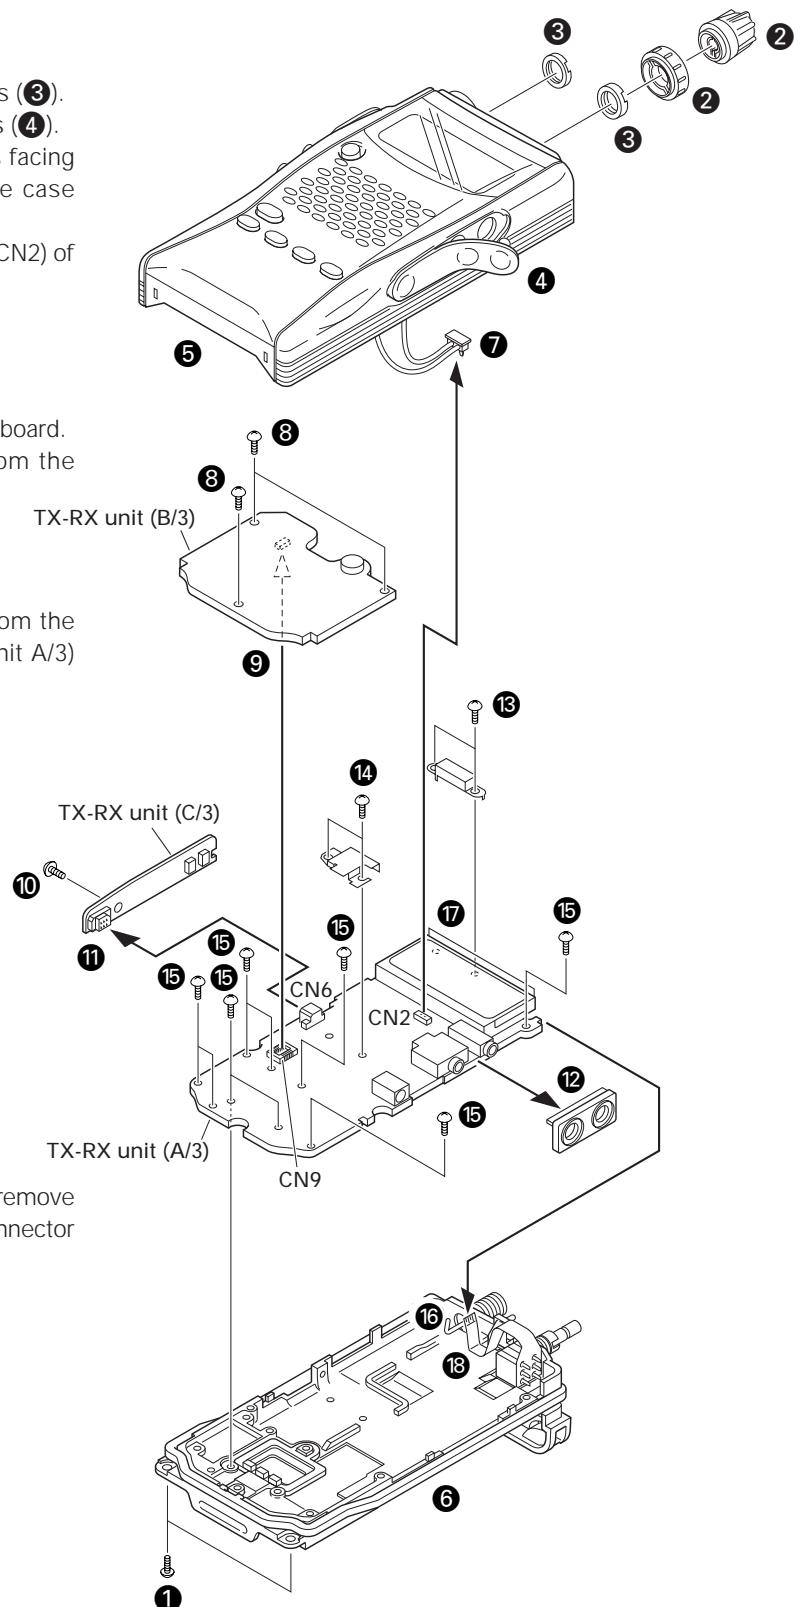

3. Remove one screw on the PTT PC board (10).
4. Pull the PTT PC board to the left and remove it from the connector (CN6) of the TX-RX PC board (TX-RX unit A/3) (11).

■ TX-RX PC board (TX-RX unit A/3)

5. Remove the SP/MIC jack cover (12).
6. Remove two screws (13) holding the shield cover (antenna terminal section).
7. Remove two screws (14) holding the shield cover (final amplifier section).
8. Remove eight screws (15) on the TX-RX PC board.
9. Absorb solder from the antenna terminal (16) with a solder absorber.

Note: Do not melt the shadow plate (17) when moving the tip of the solder absorber close to the antenna terminal.

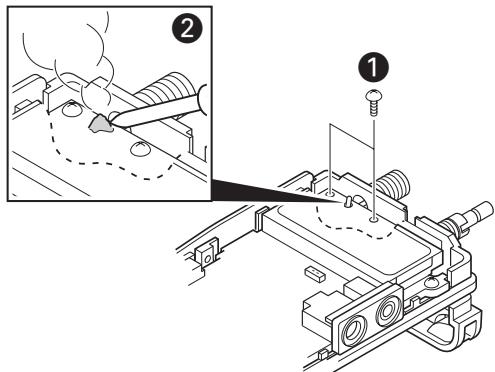

10. Remove the TX-RX PC board from the chassis, then remove the encoder volume FPC (18) from the flat cable connector of the TX-RX PC board.

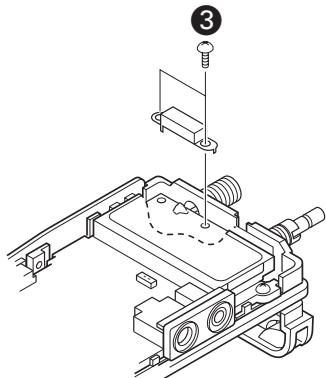

DISASSEMBLY FOR REPAIR

Soldering the antenna terminal

1. With the shield cover removed from the antenna terminal section, install two screws on the PC board and bring the PC board into contact with the chassis (①).
2. Solder the antenna terminal with a soldering iron (②).

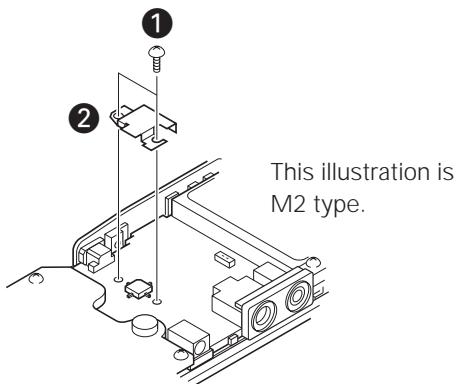

3. Remove the two screws installed in step 1 above, and install the two screws again on the PC board together with the shield cover (③).

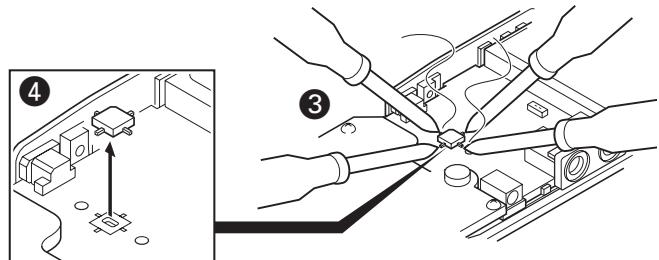

Replacing the final FET (Q12)

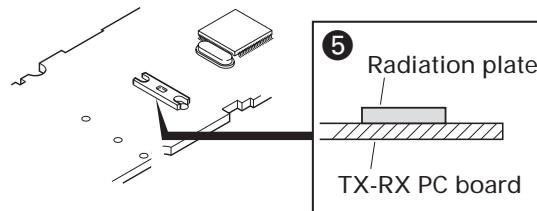

1. Remove the two screws holding the shield cover of the final FET section (①).
2. Remove solder from the shield cover completely with a solder absorber.
3. Remove the shield cover (②).

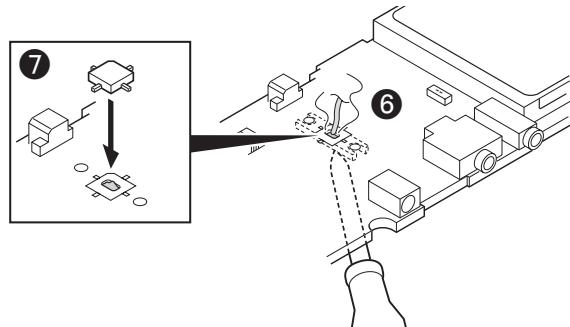

4. Apply the tips of soldering irons to all the four pins of the final FET at the same time (③), heat them sufficiently, and remove the final FET (④). (Two persons should be required to do this.)

5. Remove all PC boards from the chassis.
6. Confirm that there is no space between the radiation plate installed on the foil side of the TX-RX PC board (TX-RX unit A/3) and the PC board (⑤). If there is any space between the radiation plate and PC board, eliminate it by applying the tip of the soldering iron to the radiation plate.

7. Apply the tip of the soldering iron to the installation side of the radiation plate of the TX-RX PC board, put a little amount of solder to the radiation plate that is seen through a square hole in the final FET installation section and melt the solder (⑥).
8. When the solder in step 7 is melted, place the final FET on the PC board by aligning it with the silk of the final FET installation section of the PC board (⑦).

9. Release the soldering iron and confirm that the final FET and radiation plate have been soldered.
10. Solder the four pins of the final FET with the soldering iron.
11. Install all the PC boards.
12. Reinstall the shield cover removed in step 3 above in its original position and install two screws.
13. Solder the shield cover to the PC board.
14. Install the chassis on the case assembly and assemble them.
15. Readjust transmission power.

Note: Since the FET is sensitive to static electricity, always wear a grounding band. Use a highly insulated ceramic heater solder iron.

TH-K4AT/K4E

DISASSEMBLY FOR REPAIR

Special care and attention required for assembly

1. Gluing to the key top (MIC element section)

You must also glue on the speaker storage area and heap the glue up until wealthy glued on the speaker storage area and the key top for waterproofing the MIC element side of the key top. (Fig. 1)

Heap the glue up until wealthy glued on the speaker storage area and the key top (MIC element section).

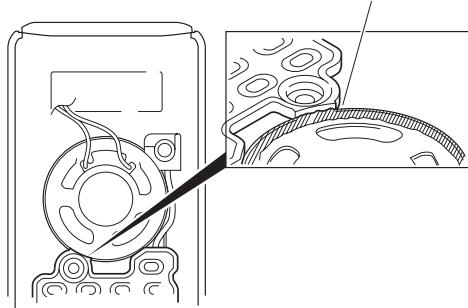

Fig. 1

2. Bending the LCD hardware fixture (J21-8456-03) tabs

(1) Insert the tabs of the LCD hardware fixture into four holes in the LCD installing position of the TX-RX PCB (TX-RX unit A/3). (Fig. 2)

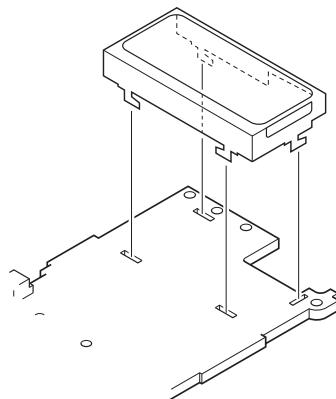

Fig. 2

(2) By pressing the LCD hardware fixture from the component side of the TX-RX PCB, you must bent all 4 tabs of the LCD hardware fixture being visible from the foil side until the bases of each tabs are folded at least 45 degrees (Fig. 3). If the bending angle of the tabs of the LCD hardware fixture is less than 45 degrees, a display error may occur.

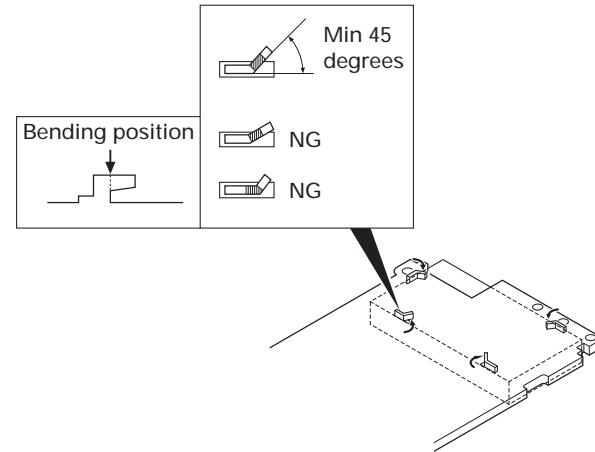

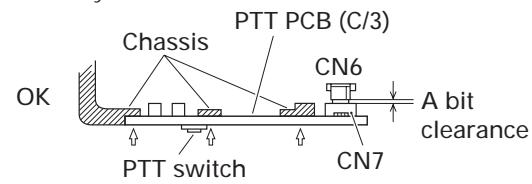

Fig. 3

3. PTT PCB (TX-RX unit C/3) installation procedure

Installing the PTT PCB on the TX-RX PCB and chassis are as follows:

- (1) Insert the PTT PCB connector (CN7) into the TX-RX PCB connector (CN6) lightly.
- (2) Push three parts of the PTT PCB to contact tightly with the chassis. There may be a small gap between the connectors. (Fig. 4)

Note: A double-side adhesive tape (J99-0376-04) is used behind the PTT switch. When reassembling the PTT PCB to the chassis, press the PTT PCB (under the PTT switch) so that the tape hold the PCB and chassis securely.

Push three parts of the PTT PCB to contact tightly with the chassis.

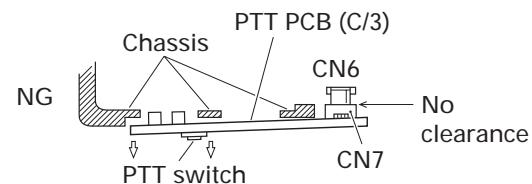

Fig. 4

- (3) Tighten one screw in the PTT PCB.

DISASSEMBLY FOR REPAIR

4. Packing (G53-1572-02) TX/BUSY lamp installation procedure

- (1) To assure waterproofing, install the packing in the chassis groove as shown in Fig. 5. (①)
- (2) Install the packing TX/BUSY lamp section on the chassis. (②)

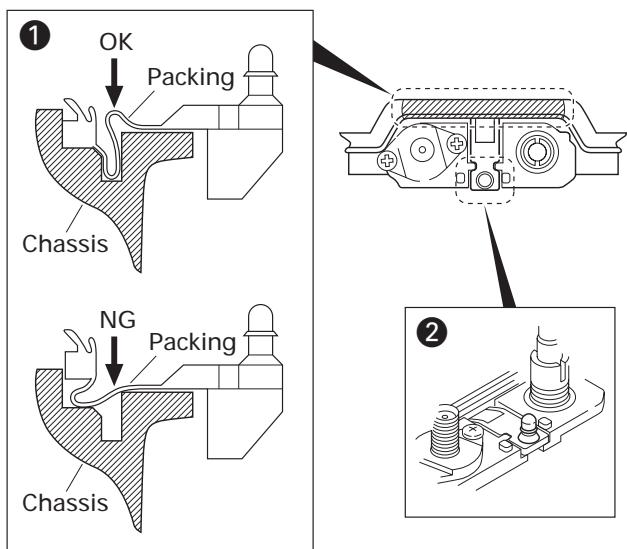

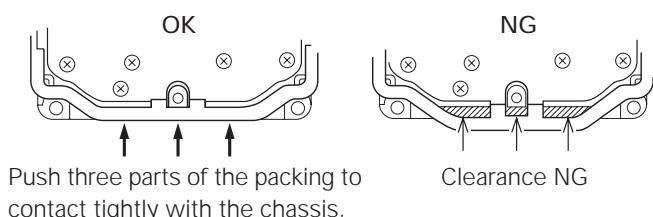

Fig. 5

5. Packing (G53-1572-02) bottom installation procedure

- (1) Before installing the numeric key PCB (TX-RX unit B/3) on the chassis, push three parts of the packing to contact tightly with the chassis as shown in Fig. 6. If the packing is not in contact with the chassis, there may be a gap between the transceiver bottom case assembly and the battery, and water may enter through the gap.

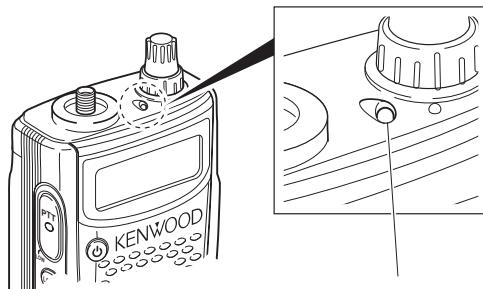

Push three parts of the packing to contact tightly with the chassis.

Fig. 6

6. Cautions for installing the chassis on the case assembly

- (1) Verify that the packing (G53-1572-02) TX/BUSY lamp section is has been past through the hole in the illumination guide section on the top of the case assembly. (Fig. 7)

The packing TX/BUSY lamp section is has been past through the hole in the illumination guide section on the top of the case assembly.

Fig. 7

- (2) Align the speaker lead as shown fig.8. Do not place the leads over the key top section, LCD section or SP/MIC/DC IN cap section.

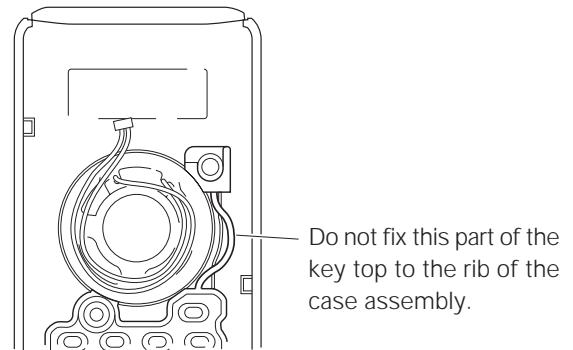

Fig. 8

7. Cautions for installing the key top on the case assembly

- (1) Install the key top keypad section and the power switch section on the rib of the case assembly.
- (2) Do not fix the part between the key top keypad section and the power switch section to the rib of the case assembly, but install it as shown in Fig. 8.

TH-K4AT/K4E

CIRCUIT DESCRIPTION

Frequency Configuration

The frequency configuration is shown in Figure 1 and Table 1.

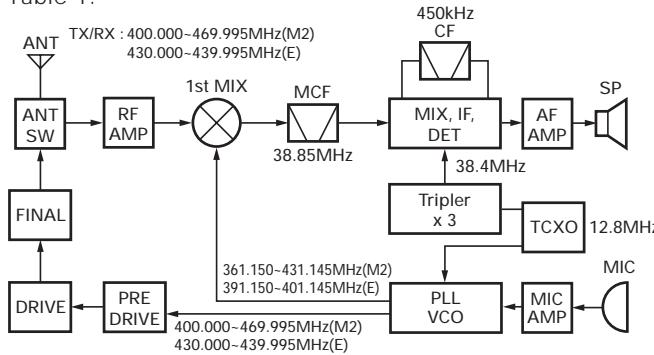

Fig. 1 Frequency configuration

Reception method	Double super heterodyne	
	1st IF Frequency	38.85MHz (Lower)
	2nd IF Frequency	450kHz (Lower)
Transmission method	VCO direct oscillation amplification	
Modulation	Variable reactance phase modulation	

Table 1 Basic configuration

Receiver System

Front End

The received signal from the antenna passes through a low-pass filter and then through a transmission/reception switching circuit (antenna switch) and enters the band-pass filter (L40, L41, L38).

The signal passing through the band-pass filter (L40, L41, L38) is amplified by with an RF amplifier (Q17), passes through a band-pass filter (L32, L34) and enters the first mixer (Q16).

These band-pass filters are tuned to a desired frequency by varicaps (D21, D20, D19, D18).

A tuning voltage corresponding to the desired signal is applied to each varicap through the BPF/APC terminal (pin 6) of the MPU (IC8) to tune to the receive frequency.

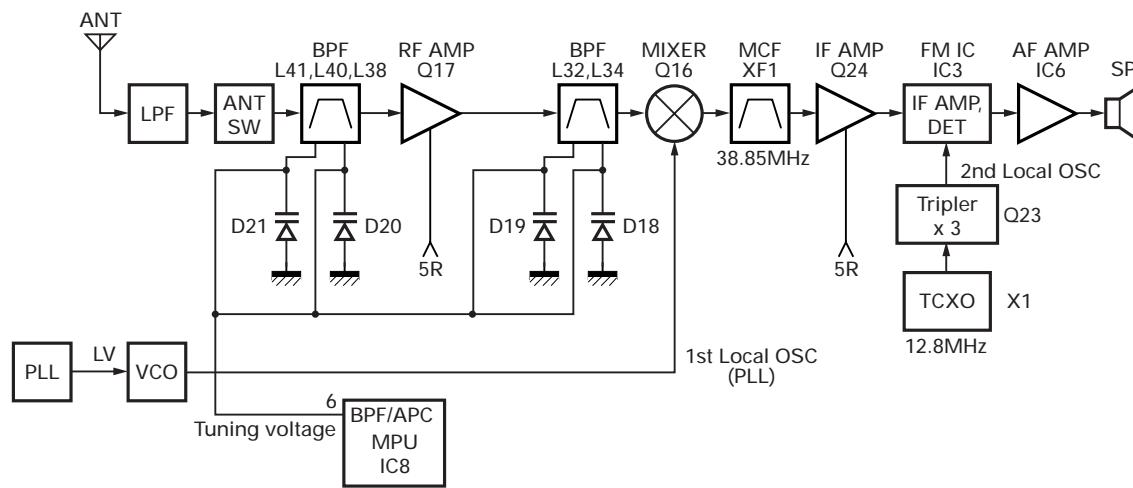

Fig. 2 Receiver section configuration

First Mixer

The received signal passing through the band-pass filter (L32, L34) is mixed with the first local signal generated by the VCO by the first mixer (Q16) to produce a first IF signal (38.85 MHz) (Lower heterodyne).

The first IF signal passes through a MCF (Monolithic crystal filter: XF1) to remove unwanted components.

The first IF signal passing through the MCF (XF1) is amplified by an IF amplifier (Q24) and the resulting signal enters the FM IC (IC3).

Item	Rating
Nominal center frequency (fo)	38.85MHz
Pass bandwidth	$\pm 6.0\text{kHz}$ or more at 3dB
Attenuation bandwidth	$\pm 25\text{kHz}$ or less at 35dB
Ultimate attenuation	70dB or more (fo -910 kHz)
Spurious response	40dB or more (fo $+1\text{MHz}$)
Ripple	1dB or less
Insertion loss	4dB or less
Terminating impedance	$610\Omega \pm 5\% // 3\text{pF} \pm 0.5\text{pF}$

Table 2 MCF (L71-0619-05) characteristics (TX-RX unit XF1)

Item	Rating
Nominal center frequency (fo)	450kHz
3dB bandwidth	$\pm 6.5\text{kHz}$ or more
50dB bandwidth	$\pm 15.5\text{kHz}$ or less
Ripple	2dB or less (fo $\pm 6.5\text{kHz}$)
Guaranteed attenuation	55dB or more (fo $\pm 18\text{kHz}$ to $\pm 33\text{kHz}$) 50dB or more (fo $\pm 100\text{kHz}$)
Insertion loss	4dB or less
I/O matching impedance	$1.5\text{k}\Omega$

Table 3 Ceramic filter (L72-0968-05) characteristics (TX-RX unit CF1)

CIRCUIT DESCRIPTION

■ IF Circuit

The first IF signal (38.85 MHz) amplified by the IF amplifier (Q24) and the second IF signal (38.4 MHz) generated by tripling the 12.8 MHz reference oscillator frequency of the TCXO (X1) by Q23, are mixed in the FM IC to produce a second IF signal (450 kHz) (Lower heterodyne).

The second IF signal passes through a ceramic filter (CF1) to remove unwanted components.

The second IF signal passing through the ceramic filter (CF1) passes through the IF amplifier in the FM IC again and is detected to produce an audio signal.

■ Squelch and Mute Circuit

A noise component is obtained by passing FM detection output (FM IC pin 9) through an operational amplifier in the

FM IC and band-pass filter consisting of R125, R126, R135, C173, C174. The noise component is rectified in the FM IC to produce a DC voltage, which is output from the N-REC terminal (pin 14) of the FM IC as squelch voltage.

The squelch voltage enters the SQ terminal (pin 48) of the MPU (IC8) and is compared with the reference voltage preset in the MPU to control audio signal ON/OFF.

When "L" is output from the AFM terminal (pin 9) of the MPU, the AF mute switch (Q20) is activated to mute the audio signal.

■ S Meter Circuit

The S meter voltage is output from the RSSI terminal (pin 12) of the FM IC (IC3) and input to the SM terminal (pin 49) of the MPU. Then the voltage is converted from analog to digital in the MPU to control the S meter display on the LCD.

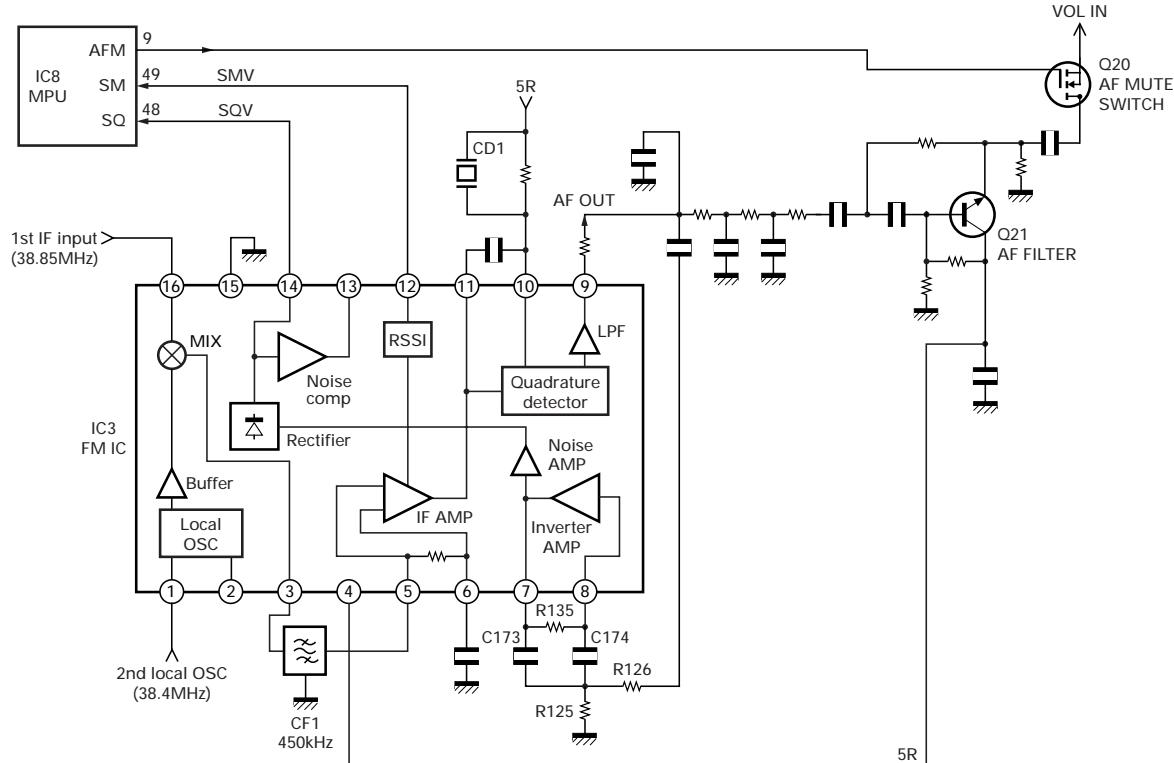

Fig. 3 IF, Squelch, Mute and S meter circuit

■ AF Amplifier

The detected audio signal passes through an AF filter (Q21) and enters an AF mute switch (Q20).

After passing through the AF mute switch (Q20), the signal passes through an AF volume (VR201) and is amplified to a specified output level with an AF amplifier (IC6).

The audio signal amplified with the AF amplifier (IC6) is output through an internal speaker or an external speaker jack (J4).

The beep tone and the DTMF signal are output from the DTMF/BEEP terminal (pin 40) of the MPU (IC8), enters the AF amplifier (IC6) and is output as a monitor tone.

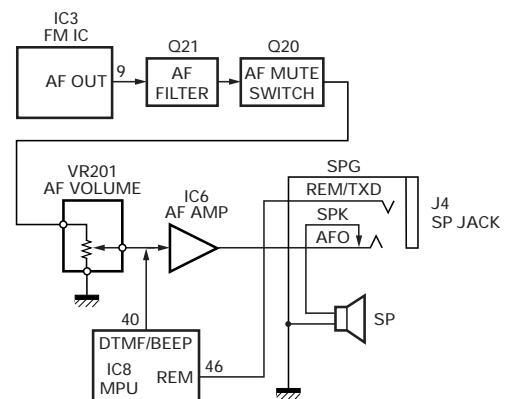

Fig. 4 AF amplifier

TH-K4AT/K4E

CIRCUIT DESCRIPTION

Transmitter System

■ Microphone Amplifier Circuit

The audio signal from the microphone passes through a high-pass filter (IC5) and enters a microphone amplifier (IC16).

The signal passes through a pre-emphasis circuit, limiter amplifier and splatter filter inside the microphone amplifier. The splatter filter will remove distortion outside the audio band.

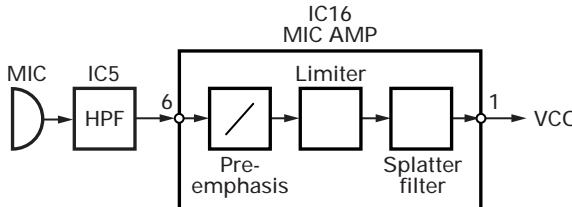

Fig. 5 Microphone amplifier circuit

■ Modulation Circuit

The audio signal amplified by the microphone amplifier (IC16) passes through a semi-fixed volume (VR5) for modulation adjustment, and goes to the VCO modulation varicap (D6) for variable reactance phase modulation.

■ Drive and Final Circuit

The output signal from VCO (Q1) passes through an RF amplifier (Q2, Q5, Q9) and drive amplifier (Q10, Q11), and is amplified by a power amplifier (Q12).

■ Transmission/Reception Switching Circuit

The signal amplified by the power amplifier (Q12) passes through a transmission/reception switching circuit and a low-pass filter, and is fed to the antenna.

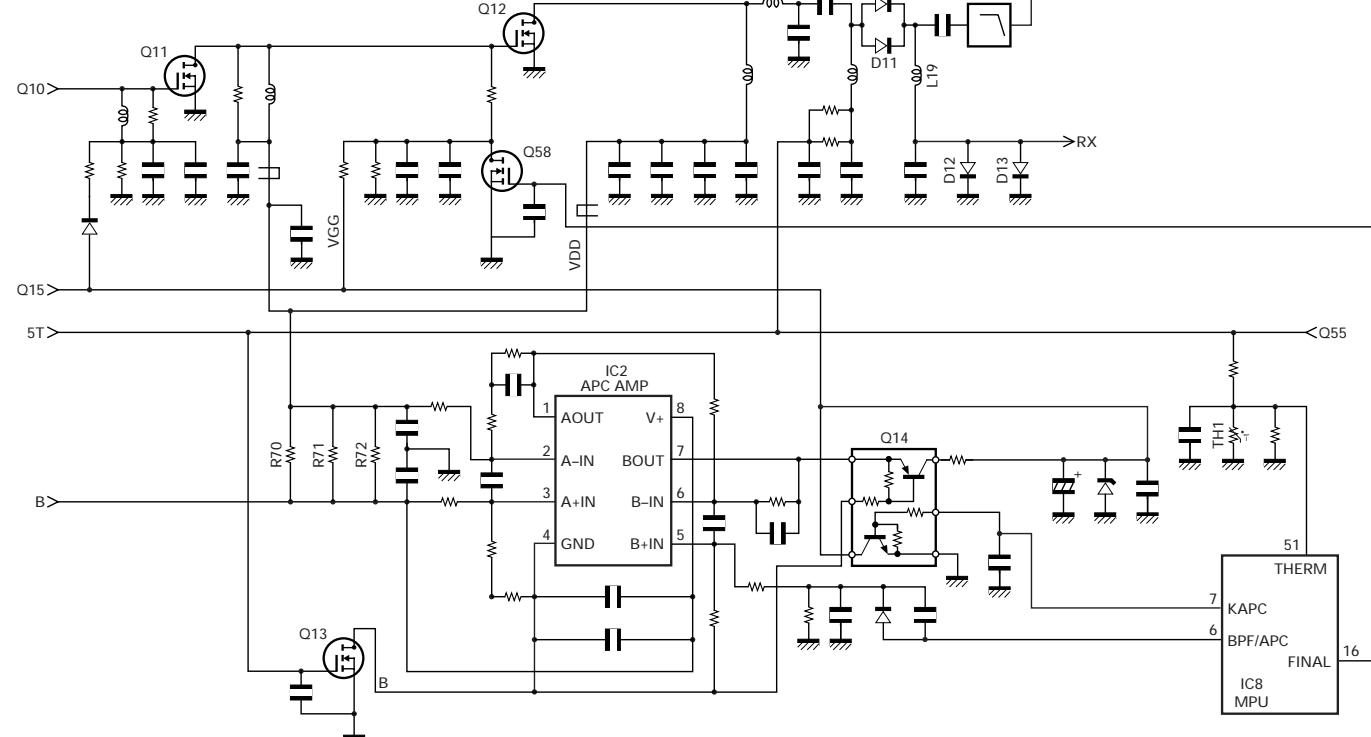

Fig. 7 APC and Temperature protection circuit

The transmission/reception switching circuit consists of D10, D11, L19, D12 and D13. These diodes are turned ON in transmit mode and OFF in receive mode to switch signals.

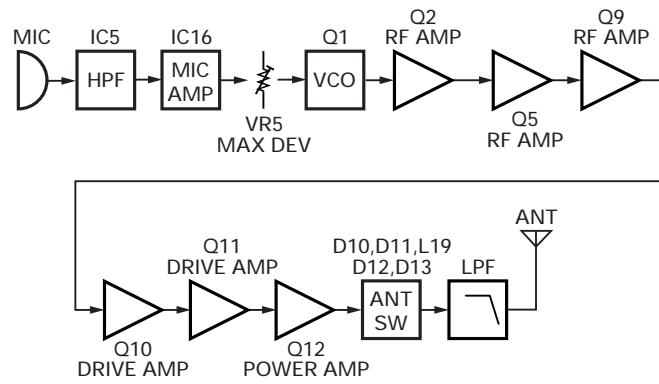

Fig. 6 Modulation, Drive, Final and Transmission/reception switching circuit

■ APC Circuit

The APC (Automatic Power Control) circuit is used to obtain a stable transmission power and controls transmission output by detecting the drain current of Q11 and Q12.

The transmission output can be changed in three levels: High, Mid, and Low.

The reference voltage is output from the BPF/APC terminal (pin 6) of the MPU (IC8) and the detection voltage generated by R70, R71 and R72 are fed to the APC differential amplifier (IC2).

The voltage in proportion to the difference between reference voltage and detection voltage is output from the BOUT terminal (pin 7) of IC2 as an APC voltage.

CIRCUIT DESCRIPTION

The APC voltage controls the gate voltage of Q11 and Q12, and keeps transmission output stable.

The MPU detects power supply voltage and controls Q58 by transmission power supply voltage and transmission power. For example, if the power supply voltage during transmission, is equal to or higher than approx. 10.5 V and if power is at Mid or Low level, the APC voltage level applied to Q12 is reduced by Q58.

■ Temperature Protection Circuit

To prevent thermal destruction of the power amplifier (Q12), this circuit reduces APC voltage when Q12 temperature rises.

The MPU (IC8) detects temperature with a thermistor (TH1) and controls reference voltage to the APC circuit.

PLL System

■ PLL Circuit

A reference frequency of 5 kHz or 6.25 kHz is produced by dividing the 12.8 MHz reference frequency of the TCXO (X1) with PLL IC (IC1). Comparison frequency is produced by

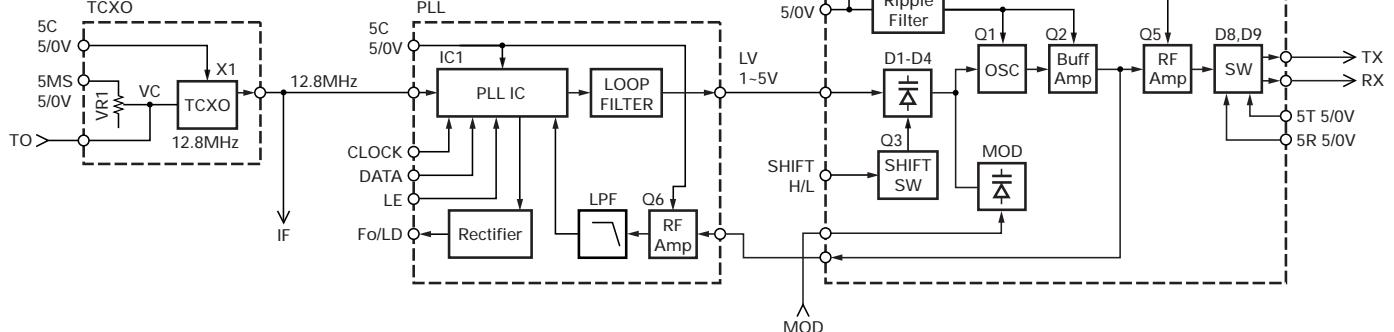

Fig. 8 PLL and VCO circuit

■ Unlock Detection Circuit

When the PLL is unlocked, the waveform of the pulse output from the Fo/LD terminal (pin 14) of the PLL IC (IC1) is rectified with R32, D16, R35 and C40, and the Fo/LD terminal is made "L" level. The voltage at the Fo/LD terminal is detected by the MPU to control transmission/reception switching timing.

amplifying VCO output with an RF amplifier (Q6) and dividing it with the PLL IC.

The PLL synthesizer with 5 kHz and 6.25 kHz step is configured by comparing phases of the reference frequency and comparison frequency.

The phase difference between reference frequency and comparison frequency passes through a charge pump in the PLL IC, then ripples are removed with a loop filter with low-range passing characteristics to produce VCO control voltage (lock voltage).

■ VCO Circuit

The VCO produces a desired frequency directly with a Colpits oscillation circuit containing an oscillation transistor (Q1) used for both transmission and reception.

The VCO control voltage is applied to varicap (D1, D2, D3, D4) to produce a desired frequency.

The SHIFT terminal (pin 113) of the MPU (IC8) goes "H" during transmission, and the shift control switch (Q3) is turned ON to change oscillation frequency.

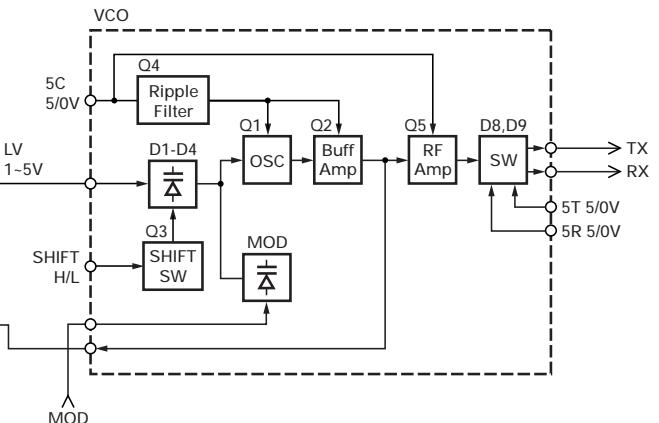

Fig. 9 Unlock detection circuit

TH-K4AT/K4E

CIRCUIT DESCRIPTION

Power Supply Circuit

■ Charging Circuit

When an external power supply is connected to the DC IN terminal, the constant-current circuit consisting of Q33 and D31 provides a constant current of approx. 110 mA to the Ni-MH battery.

If no external power supply is connected to the DC IN terminal, the constant-current circuit does not function.

Fig. 10 Charging and Power supply switching circuit

Control System

■ Reset and Backup Circuit

When power is supplied to the transceiver, the 5M voltage goes "H" as C303 is charged.

A rising edge of the 5M voltage is detected by the voltage detection IC (IC11) and when its output (RESET) goes "H", the reset status of the MPU is released.

■ Power Supply Switching Circuit

The voltage supplied through the battery terminal or DC IN terminal is branched in the power supply switching circuit as shown in Fig.10 and then supplied to the required components.

■ Battery Type Recognition Circuit

When the battery pack is attached to the transceiver, the battery type is recognized with the T terminal on the transceiver. This battery type recognition activates charging for the Ni-MH battery pack and displaying the battery meter.

If the supplied voltage to the transceiver is reduced and the 5M voltage falls below the detection voltage of the voltage detection IC (IC10), the MPU detects it by an interrupt processing, backs up data in EEPROM (IC15) and turns the power off.

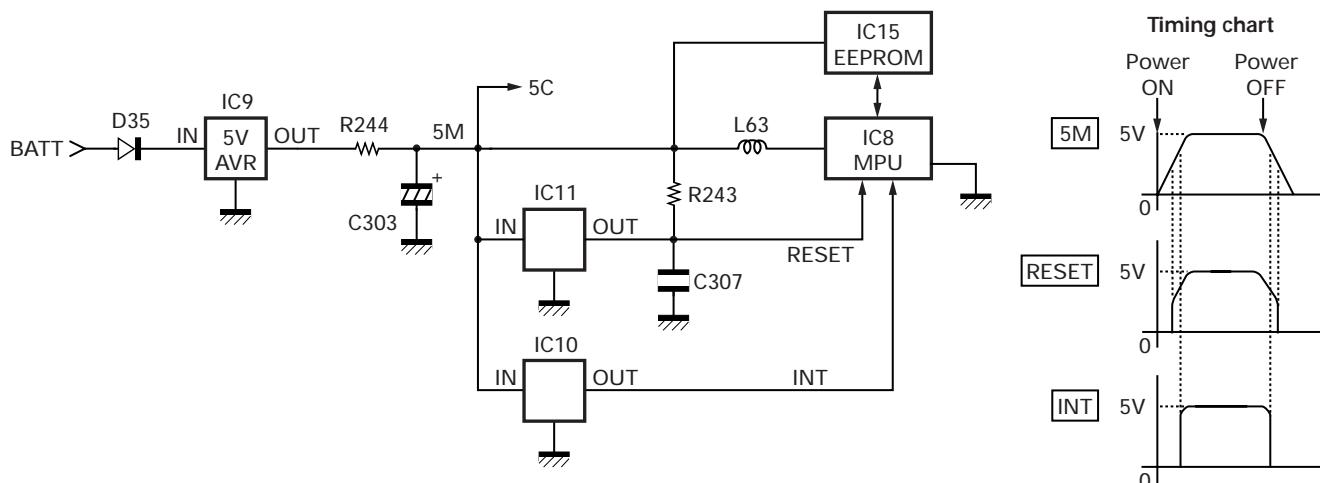

Fig. 11 Reset and Backup circuit

CIRCUIT DESCRIPTION

■ Voltage Detection Circuit

Various voltages are input to the A/D port of the MPU (IC8) for processing.

Battery voltage is divided with resistors (R240, R241) and enters the BATT terminal (pin 52) of the MPU.

Battery voltage is used for battery meter indication during transmission or for alert tone processing when an abnormal power supply voltage (approx. 16.5 V or higher) is applied.

Squelch voltage becomes DC voltage by detecting changes in noise voltage in the FM IC (IC3), and the signal is used for squelch control.

The S meter voltage is output from the RSSI pin of the FM IC to control S meter display.

Detection of thermistor voltage (temperature) in the Ni-MH battery during charging, detection of remote microphone key pressing and VOX voltage monitoring are performed through each A/D port of the MPU.

■ Battery Save Circuit

If there is no signal (squelch off, scan off or no key operation) for longer than 10 seconds, the transceiver will enter the battery save mode.

Battery save operation is performed by controlling Q57 with an output signal from the 5C (SAVE) terminal (pin 15) of the MPU.

The 5C ON/OFF cycle ratio during battery saving can be set from a transceiver menu.

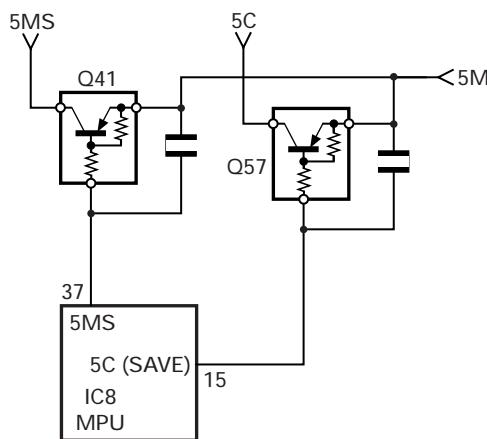

Fig. 12 Battery save circuit

■ LED Drive Circuit

The LCD and key illumination LEDs are lighted by controlling Q51 for the LCD and Q50 for keys according to the output voltage from the AF/LAMP AVR (Q37).

The BUSY and TX illumination LEDs are lighted by controlling Q47.

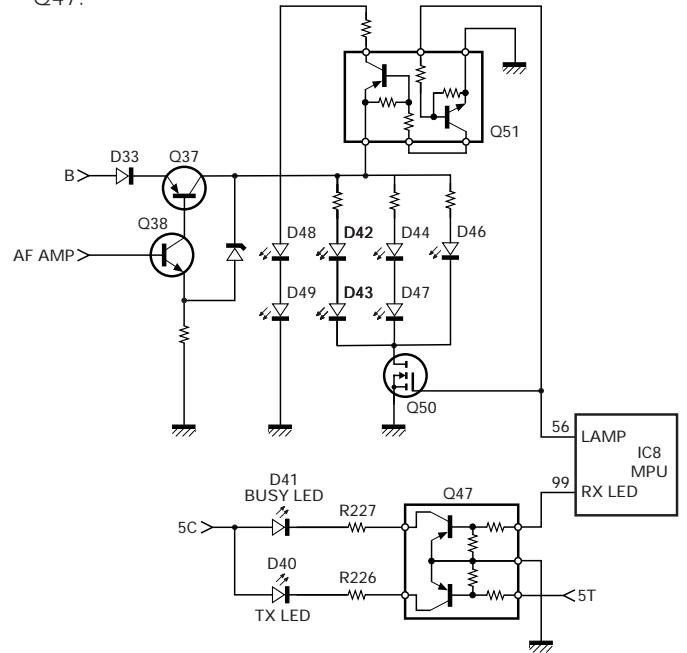

Fig. 13 LED drive circuit

RadioAmateur.EU

TH-K4AT/K4E

CIRCUIT DESCRIPTION

■ Key and Encoder Input Circuit

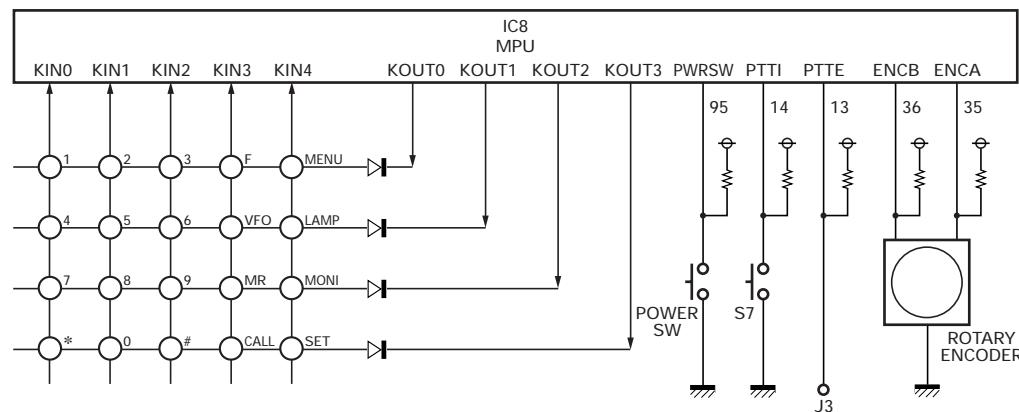

The POWER key is assigned to the interrupt port (pin 95) of the MPU.

The PTT key is assigned to the dedicated port (pins 13, 14) of the MPU.

Other keys compose a matrix and key presses are detected by scanning them by software.

The encoder reads data using the interrupt port (pins 35 and 36) of the MPU.

16 key (M2 type)

4 key (E type)

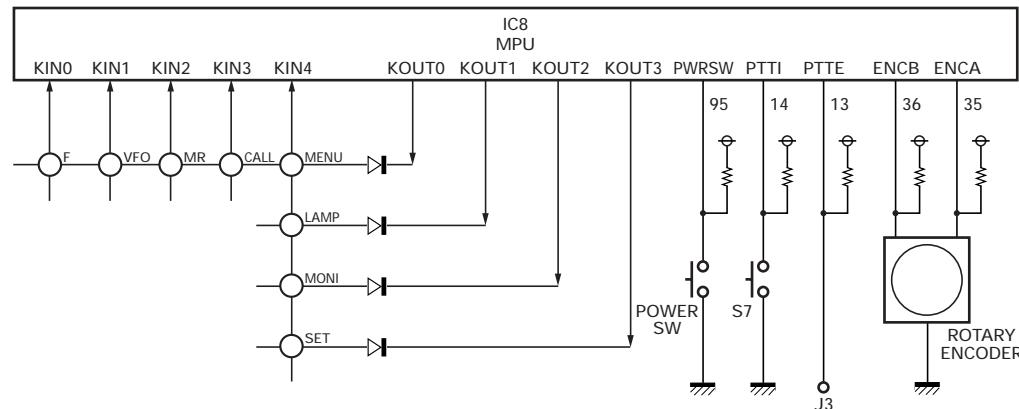

Fig. 14 Key and Encoder input circuit

CIRCUIT DESCRIPTION

■ CTCSS/DCS

The encode signal is generated by the MPU (IC8) and output from the TONE terminal (pin 41) of the MPU.

The unwanted high-frequency components of the encode signal output from the MPU are removed with a low-pass filter, and applied to VCO modulation input (MOD) and TCXO VC terminal for modulation.

The VCO and TCXO modulation levels are adjusted by VR6 to produce flat modulation characteristics in low and high ranges.

The decode signal is input to the SIGN pin (pin 47) of the MPU after the waveform of the audio signal from the FM IC is rectified with a CTCSS/DCS filter (IC17). Then the set CTCSS tone frequency and DCS code are detected by digital signal processing in the MPU to control muting.

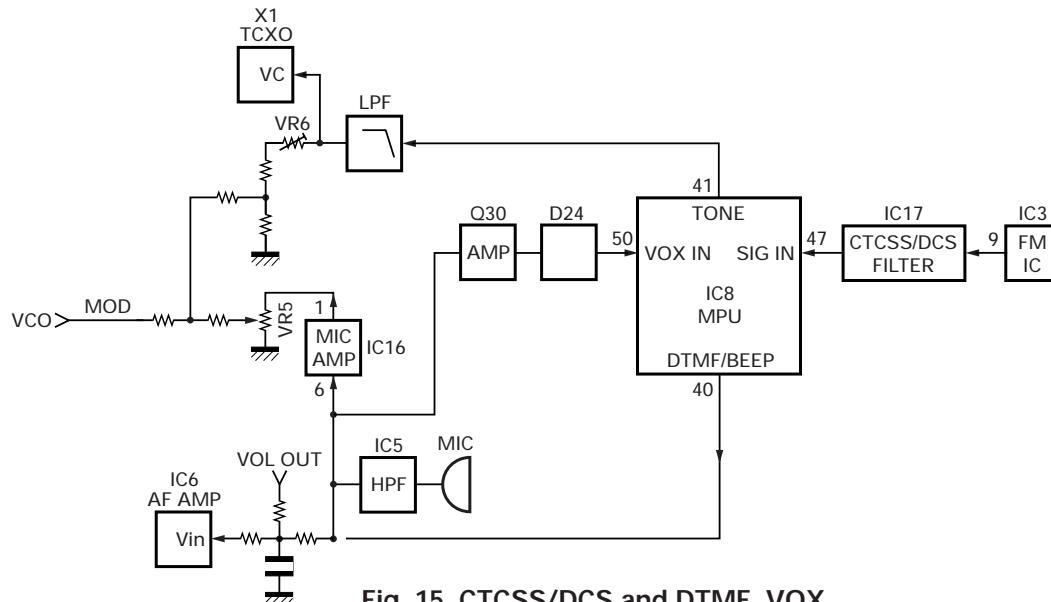

Fig. 15 CTCSS/DCS and DTMF, VOX

■ Serial Control

Serial control must be enabled from a transceiver menu so that the REM/TXD pin of the speaker jack (J4) and the PTT (RXD) pin of the microphone jack (J3) function as TXD and RXD, respectively, when communicating with a personal computer.

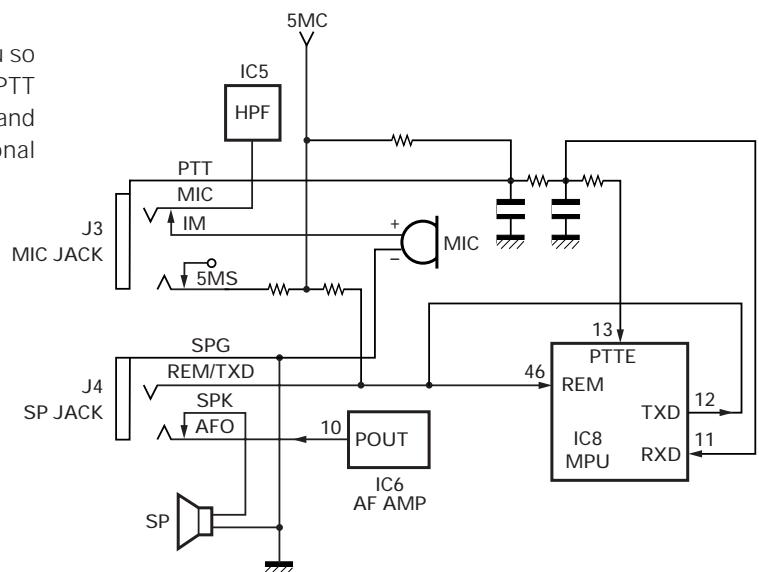

Fig. 16 Serial control

IC9	5.0V AVR	
IC10	4.4V voltage detection	MPU INT voltage detection
IC11	3.3V voltage detection	MPU Reset voltage detection
IC12	5.0V AVR	
IC15	EE PROM	
IC16	MIC amplifier	Limiter, splatter filter
IC17	CTCSS/DCS filter	Active filter
Q1	VCO	
Q2	RF amplifier	
Q3	VCO shift control switch	On TX
Q4	Ripple filter	
Q5,6,9	RF amplifier	
Q10,11	Drive amplifier	
Q12	Power amplifier	
Q13	APC circuit operation switch	On TX
Q14	APC output switch	On TX
Q15	Q10 operation switch	On TX
Q16	1st mixer	
Q17	RX 1st amplifier	
Q20	Audio mute switch	Audio mute when off
Q21	Audio filter	Active filter
Q22	Wide/narrow switching	On when wide is selected
Q23	Tripler	2nd local
Q24	IF amplifier	1st IF 38.85MHz
Q27	Wide/narrow switching	On when wide is selected
Q29	MIC mute switch	Mutes when ON
Q30	VOX detection amplifier	
Q31	Q56 operation switch	Off when the speaker outputs audio
Q33	Charge switch	

TH-K4AT/K4E

COMPONENTS DESCRIPTION

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q34	Q33 operation switch	On when charging
Q35	DC IN detection	H: DC IN detection
Q36	Ni-MH temperature detection	On when temperature detection is activated
Q37	AF amplifier/ Lamp AVR	
Q38	Q37 operation switch	On when the speaker outputs the audio or lamp lights
Q41	5MS switch	On when 5MS is applied
Q47	TX/BUSY LED switch	
Q50	Key LED switch	On when the key LED lights
Q51	LCD LED switch	On when the LCD LED lights
Q52	Beat shift switch	
Q53	5R/5MV switch	On when 5R or 5MV is applied
Q55	5T switch	On when 5T is applied
Q56	Speaker mute switch	
Q57	5C switch	On when 5C is applied
Q58	Q12 gate voltage switch	Off when High power is selected
D1-4	VCO frequency control	
D5	Frequency shift	
D6	VCO modulation	
D7	Speed up	Ripple filter
D8	RF switch	On TX
D9	RF switch	On RX
D10-13	Antenna switch	On TX
D14	Reverse current prevention	APC reference voltage
D15	APC output voltage limiter	
D16	PLL lock detection	
D18-21	RX BPF tuning	
D22	MIC mute control	
D24	VOX detection rectification	
D25	Speaker mute speed up	
D26	C246 discharge	
D27	MIC ALC rectification	
D30	Reverse current prevention	Charge current
D31	Constant-current circuit	Constant-current charge
D32	Reverse current prevention	DC IN
D33	Reverse current prevention	Battery

Ref. No.	Use/Function	Operation/Condition/Compatibility
D34	AVR constant-voltage	
D35	Reverse current prevention	Battery
D36	Reverse current prevention	DC IN
D40	TX LED	Lights on TX
D41	BUSY LED	Lights on RX
D42-44 D46,47	Key illumination LED	Key backlight illumination
D48,49	LCD illumination LED	LCD backlight illumination
D60	Key type detection	
D61	UHF type detection	
D62-65	market code detection	
D69-72	Reverse current prevention	Key matrix
D73	Voltage drop	
D74	Over input protection	
D79,80	Limiter	
D81	Reverse current prevention

ADJUSTMENT

Single Tone Mode

This mode is used to check the DTMF deviation.

Operation

■ 16key (M2 type)

1. Press the [PTT] key on the transceiver to switch to the transmission mode.
2. Press the [MONI] key to enter the single tone mode.
3. Press any key from [1] to [8] keys to transmit a single tone. The single tone is consisting of eight frequencies.
 - [1] 697Hz
 - [2] 770Hz
 - [3] 852Hz
 - [4] 941Hz
 - [5] 1209Hz
 - [6] 1336Hz
 - [7] 1477Hz
 - [8] 1633Hz
4. When the [MONI] key is pressed again during the transmission, the transceiver switches to the reception mode, the single tone mode turns OFF.

■ 4key (E type)

1. Press the [PTT] key on the transceiver to switch to the transmission mode.
 2. Press the [MONI] key to enter the single tone mode.
 3. When the [VFO] key is pressed during the transmission, a DTMF "D" dual tone (combination of 1633 Hz and 941 Hz frequencies) is transmitted.
 4. When the [MR] key is pressed during the transmission, single-tone 1633 Hz is transmitted.
 5. When the [MONI] key is pressed again during the transmission, the transceiver switch to the reception mode, the single tone mode is turned OFF.
- The single tone mode can be enabled only during the transmission.
 - When DTMF memory is transmitted in the single tone mode, the single tone mode turns OFF.

Adjustment Mode

This mode is used to replace or readjust the IC15 (EEPROM). Adjust the following adjustment items after setting the transceiver to "Adjustment Mode".

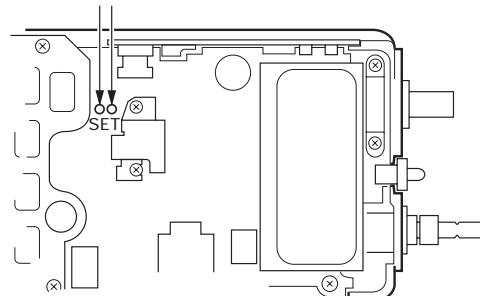

■ Adjustment Items

- A. Overvoltage warning reference voltage (14.8V [DC IN])
- B. Battery terminal reference voltage (7.5 V [Battery terminal])
- C. Squelch (SQL1, SQL2)
- D. S-meter (Two segments in S-meter light, all segments in S-meter light)
- E. RX BPF (Lower limit frequency, center frequency, upper limit frequency)
- F. 7.5V TX H power (Lower limit frequency, center frequency, upper limit frequency)
- G. 7.5V TX M power (Lower limit frequency, center frequency, upper limit frequency)
- H. 7.5V TX L power (Lower limit frequency, center frequency, upper limit frequency)
- I. 13.8V TX H power (Lower limit frequency, center frequency, upper limit frequency)
- J. 13.8V TX M power (Lower limit frequency, center frequency, upper limit frequency)
- K. 13.8V TX L power (Lower limit frequency, center frequency, upper limit frequency)
- L. DCS modulation balance
- M. Tone deviation (Lower limit frequency, center frequency, upper limit frequency)
- N. DCS deviation (Lower limit frequency, center frequency, upper limit frequency)
- O. VOX sensitivity (Level 1, level 9)

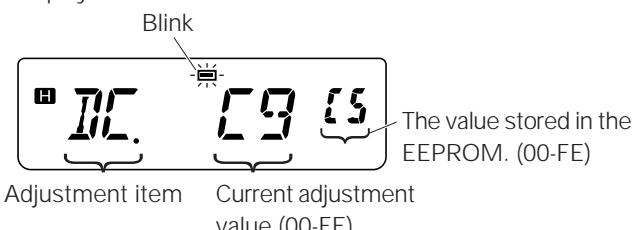

■ Operation in Adjustment Mode

1. Turn the transceiver ON.
2. Set the tone frequency to 151.4 Hz and the DCS code to 023 in Menu Mode to adjust tone and DCS modulation.
3. Set Adjustment Mode by shorting two lands (SET) on the component side of the TX-RX unit (A/3).

Short these two lands

4. When the Adjustment Mode is set, the "Overvoltage warning reference voltage (14.8V [DC IN])" adjustment item is displayed. (The "■" icon on the upper side of the LCD blinks while the transceiver is in the Adjustment Mode.) The current adjustment value is displayed at the lower digits of the frequency display, and the value stored in the EEPROM is displayed on the memory channel number display.

Adjustment item Current adjustment value (00-FE)

5. The functions of transceiver keys in Adjustment Mode are as follows:

TH-K4AT/K4E

ADJUSTMENT

Key name	[key]	[F] key → [key]
PTT	Transmit while this key is held down.	Selecting a TX power (High/Mid/Low)
LAMP	Changes adjustment items. (Forward) When this key is pressed on the frequency display, it switches to the adjustment display.	Lamp always ON
MONI	Changes adjustment items. (Back) When this key is pressed on the frequency display, it switches to the adjustment display.	Squelch level setting mode
MENU	Write adjustment values (adjustment display) Sound error tone (frequency display)	-
F	Function mode/MHz mode ON	Function mode/MHz mode OFF
VFO	VFO mode When this key is pressed on the adjustment display, it switches to the frequency display.	M→V (Memory shift)
MR	Memory mode When this key is pressed on the adjustment display, it switches to the frequency display.	M.IN (Memory registration)
CALL	Switch between frequency display and adjustment display. Each time this key is pressed, the LCD switches between the frequency display and adjustment display.	-
Encoder	Increase or decrease adjustment values (00 - FE). (adjustment display) Increase or decrease frequency and memory channel number. (frequency display)	Increase or decrease frequency (1MHz step). (frequency display)

6. To exit the Adjustment Mode, turn the transceiver OFF.

Note:

- When you press [LAMP] or [MONI] key, ensure the bosses of rubber keys align with the LAMP and MONI contacts of the PTT PCB (C/3).
- In the Adjustment Mode, Transmission and Reception frequencies becomes extensive.

A. Overvoltage warning reference voltage (14.8V [DC IN])

- (1) Press the [LAMP] or [MONI] key on the transceiver to display "DC" on the LCD.

The current voltage value is displayed at the lower digits of the frequency display, and the value stored in the EEPROM is displayed on the memory channel number display.

- (2) Press the [MENU] key to write the current voltage value into the EEPROM.

B. Battery terminal reference voltage (7.5 V [Battery terminal])

- (1) Press the [LAMP] or [MONI] key on the transceiver to display "BAT" on the LCD.

Press the [F] key and then the [PTT] key repeatedly to turn the "BAT" icon ON. The current voltage value is displayed at the lower digits of the frequency display, and the value stored in the EEPROM is displayed on the memory channel number display.

(2) Press the [PTT] key to enable the transmit mode.

- (3) Adjust the output voltage from DC power supply until the voltage at the battery terminal becomes 7.5V while the transceiver is transmitting.
- (4) Press the [MENU] key to write the current voltage value into the EEPROM.

C. Squelch (SQL1, SQL2)

①Squelch (SQL1)

- (1) Press the [LAMP] or [MONI] key on the transceiver to display "SQ1" on the LCD.

The detected DC voltage value to the current noise level is displayed at the lower digits of the frequency display, and the value stored in the EEPROM is displayed on the memory channel number display.

- (2) Press the [MENU] key to write the current noise level value into the EEPROM.

②Squelch (SQL2)

- (1) Press the [LAMP] or [MONI] key on the transceiver to display "SQ2" on the LCD.

- (2) Press the [MENU] key to write the current noise level value into the EEPROM.

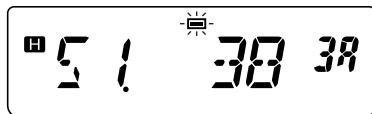

ADJUSTMENT

D. S-meter (Two segments in S-meter light, all segments in S-meter light)

①S-meter (Two segments in S-meter light)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "S1" on the LCD.

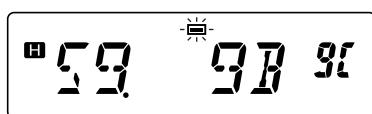

The current RSSI level value is displayed at the lower digits of the frequency display, and the value stored in the EEPROM is displayed on the memory channel number display.

(2) Press the [MENU] key to write the current RSSI level value into the EEPROM.

②S-meter (All segments in S-meter light)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "S9" on the LCD.

(2) Press the [MENU] key to write the current RSSI level value into the EEPROM.

E. RX BPF (Lower limit frequency, center frequency, upper limit frequency)

①RX BPF (Lower limit frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "BPL" on the LCD.

The current BPF tuning value is displayed at the lower digits of the frequency display, and the value stored in the EEPROM is displayed on the memory channel number display.

(2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.

(3) Turn the encoder to display the lower limit frequency on the LCD.

(4) Press the [CALL] key to switch to the adjustment display.

(5) Turn the encoder to change the current BPF tuning value and adjust RX BPF.

(6) Press the [MENU] key to write the current BPF tuning value into the EEPROM.

②RX BPF (Center frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "BPC" on the LCD.

(2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.

(3) Turn the encoder to display the center frequency on the LCD.

(4) Repeat steps (4) to (6) of "①RX BPF (Lower limit frequency)" described on page 29.

③RX BPF (Upper limit frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "BPH" on the LCD.

(2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.

(3) Turn the encoder to display the upper frequency on the LCD.

(4) Repeat steps (4) to (6) of "①RX BPF (Lower limit frequency)" described on page 29.

F. 7.5V TX H power (Lower limit frequency, center frequency, upper limit frequency)

①7.5V TX H power (Lower limit frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "P7L" on the LCD.

In this case, the "H" icon appears.

The current APC value is displayed at the lower digits of the frequency display, and the value stored in the EEPROM is displayed on the memory channel number display.

(2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.

(3) Turn the encoder to display the lower limit frequency on the LCD.

(4) Press the [CALL] key to switch to the adjustment display.

(5) Press the [PTT] key to enable the transmit mode.

(6) Adjust the output voltage from DC power supply until the voltage at the battery terminal becomes 7.5V while the transceiver is transmitting.

(7) Turn the encoder to change the current APC value and adjust the transmission power.

TH-K4AT/K4E

ADJUSTMENT

(8) Press the [MENU] key to write the current APC value into the EEPROM.

②7.5V TX H power (Center frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "P7C" on the LCD.

In this case, the "H" icon appears.

(2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.

(3) Turn the encoder to display the center frequency on the LCD.

(4) Repeat steps (4) to (8) of "①7.5V TX H power (Lower limit frequency)" described on page 29.

③7.5V TX H power (Upper limit frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "P7H" on the LCD.

In this case, the "H" icon appears.

(2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.

(3) Turn the encoder to display the upper limit frequency on the LCD.

(4) Repeat steps (4) to (8) of "①7.5V TX H power (Lower limit frequency)" described on page 29.

G. 7.5V TX M power (Lower limit frequency, center frequency, upper limit frequency)

①7.5V TX M power (Lower limit frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "P7L" on the LCD.

In this case, the "M" icon appears.

The current APC value is displayed at the lower digits of the frequency display, and the value stored in the EEPROM is displayed on the memory channel number display.

(2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.

(3) Turn the encoder to display the lower limit frequency on the LCD.

(4) Press the [CALL] key to switch to the adjustment display.

(5) Press the [PTT] key to enable the transmit mode.

(6) Adjust the output voltage from DC power supply until the voltage at the battery terminal becomes 7.5V while the transceiver is transmitting.

(7) Turn the encoder to change the current APC value and adjust the transmission power.

(8) Press the [MENU] key to write the current APC value into the EEPROM.

②7.5V TX M power (Center frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "P7C" on the LCD.

In this case, the "M" icon appears.

(2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.

(3) Turn the encoder to display the center frequency on the LCD.

(4) Repeat steps (4) to (8) of "①7.5V TX M power (Lower limit frequency)" described on page 30.

③7.5VTX M power (Upper limit frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "P7H" on the LCD.

In this case, the "M" icon appears.

(2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.

(3) Turn the encoder to display upper limit frequency on the LCD.

(4) Repeat steps (4) to (8) of "①7.5V TX M power (Lower limit frequency)" described on page 30.

H. 7.5V TX L power (Lower limit frequency, center frequency, upper limit frequency)

①7.5V TX L power (Lower limit frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "P7L" on the LCD.

In this case, the "L" icon appears.

The current APC value is displayed at the lower digits of the frequency display, and the value stored in the EEPROM is displayed on the memory channel number display.

ADJUSTMENT

- (2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.
- (3) Turn the encoder to display the lower limit frequency on the LCD.
- (4) Press the [CALL] key to switch to the adjustment display.
- (5) Press the [PTT] key to enable the transmit mode.
- (6) Adjust the output voltage from DC power supply until the voltage at the battery terminal becomes 7.5V while the transceiver is transmitting.
- (7) Turn the encoder to change the current APC value and adjust the transmission power.
- (8) Press the [MENU] key to write the current APC value into the EEPROM.

②7.5V TX L power (Center frequency)

- (1) Press the [LAMP] or [MONI] key on the transceiver to display "P7C" on the LCD.

In this case, the "L" icon appears.

- (2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.
- (3) Turn the encoder to display the center frequency on the LCD.
- (4) Repeat steps (4) to (8) of "①7.5V TX L power (Lower limit frequency)" described on page 30.

③7.5V TX L power (Upper limit frequency)

- (1) Press the [LAMP] or [MONI] key on the transceiver to display "P7H" on the LCD.

In this case, the "L" icon appears.

- (2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.
- (3) Turn the encoder to display the upper limit frequency on the LCD.
- (4) Repeat steps (4) to (8) of "①7.5V TX L power (Lower limit frequency)" described on page 30.

I. 13.8V TX H power (Lower limit frequency, center frequency, upper limit frequency)

①13.8V TX H power (Lower limit frequency)

- (1) Press the [LAMP] or [MONI] key on the transceiver to display "P13L" on the LCD.

In this case, the "H" icon appears.

The current APC value is displayed at the lower digits of the frequency display, and the value stored in the EEPROM is displayed on the memory channel number display.

- (2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.
- (3) Turn the encoder to display the lower limit frequency on the LCD.
- (4) Press the [CALL] key to switch to the adjustment display.
- (5) Press the [PTT] key to enable the transmit mode.
- (6) Turn the encoder to change the current APC value and adjust the transmission power.
- (7) Press the [MENU] key to write the current APC value into the EEPROM.

②13.8V TX H power (Center frequency)

- (1) Press the [LAMP] or [MONI] key on the transceiver to display "P13C" on the LCD.

In this case, the "H" icon appears.

- (2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.
- (3) Turn the encoder to display center frequency on the LCD.
- (4) Repeat steps (4) to (7) of "①13.8V TX H power (Lower limit frequency)" described on page 31.

③13.8V TX H power (Upper limit frequency)

- (1) Press the [LAMP] or [MONI] key on the transceiver to display "P13H" on the LCD.

In this case, the "H" icon appears.

- (2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.
- (3) Turn the encoder to display upper limit frequency on the LCD.
- (4) Repeat steps (4) to (7) of "①13.8V TX H power (Lower limit frequency)" described on page 31.

TH-K4AT/K4E

ADJUSTMENT

J. 13.8V TX M power (Lower limit frequency, center frequency, upper limit frequency)

①13.8V TX M power (Lower limit frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "P13L" on the LCD.

In this case, the "M" icon appears.

The current APC value is displayed at the lower digits of the frequency display, and the value stored in the EEPROM is displayed on the memory channel number display.

(2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.

(3) Turn the encoder to display the lower limit frequency on the LCD.

(4) Press the [CALL] key to switch to the adjustment display.

(5) Press the [PTT] key to enable the transmit mode.

(6) Turn the encoder to change the current APC value and adjust the transmission power.

(7) Press the [MENU] key to write the current APC value into the EEPROM.

②13.8V TX M power (Center frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "P13C" on the LCD.

In this case, the "M" icon appears.

(2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.

(3) Turn the encoder to display the center frequency on the LCD.

(4) Repeat steps (4) to (7) of "①13.8V TX M power (Lower limit frequency)" described on page 32.

③13.8V TX M power (Upper limit frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "P13H" on the LCD.

In this case, the "M" icon appears.

(2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.

(3) Turn the encoder to display the upper limit frequency on the LCD.

(4) Repeat steps (4) to (7) of "①13.8V TX M power (Lower limit frequency)" described on page 32.

K. 13.8V TX L power (Lower limit frequency, center frequency, upper limit frequency)

①13.8V TX L power (Lower limit frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "P13L" on the LCD.

In this case, the "L" icon appears.

The current APC value is displayed at the lower digits of the frequency display, and the value stored in the EEPROM is displayed on the memory channel number display.

(2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.

(3) Turn the encoder to display the lower limit frequency on the LCD.

(4) Press the [CALL] key to switch to the adjustment display.

(5) Press the [PTT] key to enable transmit mode.

(6) Turn the encoder to change the current APC value and adjust transmission power.

(7) Press the [MENU] key to write the current APC value into the EEPROM.

②13.8V TX L power (Center frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "P13C" on the LCD.

In this case, the "L" icon appears.

(2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.

(3) Turn the encoder to display the center frequency on the LCD.

(4) Repeat steps (4) to (7) of "①13.8V TX L power (Lower limit frequency)" described on page 32.

③13.8V TX L power (Upper limit frequency)

(1) Press the [LAMP] or [MONI] key on the transceiver to display "P13H" on the LCD.

In this case, the "L" icon appears.

ADJUSTMENT

- (2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.
- (3) Turn the encoder to display the upper limit frequency on the LCD.
- (4) Repeat steps (4) to (7) of “①13.8V TX L power (Lower limit frequency)” described on page 32.

L. DCS modulation balance

- (1) Press the [LAMP] or [MONI] key on the transceiver to display “DCS.BAL” on the LCD. Press the [F] key and then the [PTT] key repeatedly to turns the “■” icon ON.

- (2) When the [PTT] key is pressed to enable transmit mode, a 100Hz square waveform is internally generated and modulated.
- (3) While observing the waveforms on the oscilloscope, turn the semi-fixed volume (VR6) to adjust the DCS modulation waveform to a square waveform.
- (4) When the DCS modulation waveform becomes a square waveform, release the [PTT] key.

M. Tone deviation (Lower limit frequency, center frequency, upper limit frequency)

① Tone deviation (Lower limit frequency)

- (1) Press the [LAMP] or [MONI] key on the transceiver to display “DVL” on the LCD.

In this case, the “■” icon appears. Press the [F] key and then the [PTT] key repeatedly to turn the “■” icon ON. The current adjustment value is displayed at the lower digits of the frequency display, and the value stored in the EEPROM is displayed on the memory channel number display.

- (2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.
- (3) Turn the encoder to display the lower limit frequency on the LCD.
- (4) Press the [CALL] key to switch to the adjustment display.
- (5) When the [PTT] key is pressed to enable transmit mode, a preset tone frequency (151.4Hz) is internally generated and modulated.
- (6) Turn the encoder to change the current adjustment value and adjust tone deviation.
- (7) Press the [MENU] key to write the current adjustment value into the EEPROM.

② Tone deviation (Center frequency)

- (1) Press the [LAMP] or [MONI] key on the transceiver to display “DVC” on the LCD.

In this case, the “■” icon appears. Press the [F] key and then the [PTT] key repeatedly to turn the “■” icon ON.

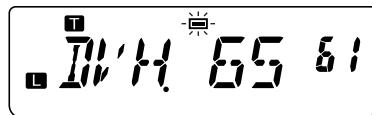

- (2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.
- (3) Turn the encoder to display the center frequency on the LCD.
- (4) Repeat steps (4) to (7) of “① Tone deviation (Lower limit frequency)” described on page 33.

③ Tone deviation (Upper limit frequency)

- (1) Press the [LAMP] or [MONI] key on the transceiver to display “DVH” on the LCD.

In this case, the “■” icon appears. Press the [F] key and then the [PTT] key repeatedly to turn the “■” icon ON.

- (2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.
- (3) Turn the encoder to display the upper limit frequency on the LCD.
- (4) Repeat steps (4) to (7) of “① Tone deviation (Lower limit frequency)” described on page 33.

N. DCS deviation (Lower limit frequency, center frequency, upper limit frequency)

① DCS deviation (Lower limit frequency)

- (1) Press the [LAMP] or [MONI] key on the transceiver to display “DVL” on the LCD.

In this case, the “■” icon appears. Press the [F] key and then the [PTT] key repeatedly to turn the “■” icon ON. The current adjustment value is displayed at the lower digits of the frequency display, and the value stored in the EEPROM is displayed on the memory channel number display.

- (2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.
- (3) Turn the encoder to display the lower limit frequency on the LCD.

TH-K4AT/K4E

ADJUSTMENT

- (4) Press the [CALL] key to switch to the adjustment display.
- (5) When the [PTT] key is pressed to enable transmit mode, a preset DCS code (023) is internally generated and modulated.
- (6) Turn the encoder to change the current adjustment value and adjust DCS deviation.
- (7) Press the [MENU] key to write the current adjustment value into the EEPROM.

②DCS deviation (Center frequency)

- (1) Press the [LAMP] or [MONI] key on the transceiver to display "DVC" on the LCD.
In this case, the "DCS" icon appears.

- (2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.
- (3) Turn the encoder to display the center frequency on the LCD.
- (4) Repeat steps (4) to (7) of "①DCS deviation (Lower limit frequency)" described on page 33.

③DCS deviation (Upper limit frequency)

- (1) Press the [LAMP] or [MONI] key on the transceiver to display "DVH" on the LCD.
In this case, the "DCS" icon appears.

- (2) Press the [VFO], [MR] or [CALL] key to switch to the frequency display.
- (3) Turn the encoder to display the upper limit frequency on the LCD.
- (4) Repeat steps (4) to (7) of "①DCS deviation (Lower limit frequency)" described on page 33.

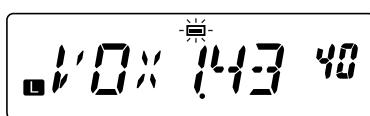

O. VOX sensitivity (Level 1, level 9)

①VOX sensitivity (Level 1)

- (1) Press the [LAMP] or [MONI] key on the transceiver to display "VOX1" on the LCD.

Press the [F] key and then the [PTT] key repeatedly to turn the "L" icon ON.

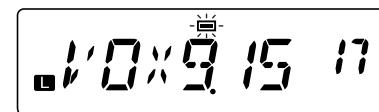

The current microphone input level value is displayed at the lower digits of the frequency display, and the value stored in the EEPROM is displayed on the memory channel number display.

- (2) Input a specified AG signal to microphone input.
- (3) Press the [MENU] key to write the current microphone input level value into the EEPROM.

②VOX sensitivity (Level 9)

- (1) Press the [LAMP] or [MONI] key on the transceiver to display "VOX9" on the LCD.
- (2) Input a specified AG signal to microphone input.
- (3) Press the [MENU] key to write the current microphone input level value into the EEPROM.

Reference voltage value are measured when the power supply voltage is 13.8V(DC IN).

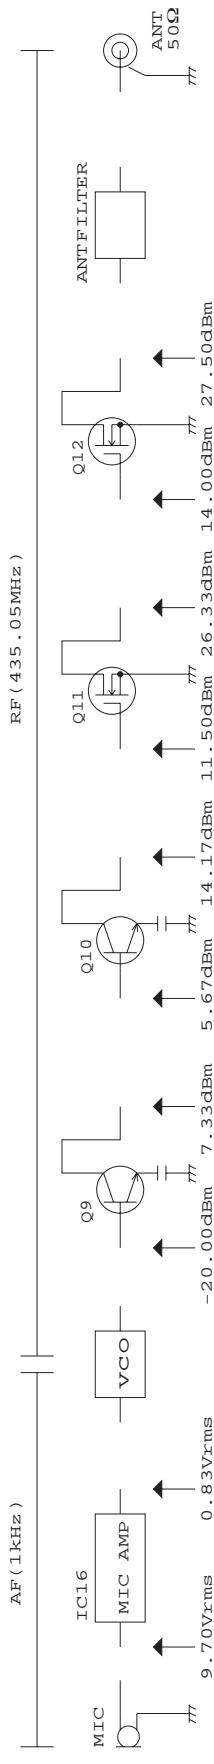

Note : The components marked with a dot (●) are parts of layer1.

TH-K4AT/K4E SCHEMATIC DIAGRAM

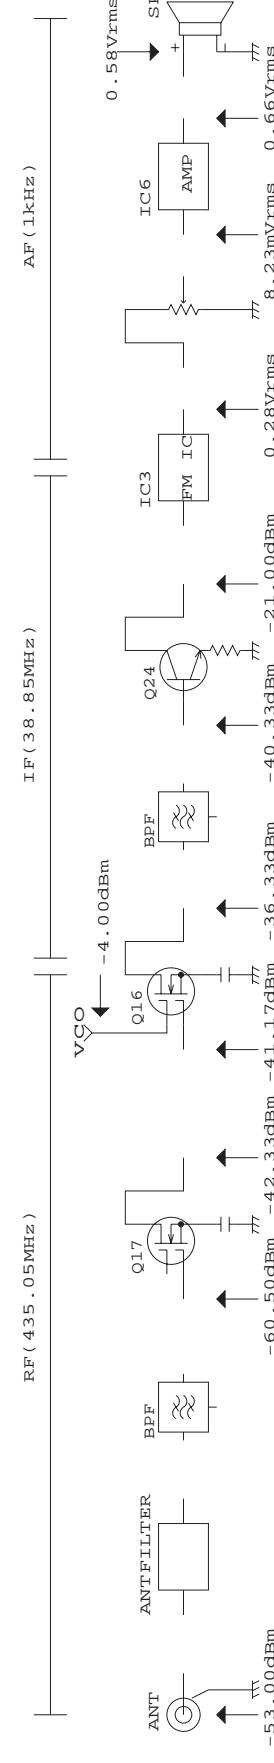

LEVEL DIAGRAM

Transmitter Section

All voltage levels must be measured at High power transmission.
The RF and IF sections are measured by using a spectrum analyzer.
After setting the standard (1 kHz, 3 kHz Dev), deviation, each voltage
of the AF section is measured by using an AF VTM or oscilloscope.
The level for each point is measured without removing parts or cutting
the pattern.

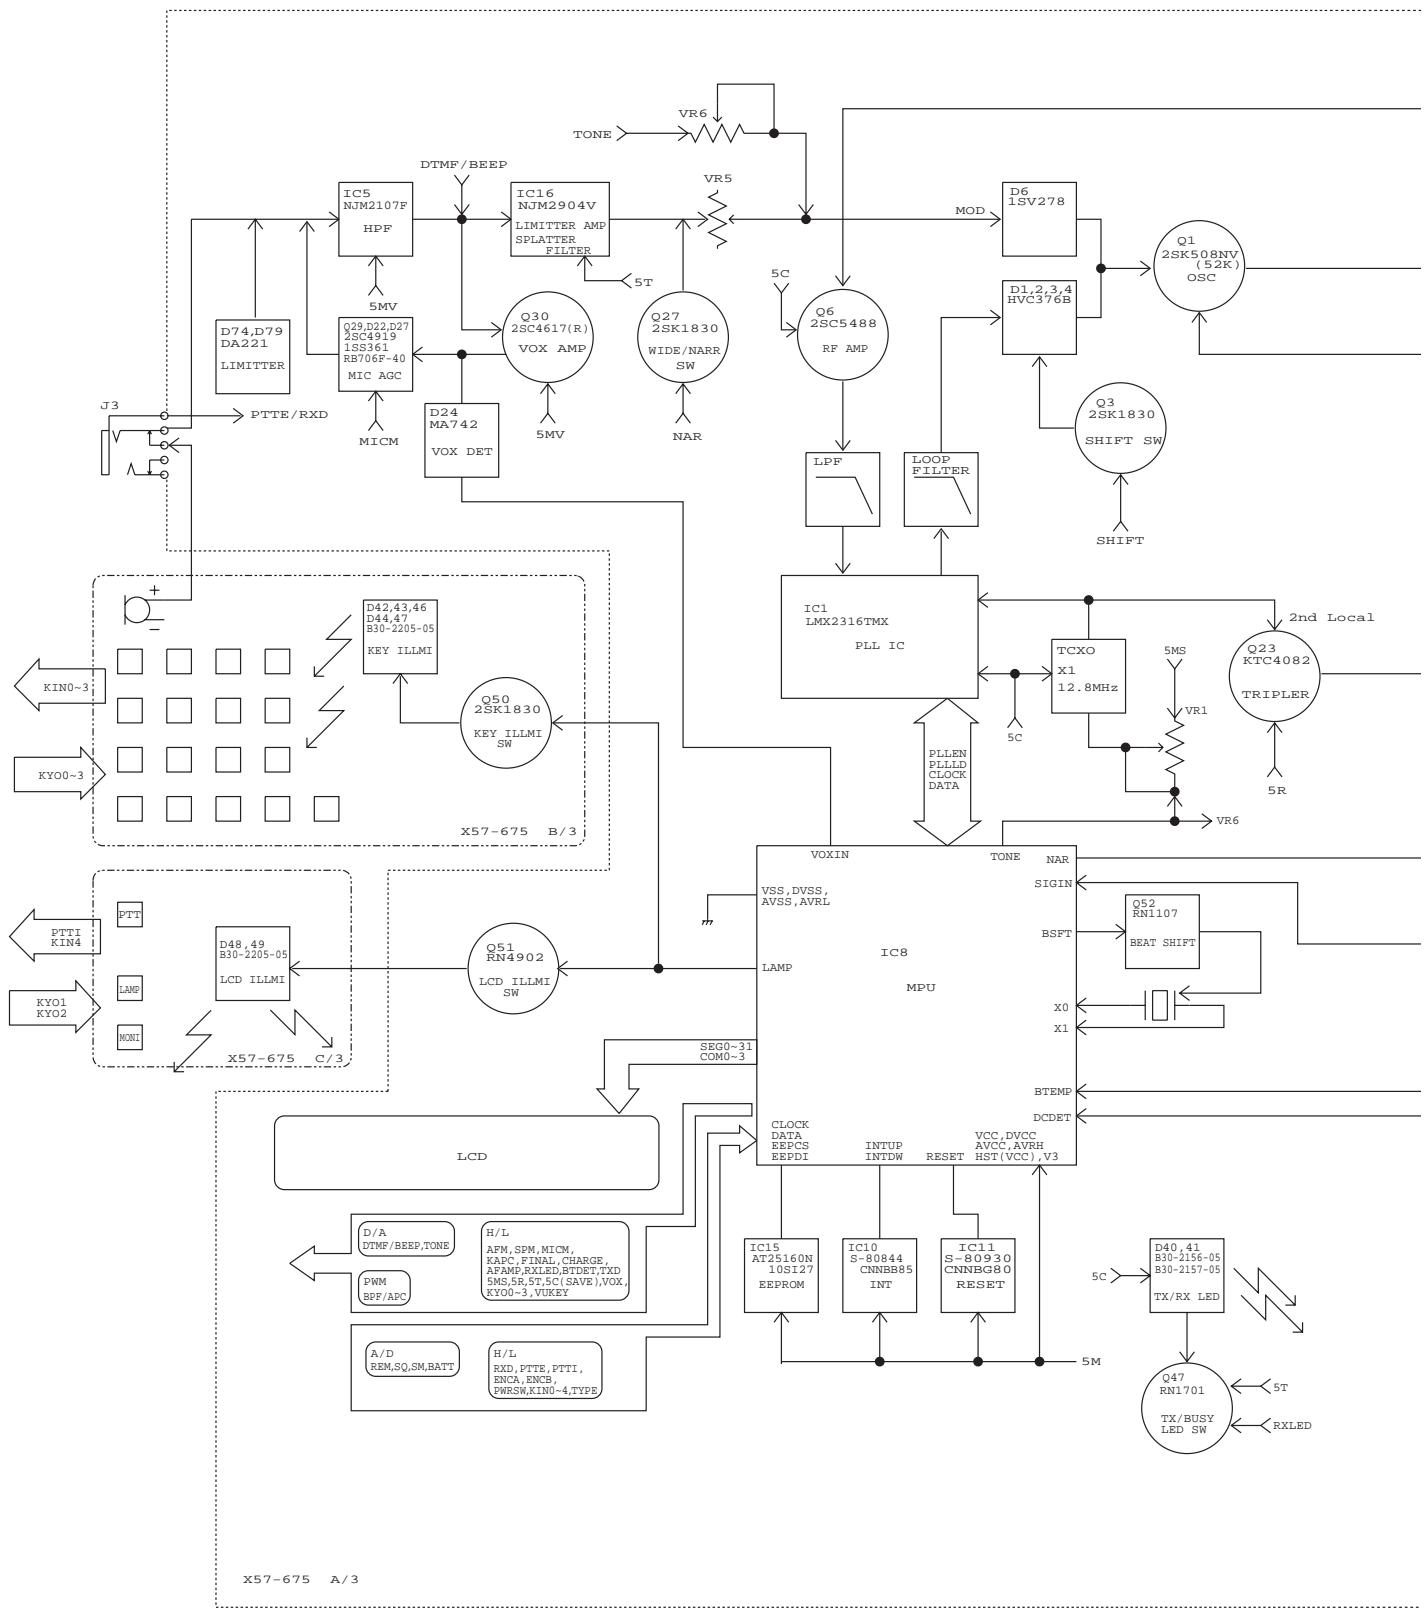

Receiver Section

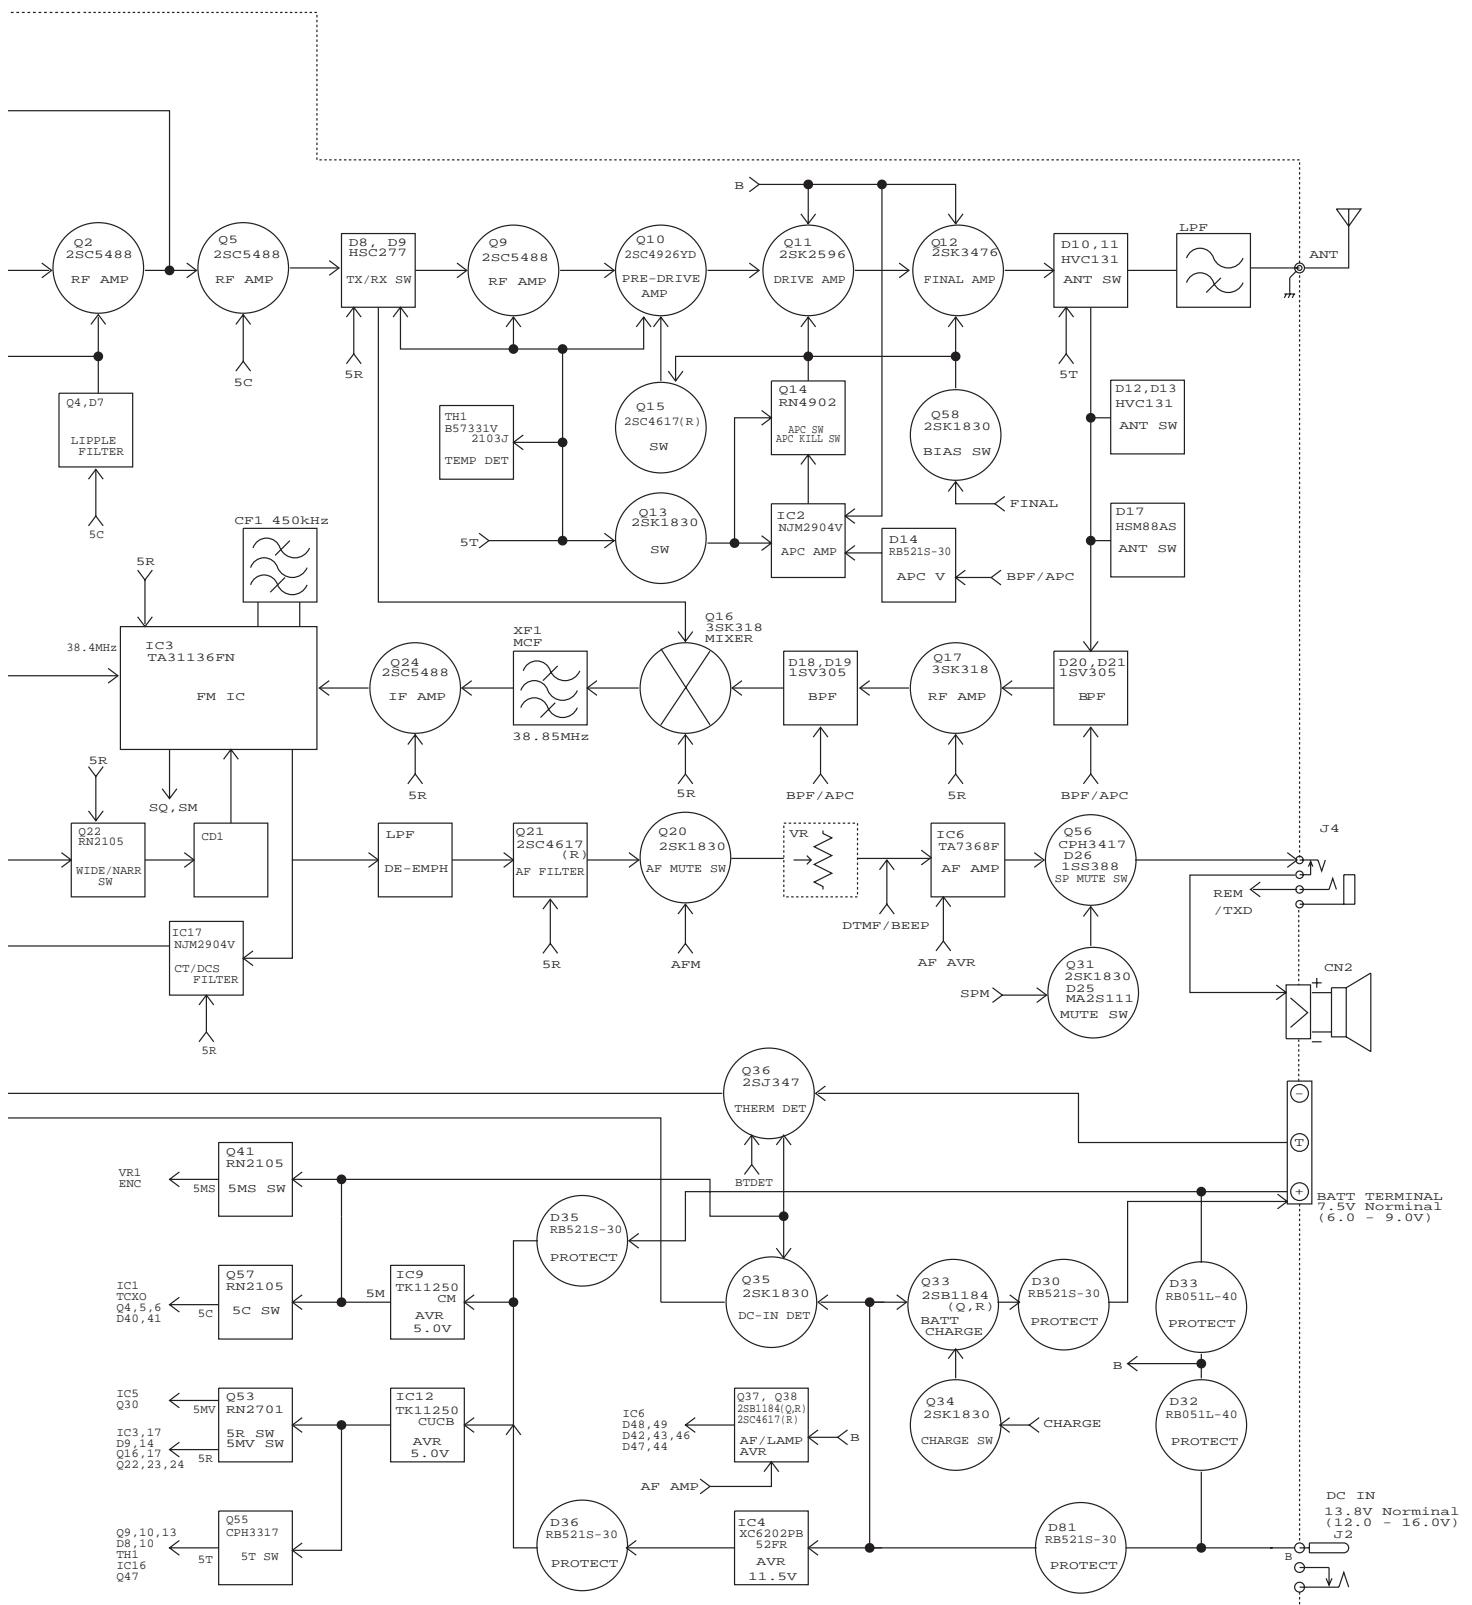

All voltage levels must be measured after setting the AF output volt-
age at 0.58V rms.
The RF and IF sections are measured by using a spectrum analyzer.
Each voltage of the AF section is measured by using an AF VTM or
oscilloscope.
The level for each point is measured without removing parts or cutting
the pattern.

TH-K4AT/K4E

SPECIFICATIONS

General		TH-K4AT	TH-K4E
Market code		M2	E
Number of memory channels	100 (50) + 8 special function memories		
Antenna impedance (Connector type)	50 Ω (SMA)		
Operating Voltage	DC IN Jack	DC 12.0 ~ 16.0 V (13.8 V nominal)	
	Battery terminal	DC 6.0 ~ 9.0 V (7.2 V nominal)	
Grounding method	Negative ground		
Current	Transmit with H, 13.8 V (DC IN)	1.8 A or less	
	Transmit with H, 7.2 V (PB-43N)	2.0 A or less	
	Transmit with M, 7.2 V (PB-43N)	1.5 A or less	
	Transmit with L, 7.2 V (PB-43N)	0.8 A or less	
	Receive (no signal)	100 mA or less	
	Battery Saver ON (Average)	30 mA or less	
Usable temperature range	-20° C ~ 60° C (-4° F ~ 140° F) -10° C ~ 60° C (+14° F ~ 140° F) with PB-43N		
Frequency stability	Within ±5 ppm (-20° C ~ 60° C)		
Dimensions (W x H x D Projections not included)	58 x 110 x 28.4 mm / 2 7/16" x 4 6/16" x 1 2/16" with PB-43N 58 x 110 x 29.6 mm / 2 7/16" x 4 6/16" x 1 5/32" with BT-14		
weight	Approx. 320 g / 11.3 oz with PB-43N Approx. 320 g / 11.3 oz with BT-14		
Transmitter			
Transmission Mode	F3E (FM) / F2D (FM)		
Frequency range	400 ~ 470 MHz	430 ~ 440 MHz	
Output Power	DC-IN jack (13.8 V)	H: 5.0 W (approx.) M: 1.5 W (approx.) L: 0.5 W (approx.)	
	PB-43N (7.2 V)	H: 5.0 W (approx.) M: 1.5 W (approx.) L: 0.5 W (approx.)	
	BT-14 (9.0 V)	H: 3.5 W (approx.) M: 1.2 W (approx.) L: 0.3 W (approx.)	
Modulation	Reactance		
Maximum frequency deviation	±5 kHz (FM) / ±2.5 kHz (NFM)		
Squurious emissions	-60 dB or less (H and M power), -50 dB or less (L power)		
Microphone impedance	2 kΩ		
Receiver			
Reception Mode	F3E (FM) / F2D (FM)		
Frequency range	400 ~ 470 MHz	430 ~ 440 MHz	
Intermediate Frequency (IF)	1st IF : 38.85 MHz 2nd IF : 450kHz		
Circuit type	Double super - heterodyne		
Sensitivity	FM (12 dB SINAD) 70 cm amateur radio band: 0.18 μV or less		
Squelch Sensitivity	0.13 μV or less (within 70 cm amateur radio band)		
Selectivity	-6 dB / 10 kHz or less -40 dB / 28 kHz or less (within 70 cm amateur radio band)		
Audio output (10% distortion)	400 mW or higher (7.2 V, 8 Ω load)		

Note: All specifications (General, Transmitter and Receiver) are guaranteed within the amateur radio band.
