## CIRCUIT DESCRIPTION

## Outline

The TS-780 is an all mode transceiver which covers both the 144 MHz and 430 MHz bands. It uses the double conversion system in the SSB and CW modes and the triple conversion system in the FM mode.

The first IF frequency is 30.865 MHz, the second IF frequency is 10.695 MHz and the third IF frequency is 455 kHz (FM mode only).

The unit includes a built-in IF SHIFT circuit, VOX circuit (which can be used as a semi break-in circuit), noise blanker, automatic scanning circuit (5 selectable scanning bandwidths), and memory scanning circuit.

**Receiver section** (Note : Items in brackets pertain to the 430 MHz band).

The 144 MHz [430 MHz] antenna input signal is applied to the front end (RF unit) of the receiver section through the diode switch in the 144 MHz final unit [430 MHz final unit].

The front end consists of an RF amplifier with a dual gate MOS FET (Q1 : 3SK76 or 3SK92) [a 2-stage RF amplifier using a dual gate MOS FET (Q5 : 3SK76-O) and a junction FET (Q7 : 2SK125)], a helical resonator with a bandwidth of 2 MHz [10 MHz], a 1st mixer (Q3 : 3SK74) [(Q8 : 3SK48)] and the first IF monolithic crystal filter (MCF). The 1st IF signal output from the front end is applied to the IF unit, where it is converted into the 2nd IF signal by the balanced mixer (Q1 and Q2 : 2SK125s) and filtered by the 2nd IF MCF.

The 10.695 MHz 2nd IF signal output from the 2nd IF MCF is then applied to both the SSB and FM IF circuits. In the SSB mode, the 2nd IF signal is applied to the crystal filter through the NB (noise blanker) gate, then is amplified by the IF amplifier consisting of Q9 through Q11.

The signal is then demodulated to an audio signal by the ring detector.

The noise component included in the 2nd IF signal is converted to a 455 kHz signal by the 3rd mixer (Q4 : 2SC1923(O)), then amplified by Q5 and Q6 (2SC460(O)s) to switch the NB gate.

The AGC circuit picks up the signal from the last stage of the 2nd IF amplifier (Q11 : 3SK73(GR)), then detects and amplifies it to obtain the AGC voltage. The time constant setting of the AGC circuit is automatically switched between FAST (for the CW mode) and SLOW (for the SSB mode). The AGC voltage is applied to the 2nd IF amplifier (Q9 through Q11 : 3SK73(GR)s) and the 144 MHz RF amplifier (Q5 : 3SK76-O) [the 430 MHz RF amplifier (Q1 : 3SK92)], and is also used to drive the meter for S indication.

In the FM mode, the 2nd IF signal is applied to the 3rd mixer (Q4 : 2SC1923(O)) where it is converted to the 455 kHz 3rd IF signal.

The 3rd IF signal is filtered by the ceramic filter (CFW455E), then amplified by Q20 (TA7302P) and Q21-Q24 (2SC460 (B)s) and demodulated.

The squelch circuit consists of Q27-Q31, D30, and D31. The demodulated signal is amplified by Q27 and Q28 (2SC1815 (Y)s), then rectified by D30 and D31 to control the switching circuit consisting of Q29-Q31 (2SC1815 (Y)s) and Q32 (2SA1015 (Y)). The switching circuit turns the AF amplifier (Q33 : 2SC2240 (GR)) and the BUSY indicator on and off and applies scan stop signal SQS to pin 37 of IC3 ( $\mu$ PD8035LC) on the control unit board (X53-1240-XX).

In all modes, the demodulated audio signal passes through AF amplifier Q33, the active LPF (Q34 : 2SC1815 (Y)) and the AF volume control circuit, and is then amplified by the power amplifier (Q35 : MB3713) to drive the speaker.

Unit	Mode/band	Frequency generated
CAR unit	FMT	10.695 MHz
	USB	10.6965 MHz
	LSB	10.6935 MHz

### Transmitter section

The audio signal from the microphone is amplified by the microphone amplifier in the IF unit consisting of Q36 and Q38 (2SC2240 (GR)s). The amplified audio signal is then applied to both the SSB and FM MIC gain controls. In the SSB mode, the audio signal from SSB MIC gain control VR1 is amplified by microphone amplifiers Q39 through Q41 (2SC1815 (Y)s) in the IF unit, and is then applied to the balanced modulator (BM) along with the carrier (10.695 MHz).

## CIRCUIT DESCRIPTION

The DSB signal output from BM is buffered by Q42 (3SK73 (GR)), then filtered by the crystal filter (XF2) so that the SSB signal is obtained. The SSB signal is applied to the balanced mixer consisting of Q51 and Q52 (2SK125s) through buffer amplifier Q43 (2SK61). The balanced mixer converts the frequency of the SSB signal from 10.695 MHz to 30.865 MHz. The 30.865 MHz SSB signal is applied to the 2-stage BPF, where spurious signals are eliminated, then is applied to the TX unit as the transmission IF signal.

In the FM mode, the audio signal from FM MIC gain control VR4 in the AVR unit (X43-1420-00) is amplified by Q45 (TA7061P) and Q48 (2SC1815 (Y)) in the IF unit. The audio signal is then applied to D46 (1SV50S) to frequency modulate the 13.8533 MHz signal generated by Q49 (2SC460 (B)). The 13.8533 MHz FM signal is tripled to obtain the 41.56 MHz FM signal used as the local signal. The local signal is mixed with the carrier (the 10.695 MHz signal obtained by unbalancing BM) by Q51 and Q52, then is applied to the TX unit as the transmission IF signal in the same manner as the SSB signal.

In the TX unit, the 30.865 MHz transmission IF signal is amplified by Q1 (3SK73(GR)), then mixed with the VCO signal by the balanced mixer consisting of Q2 and Q3 (3SK74 (M)s) [mixed with the 430 HET signal by the double balanced mixer (D15 : ND487C1-3R)] to obtain the 144 MHz [430 MHz] signal.

The 144 MHz signal is filtered by the BPFs and amplified by Q4 (2SK125), Q5 (2SC2026) and Q6 (2SC2538-22-A) to drive the 144 MHz final unit. [The 430 MHz signal is filtered by 2-pole helical resonators and amplified by Q9 (2SC2549), Q10 (3SK92), Q11 (2SC2026) and Q12 (2SC2762) to drive the 430 MHz final unit.]

In the 144 MHz final unit (X45-1200-00) [the 430 MHz final unit (X45-1210-00)], the signal is amplified by power module M57713 (final ASS'Y Q1) [M57716 (Q7)], then fed to the 144 MHz [430 MHz] antenna through the LPF. The ALC circuit picks up the signal from terminal 14D [43D] on the TX unit and amplifies it with Q7 (2SC1815 (Y)). This signal is applied to the 2nd gate of Q1 and the 2nd gate of Q42 (in the IF unit), and is also used to drive the meter for ALC indication. The ALC circuit system can be externally controlled.

Protection is provided by decreasing the source voltage of Q1 in the TX unit and the DB voltage supplied to the final units. HI/LOW power switching in the FM mode is also obtained in the same manner.

In the CW mode, keying is performed by switching the bias line to straight amplifier Q5 [Q11] in the TX unit with Q8 (2SA1015 (Y)).

## CIRCUIT DESCRIPTION

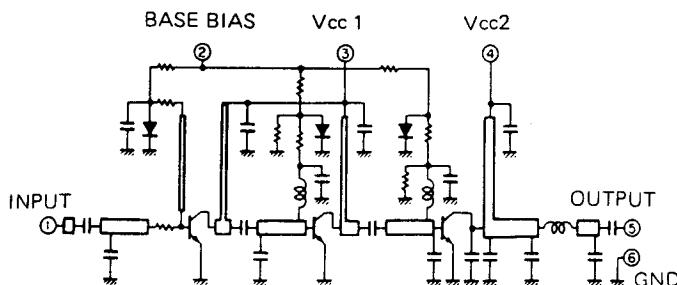

Fig. 5 Power module M57716 Equivalent circuit

This is then amplified by the circuit consisting of two helical resonators, Q1, Q2 (2SC2549s) and Q3 (2SK125) and used as the 1st local signal for 430 MHz operation. The 2nd local signal is generated in the IF unit : Q49 (2SC460 (B)) generates a 13.8533MHz signal and Q50 (2SC1923 (O)) triples it. The 2nd local signal is frequency modulated in the FM mode, shifted by 800 Hz in the CW mode, and subject to RIT control in the SSB and CW modes by means of D46 (1SV50S).

The 10.24 MHz reference signal generated in the PLL unit is used as the 3rd local signal.

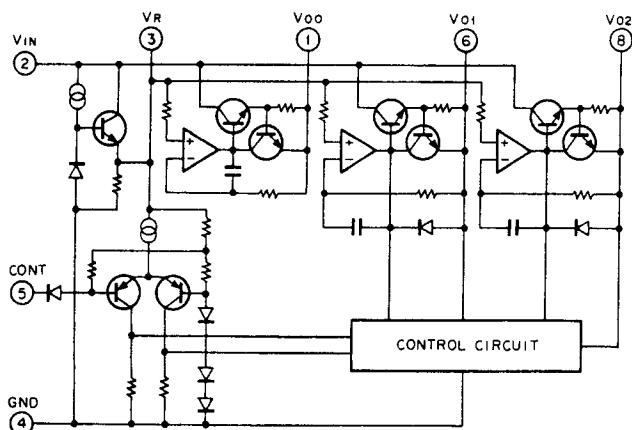

Fig. 6 MB3756 Equivalent circuit (AVR unit IC2)

### HET Circuit

The VCO signal is used as the 1st local signal for 144 MHz operation. On the other hand, the 430 HET unit (X50-1790-00) is used for 430 MHz operation to generate the 1st local signal. In the 430 HET unit, Q4 (2SC460 (B)) generates 40.85714 MHz for the low band segment and 41.57143 MHz for the high band segment. Q5 (2SC2026) multiplies this to 286 MHz or 291 MHz. This 286 MHz or 291 MHz signal is amplified by the circuit consisting of two BPFs, Q6 (3SK92) and Q7 (2SK125), then mixed with the VCO signal by DBM (D1 : ND487C1-3R) to generate a 399.135 MHz–409.13498 MHz signal.

### PLL Circuit

A block diagram of the PLL unit is shown in Fig. 7. This is a double loop PLL circuit consisting of A and B loops.

#### • Loop B circuit

The phase locked loop formed of IC7, IC8, IC12, Q21 and Q22 is called loop B. The VCO frequency is mixed with a 32.431 MHz signal to obtain a 12.7–14.698 MHz signal. This signal is divided by 100 so that a 127–146.98 kHz signal is obtained. The result is varied in 20 Hz steps because the VCO frequency is varied in 2 kHz steps.

#### • Loop A circuit

The phase locked loop formed of IC1, IC9, IC10, Q2, Q6 and Q7 is called loop A. The VCO generates a signal whose frequency is varied in 20 kHz steps over a bandwidth of about 5 MHz.

#### • Reference signal generator

Q16 generates the reference signal, which is applied to both loops A and B via buffer amplifiers. The reference signal is also used as the 3rd local signal for the receiver section.

#### • Local signal generator

The carrier frequency, which differs according to mode, is converted to 10.055 MHz±2.5 kHz. Up-conversion method is used for FM reception because the carrier frequency cannot be set to 10.695 MHz (the 2nd IF frequency). The 10.055 MHz signal is then mixed with the loop B output signal. The signal output by the mixer is filtered by the 10.192 MHz narrow band filter, then mixed with the signal from Q13 by the mixer consisting of Q3 and Q4. The output of the last mixer is fed to the loop A mixer (IC1) as the local signal.

#### • Unlock protection

The unlock signal from the loop A PLL IC (IC9) is applied to Q10 and Q11 to generate ULB and UL signals for preventing unwanted transmission.

## CIRCUIT DESCRIPTION

### Control Circuit

The microcomputer used in the control unit consists of 3 IC's, a CPU (IC3 :  $\mu$ PD8035LC), ROM (IC4 :  $\mu$ PD2332C-384) and RAM (IC5 :  $\mu$ PD5101LC).

#### • Fundamental operation

CPU clock signal ALE is generated by dividing the 5.745 MHz signal produced by ceramic resonator X1 by 15 in CPU. The control program is stored in ROM and read out through the bus (DB0-DB7) in the following manner : CPU outputs an address to the bus, then the address data is latched by the address latch (IC13 and IC14) at the timing of ALE. The latched address is given to ROM. ROM outputs program data to the bus according to the given address when the CPU outputs PSEN. CPU reads this program data and executes it.

The above procedures are repeated as necessary.

For example, the following procedures are used when RAM is accessed. CPU outputs the RAM address to the bus and the address is latched at the timing of ALE.

The latched address is given to RAM when RAM is enabled by the most significant bit (that is, when CE1 is logical "1").

When data (a VFO frequency or memory channel) is written in RAM, CPU outputs the data to the bus and sets WR to logical "1". When data is read from RAM, CPU sets RD to logical "1" and reads the data on the bus. WR and RD are applied to the R/W and OD terminals of RAM, Respectively.

#### • Reset

When the line voltage reaches about 3.8 V after the power is turned ON, current flows through D1 (MA522 (R)) to turn Q1 ON. The level at pin 4 (RESET) is then set to "L" and CPU is reset. As the line voltage rises further, the level at pin 4 of CPU returns to "H". CPU is reset whenever the power is switched ON or OFF, regardless of whether a backup battery is installed.

When the CPU is reset, program execution starts at program address 0 ; that is the CPU checks for the backup battery and, if it is not installed, the CPU initializes the frequency and resets the memory channels.

#### • Backup

During backup operation, power is supplied to RAM only. The reset signal is applied to CE2 (pin 17 of IC5) so that data to be backed up is protected when the main power is switched ON or OFF.

#### • Display

The 8-digit display indicates the function selected (A, B and CH No.) and the frequency in units of 100 Hz. The display is driven dynamically. The digit data is latched by the display digit latch (IC8 and IC9) for application to the display. CPU outputs 90 (HEX) to the bus before it outputs the digit data to the latch. 90 (HEX) is latched by the address latch (IC13 and IC14) at the timing of ALE. The latched data is applied to the address 90 detection gate (IC17A) to open it. Therefore, WR output from the CPU is applied to the EN terminal of the display digit latch through the address 90 detection gate. Thus, digit data output from the CPU is latched by the display digit latch.

The segment data is output from terminals P10 through P17 (pins 27 through 34) of the CPU and applied to the display.

#### • Display control signal generator

The signal generated by IC16 is differentiated, then shaped by IC15B. The shaped signal is applied to the INT terminal of the CPU. CPU operation is interrupted when the level at the INT terminal becomes "L" to output display data for one digit. After the display data is output, CPU continues the execution interrupted.

## CIRCUIT DESCRIPTION

## • PLL data

16-bit PLL serial data for loops A and B is output simultaneously from terminals DTA and DTB. A clock pulse is output for each bit, and EN is output to the PLL unit after all bits have been output.

The CPU outputs (HEX) A0 to the bus, then this data is latched by the address latch (IC13 and IC14) at the timing of ALE.

The latched data is then applied to the address A0 detection gate (IC17B), whereupon the CPU outputs WR. At the same time, the CPU outputs the PLL data for loop A to DB3 and that for loop B to DB7.

Both loop A data and loop B data are output to the PLL unit through the gates (IC18C and IC18D) which are opened by the address A0 detection gate. WR is also used as the clock signal (CLK) for the programmable counters in the PLL unit. EN is output from pin 38 of the CPU.

PLL data is the same whether the frequency is 144.0000, 430.0000 or 435.0000. Data for loop A is 283 (decimal) and that for loop B is 6350 (decimal). The value for loop A (or B) increases by one as the frequency is increased by 20 kHz (or 20 Hz). The PLL data is output once when the frequency is changed.

Table 14 Functions of terminals

Symbol	Name	Description
A0~A7	ADDRESS	Address input terminals.
DI1~DI4	DATA INPUT	Write data input terminals.
R/W	READ/WRITE	Reads are performed when the level applied to this terminal is "H", otherwise, writes are performed.
CE1	CHIP ENABLE1	The chip is enabled when the level applied to this terminal is "L" while the level at CE2 is "H".
CE2	CHIP ENABLE2	The chip is enabled when the level applied to this terminal is "H" while the level at CE1 is "L".
OD	OUTPUT DISABLE	The output terminals are enabled when the level applied to this terminal is "L", otherwise they are disabled and their output impedance is set to high.
DO1~DO4	DATA OUTPUT	Read data output terminals.
Vcc	POWER (+5V)	Terminal connected to +5V power supply
GND	GROUND (0V)	Ground terminal.

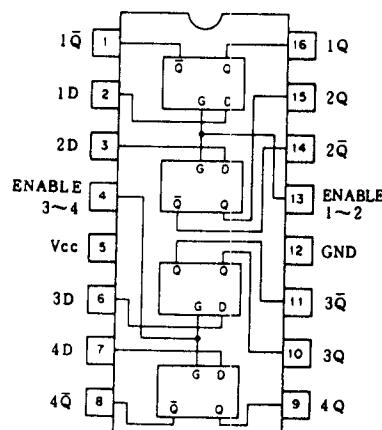

Table 16 Functions of  $\mu$ PD5101LC (CONT. unit IC5)

Fig. 13 HD74LS75P (CONT. unit IC8, 9, 13, 14)

Terminal Name	Function
PROG	Clock input terminal. Clock signals for data or commands are input to this terminal.
CS	The PROG terminal is enabled so that data can be transferred between the CPU and this IC and so that commands can be input to this IC from the CPU.
PORT2	Data and commands from the CPU and data to the CPU are transferred through this port.
PORT4	Data is transferred between this IC and external circuits through these ports. Ports are selected by port address data (commands) and I/O operations are selected by control commands.
PORT7	

Table 15 Functions of  $\mu$ PD8243C (CONT. unit IC1, 2)

Input		Output	
D	G	Q	$\bar{Q}$
L	H	L	H
H	H	H	L
X	L	$Q_0$	$\bar{Q}_0$

- Notes ) H : High level  
 L : Low level  
 X : Either level  
 Q0 : The state of Q immediately before the indicated input conditions are established.  
 $\bar{Q}_0$  : The complement of Q0.

Table 17 HD74LS75P truth table

## CIRCUIT DESCRIPTION

## ● Encoder waveform shaping

Square waves with a duty ratio of 50% are applied to V1 through V4. The waves applied to V1 and V3 are 180 degrees out of phase with those applied to V2 and V4, respectively, and the wave applied to V1 leads that applied to V3 by 90 degrees. These waves are differentiated. The square

waves and the differentiated waves are subjected to logical operations to obtain the VFO pulse signals.

IC10 is the gate which closes during FM CH operations. IC15C and IC15D form an RS flip-flop used for determining the direction of rotation of the encoder.

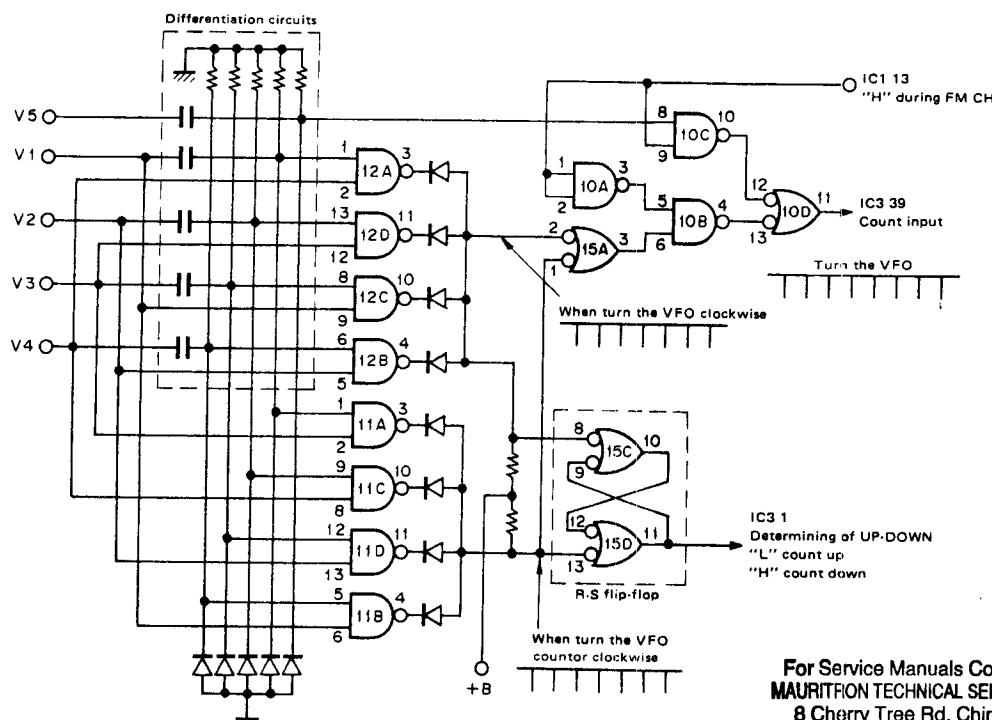

Fig. 14 Encoder waveform shaping

## ● UP and DOWN switch signal processing

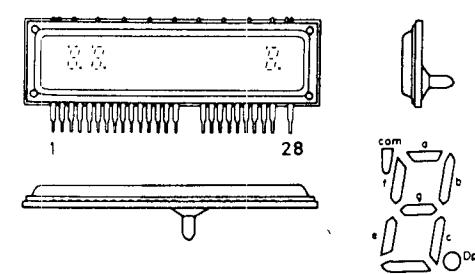

The microphone UP and DOWN switch signals and the BAND UP and DOWN switch signals are applied to gates IC6A, IC6D, IC7A and IC7D.

The CPU outputs A0 (HEX) to the bus at the prescribed timing ; this address data is latched by the address latch (IC13 and IC14), then is applied to the address A0 detection gate (IC17C). This gate opens the gates in IC6 and IC7 when the CPU outputs RD to allow the CPU to read the switch status.

## ● I/O expansion ports

When an I/O operation is performed through the I/O expansion ports, the CPU outputs an "L" level signal from terminal P24 or P25 (pin 35 or 36) to select IC2 or IC1.

The I/O operation is performed in 4 bit units through ports 4 through 7 (of IC1 and IC2). Ports 6 and 7 of IC1 are used only for output, while ports 4 and 5 of both IC1 and 2 are used only for input. The CPU outputs PROG as the clock signal for the expansion ports.

## DC Operation

No DC power cable is provided with the TS-780. Purchase a DC power cable such as that shown in Fig. 15 for DC operation. Since this cable does not include a fuse, use a 7A fuse in the TS-780.

DC power cables and fuses are available at any Kenwood branch or service center. The part number of the DC power cable assembly is E30-1622-05.

## PARTS LIST

**Note 1:**  
K: USA T: Britain W: Europe X: Australia

**Note 2:**

Only special type of resistors (example: cement, metal film, etc.) and capacitors (example: electrolytic, tantalum, mylar, temp. coeff., capacitors) are detailed in the PARTS LIST. For the value of all common type components, refer to the schematic diagram of the P.C. board illustration. Resistors not otherwise detailed are carbon type (1/4W or 1/8W). Order carbon resistors and capacitors according to the following example.

A carbon resistor's part number is RD14BY 2E222J.

A ceramic capacitor's number is CK45F1H103Z. CC45TH1H220J.

**RESISTOR**

## 1. Type of the carbon resistor

RD14BY

# ADJUSTMENT

## REQUIRED TEST EQUIPMENT

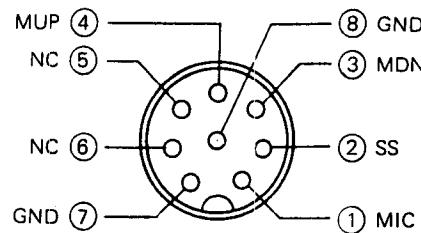

1. DC V.M
  - High input impedance
2. RF VTVM (RF V.M)
  - Input impedance:  $1M\Omega$  min.,  $2pF$  max
  - Voltage range: F.S =  $10 \text{ mV} \sim 300 \text{ V}$
  - Frequency range: Up to 450 MHz
3. Frequency Counter (F count)
  - Input sensitivity: Approx. 50 mV
  - Frequency range: Up to 450 MHz
4. DC Power Supply
  - Voltage:  $10 \text{ V} \sim 17 \text{ V}$ , variable
  - Current: 6A min
5. Power Meter
  - Measurement range Approx. : 30W, 3W, 1W.
  - Input impedance:  $50 \Omega$
  - Frequency range: 450 MHz
6. AF VTVM (AF V.M)
  - Input impedance:  $1M\Omega$  min.
  - Voltage range: F.S =  $1 \text{ mV} \sim 30 \text{ V}$
  - Frequency range: 50 Hz  $\sim$  10 kHz
7. AF Generator (AG)
  - Output frequency:  $100 \text{ Hz} \sim 10 \text{ kHz}$
  - Output voltage:  $0.5 \text{ mV} \sim 1 \text{ V}$
8. Linear Detector
  - Frequency range: 450 MHz
9. Field Strength Meter
  - Frequency range: 450 MHz
10. Directional Coupler
11. Oscilloscope
  - High sensitivity oscilloscope with horizontal input terminal
12. SSG
  - Frequency range: 144 MHz and 430 MHz band.
  - Modulation: AM and FM MOD.
  - Output level:  $-20 \text{ dB}$  to  $100 \text{ dB}$
13. Dummy Load
  - $8\Omega$ , 5W (approx.)
14. Noise Generator
  - Must generate ignition-like noise containing harmonics beyond 450 MHz.
15. Sweep Generator
  - Sweep range: 144 MHz and 430 MHz bands
16. Tracking generator

## Preparation

- 1) Unless otherwise specified, Knobs and switches should be set as follows **Table 19**.

POWER SW	ON	SSB MIC VR	MIN
SEND/REC SW	REC	RIT VR	CEN
VOX/MAN SW	MAN	IF SHIFT VR	CEN
ALC/CEN/RF/S SW	RF/S	SQUELCH VR	MIN
NB SW	OFF	RF GAIN VR	MAX
LOW/HIGH SW	HIGH	AF GAIN VR	MIN
PRIOR. M [9]	OFF	F.STEP SW	OFF
PRIOR. M [10]	OFF	RIT SW	OFF
TX-OFFSET SW	SIMP	SCAN SW	OFF
TONE SW	OFF	MS 144 SW	OFF
MODE SW	USB	MS 430 SW	OFF
FUNCTION SW	A	MR SW	OFF
MEMORY	1	F.LOCK SW	OFF

**Table 19**

**Fig. 17 MIC terminals (view from front panel side)**

- 2) Use an insulated adjusting rod to adjust trimmers and coils.
  - 3) To prevent damaging SSG, never set the stand by switch to SEND while adjusting the receiver section.
  - 4) Be sure to turn the power and VOX switches OFF before connecting the power cable to a power source.
- Note:** The set enters the transmission mode for an instant when the power switch is turned ON with the VOX switch ON.
- 5) SSG output levels are those at the time the output terminal is open.

## ADJUSTMENT

## GENERAL ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specification	Remarks
		Test equipment	Unit	Terminal	Unit	Parts	Method		
1. Voltage adjustment (1)	1) Connect the AC power to the POWER terminal on the rear panel.								
	2) POWER SW : ON SEND/REC SW : REC		Digital voltmeter	AVR	FB	AVR	VR1	13.8V	±0.1V
2. Voltage adjustment (2)	1) Connect the DC power to the POWER terminal on the rear panel. (DC 13.8V)								
	2) CALL SW : ON SEND/REC SW : SEND REC		Digital voltmeter	AVR	43T	AVR	VR2	9.0V	0V
3. Voltage check	1) Same as above.		Digital voltmeter	AVR	PL8				8.0V±0.3V

	6) Frequency : 430.00 439.9875			TP4		TC1	Adjust the band-edge levels so that they are the same. (0.06V)		

## CONFIRM OF RESET VOLTAGE

Item	Condition	Measurement			Adjustment			Specification	Remarks
		Test equipment	Unit	Terminal	Unit	Parts	Method		
1. Setting	1) Connect an AVR (5V) to both pins 1 and 8 of connector of the control unit.								
	2) Set VR1 to maximum.								
2. Reset voltage	1) Decrease the AVR voltage.	DC V.M	Control	② 5V			The frequency display should go out when the AVR voltage is 3.95~4.5V.		Check
	2) In case the frequency display does not go out after the AVR voltage drops below 3.95V.				Control	VR1	Set the AVR voltage to 3.95V and adjust VR1 so that the frequency display goes out.		

## ADJUSTMENT

## RECEIVER ADJUSTMENT (2m BAND)

Item	Condition	Measurement			Adjustment			Specification	Remarks
		Test equipment	Unit	Terminal	Unit	Parts	Method		
1. BPF	1) MODE SW : FM CH BAND SW : 144 Pull connector LR out from the RF unit.	Sweep generator Linear detector Oscilloscope	RF TP3	144 ANT TP3	RF	HB(D) HB(E)	Adjust HB(D) and HB (E) so that the waveform shown at right is observed. (The level at 144 MHz is a little lower than that at 146 MHz).		Insert connector LR after adjustment.
									
2. Sensitivity	1) Turn the core of L6 in the IF unit outward as far as possible. Connect SSG to the 144 ANT connector. (MOD : 1 kHz, FM DEV : 5 kHz).	RF V.M Frequency counter	IF TP1	IF	L30,31 TC3	MAX 41.560 MHz	(0.3V) ±1 kHz		Temporary setting
		S meter		RF	L1~3	Adjust specified parts repeatedly to obtain the maximum S meter reading.	Lower the SSG output level so that the S meter reads "3".		NOTE : This adjustment influences upon sensitivity in the 430 MHz band.
				IF	L1,2 L30,31 L3~5				
3. S meter reading in the FM mode	1) MODE SW : FM CH Frequency : 145.0125 SSG output : 60 dB $\mu$	SSG S meter		144 ANT	IF	L20	MAX		
	2) Adjust the SSG output level so that the S meter reads "5".				VR4	Adjust VR4 so that the S meter reads "10".			
	3) SSG output : 40 dB $\mu$				L6	Turn the core of L6 clockwise until the S meter reads "2".			
					L3~L5	Adjust L3~5 for the maximum S meter reading.			Repeat the adjustment.
					VR4	Adjust VR4 so that the S meter reads "10".	Perform this adjustment with set placed right-side up.		
4. Sensitivity in the SSB (CW) mode	1) MODE SW : USB SSG output : -14 dB $\mu$	AF V.M SSG		EXT SP 144 ANT	IF	L7,14 L16,17	AF output : MAX Repeat the adjustment.	Turn the core of L14 a little to the left if noise makes adjustment difficult.	
5. S meter zero adjustment	1) IF unit VR1 : center SSG output : OFF	S meter			IF	VR2	Adjust VR2 so that the S meter needle points exactly to "1" on the RF scale		
	2) Turn RF GAIN VR to the left until the S meter needle points to "4" on the RF scale.				VR2	Adjust VR2 so that the S meter needle points exactly to "1" on the RF scale.			

## ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specification	Remarks
		Test equipment	Unit	Terminal	Unit	Parts	Method		
6. RX carrier suppression	1) RF GAIN VR : MIN	RF V.M	IF	D17	IF	TC1	MIN	(0.01V)	
7. S meter reading in the SSB (CW) mode	1) SSG output : 20 dB $\mu$ Adjust the SSG frequency for the maximum S meter reading.	S meter			IF	VR1	"S-9"		
	2) SSG output : 0 dB $\mu$				L14	Turn the core of L14 outward until the S meter reads "S1".			
	3) SSG output : 20 dB $\mu$				VR1	Adjust VR1 so that the S meter reads "S9".			
8. N.B	1) SSG output : 10dB $\mu$	DC V.M	IF	TP2	IF	L9,10	MIN		
9. C.M	1) MODE SW : FM ALC/CEN-RF /S SW : ALC/CEN SSG output : OFF	DC V.M	IF	TP4 TP3	IF	VR12	Adjust VR12 so that the level at TP3 is equal to that at TP4.	If this is not possible, a difference between the two levels of within 0.6V is permissible.	No signal may be applied during this adjustment.
	2) Frequency : 145.0125 Frequency : 435.0125	Center meter			IF	VR5	Center meter : center		
	3) SSG output : 20 dB $\mu$ (MOD, 1 kHz) (DEV, 5 kHz) Fine-adjust the SSG frequency so that the maximum AF output is obtained. Then, turn MOD OFF.				VR13	Center meter : center	Confirm that the center meter needle swings beyond the range beyond the range between the two E's of the CENTER marking as the VFO dial is rotated right and left.		Check
10. RIT,CW SHIFT	1) MODE SW : USB	Frequency counter	IF	TP1	IF	TC3	41.560 MHz	$\pm 100$ Hz	
	2) RIT SW : ON RIT VR : Center				VR9	Adjust VR9 so that the frequency is within 41.560 MHz $\pm$ 20 Hz.		The RIT indicator lights.	
	Turn RIT VR all the way to the right and left.					The frequency must be varied by more than $\pm 1.5$ kHz.			
	3) MODE SW : CW RIT VR : Center RIT SW : OFF				CW shift	VR6	41.5592 MHz	$\pm 20$ Hz	
	4) RIT SW : ON				VR5	41.5592 MHz	$\pm 20$ Hz		

## ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specification	Remarks
		Test equipment	Unit	Terminal	Unit	Parts	Method		
	5) Confirm that SEND/REC SW is set to SEND, then set it to REC.	Frequency counter	IF	TP1	CW Shift			41.560 MHz	Check
11. Sensitivity check	1) MODE SW : USB SSG output : -8 dB $\mu$ Frequency : 144.0125 or 145.9875	SSG AF V.M Oscilloscope		144 ANT EXT SP				S/N : better than 10 dB	Check
	2) MODE SW : FM CH SSG output : -6 dB $\mu$ Frequency : 144.00 or 145.9875							S/N : better than 20 dB.

## ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specification	Remarks
		Test equipment	Unit	Terminal	Unit	Parts	Method		
2. ALC meter	2) MODE SW : CW CAR VR : MAX SEND/REC SW : SEND  Check at the following frequencies. 144.000.0 or 145.990.0 430.000.0 or 439.990.0	ALC meter			IF	VR11	Adjust VR11 so that the meter reads "10" on the RF scale.	"S9+40 dB" or more on the S scale	
	3) MODE SW : USB Connect AG to the MIC terminal. (1.5 kHz, 2mV) Check at the following frequencies. 144.000.0 or 145.990.0 430.000.0 or 439.990.0	ALC meter					The ALC meter needle should start swinging before SSB MIC VR is turned beyond the 3 o'clock position.		
3. Deviation	1) MODE SW : FM Frequency : 145.000.0 FM MIC VR : MAX Connect AG to the MIC terminal. (1 kHz, 20mV)	Linear detector		144 ANT (Directional coupler)	IF	VR8	5 kHz		
	2) MIC input level : 2 mV				AVR	FM MIC	3.5 kHz deviation should be obtained before FM MIC VR is turned beyond the 3 o'clock position.	Check	
4. VOX (ANTI VOX) operation check	1) MODE SW : USB VOX GAIN VR : MIN ANTI VOX VR : MIN Connect AG to the MIC terminal. (1.5 kHz, 2mV)						1) VOX should operate before VOX GAIN VR is turned beyond the 12 o'clock position. 2) The VOX relay holding time decreases as VOX DELAY VR is turned counterclockwise (and vice versa).	Check	
	2) Confirm operation in the modes shown at right.						USB FM	Operate	
	3) MODE SW : USB ANTI VOX VR : MIN							CW Not operate	
							VOX is not operate when turn VOX GAIN VR at condition of ANT VOX voltage (EXT. SP) is 200mV.		

## ADJUSTMENT

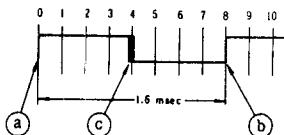

Item	Condition	Measurement			Adjustment			Specifications	Remarks
		Test equipment	Unit	Terminal	Unit	Parts	Method		
5. SIDE TONE	1) MODE SW : CW SEND/REC SW : REC SIDE TONE VR : MAX AF GAIN VR : Center Connect the key to the terminal KEY rear panel.	AF V.M		EXT. SP	AVR	VR5	Mechanical center.	The side tone should be heard when the key is pressed. 0.3~1.26V/ 8Ω	
	2) SEND/REC SW : SEND	Power meter					The side tone should be heard and transmission start when the key is pressed.	Check	
	3) SEND/REC SW : REC VOX/MAN SW : VOX DELAY VR : MIN	Power meter					The side tone should be heard and transmission start when the key is pressed. Reception should start immediately when the Key is released.		
6. Frequency response in the SSB mode	1) MODE SW : USB SSB MIC VR : CEN Connect AG to the MIC terminal. (AG1 : 400 Hz, 1 mV AG2 : 2.6 kHz, 1 mV SEND/REC SW : SEND	Oscillo-scope RF V.M (power meter)		ANT	CAR	TC1	Adjust TC1 so that the waveform shown below is observed.		NOTE : Check carrier suppression after this adjustment.
	2) MODE SW : LSB SEND/REC SW : SEND								

## ENCODER ASS'Y ADJUSTMENT

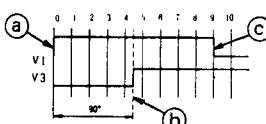

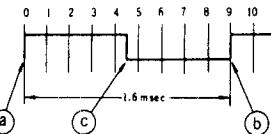

Item	Condition	Measurement			Adjustment			Specifications	Remarks
		Test equipment	Unit	Terminal	Unit	Parts	Method		
1. Setting	1) POWER terminal on the rear panel : AC Mount a motor in place of the VFO knob.	Oscillo-scope	Control	⑧ 5- V1			Set the sweep control of the oscilloscope to 0.2msec/cm. Adjust the motor speed so that position (a) ~ (b) to 8 graduations on the oscilloscope screen.	Motor speed : 300 rpm.	(c) point may be at any position. If a motor is not available, turn the VFO knob by hand to check the duty ratio.

Email: [enquiries@mauritron.co.uk](mailto:enquiries@mauritron.co.uk)

## ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specification	Remarks
		Test equipment	Unit	Terminal	Unit	Parts	Method		
2. V1 duty ratio	1) Set the sweep control of the oscilloscope to 0.1 msec/cm.	Oscillo-scope	Control	@5-V1			Turn the variable control of the oscilloscope so that point (b) is positioned to graduation 9.		
	2)	DC V.M				Encoder	VR3	2.7V	$\pm 0.1V$
3. V3 duty ratio	1) same as above.	Oscillo-scope DC V.M	Control	@3-V3	Encoder	VR2	2.7V	$\pm 0.1V$	
4. Phase difference between V1 and V3	1) Set the sweep control of the oscilloscope to 50 $\mu$ sec/cm. Do not turn the variable control.	Oscillo-scope	Control	@3-V3 @5-V1			Point (b) is positioned to graduation (4) ~ (5)	Check	
5. V5	1) Set the sweep control of the oscilloscope to 0.5 msec/cm.	DC V.M	Pulse generator	J1-C	Encoder	VR1	2.7V	$\pm 0.1V$	
	2) MODE SW SW : FM CH							"H" level (5V) when encoder is stopped.	Check

## MICROPROCESSOR OPERATION CHECK

Item	Condition	Operation check
1. Reset	1) Remove the backup battery, if installed.	
	2) POWER SW : ON	"A 144.000.0" is displayed.
2. F.STEP	1) Slowly rotate the VFO knob through one turn.	The display value varies by 10 kHz as the VFO knob is rotated through one turn.
	2) F.STEP SW : ON Slowly rotate the VFO knob through one turn.	F. STEP LED lights. The display value varies by 100 kHz as the VFO knob is rotated through one turn.
	3) NORM/TIGHT SW : TIGHT	More force is required to turn the VFO knob than in the NORM setting.
	4) SEND REC SW : SEND Turn the VFO knob slowly	The ON AIR LED lights and the display varies.
3. FM CH	1) SEND REC SW : REC F.STEP SW : OFF MODE SW : FM CH Turn the VFO knob one click at a time.	The frequency changes by 12.5kHz every step, and changes 625kHz for one revolution of the VFO knob.

Item	Condition	Operation check
	2) F.STEP SW : ON	The frequency changes by 5 kHz every step, and changes 25 kHz for one revolution of the VFO knob.
4. F.LOCK	1) F.LOCK SW : ON	The F. LOCK LED lights. The display does not change even if the VFO knob is rotated.
	2) F. LOCK SW : OFF	
5. BAND SW	1) Press BAND SW (UP) several times.	1) The 1 MHz digit display value increases by one every time the switch is pressed. 2) The buzzer sounds every time the switch is pressed.
	2) Hold down BAND SW (UP).	The 1 MHz digit display value increases continuously.
	3) Press BAND SW (DOWN) several times.	The 1 MHz digit display value decreases by one every time switch is pressed.

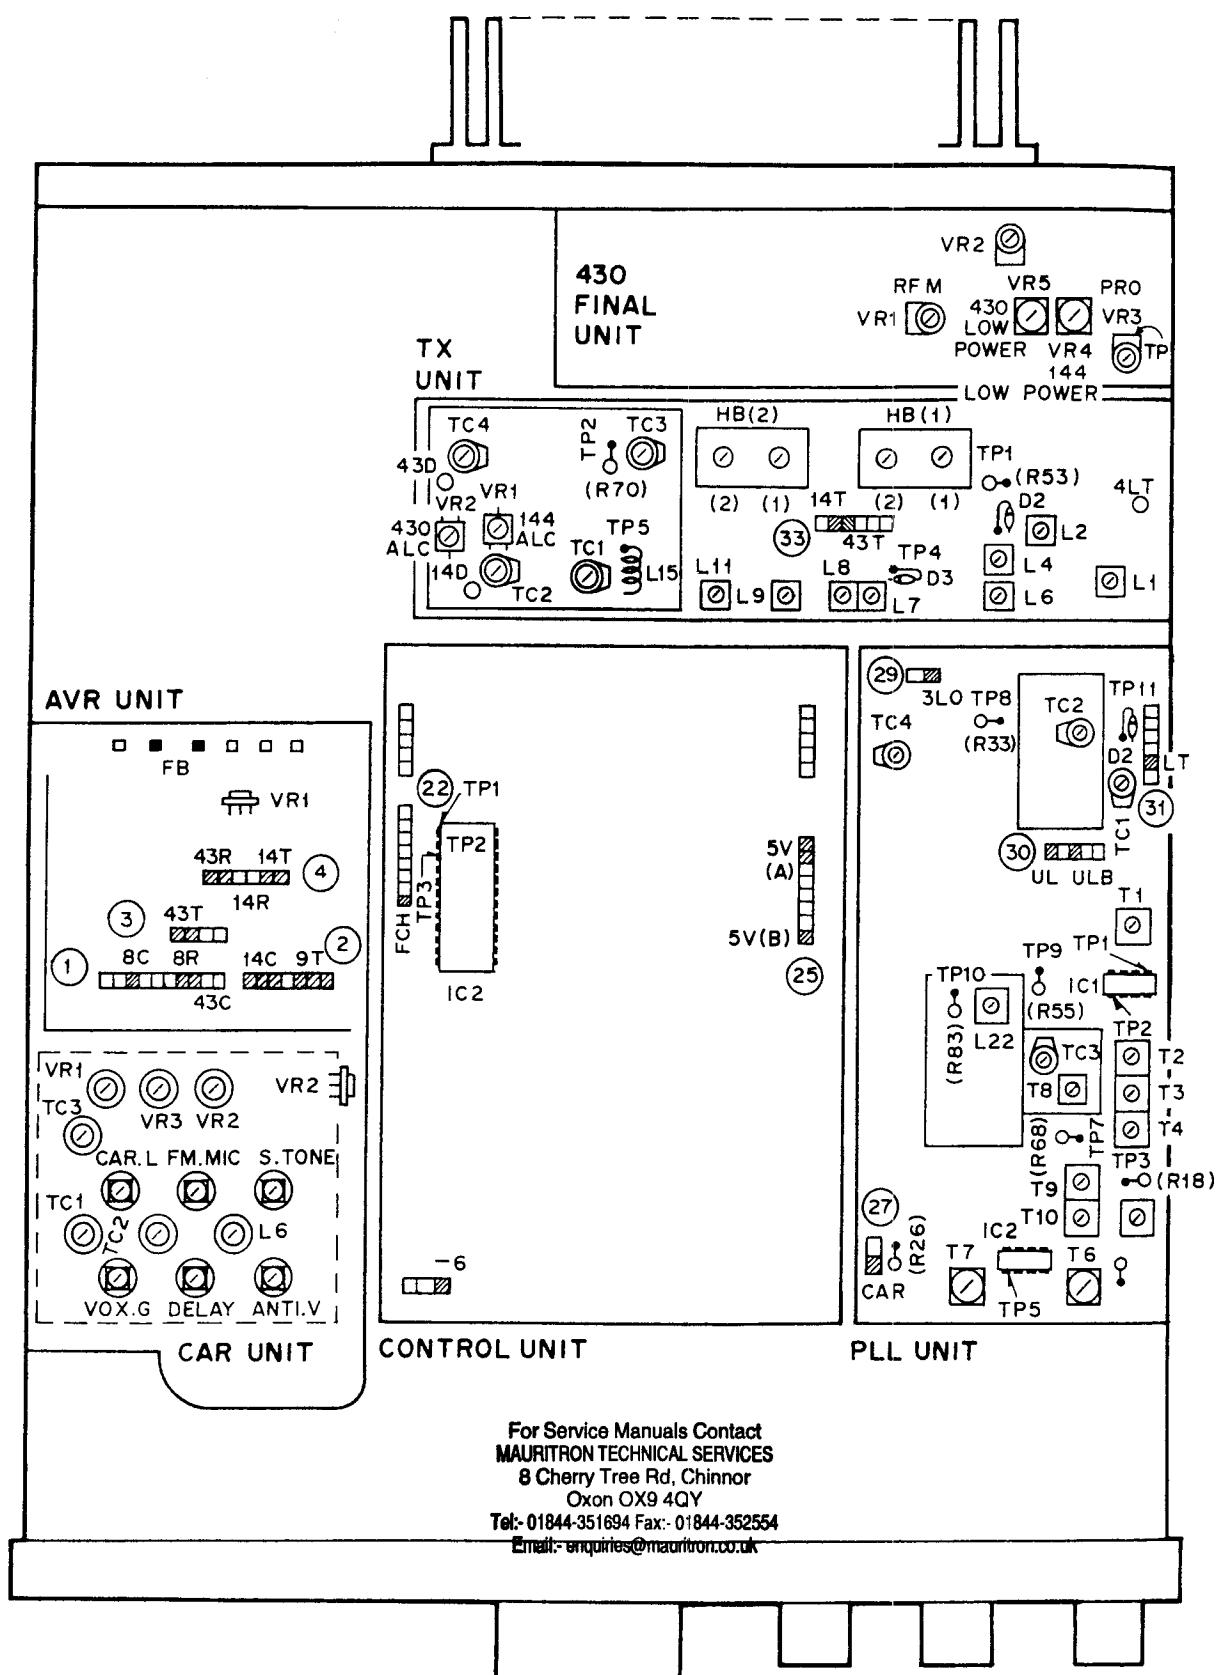

## ADJUSTMENT

Item	Condition	Operation check	Item	Condition	Operation check
	4) Hold down BAND SW (DOWN).	The 1 MHz digit display value decreases continuously.	10. MS	1) 144MS SW : ON	1 144.012.5 2 144.025.0 3 144.037.5 4 144.050.0 5 144.062.5 Memory channels should be scanned in this order. (The top letter on the display flickers.)
6. SCAN	1) MODE SW : FM SQL VR : MIN SCAN SW : ON	BUSY LED lights. Indication "A" flickers and the frequency varies scanning only when the SCAN SW is depressed.		2) 144MS SW : OFF 430MS SW : ON	6 430.075.0 7 430.087.5 8 430.100.0 C 430.112.5 C 430.125.0 Memory channels should be scanned in this order. (The top letter on the display flickers.)
	2) Turn SQL VR until BUSY LED goes out.	Scan starts.		3) 144MS SW : ON (430MS SW : ON)	Memory channels 1 through 10 should be scanned in sequential order.
	3) SEND/REC SW : SEND	Scan stops.		4) 144MS SW : OFF 430MS SW : OFF	
	4) SCAN SW : ON	Scan does not start.		11. VFO	1) POWER SW : OFF
	5) SEND/REC SW : REC SCAN SW : ON	Scan restarts.		2) POWER SW : ON VFO knob : 145.00	"A 145.00" is displayed.
	6) HOLD SW : ON	Scan stops.		3) FUNCTION SW : B	"b 144.00" is displayed.
7. PRIO. M	1) PRIO.M SW (10) : ON	"C 433.000.0" is displayed.		4) FUNCTION SW : A-R SEND/REC SW : REC SEND	"A 145.00" is displayed. "b 144.00" is displayed.

# SPECIFICATIONS

## GENERAL

Frequency Range .....	144.0 ~ 146.0 MHz 430.0 ~ 440.0 MHz
Mode .....	SSB (USB, LSB), CW, FM
Antenna impedance .....	50 Ω (144 MHz, 430 MHz)
Voltage Requirements .....	220 V AC, 50/60 Hz 13.8 V DC ± 15%
Power Consumption .....	Receive (no signal): 45 watts (220 V AC), 1.2 A (13.8 V DC) Transmit: 130 watts (220 V AC), 5 A (13.8 V DC)
Backup current (Battery) .....	Less than 10 μA
Semiconductor Complement .....	Transistors: 149 FETs: 35 ICs: 41 Diodes: 195
Dimensions .....	290 (W) x 124 (H) x 322 (D) mm (11 7/16) x (4 7/8) x (12 5/8)
Weight .....	10.1 kg (22.2 lbs)

## TRANSMITTER SECTION

RF Power Output .....	SSB, CW, FM: 10 watts FM (LOW): Approx. 1 watt
Modulation .....	SSB: Balanced modulation FM: Variable reactance frequency shift
Maximum frequency deviation (FM) .....	± 5 kHz
Carrier Suppression .....	Better than 40 dB
Unwanted Sideband Suppression .....	Better than 40 dB
Spurious Radiation .....	Better than -60 dB
Microphone Impedance .....	500 ~ 600 Ω
AF Response of Transmitter (SSB) .....	400 ~ 2600 Hz (-9 dB)
Repeater Frequency Shift .....	-600 kHz or +600 kHz (144.0 ~ 146.0 MHz) -7.6 MHz or -1.6 MHz (430.0 ~ 440.0 MHz)
RPT Tone Frequency .....	1750 Hz

## RECEIVER SECTION

Receiver Sensitivity .....	SSB, CW: 0.2 μV for 10 dB (S+N)/N FM: 1 μV for 30 dB (S+N)/N 0.2 μV for 12 dB SINAD
Intermediate Frequency .....	1st: 30.865 MHz 2nd: 10.695 MHz 3rd: 455 kHz (FM only)
Squelch Sensitivity .....	0.16 μV (At threshold)
Audio Output .....	2.0 watts (with less than 10% distortion) into an 8 ohm load
Receiver Selectivity .....	SSB, CW: 2.2 kHz (-6 dB) 4.8 kHz (-60 dB) FM: 14 kHz (-6 dB) 30 kHz (-60 dB)
