

CG-3000 service manual

Overview

CG-3000 automatic antenna tuner consists by power protection circuit, power regulation circuit, relay driver circuit, SWR detection circuit, phase detection circuit, impedance detection circuit, main matching circuit, reset circuit, CPU and memory.

Block Diagram

Work flow

1. After power on, reset circuit sends signal to CPU to reset whole system.
2. System ready for RF input.
3. Transverter converts the RF signal to CPU, CPU try to find if there is record already exists in the memory for this frequency.

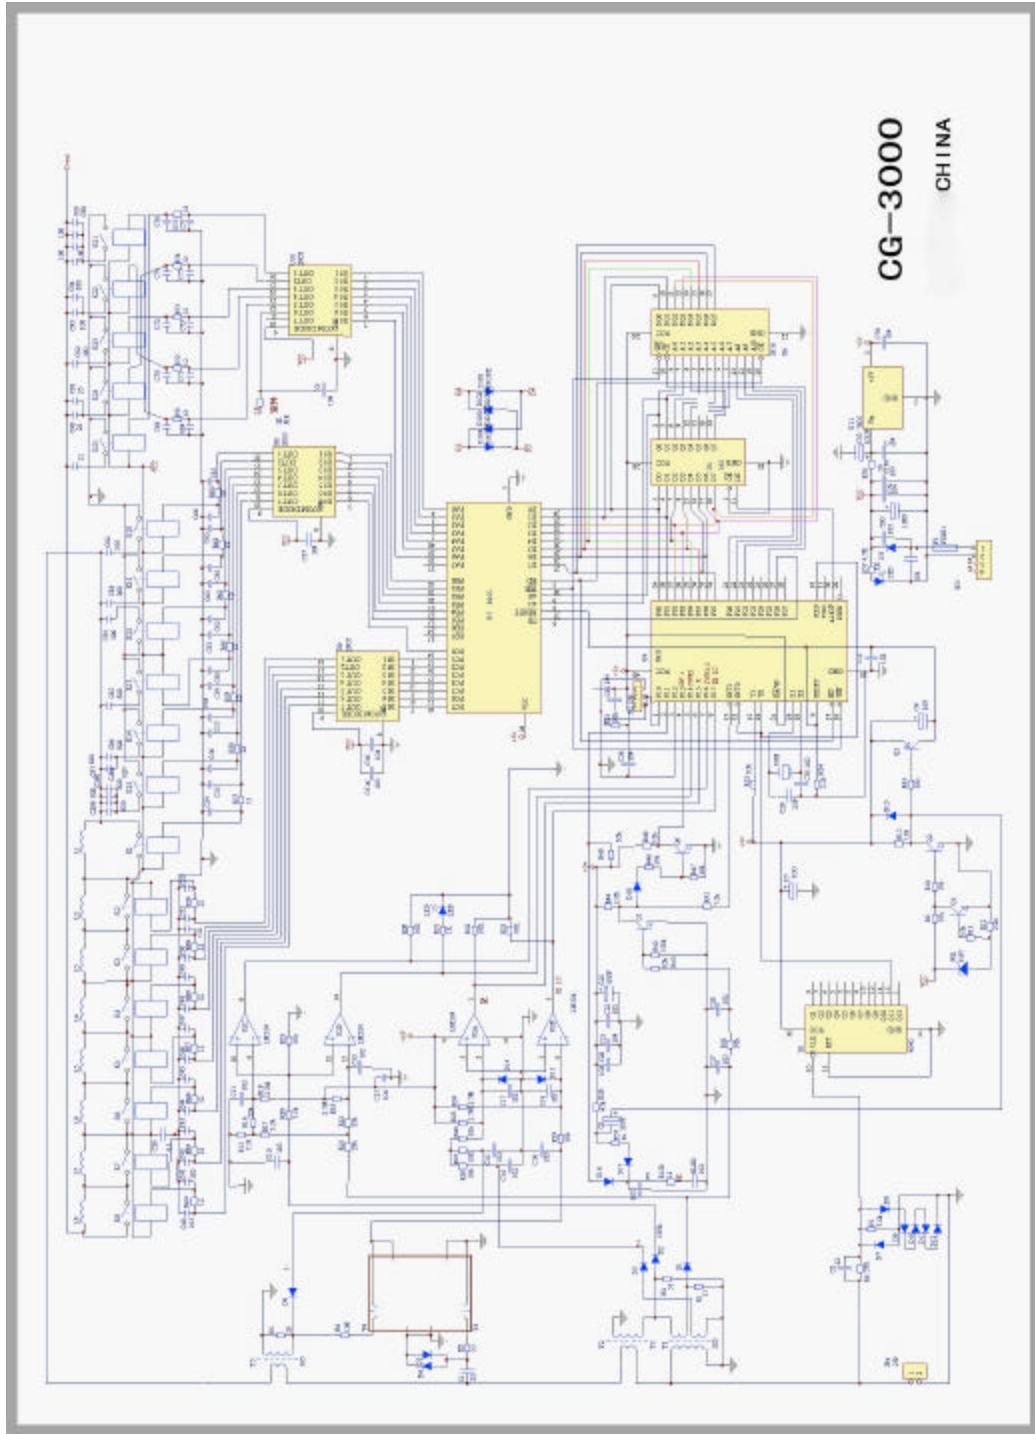

If there is record for it, it will load the parameter directly to relay driver to quick tune. Normally it takes less than 20ms.

If CPU doesn't find record in memory, then SWR detection circuit, phase detection circuit and impedance detection circuit starts to calculate the L/C configuration and send command to relay driver to tuning. Normally it takes less than 2 seconds. After tuning(SWR<1:2), CPU stores the parameter into the memory for next quick tuning

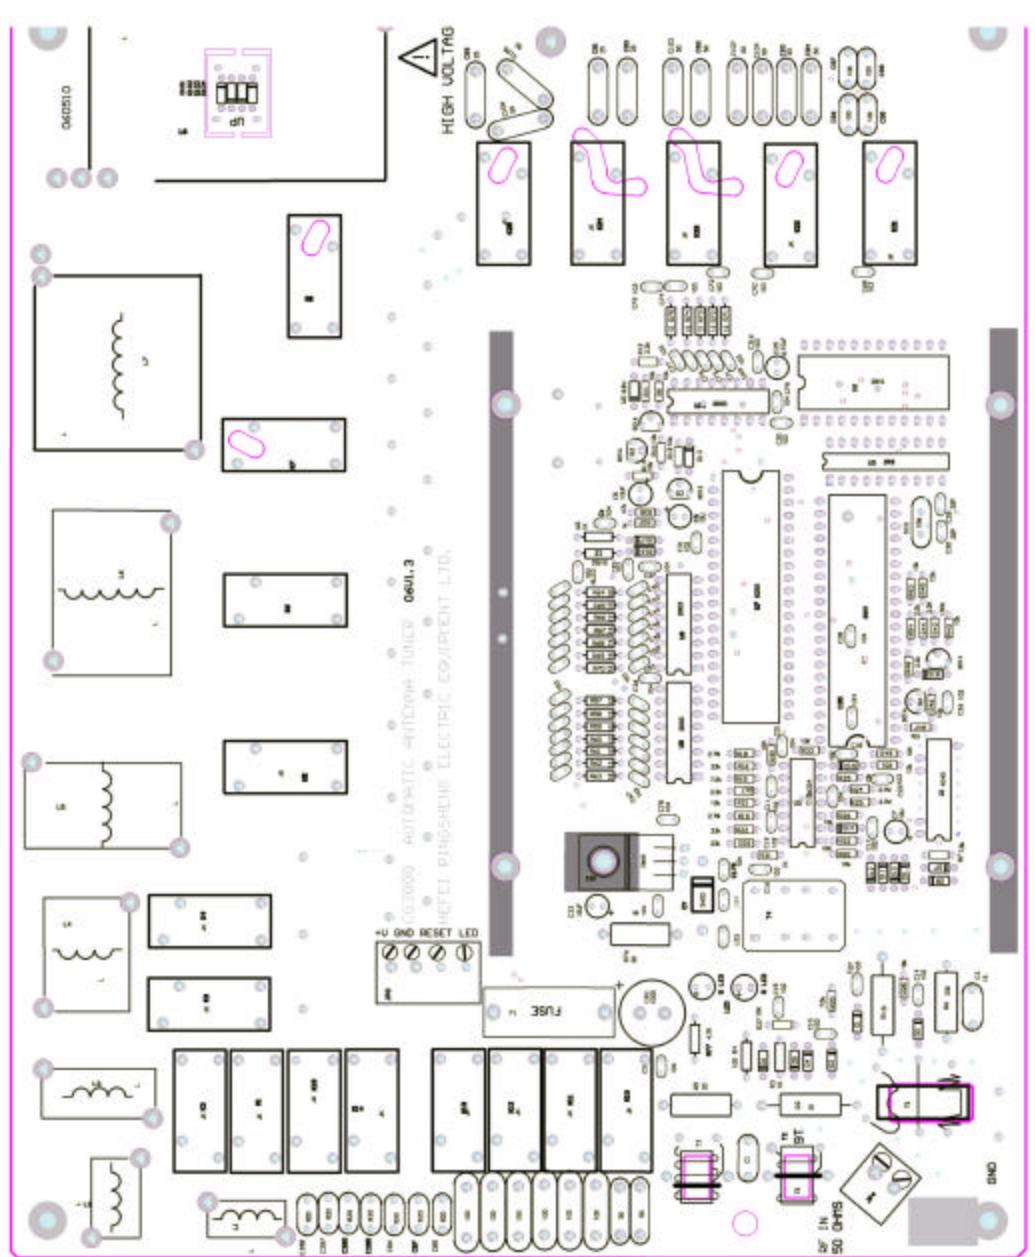

Specifications

Tunable frequency:	1.8 – 30 Mhz with long wire antenna from 8 meters
Input impedance:	50 ohms
Input power:	10 – 200W PEP
SWR:	<2:1
Power supply voltage:	12V +/- 10%
Current consumption:	<0.8A
Auto tuning time:	Approx. 2 seconds (first time tuning) Less than 20 milli second (return to memory frequency)
Number of memory channel:	200
Weight:	1.8 KG without accessories
Size:	310mm X 240mm X 72mm (L – W – H)
