## SERVICE INSTRUCTIONS : NDH518 MEMORY UNIT

### GENERAL

The block diagram and schematic for the memory unit are shown in the appendix. The unit is made up of a memory circuit utilising six integrated circuits type  $\mu$ PD5101LC. These IC's are 1K CMOS static RAM (256 x 4) where the FF is used to store data, clocks are not needed, and the information stays in storage as long as power is supplied. It should be noted that an optional battery(s) can be installed to back up data stored.

Important - Alkaline batteries should be used as commonly used manganese types will possibly leak when they become exhausted. Any consequent damage is not covered by warranty.

Frequency data is transferred from the receiver via the three state buffers (IC 9, 10, 11, 12, 13, 14).

Data input and memory output is via the cable terminated with the plug P4.

96 frequencies can be put in memory (24 channels per channel switch x 4 - A, B, C, D, selected by the push button switches).

The channel is designated by specifying the address of the RAM's by the channel switches and this information is simultaneously sent to the channel display circuit, IC7 and IC3.

The power source voltage detecting circuit controls the chip enable terminal of the RAM's in order to protect the memory frequency data from being lost when the power switch is turned off.

The power detecting circuit is TR2/IC16.

### POWER

Since CMOS is used, power supply requirements are low. 10-11V from the receiver is supplied through P4 and P7/J7 pin 2,3 and regulated to 5V through IC17.

### DATA - TESTING

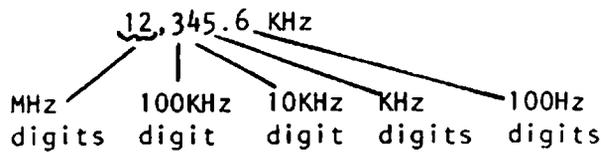

The table below shows the INPUT state of data from the receiver for each of the digits that are capable of being displayed on the receiver. Levels for all digits representing 100Hz, 1KHz, etc. are similar, the exception being the digits representing tens of MHz and the 20MHz digit.

If incorrect levels are being returned from the memory resulting in an incorrect display, isolation of the faulty digit(s) may be made by comparing actual level on the appropriate pins of J7.

### PROCEDURE

1. Set the receiver in manual.
2. Check with logic tester to see if the levels are according to the following table as each digit is selected. Increment the tuning

knob or band switch as required to access the digits corresponding to their place in the dialled up frequency, e.g.

J7 PINS

<u>100Hz UNITS</u>	<u>5</u>	<u>6</u>	<u>7</u>	<u>8</u>
0	L	L	L	L
1	L	L	L	H
2	L	L	H	L

6	L	H	H	L
7	L	H	H	H
8	H	L	L	L
9	H	L	L	H

H = HIGH ≈ 5V

Similar levels will be evident for KHz, tens KHz, and 100KHz digits.  
 1KHz Pins are on J7 Pins 9 and 10, J6 Pins 1 and 2  
 10KHz Pins are on J6 Pins 3,4,5 and 6  
 100KHz Pins are on J6 Pins 7,8,9 and 10  
 Levels for 1MHz are on J5 Pins 1,2,3 and 4

Note: Levels will be same as in 100Hz sample chart as above, with pins taken in sequence listed.

For tens of MHz, J5 pin 9 is "High" for a reading of "1", and pin 8 is "High" for a reading of "2".

MEMORY IC

Levels noted on all pins including the supply rail for IC 1,2,3,4,5 and 6 are shown in the table below.

TEST CONDITIONS

1. Dial up a frequency of 12,345.6 MHz on the receiver, with memory unit connected.
2. Select CH1, depress button "A" and "preset" button.
3. Check levels per table below.

## Testing

How do you know whether the I/O works OK, and all is well with the data bits?  
Are all address lines all well connected?

Fill channel 1 to 10 of bank A  
with:

Chan	figures	binary
1	11.111.1	0001
2	22.222.2	0010
3	3.333.3	0011
4	4.444.4	0100
5	5.555.5	0101
6	6.666.6	0110
7	7.777.7	0111
8	8.888.8	1000
9	9.999.9	1001
10	10.000.0	0000

### First test

Choose Bank A (all switches adresbit B, C and D would be dis-engaged, contact problems with those adresbit pull-down than not applicable)  
With the table left you quickly see whether there are any address or data bit errors.

Because never programmed channels can contain invalid data noise, you can see the strangest characters or dark spots on the display prior to a real channel MEM write action. This is normal and NOT worrying!  
So do: → tune in something → press MEM → press Preset → identical? → OK.

You can quickly erase all noise everywhere: set tune to 000.0, hold MEM, and rotate 24 steps quickly, everything is reset to 0. Next bank.

After a long standstill, the switches B, C and D may have contact cracking, use intensely or perhaps a tiny drop contact cleaner or spray?

## 1024 BIT (256x4) STATIC CMOS RAM

**DESCRIPTION** The μPD5101L and μPD5101L-1 are very low power 1024 bit (256 words by 4 bits) static CMOS Random Access Memories. They meet the low power requirements of battery operated systems and can be used to ensure non-volatility of data in systems using battery backup power.

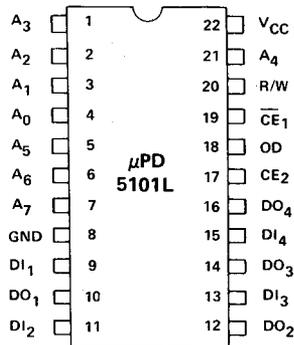

All inputs and outputs of the μPD5101L and μPD5101L-1 are TTL compatible. Two chip enables ( $\overline{CE}_1$ ,  $CE_2$ ) are provided, with the devices being selected when  $\overline{CE}_1$  is low and  $CE_2$  is high. The devices can be placed in standby mode, drawing 10 μA maximum, by driving  $\overline{CE}_1$  high and inhibiting all address and control line transitions. The standby mode can also be selected unconditionally by driving  $CE_2$  low.

The μPD5101L and μPD5101L-1 have separate input and output lines. They can be used in common I/O bus systems through the use of the OD (Output Disable) pin and OR-tying the input/output pins. Output data is the same polarity as input data and is nondestructively read out. Read mode is selected by placing a high on the R/W pin. Either device is guaranteed to retain data with the power supply voltage as low as 2.0 volts. Normal operation requires a single +5 volt supply.

The μPD5101L and μPD5101L-1 are fabricated using NEC's silicon gate complementary MOS (CMOS) process.

- FEATURES**
- Directly TTL Compatible — All Inputs and Outputs
  - Three-State Output
  - Access Time — 650 ns (μPD5101L); 450 ns (μPD5101L-1)
  - Single +5V Power Supply
  - $CE_2$  Controls Unconditional Standby Mode
  - For operation at +3V Power Supply, Contact the NEC Sales Office.

## ABSOLUTE MAXIMUM RATINGS\*

\*COMMENT: Stress above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

T<sub>a</sub> = 0°C to 70°C; V<sub>CC</sub> = +5V ± 5%, unless otherwise specified.
