Accessories

Flexible antenna, hand strap, belt clip, CMU160, *CBT160, *CNB161, *CWC150A. (Accessories provided with the MODEL C168A include the CTN160 CNB161 and CWC150A.)

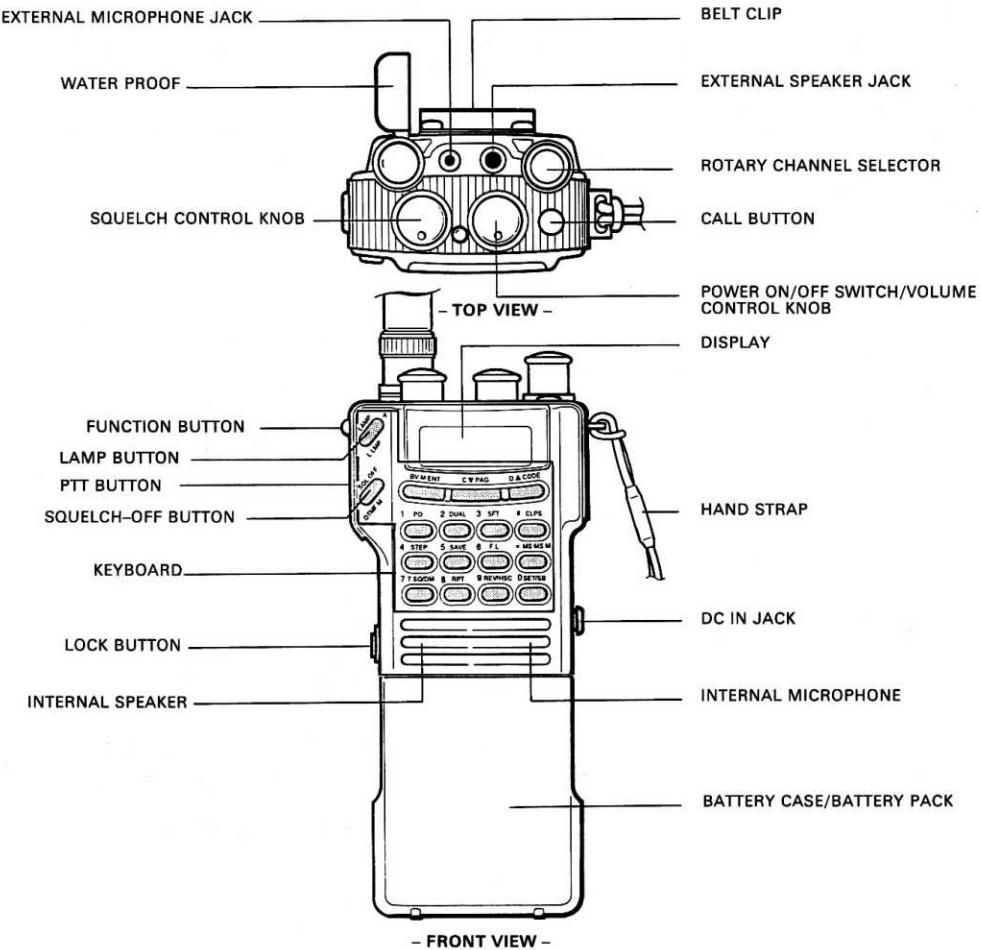

Options

CAW150	Mobile power supply cable	CMP111	Microphone and speaker
CAX03	Bottom cover	CMP113	Tiepin microphone
CAX160	Remote battery adaptor	CMP115	Miniature microphone and speaker
CBH160	Molded clip	CMU160	Memory unit (4 kbit)
CBT160	Battery case (holds 5 size AA batteries)	CMU161	Memory unit (16 kbit)
CCA160	Charger adaptor (CNB160/CNB161/CNB163)	CNB160	Rechargeable battery pack (6 V, 300 mAH)
CHP111	Headset with PTT switch	CNB161	Rechargeable battery pack (7.2 V, 700 mAH)
CHP150	Headset with VOX	CNB162	Rechargeable battery pack (12 V, 600 mAH)
CLC160	Soft case (for use with CNB160 mounted)	CNB163	Rechargeable battery pack (7.2 V, 1,000 mAH)
CLC161	Soft case (for use with CNB161/CBT160 mounted)	*CTN160	CTCSS (tone squelch) unit
CLC162	Soft case (for use with CNB162/CNB163 mounted)	*CSA160	Desktop charger
CMC151	Mobile charger (CNB160/CNB161/CNB163)	*CWC150	Wall charger (for CNB160/CNB161/CNB163)
CMB111	Mobile bracket	*CWC151K	Wall charger (for CNB162)

* Accessories provided with the MODEL C168A option include the CSA160A, CWC150A and CWC151A.

* Accessories provided with the MODEL C168 option include the CSA160E, CWC150K and CWC151K.

1. CONTROLS AND CONNECTION

2. THEORY OF OPERATION

2.1 PLL Synthesizer

The strobe, clock and serial data signals from microprocessor Q248 are input to pins 11, 9 and 10, respectively, of PLL IC Q424. The frequency division ratio is determined by Q424.

The VCO frequency is applied to Q424 pin 8. The Q424's programmable frequency division ratio works as follows: the input frequency is divided by 1/N based on the frequency setting data, resulting in the reference frequency of 5 (6.25) kHz. The PLL circuit frequency is controlled by serial data from Q248.

The VCO circuit directly generates the transmission frequency (f_0 MHz) and the reception frequency (f_0 -30.85 MHz).

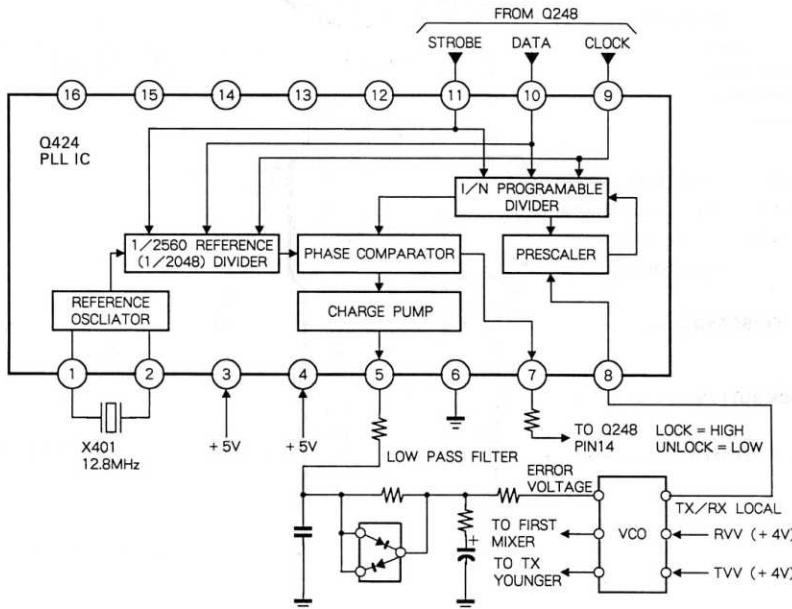

Figure 2-1 PLL Block Diagram

– Reference Frequency Circuit –

The reference frequency circuit generates the reference frequency of 5 (6.25) kHz. The reference generator frequency of 12.8 MHz is divided by the reference frequency divider stage in the PLL IC to produce this 5 (6.25) kHz reference frequency.

The reference frequency divider comprises a 16-bit shift register, a 15-bit latch register and a binary 14-bit reference counter. A reference frequency of either 5 or 6.25 kHz is generated based on the serial data received from microprocessor Q248. If the tuning step size is 5, 10, 20, 25, 50, 75 or 100 kHz, the microprocessor sends data causing a reference frequency of 5 kHz to be produced. If the tuning step size is 12.5 kHz, a reference frequency of 6.25 kHz is generated instead.

– Phase Comparator –

The phase comparator determines the phase shift between the frequency divided 5 (6.25) kHz reference frequency and the frequency divided by the programmable frequency divider.

If there is a difference in the phases, a low level output is produced from Q424 pin 7. If there is no phase difference, a high level signal is output from Q424 pin 7. The output from the phase comparator is also applied to the charge pump.

– Low-pass Filter –

The low-pass filter (PLL loop filter) consists of a CR integrated circuit.

The pulse wave output from Q424 pin 5 is converted into a DC voltage by the low-pass filter. It is then applied to varactors Q551, Q552, Q564 and Q565 (reception VCO) or Q557 and Q558 (transmission VCO) in the VCO circuit block.

– RX VCO Circuit –

The DC voltage from the low-pass filter is applied to varactors Q551, Q552, Q564 and Q565.

The DC voltage controls the frequency generated by the VCO by altering the capacitance between the poles of Q552 and Q553.

– TX VCO Circuit –

The DC voltage from the low-pass filter is applied to varactors Q557 and Q558.

The DC voltage controls the frequency generated by the VCO by altering the capacitance between the poles of Q557 and Q558.

Frequency modulation is controlled by applying the modulation signal from the microphone amplifier to varactor Q559.

– Unlock Detect Circuit –

Lock/unlock status detection is performed by pin 14 of microprocessor Q248. After the pulse voltage output from Q424 pin 7 is converted to a DC voltage by the CR integrator circuit composed of R454 and C474, it is applied to Q248 pin 14.

In lock status, a high level pulse voltage is output from Q424 pin 7, so a high level signal is applied to Q415 pin 7. On the other hand, for as long as unlock status continues, a low level pulse voltage is output from Q415 pin 7, and a low level signal is applied to Q248 pin 14.

– PLL Local –

The RX VCO output is amplified by buffer amplifier Q555 and then input to the gate of first mixer Q413. The TX VCO output is amplified by buffer amplifier Q561 and then applied to Younger amplifier Q421.

2.2 Receiver

The reception method used is first IF 30.85 MHz (Lower)/second IF 455 kHz (Lower) double conversion super heterodyne. The reception frequency band covered is 144.000 MHz ~ 147.995 MHz.

– Front End –

The reception signal from the antenna passes through the low-pass filter and antenna switching circuit, and is then applied to RF coil L405. The reception signal tuned in by L405 is amplified by RF amplifier Q408. It then passes through a low-pass filter (L406, L407) and is then applied to the gate of first mixer Q413.

– First Mixer –

The reception signal amplified by RF amplifier Q408 (f0) and the PLL local signal (f0-30.85 MHz) are both applied to first mixer Q413.

Q413 produces both the sum of f0 and f0-30.85 MHz and the difference between them. However, the 30.85 MHz difference alone is selected by the crystal filter circuit (F401), thereby eliminating signal elements at adjacent frequencies. The result is then applied to first IF amplifier Q419 as the first IF signal.

– IF Amplifier –

After the first IF signal is amplified by Q419 it is applied to pin 20 of IC Q203.

This 30.85 MHz IF signal is mixed by the second mixer in Q203 with the 30.395 MHz second local filter, which is generated internally by Q203. The result is output via Q203 pin 4 as the second IF signal.

After adjacent frequency elements have been removed from the second IF signal by F201, it is applied to Q203 pin 6. It is then demodulated by the IF limiter amplifier and quadrature detector circuit in Q203 and output from Q203 pin 11 as the audio signal.

– Squelch Circuit –

A low-pass filter (R212, C213) eliminates 455 kHz elements from the audio signal output via Q203 pin 11. Noise elements pass through the R216 squelch controller. The squelch line is set by adjusting R216. Next, the noise elements which have passed through the high-pass filter (R215, C210, C211) are applied to IC Q203 pin 13. After being amplified by Q203's internal noise amplifier, they are output from pin 14. After the noise elements have been further amplified by Q202, they are detected by Q201, producing a DC voltage which is applied to Q203 pin 15. This signal is then output via pin 16 as the squelch signal. The squelch signal from pin 16 is input to Q248 pin 30 and used for future operation control. If the signal applied to pin 15 is 0.7 V or higher pin 16 becomes low level and squelch operates.

On the other hand, if the signal applied to pin 15 is lower than 0.7 V, pin 16 becomes high level and squelch does not operate.

- Signal Strength Meter (S Meter) -

The Q203 pin 12 audio signal passes through semi-fixed resistor R211 and is input to Q248 pin 17. It is then A/D converted and used to light LCDs to produce the signal strength meter display.

- Audio Circuitry -

After the audio signal output from IC Q203 passes through the de-emphasis circuit (R213, R332, C223) it is amplified by audio preamp Q221.

The output from Q221 passes through muting circuit Q215 and is adjusted by audio volume semi-fixed resistor R237. It is then applied to audio power amplifier Q214. After amplification by Q214 the audio signal passes through external speaker jack J402 and drives internal speaker E101.

- DTMF Decoder -

A part of the audio signal from Q203 pin 11 is applied to pin 2 of DTMF decoder Q103. The audio signal applied to this pin is decoded to produce a digital signal and is output to pins 12 ~ 15 (D0 ~ D3) of Q103.

2.3 Transmitter

- Microphone Amplifier -

The sound of the user's voice is converted into an audio signal by the internal and external condenser microphones, and applied to microphone amplifier Q238. Q238 comprises a opamp stage which includes a pre-emphasis circuit, and a low-pass filter. The signal amplified by Q238 is level adjusted by semi-fixed resistor R288 and then applied to the VCO modulator circuit. The internal tone signal is a rectangular waveform output from Q248 pin 23. Following level adjustment by semi-fixed resistor R303 it is input to the low-pass filter in Q238.

- Power Amplifier -

The transmission signal from the VCO is amplified by Younger amplifier Q421 and applied to pin 1 of RF power module Q422. After amplification by Q422, the transmission signal is output via pin 5 and passes through a low-pass filter, the antenna switch and a low-pass filter. After second and third order harmonics have been sufficiently attenuated, the signal is supplied to the antenna. The transmission output power level is adjusted by semi-fixed resistor R229 to 5.0 W in the high power setting, to 2.5 W by R230 in the medium power setting or to 0.35 W by R228 in the low power setting.

- APC Circuit -

After passing through the low-pass filter, a part of the transmission signal output from Q422 is detected by diode Q423 and converted into a DC voltage. The detection voltage is applied to APC amplifier Q591 and controls the emitter current of Younger amplifier Q421. In this way the transmission output is maintained at a constant level. Also, thermal sensor circuit Q592 controls Q591 based on the amount by which the temperature rises, causing the transmission output level to drop.

- DTMF Encoder -

The DTMF signal is output from pin 17 of DTMF encoder Q234. Next, it is level adjusted by semi-fixed resistor R281 and applied to the low-pass filter in Q238.

2.4 Power Supply Circuitry

Power supplied via the DC IN jack and the battery terminal is routed by the power switch into the following categories.

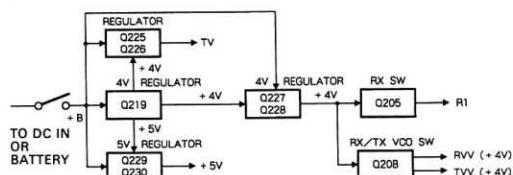

Figure 2-2

2.5 Control

2.5.1 Q248 Microprocessor

The microprocessor I/O port functions are as follows.

Table 2-1 I/O port functions

Pin no.	I/O	Symbol	Description
1	O	K3	Keyboard data lines. Low: Q101 LCD driver BUSY signal detected.
2	O	K2	
3	O	K1	
4	O	K0	
5	O	CS	Low: Output of Q101 LCD driver chip select signal.
6	O	LSO	LCD driver (Q101) serial data output.
7	O	LCK	LCD driver (Q101) clock output.
8	O	OE	Output of DTMF decoder (Q103) enable signal. High: latched.
9	—	VSS	Ground.
10	I/O	D3	Keyboard data lines. High: LCD driver (Q101) data input enabled.
11	I/O	D2	
12	I/O	D1	
13	I/O	D0	
14	I	UL	Unlock detect. Approx. 1.6 V or greater: PLL locked. Approx. 1.6 V or less: PLL unlocked.
15	I	BAT	Power supply voltage for lighting LCD mark detected. Lights when approx. 4.5 V.
16	I	SQLOFF	Low: Squelch off button depressed.
17	I	SM	Signal strength meter analogue signal input.
18	I	ED	High: Up signal indicating that rotary channel selector is being turned clockwise detected.
19	I	EU	High: Down signal indicating that rotary channel selector is being turned counterclockwise detected.
20	O	PD	High: DTMF decoder IC (Q103) power-down.
21	O	LAMP	Low: LCD backlight lights.
22	O	MONI	High: Audio power amplifier operating.
23	O	BST	Tone rectangular wave output.
24	I	CALL	Low: CALL button depressed.
25	O	SO	Serial data output to PLL and tone IC.
26	O	CK	Clock output to PLL and tone IC.
27	I	INT4	High: Transceiver operating. Low: Power ON/OFF detect when power is off.
28	—	—	—
29	I	PTT	High: PTT depressed.
30	I	SQL	Squelch input. High: Squelch off. Low: Squelch on.
31	I	FUNC	FUNC button. Low: FUNC button depressed.
32	—	—	—

Table 2-1

Pin no.	I/O	Symbol	Description
33	O	SQC	Squelch operation. Low: Squelch operating.
34	O	R1	Low: Receiving. High: Transmitting.
35	—	—	—
36	—	—	—
37	—	—	—
38	O	TVV	Transmitter VCO power supply.
39	O	TV	Low: Transmitting.
40	—	VDD	Microprocessor power supply pin. Approx. 4 V.
41	—	VDD	Microprocessor power supply pin. Approx. 4 V.
42	I	SQT	When tone squelch unit is installed. Low: squelch non-operational (tone frequency matches).
43	O	H	Low: Transmitting at high power.
44	O	M	Low: Transmitting at medium power.
45	O	POW	5 V power supply. Low: on.
46	O	TE	Tone data enable signal. High: latched.
47	O	RLED	High: RX LED lit.
48	O	PE	PLL data enable signal. High: latched.
49	O	MUTE	High: DTMF signal transmission with muting on.
50	O	COL3	DTMF encoder (Q234) COL signal. Always low.
51	O	COL2	
52	O	COL1	
53	O	COL4	
54	—	RES	Low: Resets microprocessor.
55	—	X2	Ceramic oscillating element connection.
56	—	X1	Ceramic oscillating element connection.
57	I/O	RAD	EEPROM data line.
58	O	RCK	EEPROM clock line.
59	O	MTX	Diode matrix line.
60	I	DV	High: DTMF decoder active.
61	O	ROW1	DTMF encoder (Q234) ROW signal. Always high.
62	O	ROW2	
63	O	ROW3	
64	O	ROW4	

2.5.2 Buzzer

DTMF encoder Q234 receives data from the microprocessor and outputs a single tone signal via pin 17. This signal passes through R281 and is applied to pin 2 of audio power amplifier Q214.

2.5.3 LCD Driver

LCD driver Q101 receives data from the microprocessor Q248 and drives LCD Q102.

2.5.4 Display

The display employs electrolytic effect type dynamically driven (1/3 duty ratio, 1/3 bias) LCD elements.

There are 31 segment pins and three common pins, and the third-order division technique results in a display duty ratio of 1/3. The numbers in parentheses () in Figure 2-3 below indicate the Q101 LCD driver pin numbers.

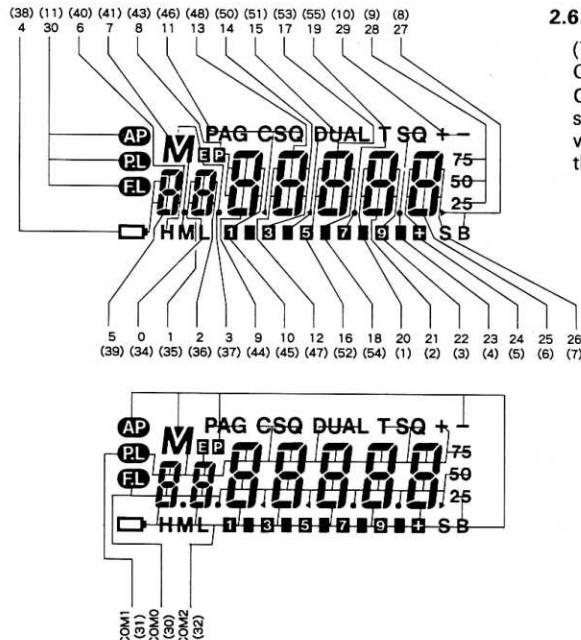

Figure 2-3 Segment Display

2.6 Options

2.6.1 CTN160

(The CTN160 already installed on the MODEL C168A.)

– Decoder –

After passing through audio preamp Q221, a part of the audio signal from Q203 pin 11 is applied to pin 24 of tone IC Q801 via the AFT terminal. When the preset tone frequency is detected within Q801, pin 13 (SOT) becomes low level, controlling microprocessor future operation.

– Encoder –

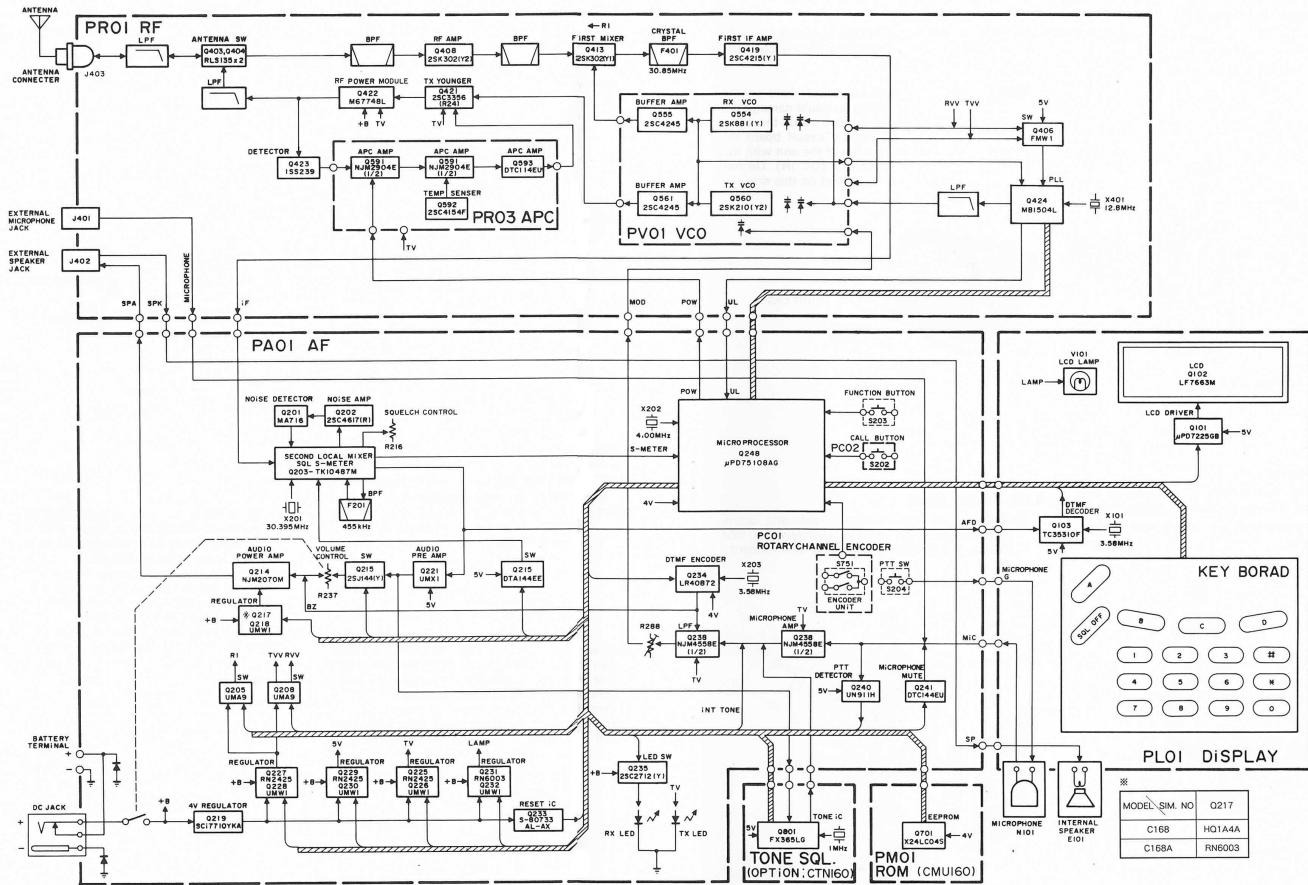

Q801 receives serial data from microprocessor Q248 and, based on this data, outputs the specified tone signal via pin 16. After level adjustment by semi-fixed resistor R805, the tone signal is input to the low-pass filter of microphone amplifier Q238 via the TON terminal.

2.6.2 CMU160/CMU161

(The MODEL C168/C168A comes with the CMU160 already installed.)

Control signals (or data) output from microprocessor Q248 are input to Q701 pin 9. Q701 determines whether data write or read is to take place based on the control signals received.

3. BLOCK DIAGRAM

MODEL-SIM. NO	Q217
C168	HQ1A4A
C168A	RN6003

4. MAINTENANCE

4.1 Disassembly Instructions

- a) Before removing any screws, switch the power off and remove the antenna, battery case and water proof cap (DC IN).

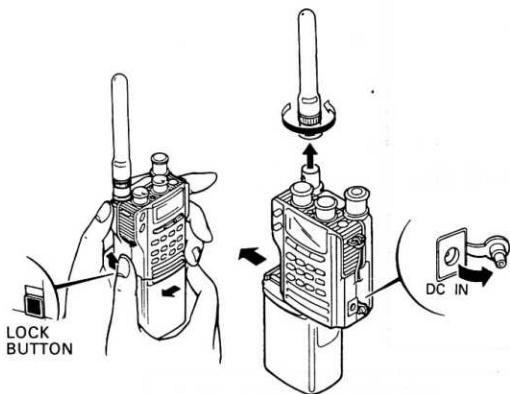

Figure 4-1

4.1.2 Front Case

- a) Turn the unit over so that the front case (the side with the display) is facing up. Slowly open the front case to the right.

NOTE: 1. Do not pull excessively hard on the left side. Doing so could damage the flexible circuit board inside the unit.
2. There is a flexible circuit board located on the side of the unit with the external input jack (DC IN). Do not pull excessively hard on this side.

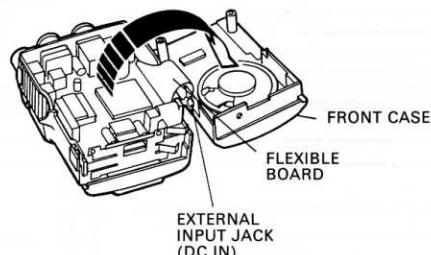

Figure 4-3

4.1.1 Bottom Cover

- a) Unscrew the two screws **(A)** and remove the bottom cover. Loosen the two screws **(B)** slightly.
b) Unscrew the two screws **(C)** which hold the rear case in place.

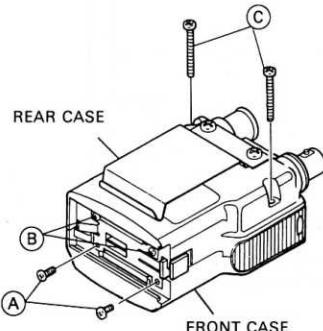

Figure 4-2

4.1.3 Display Board

- a) Unscrew the three screws **(L)** and one screw **(M)** and remove the speaker. Unscrew the four screws **(N)** and remove the display circuit board.

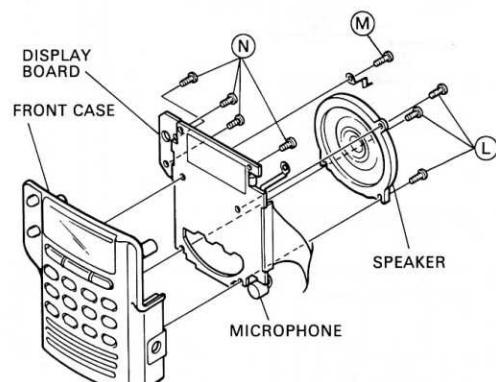

Figure 4-4

4.1.4 AF/RF Board

- a) Unplug connectors **D**, **E**, **F** and unscrew the two screws . The AF board can now be removed.
- b) Remove the VOL and SQL control knobs and the two nuts . The escutcheon can now be removed.
- c) Remove the shield panel and unscrew the four screws **H**, **I**, **J** and **K**. The RF and APC boards as well as Q422 can now be removed.
- d) Unscrew the antenna nut. The antenna connector and antenna jack can now be removed.
- e) Remove the channel knob and nut **G**. The channel switch can now be removed from the rear case.

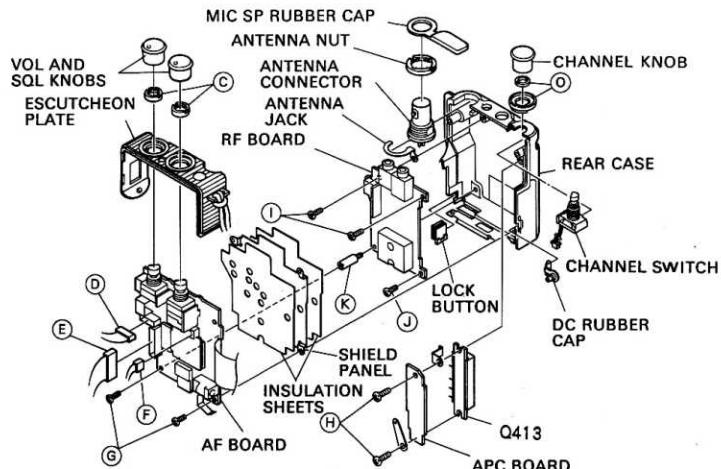

Figure 4-5

4.2 Option Installation

4.2.1 CTN160 (The MODEL C168A comes with the CTN160 already installed.)

- NOTE:**
1. Firmly plug the CTN160 into the connector as far as it will go. If it is not well seated malfunctions or damage may result.
 2. Plugging in the CTN160 at an angle or pulling up on it after it has been installed could damage it.
 3. There is no need to reset the microprocessor.

- a) After removing the bottom cover and front case, turn the unit over so that the control panel (the side with the display) is facing up. Grip the control panel case and slowly open it.
- b) Place the CTN160 on top of the microprocessor and slide it to the connector as shown in Figure 4-6. Then plug it firmly into the connector.

- c) Replace the front case and back cover so that they fit together. As shown in Figure 4-2, secure the front case in place by screwing in the two body and bottom cover fixing screws **B**.
- d) Replace the electrical contact screw **A** which was removed earlier (Figure 4-2). First inserting the electrical contact back into the lock button groove and then secure it with the screw.
- e) This completes the CTN160 installation procedure. Tone squelch operation is now possible.

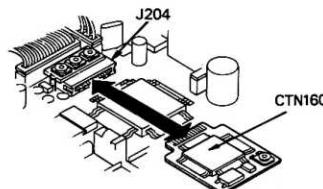

Figure 4-6

4.2.2 CMU161

- NOTE:**
1. If the unit is connected to an external power supply, make sure the power has been switched off before installing the CMU161.
 2. Firmly plug the memory unit (CMU161) into the connector as far as it will go. If it is not well seated malfunctions or damage may result.
 3. Plugging in the memory unit (CMU161) backwards could damage it.

- a) Remove the battery case from the main unit as shown in Figure 4-7. The connector for the memory unit (CMU161) is located on the base of the main unit.

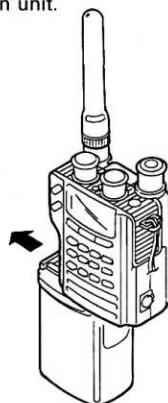

Figure 4-7

- b) Unplug the memory unit (CMU160) which is already installed. Insert the tip of a pair of tweezers or similar instrument into the hole in the memory unit (CMU160) and pull it out. (As shown in Figure 4-8)

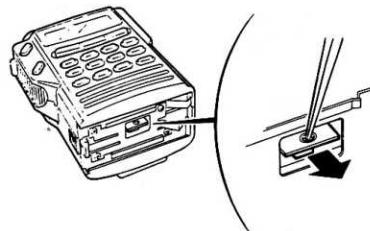

Figure 4-8

- c) Plug in the new memory unit (CMU161). The memory unit (CMU161) should be inserted straight and with the back facing up as shown in Figure 4-9.

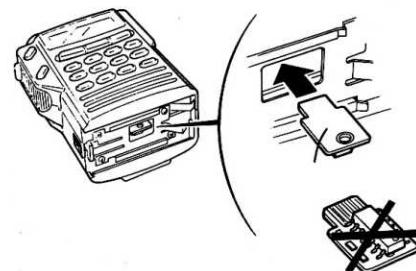

Figure 4-9

4.3 Test Set-Up

Be sure to correctly adjusted instruments only.

Warm up the instruments for at least 30 minutes before.

- General Conditions -

Supply voltage 7.2 V DC
Audio Output power 75 mW
AF dummy load 8 Ω
Standard modulation ±3.5 kHz at 1 kHz

RF dummy load 50 Ω
Alignment frequency Receive 146.050 MHz
Transmit 146.000 MHz

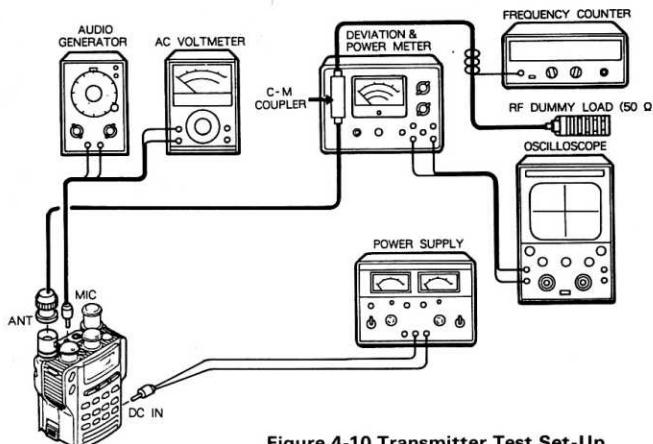

Figure 4-10 Transmitter Test Set-Up

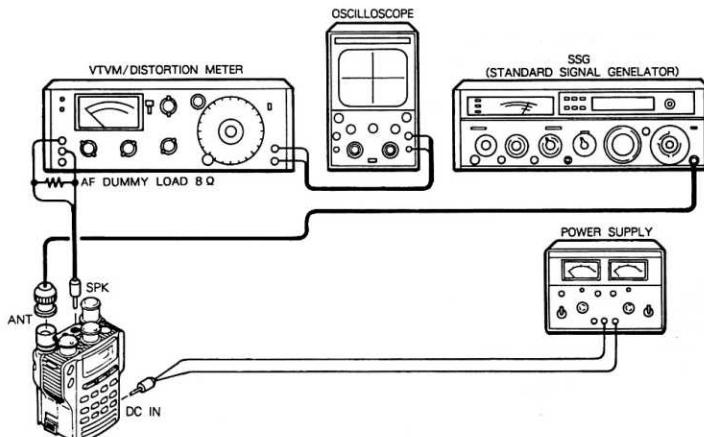

Figure 4-11 Receiver Test Set-Up

4.4 Alignment Reference Points

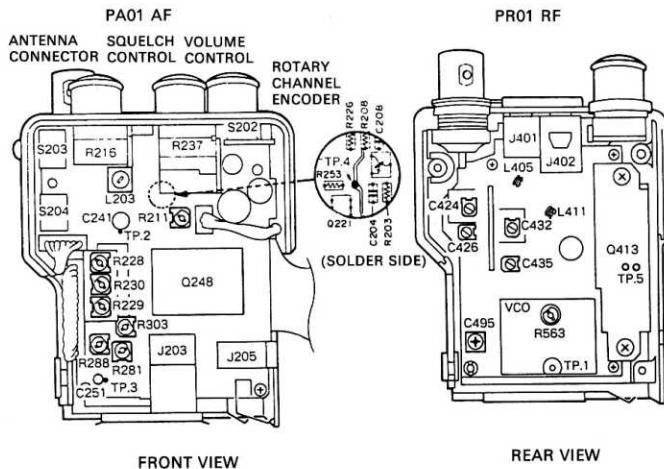

Figure 4-12

4.5 Alignment

4.5.1 Current Consumption Check

- After applying 7.2 V from the stabilized power supply, switch on the power.
- Turn the squelch control knob all the way clockwise.
- Confirm that the amperage of the power being supplied to the unit from the stabilized power supply is approximately 32 mA.

4.5.2 Power Supply Line Check

– 4 V System and 5 V System Regulator Check –

- Connect the voltmeter to TP2.
- Confirm that the reading of the voltmeter connected to TP2 is between 4.75 and 5.25 V.
- Connect the voltmeter to TP3.
- Confirm that the reading of the voltmeter connected to TP3 is between 3.8 and 4.2 V.

4.5.3 PLL Block

– VCO Voltage Check –

- Set the transceiver display frequency to 146.000 (receive status).
- Connect the voltmeter to TP1.
- Confirm that the reading of the voltmeter connected to TP1 is between 0.40 and 0.70 V.
- Put the transceiver into transmit status. (Press the PTT button.)
- Confirm that the reading of the voltmeter connected to TP1 is between 0.80 and 1.10 V.

– Local Frequency Adjustment –

- Set the transceiver display frequency to 146.000
- Put the transceiver into transmit status. (Press the PTT button.)
- Check the frequency of the output passing through the directional connector using a frequency counter.
- Adjust C467 so that the frequency counter reading is 146 OMHz \pm 50 Hz

4.5.4 Receiver

NOTE: Perform the following adjustments without removing the shield attached to the RF circuit board.

– Sensitivity Adjustment –

- a) Turn the transceiver's squelch control knob all the way counterclockwise.
- b) Set the transceiver display frequency to 146.050 and the output frequency from the SSG to the transceiver to 146.050 MHz.
- c) Connect the voltmeter to TP4.
- d) Raise the SSG output level until the reading of the voltmeter connected to TP4 is approximately 1.5 V.
- e) Adjust L405, L406, L407 and L408 in that order, so that the reading of the voltmeter connected to TP4 reaches the maximum level possible.
- f) Adjust L203 so that the audio output level of the speaker reaches the maximum level possible.

– 12 dB SINAD Check –

- a) Set the transceiver display frequency to 146.050 and the output frequency from the SSG to the transceiver to 146.050 MHz.
- b) Confirm that 12 dB SINAD is -9.5 dB or less.
- c) Confirm that 12 dB SINAD is within 1.0 dB μ of the values listed in step b) above within the frequency range 144.000 ~ 147.995 MHz.

– 20 dB QS Check –

- a) Set the transceiver display frequency to 146.050 and the output frequency from the SSG to the transceiver to 146.050 MHz.
- b) Confirm that 20 dB QS is -7 dB or less.

– First Image Check –

- a) With the transceiver display frequency set to 148.050 and the output frequency from the SSG to the transceiver to 86.350 MHz (MODEL C468), confirm that the first image ratio is 70 dB.

– S/N Check –

- a) With the transceiver display frequency set to 146.050 and the output frequency from the SSG to the transceiver to 146.050 MHz , confirm that the S/N ratio is 48 dB or greater.

NOTE: If the above values do not conform to the specification, re-perform the 4.5.4 receiver block sensitivity adjustment and check items.

– Signal Strength Meter Check –

- a) Set the transceiver display frequency to 146.050 , the output frequency from the SSG to the transceiver to 146.050 MHz and the output level to 20 dB.
- b) Adjust R211 so that all segments of the signal strength meter light (Figure 4-13).

Figure 4-13

- c) Set the transceiver to receive within the frequency range 144.000 ~ 147.995 MHz.
- d) Confirm that the SSG output level is between 16 dB μ and 24 dB μ when the signal strength meter reading is at its maximum.

4.5.5 Transmitter

NOTE: Perform the following adjustments without removing the shield attached to the RF circuit board.

Also, in order to obtain accurate transmission output the – (negative) terminal of the stabilized power supply should be connected to the chassis of the RF board as a reinforced ground, in addition to the power connection between the stabilized power supply and the CD jack. A thick cable capable of withstanding current in excess of 2 A and equipped with an alligator clip should be used to make the ground connection.

– Maximum Transmission Output Adjustment and Check –

- a) Apply 13.8 V from the stabilized power supply.
- b) Set the transmission mode to high power.
- c) Set the transceiver display frequency to 146.000 and transmit.
- d) Turn R229 all the way clockwise.
- e) Confirm that the maximum transmission output level is 6.0 W or greater.

– Transmission Output Adjustment and Check –

- a) Apply 7.2 V from the stabilized power supply.
- b) Set the transmission mode to low power.
- c) Adjust R228 so that the transmission output level is 0.35 W. Confirm that at this point the current consumption is between 280 mA and 400 mA.
- d) Apply 13.8 V from the stabilized power supply.
- e) Set the transmission mode to high power.
- f) Adjust R229 so that the transmission output level is 5.1 W. Confirm that the current consumption is between 800 mA and 1,200 mA.
- g) Set the transmission mode to medium power.
- h) Adjust R230 so that the transmission output level is 2.5 W. Confirm that the current consumption is between 500 mA and 900 mA.
- i) Apply 6.0 V from the stabilized power supply.
- j) Set the transmission mode to high power.
- k) Confirm that the transmission output level is 1.0 W or greater.

– Power Balance Check –

- a) Apply 13.8 V from the stabilized power supply.
- b) Set the transmission mode to high power.
- c) Transmit within the frequency range 144.000 ~ 147.995 MHz.
- d) Confirm that the gap between the maximum and minimum transmission output levels is 0.55 W or less.
- e) Set the transmission mode to medium power.
- f) Confirm that the gap between the maximum and minimum transmission output levels is 0.55 W or less.
- g) Apply 7.2 V from the stabilized power supply.
- h) Set the transmission mode to low power.
- i) Confirm that the gap between the maximum and minimum transmission output levels is 0.06 W or less.

– Thermal Sensor Check –

- a) Apply 13.8 V from the stabilized power supply.
- b) Set the transmission mode to high power.
- c) After setting the transceiver display frequency to 146.000, short TP5 and transmit. Confirm that at this point the transmission output level is between 2.0 W and 3.2 W.

– Deviation Adjustment and Check –

- a) Apply 7.2 V from the stabilized power supply.
- b) Set the transceiver display frequency to 146.000 and transmit.
- c) Turn on the 750 μ sec. filter of the direct wired detector.
- d) Insert a micro-plug configured as shown in Figure 4-14 into the EXT MIC jack. Then input a 1 kHz, 60 mV sine wave from the AG.
- e) Adjust R288 so that deviation is ± 5.0 kHz.
- f) With deviation at ± 5.0 kHz, confirm that the gap between the plus and minus range frequencies is no more than 0.3 kHz.
- g) Adjust the AG output so that the deviation is ± 3.5 kHz. Confirm that the distortion is no more than 4%.
- h) After performing step g) above, remove the micro-plug from the AG.
- i) Confirm that the AG open output voltage is AC 4 mV ~ 8 mV and that the modulation distortion is no more than 4%.

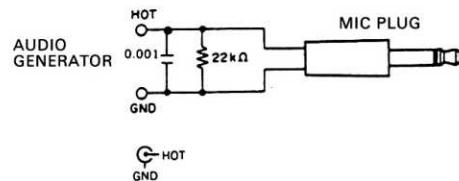

Figure 4-14

**– Internal Tone Adjustment and Check –
(Adjustment/Confirmation for the
MODEL 168A)**

- a) Apply 7.2 V from the stabilized power supply.
 - b) Set the transceiver display frequency to 146.000.
 - c) Insert a micro-plug configured as shown in Figure 4-14 into the EXT MIC jack. Transmit the AG output at 0 mV.
 - d) Set the high-pass filter of the direct wired detector to 50 Hz and the low-pass filter to 20 kHz.
 - e) With the transceiver in transmit status and the call button depressed, adjust R303 so that the deviation is ± 3.5 kHz.
 - f) The distortion is no more than 7%.
- Internal Tone Adjustment and Confirmation –
- a) Apply 7.2 V from the stabilized power supply.
 - b) Set the transceiver display frequency to 444.00.
 - c) Turn on the repeater. Set the offset frequency to 0.00 MHz and the internal tone frequency to 88.5 Hz.
 - d) Insert a micro-plug configured as shown in Figure 4-14 into the EXT MIC jack. Transmit the AG output at 0 mV.
 - e) Set the high-pass filter of the direct wired detector to OFF and the low-pass filter to 3 kHz.
 - f) Adjust R303 so that the deviation is ± 0.7 kHz.
 - g) Confirm that the tone frequency is $88.5 \text{ Hz} \pm 0.3 \text{ Hz}$ and that the distortion is no more than 7%.

– DTMF (Deviation) Adjustment and Check –

- a) Apply 7.2 V from the stabilized power supply.
- b) Set the transceiver display frequency to 146.000 and transmit.
- c) Insert a micro-plug configured as shown in Figure 4-14 into the EXT MIC jack. Transmit the AG output at 0 mV.
- d) Hold down the "8/RPT" key and adjust R281 so that the deviation is ± 3.2 kHz.

4.5.6 Tone Squelch Unit

**– CTN160 (Already installed on the
MODEL 168A.) –**

- a) Apply 7.2 V from the stabilized power supply.
 - b) Switch on the power to the transceiver.
 - c) Set the transceiver display frequency to 146.000 and activate the tone squelch function.
 - d) Set the tone frequency to 67.0 Hz.
 - e) Confirm that the deviation is ± 0.5 kHz $\sim \pm 0.9$ kHz and that the distortion is no more than 15%.
 - f) Set the tone frequency to 250.3 Hz.
- Confirm that the deviation is ± 0.5 kHz $\sim \pm 0.9$ kHz and that the distortion is no more than 15%.
- g) If any of the adjustment values in steps d through f above do not conform to the specification, set the transceiver display frequency to 146.000 and the tone frequency to 250.3 Hz.
 - h) Adjust R805 so that deviation is ± 0.7 kHz.

P001 TONE SQUELCH BOARD

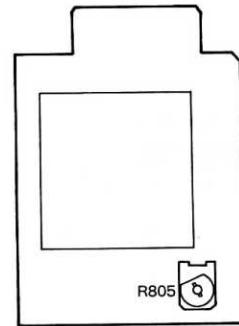

Figure 4-15

5. SPECIFICATIONS

5.1 Transceiver

5.1.1 General

Frequency Range	144.000 ~ 147.995 MHz
Tuning steps	5, 10, 12.5, 20, 25, 50, 75, 100 kHz
Modulation Type	F3
Input Voltage	DC 7.2 V
Current consumption Transmitting	
13.8 V	High power Approx. 1,000 mA Medium power Approx. 800 mA
7.2 V	High power Approx. 900 mA Medium power Approx. 900 mA
13.8/7.2 V	Low power Approx. 400 mA
Receiving	Approx. 32 mA
With battery save enabled	Approx. 12 mA
With auto power-off enabled	Approx. 0.5 mA
Microphone input impedance	600 Ω
Speaker impedance	8 Ω
Dimensions (excluding protrusions)	0.47 in (H) x 0.19 in (W) x 0.12 in (D) (120 mm (H) x 47 mm (W) x 31 mm (D))
Weight	0.64 lb. (290 g) (including antenna and CBT160)

5.1.2 Receiver

– Measurements are made in accordance with EIA ATR-04 –

Receiver System	Double conversion super heterodyne
Intermediate Frequencies	First IF 30.85 MHz (Lower) Second IF 455 kHz (Lower)
Reception sensitivity (12 dB SINAD)	0.158 μV
0.5 μV input S/N ratio	Better than 30 dB
Squelch open sensitivity	0.1 μV
Low frequency output	200 mW (8 Ω, 10% distortion)

5.1.3 Transmitter

– Measurements are made in accordance with EIA ATR-03 –

RF Output power	High power	1.0 W (with CBT160) 1.5 W (with CNB160)
		2.8 W (with CNB161/CNB163) 5.0 W (with CNB162)
	Medium power	1.0 W (with CBT160) 2.3 W (with CNB160)
		2.5 W (with CNB161/CNB163) 2.5 W (with CNB162)
	Low power	0.35 W
Spurious ratio		Better than -60 dB
Maximum frequency deviation		±5 kHz
Modulation method		Reactance modulation

5.1.4 Internal DTMF

- Encoder -

Tone frequency (f) $697 \leq f \leq 1,633$ Hz
Tone frequency deviation ± 3.2 kHz

- Decoder -

Squelch open sensitivity ≤ 20 dB SINAD

Squelch open sensitivity value obtained when conditions a) through d) below are met.

- a) The modulation frequency is flat.
- b) Deviation with the "8" key depressed is ± 3.2 kHz.
- c) Paging mode operating at 777 * 777.
- d) Operating with a signal timing of 50 msec. ON, 50 msec. OFF for each digit of the transmission code.

5.2 Options

5.2.1 CNT160 (The MODEL C168A comes with the CTN160 already installed.)

Input voltage 4.5 ~ 5.5 V

- Encoder -

Tone frequency (f) $67.0 \leq f \leq 250.3$ Hz
Tone frequency deviation $\pm 0.5\%$

Output level (at max. volume) $\leq 530 \pm 20$ mV

Tone frequency distortion $\leq 10\%$

- Decoder -

Open level ≤ 22 mV (at 179.9 Hz)

Response time ≤ 220 msec. (at 166.2 Hz)

Current consumption ≤ 8 mA (max.)

Performance specifications are nominal, unless otherwise indicated, and are subject to change without notice.

6. EXPLODED PARTS VIEW AND PARTS LIST

- General -

- Information on most electrical and mechanical parts is included in the parts list. The parts are listed by reference symbols in alphanumeric order.

- Chips Parts -

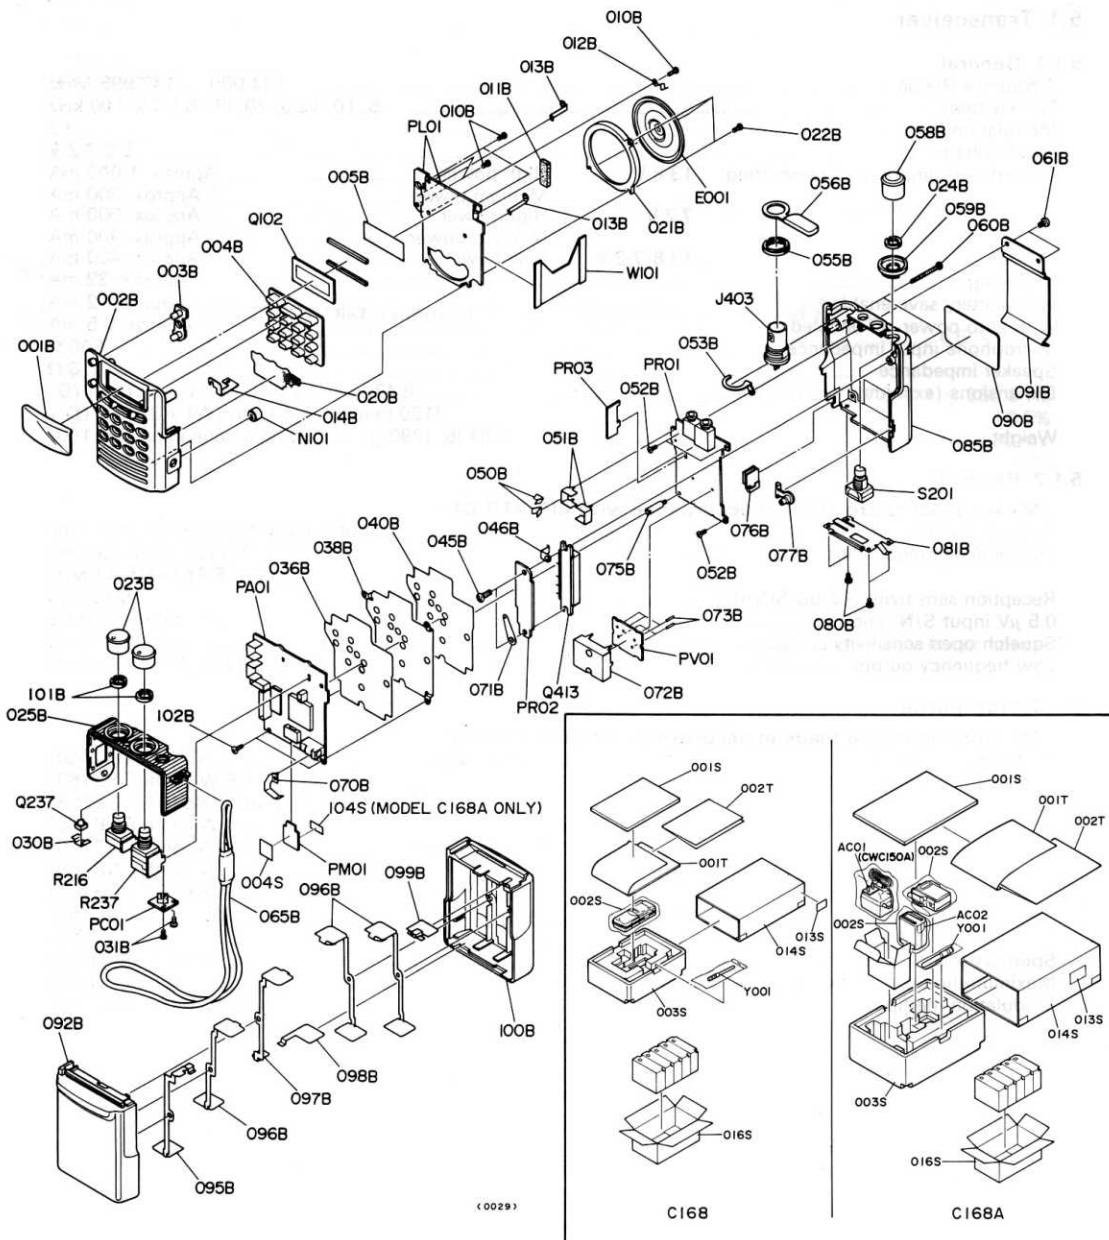

First through fourth digit of part number indicates chip part as follows:

- CAPACITORS -	- RESISTORS -	- SEMICONDUCTORS -	- INDUCTOR -
DD4.....	NI.....	BA.....	LU.....
DD5.....	NN.....	HX.....	
DD9.....	NY.....	HY.....	
DF9.....	RI.....	HZ.....	
DK4.....			
DK5.....			
DK9.....			
EY.....			

- Ordering Replacement Parts -

Please note that dealer may not be able to fill replacement parts orders without such identifying information as:

- ◆ Reference Symbol
- ◆ Parts Number
- ◆ Description
- ◆ Unit Model Serial Number
