

HF TRANSCEIVER
X108G
SERVICE MANUAL

XIEGU COMMUNICATIONS

【Important Notes】

- Before disassembling, make sure that the problem comes from inside the transceiver.
 - Be sure to completely cut off the external power before opening case.
 - Do not forcibly remove any parts to avoid any damage.
 - Please use insulated screwdriver to adjust the circuit to avoid short circuit.
 - Do not turn on the radio for a long time if there is any fault.
 - Do not connect the transmit port directly to the test ports of signal generator or network analyzer.
 - Do not keep transmitting in open circuit status for repairing.
 - Read the manual carefully before doing any test.
-

VERSION: 1.00.0

Copyright © 2010~2017, Xiegu Communications

Part 1 Technical Specs

Basic specs:

Frequency range: RX: 0.5~30MHz

TX: All ham band

Operate mode: SSB (J3E)

CW (A1A)

AM (A3E)

Min freq. Step: 1Hz

Antenna impedance: 50 Ω

Operating temperature range: -10°C ~ +60°C

Frequency stability: ±0.5ppm @ Power on 5mins, -10°C~+60°C

Operating voltage: 12~14.5V DC

Current parameter: RX 700mA @Max

TX 7.5A @Max

Size: 120*45*180 (mm) [Not including knob, holder etc.]

TX

TX Power: ≥15W (@13.8V)

Modulation: SSB Balanced modulation

AM Low level modulation

Spurious suppression: ≥40dBc

Carrier suppression: ≥45dBc

Selectivity: SSB 2.2kHz(-6dB)

CW 500Hz(-6dB)

RX

Middle frequency: 10.7MHz

RX sensitivity: 0.5uV @ 12dB SINAD (PRE ON, ≤2.0MHz)

0.35uV @ 12dB SINAD (PRE ON, >2.0MHz)

RX Band: 1.8~2.0MHz

3.5~4.0MHz

5.0~5.5MHz

7.0~7.3MHz

10.0~10.2MHz

14.0~14.5MHz

18.0~18.2MHz

21.0~21.6MHz

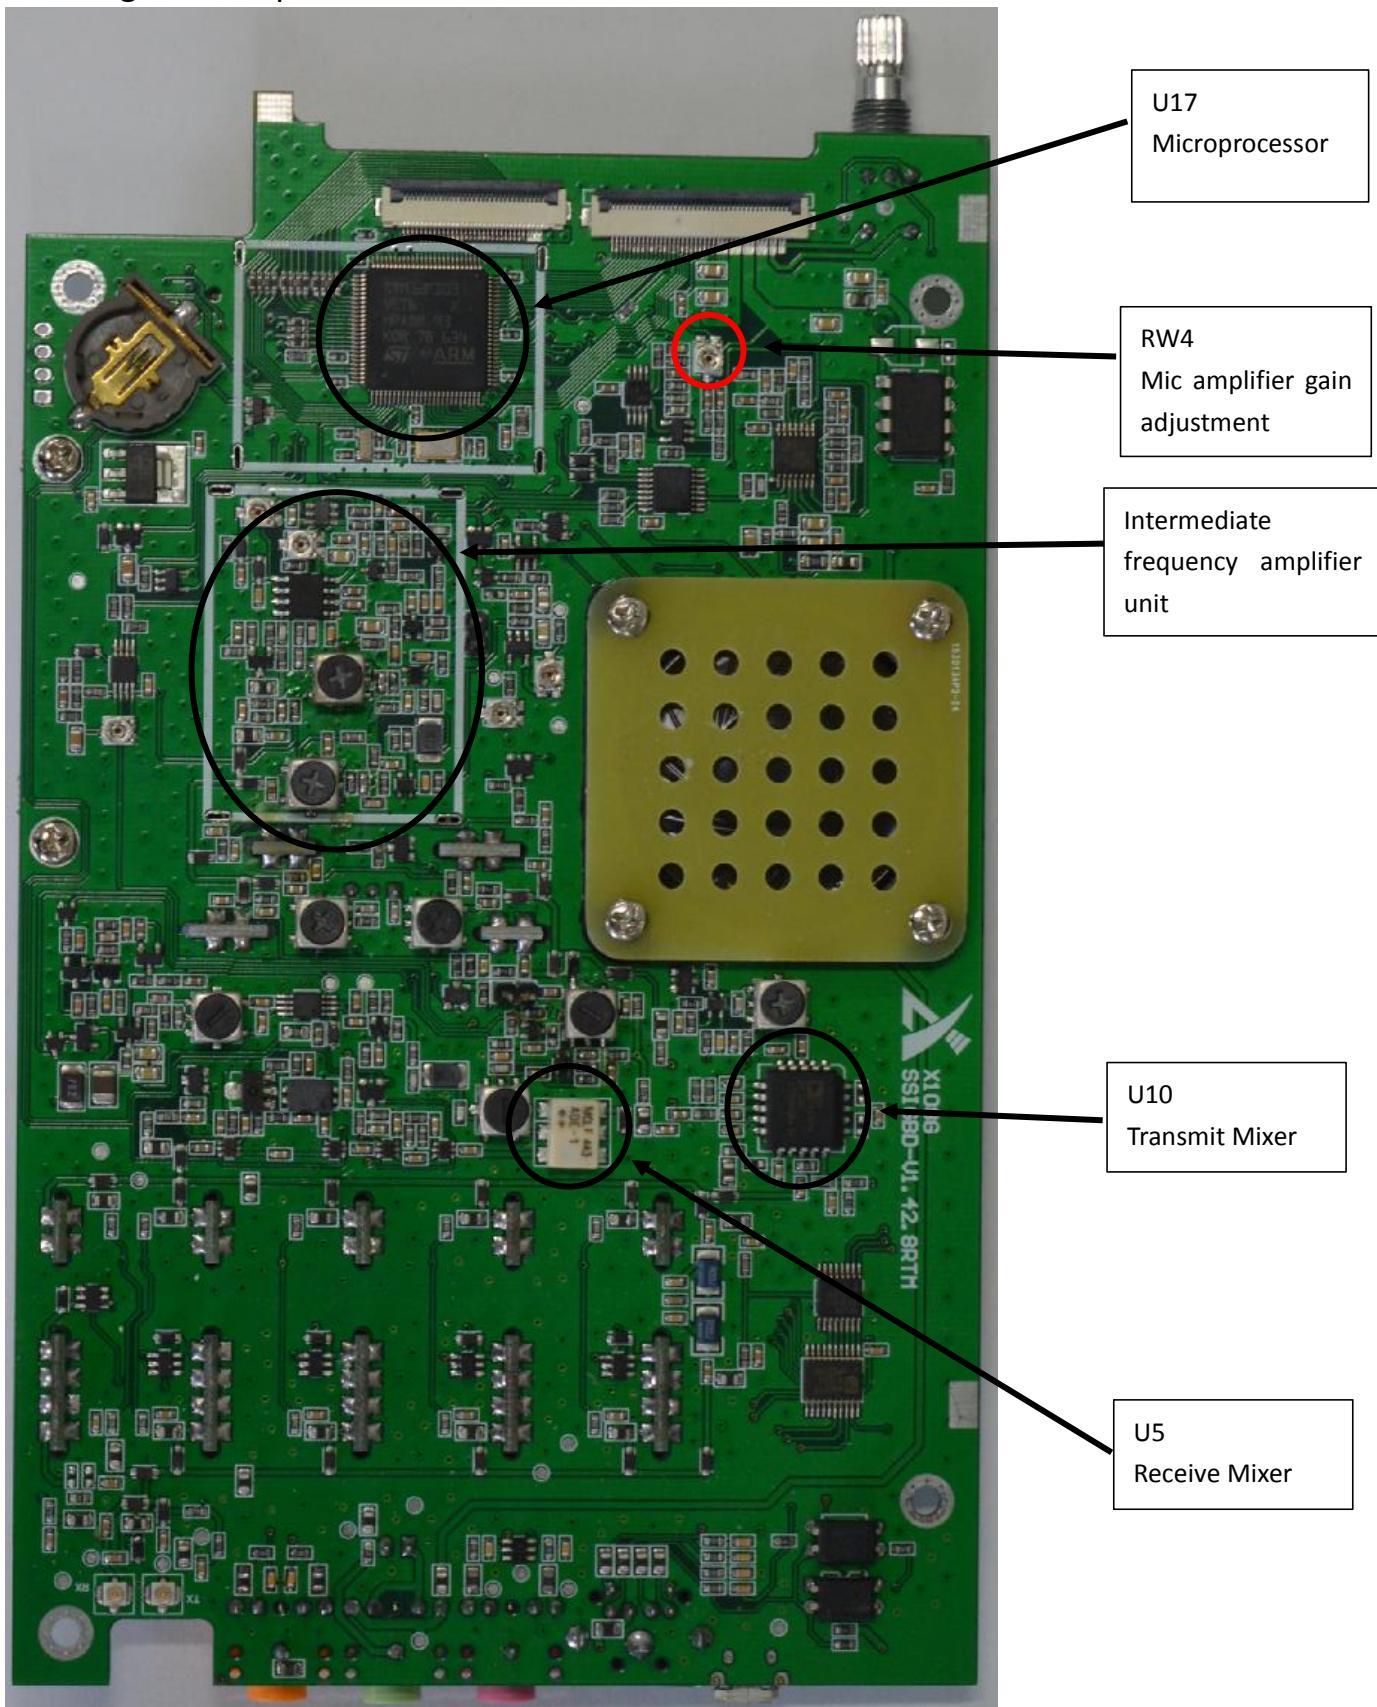

24.8~25.0MHz

28.0~28.8MHz

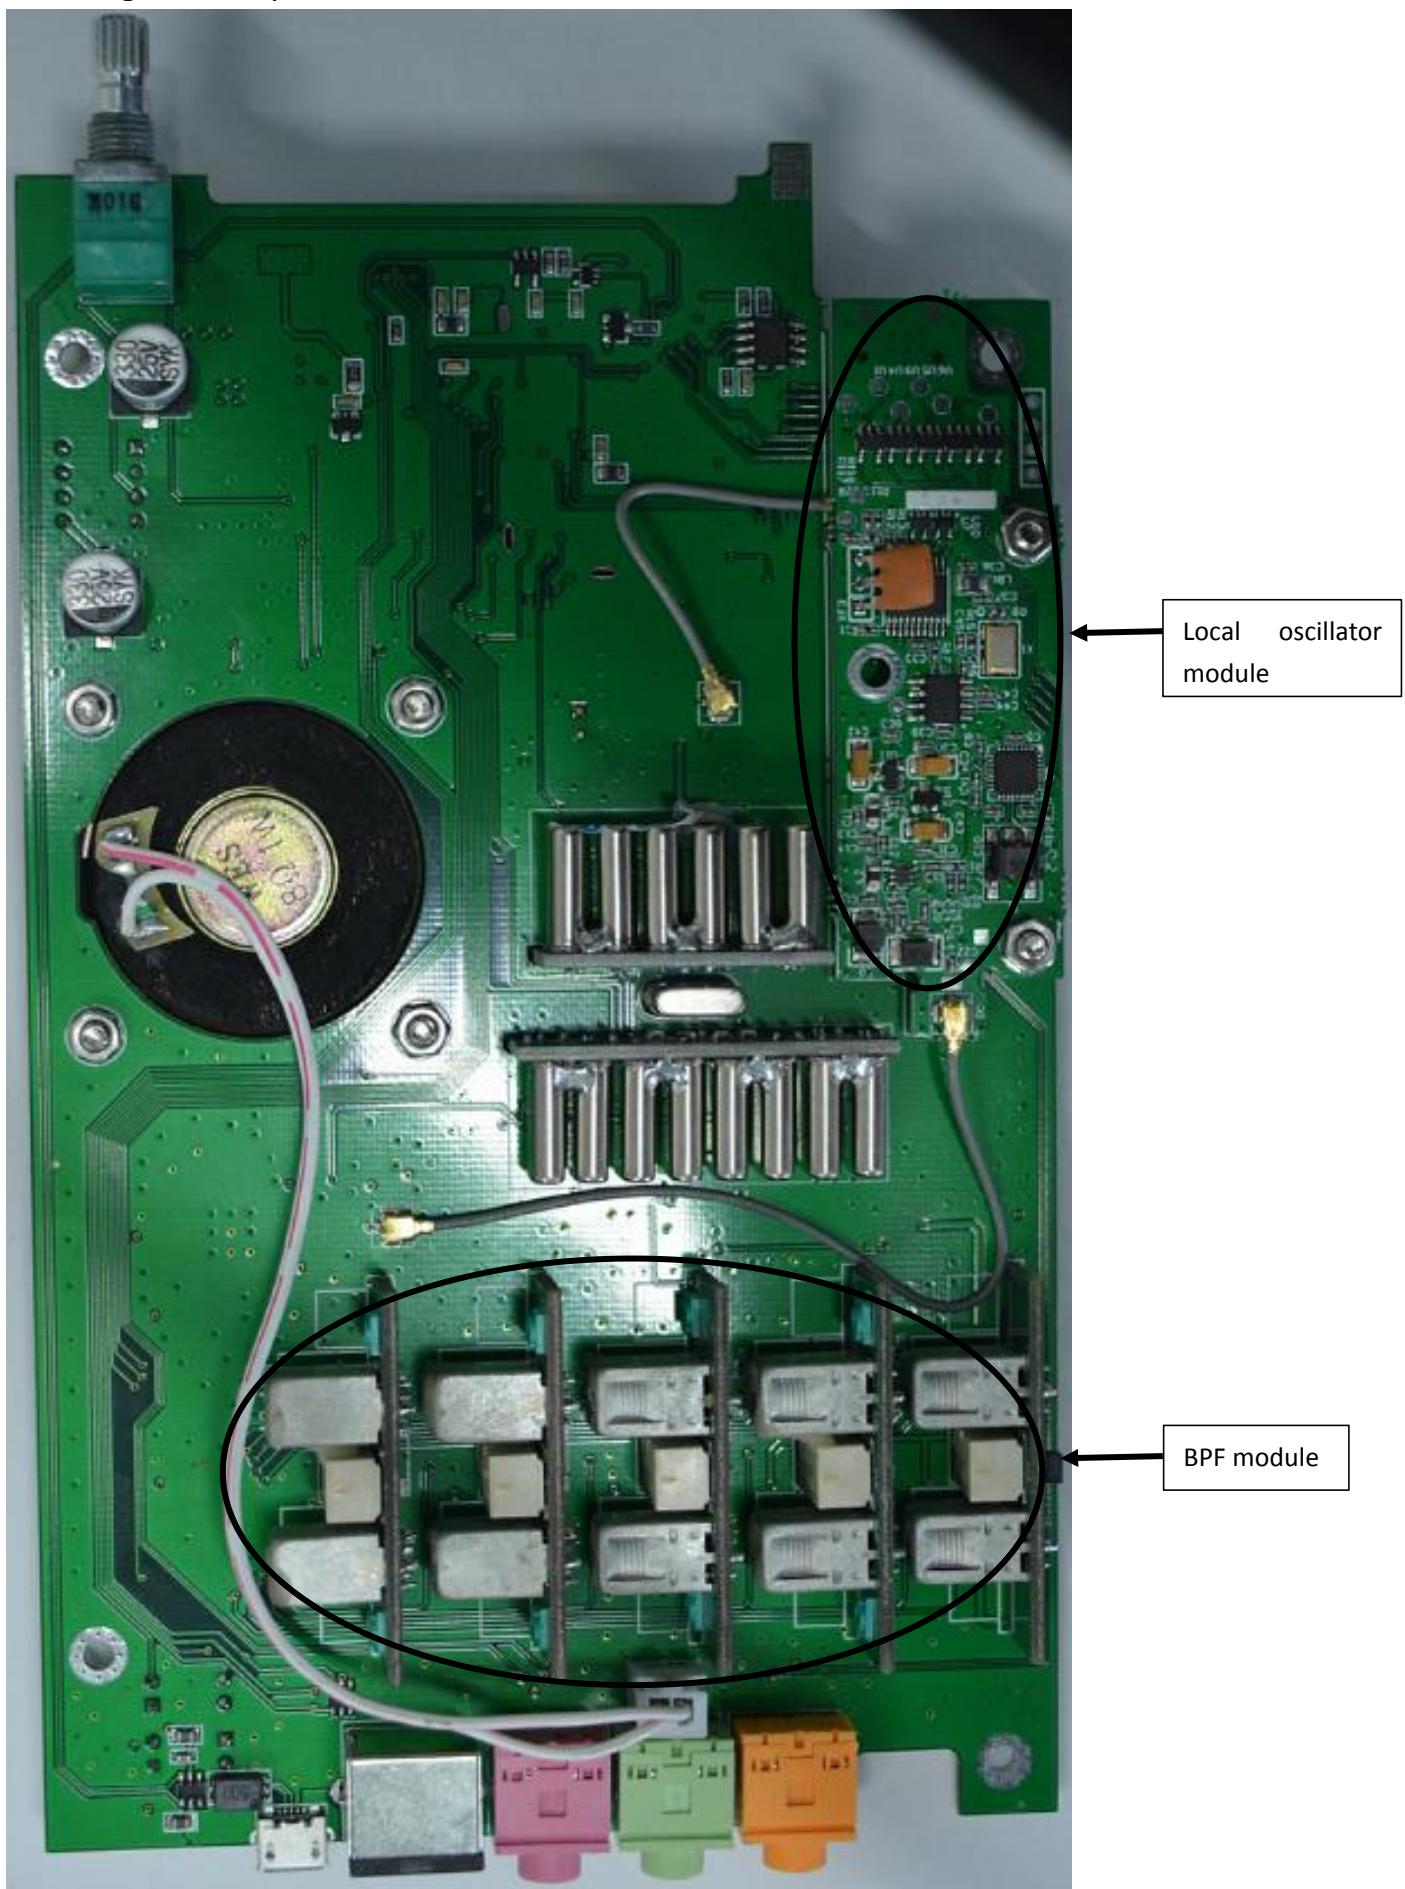

Dynamic range: ≥90dB

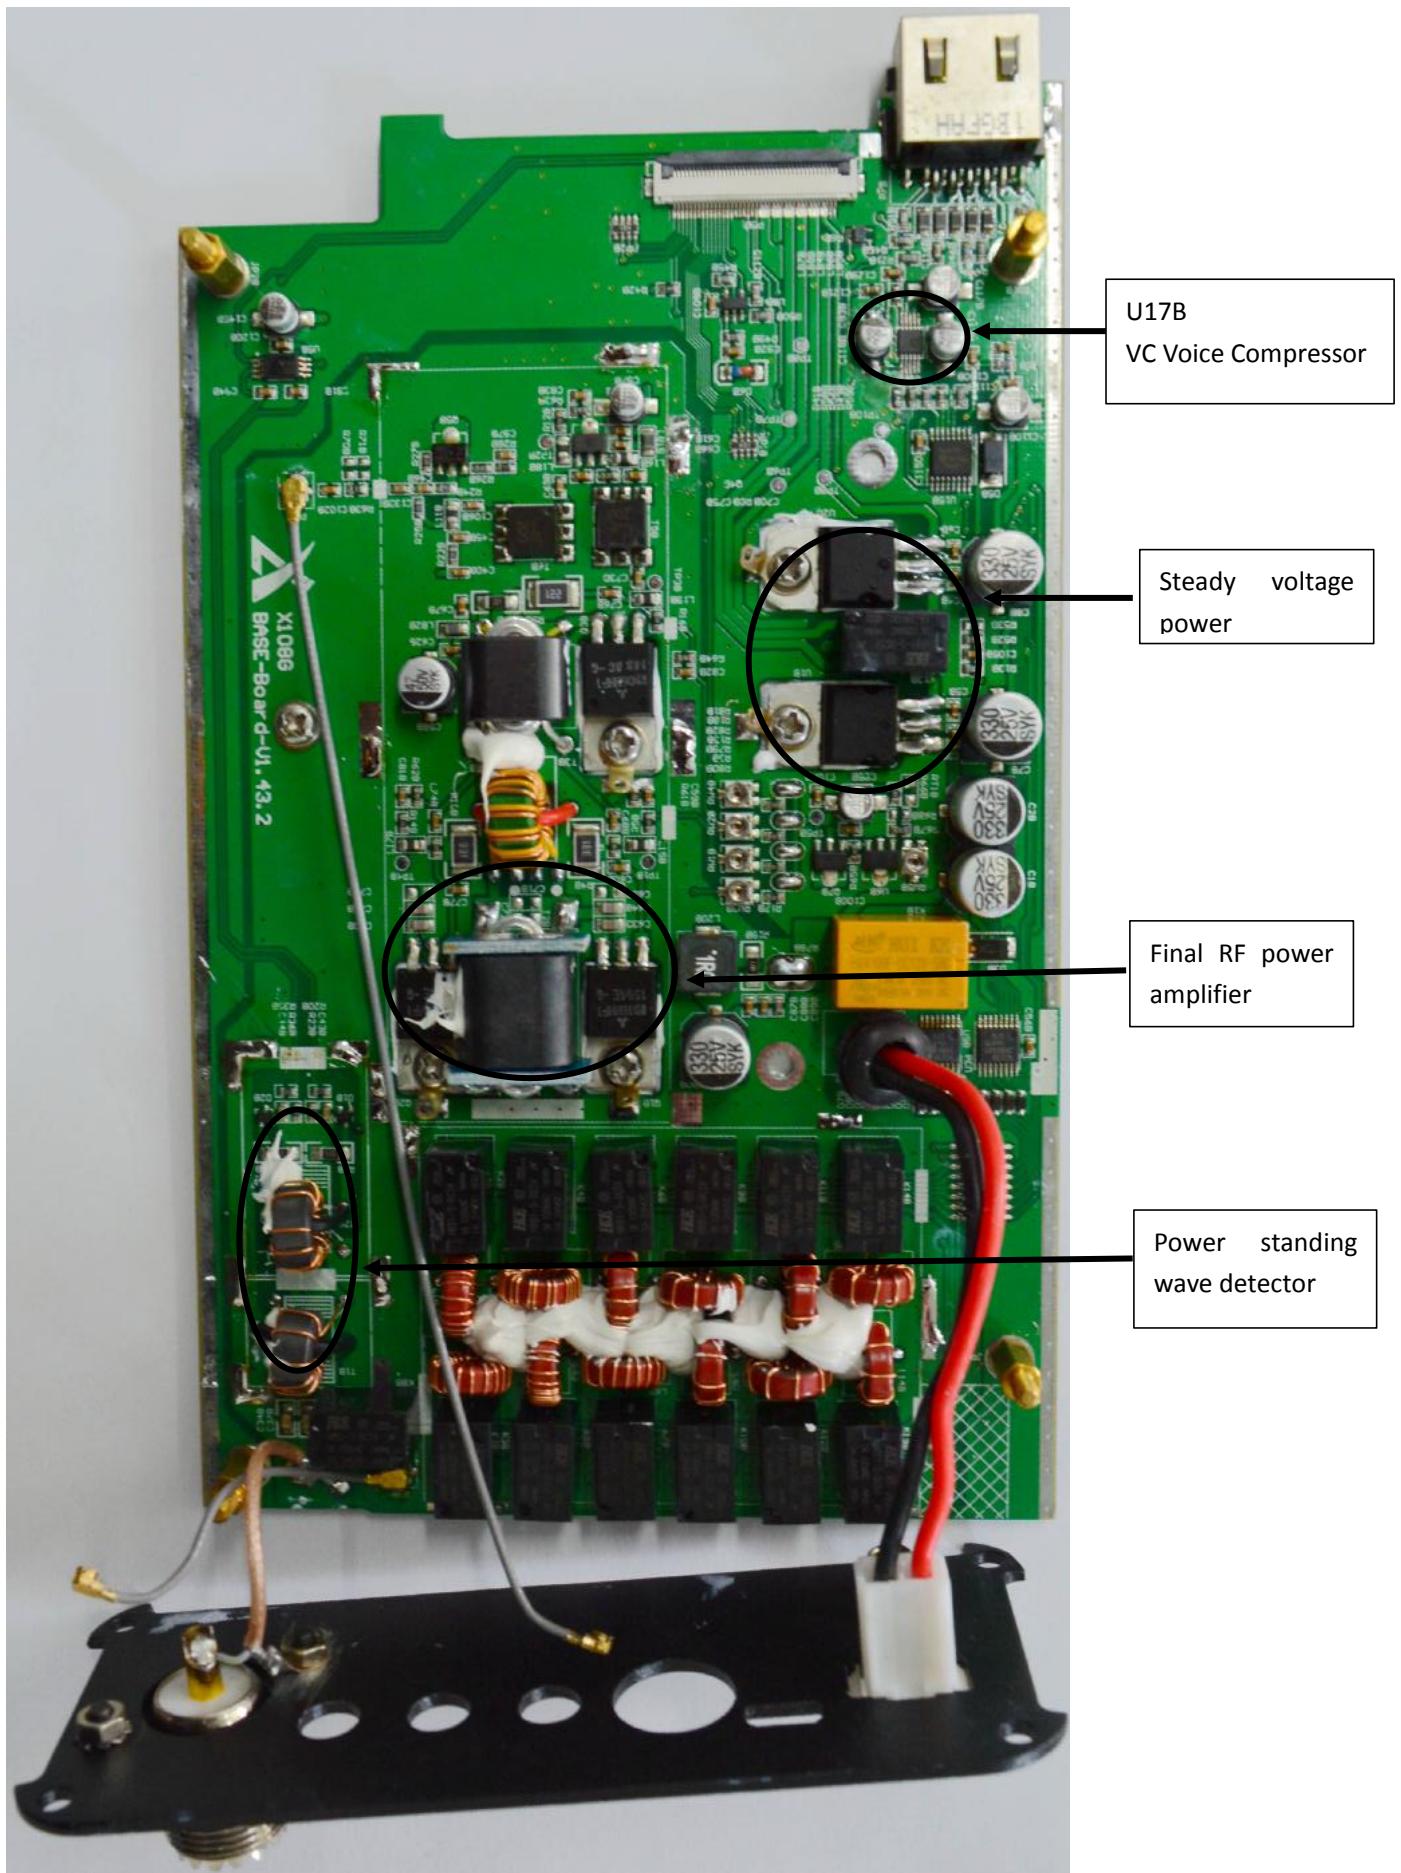

Part 2 Inside Circuit

Small signal front panel

Small signal back panel

Part 3 Circuit principle

3.1 Receiving Circuit

3.1.1 RF front-end circuit

The RF front-end circuit of 0.5--30MH is composed of a Receiving band-pass filter, receiving preamplifier, pre attenuator.

Band-pass filter consists of 5 modules (XGM1--XGM5), it can make 10 amateur bands. U20, U21 are band switching controller, connect the input band switching signal to LPF unit switching relay of power amplifier board.

Preamplifier is composed of Q7 and its periphery circuit. Preattenuator is π Type attenuator, which is composed of R57、R64、R65. U4、U12、U15、U18 are RF switching trigger, to control the RX Signal trend. PRE_EN and ATT_EN are control signals, by these 2 control signals to control the signal to be passthrough mode, amplifier mode, attenuator mode, amplifier+attenuator mode. Q8、Q9 are switching control digital triode.

3.1.2 Receiving mixer

U5 (ADE-1) is receiving mixer, inside is diode balanced mixing structure. The RX receiving signal is mixing 1st LO here, to bring 10.7MHz IF signal.

D15 is LO input switch, it's in forward conduction status when receiving, the LO enters the mixer. D15 is closed when transmitting.

3.1.3 IF PREAMP

After mixing, it brings a receiving 1st IF signal. This signal enters IF preamplifier Q21 via transformer T7 to finish the first IF amplify. This amplified IF signal

outputs to intermediate frequency crystal filter(IFCF) by T5. Q6 is NB control switch which controls the conducting of the Q21.

3.1.4 IFCF sets

The radio is builtd-in with 3 sets of IFCF, they are SSB - 2.2k (XMD1), CW - 500Hz (XMD2), and AM - 7.5K (XF1). Q1, Q11 and Q12 control the access of this three IFCF respectively.

3.1.5 IF Two stage amplifier circuit

The IF two stage amplifier circuit is composed of Q13 and Q15, the IF signal which be input by T4 makes the final IF amplification here then sent to the automatic gain control unit and the demodulation unit.

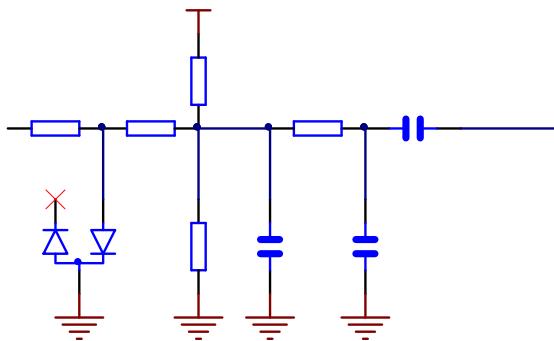

The automatic gain control unit is composed of Q4, D1, U1 and its peripheral devices. The automatic gain control voltage is sent to the G2 pole of the two stage IF amplifier respectively to receive automatic gain control. The starting speed is switched by U1 and Q23, and the switching signal is AGC-S.

The automatic gain control voltage outputs S table signal after buffering and amplifying by U2.

3.1.6 Demodulator circuit

The demodulation of single sideband signal SSB and continuous wave signal CW is accomplished by a product detector which is composed of U6 (SA602). The BFO signal is input through by the 6 pins to the demodulator, and the demodulated audio signal is output by 5 pins. By controlling the frequency of the injected BFO signal, the demodulation of SSB and CW modes can be completed.

The demodulation of AM mode is accomplished by D2 and its peripheral circuit.

The demodulated SSB, CW and AM audio signals are input to the U13 audio switcher then switch in different modes and output.

3.1.7 Audio unit

The audio switcher U13 input an audio signal, this signal is amplified by the active filter amplifier U7, then amplified and output by an audio power amplifier U9 (LM386) to drive speaker.

3.1.8 Pulse noise blanking processor NB

Receiving an IF signal which is output by a mixer enters the NB amplification/control unit after Q22 buffering, this part is composed of U3, Q27, D47, Q29, Q34, Q30, Q28 and Q6. When the pulse interference signal strength exceeds the threshold, this circuit starts to work, Q6 controls the IF preamplifier Q21 to be shutoff to bring the noise elimination.

3.2 Transmitting circuit

3.2.1 Microphone amplifying circuit

The microphone amplifying circuit is located on the power board, and consists of U15B and U17B. U15B (SSM2167) has voice amplification and voice compression function, and the compression ratio is switched by U15B.

3.2.2 Modulator circuit

The microphone amplified signal enters the modulator U6 via the audio switch U27 to do SSB modulation. AM modulator circuit consists of U6, Q10, D3, D8 and so on, to restore carrier and modulate.

3.2.3 Transmit 1 IF amplified / filtered circuit

The output signal of the debugger U6 is amplified by Q25 and then enters the IFCF (XMD1, XMD2, XF1) for filtering, then amplified by Q3 for the second time, and output to the transmitting mixer by T8.

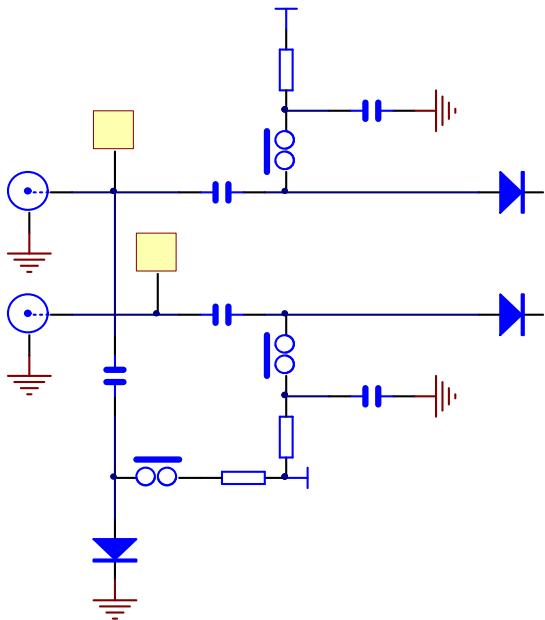

The CW_TXE signal is the transmit control enable signal in the CW mode.

3.2.4 Transmitted mixer

T8 outputs a transmitting 1 IF signal which is sent to the transmit mixer U10 (AD831) for mixing, then output a final transmitting small signal by the 16 pin.

3.2.5 Transmit small signal filter/output switching

U10 outputs a small signal and this small signal is filtered through the BPF module (XGM1 - XGM5), and then output transmitting final small signal by a electric switcher which is composed of D28 and D9, the interface is P2 (U.FL socket).

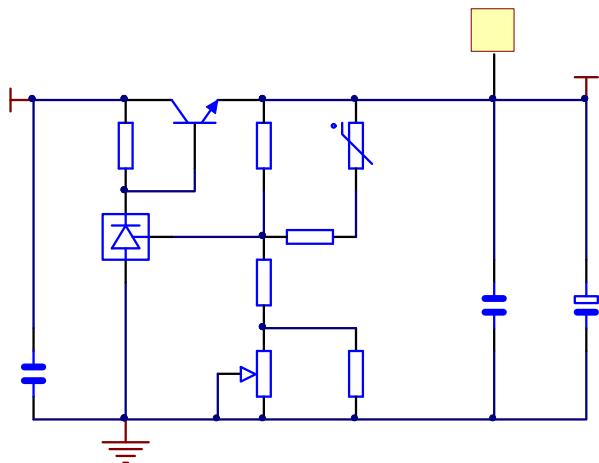

3.2.6 Power prime amplifier

P2 outputs a transmitting small signal, this small signal is connected to the socket P4B on the power supply board by IPEX wire, and it is prime amplified by Q5B (2SC5551), then output by the T6B.

3.2.7 Power amplifier units

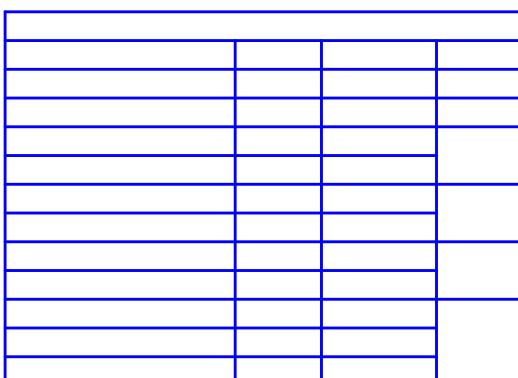

Power amplifier units are composed of Q4B、Q3B、Q1B、Q2B. Q1B and Q2B are final stage power amplifier , Push-pull amplifier are made up of 2pcs RD16HHF1 , stable output around 18W power signal. T2B is final stage output transformer.

The bias voltages of each level power tubes are all generated and supplied by a pedestal generator which consists of Q7B and U6B.

3.2.8 Low pass filter

The 6 stage, 5th order elliptic low-pass filter which is composed of relay and magnetic winding is responsible for filtering and removing the spurious and harmonic signals which are generated by the power amplifier, and U3B, U4B and U9B control the band switching.

3.2.9 Power/Standing wave detector

The power/SW detector is composed of T1B, T7B, D1B, D2B etc. It detects the output of antenna port and reflected power, U5B buffs and amplify the tested output signal, then sent to the microcontroller for processing and display the power and SW value.

3.2.10 Automatic power control circuit

The forward power detection value and the setting power value are sent into the U22A at the same time to process automatic power control, and output VALC voltage to control the amplification of the Q3, so as to achieve the purpose of automatic power control.

3.3 Control unit / Interface circuit

3.3.1 Microprocessor unit

Microprocessor U17 controls the whole work of the machine. Its I/O signal is mainly divided into switching signals and digital signals.

Microprocessor comes with AD/DA converter. The inside detection signal, such as S table, forward power and back power, are input to inside the processor to read by a special ADC port.

The microprocessor expands the I2C memory U8 to store the related data information.

3.3.2 External interface circuit unit

X108G has the following external interfaces: AUX, KEYER, ACC, SPK, Micro-USB.

Micro-USB is the real USB connector and it connects to the processor U17.

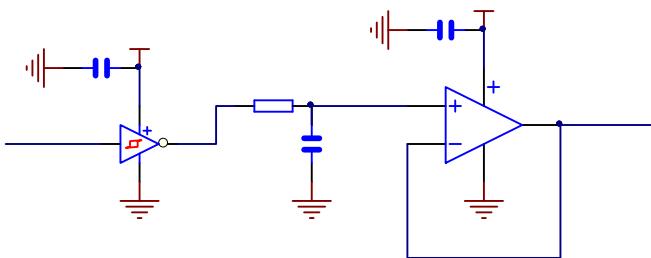

Key interface KEYER is common interface for manual/automatic key, connects to processor U17.

SPK port is the external speaker interface, it connects to the audio power amplifier U9.

ACC port is MIDI-DIN type 6 core data interface, which extends the external PTT signal, band voltage, external ALC input, external audio, +9V and GND ports.

AUX interface function is not open yet, the internal connects to the RX/TX port of processor, can be reserved as a backup serial port.

The band voltage generator consists of microprocessor and U25 and U26.

3.4 Power unit

There are 2 groups main power supply for X108G, 9V and 5V, which are generated by U1B (LM2940T-9.0) and U2B (LM7805) on the power amplifier board.

The microprocessor requirs 3.3V voltage which is generated by the U19.

The local oscillator requires 3.3V and 1.8V voltages which are generated by their BMP power supply.

Q9B and Q10B generates transmit-receive voltage +9R and +9T.

The power switch is an electronic power switch which is composed of Q6B and Q8B. PWR_SW is the control signal of the power on/off.

Part 4 Debugging

Following the below debugging methods to adjust the parameters of the small signal board and the power amplifier board to resume to default setting.

4.1 Machines

Machine	SPECS	Machine	SPECS
DC power supply	Output voltage: 13.8V	RF spectrum analyzer	Frequency range: 0.1-1000MHz
	Output current: maximum 10A		BW resolution ratio: 10Hz
	It has perfect protection function	Audio analyzer	SINAD analysis function
Audio frequency generator	Output frequency: 100Hz-10kHz	Oscilloscope	Measuring range: 10mV-10V
	Output amplitude: 1mV-1V RMS		Frequency range: DC-100MHz
RF signal generator	Output frequency: 0.1-500MHz	Digital multimeter	Measuring range: 0.01-20V
	Output amplitude: -127dBm-0dBm		3 and a half
Digital ammeter	Measuring range: 0.001-10A	External speaker	8 Ω & 2W

All equipment has been measured and tested within the period of validity.

4.2 Small signal board debugging

4.2.1 The small signal board has used the network analyzer to adjust the channel to the predetermined status. Please do not make any adjustments to the IF transformer on the channel, otherwise it will cause the deterioration of the transmit-receive capability.

4.2.2 Receiving channel gain debugging

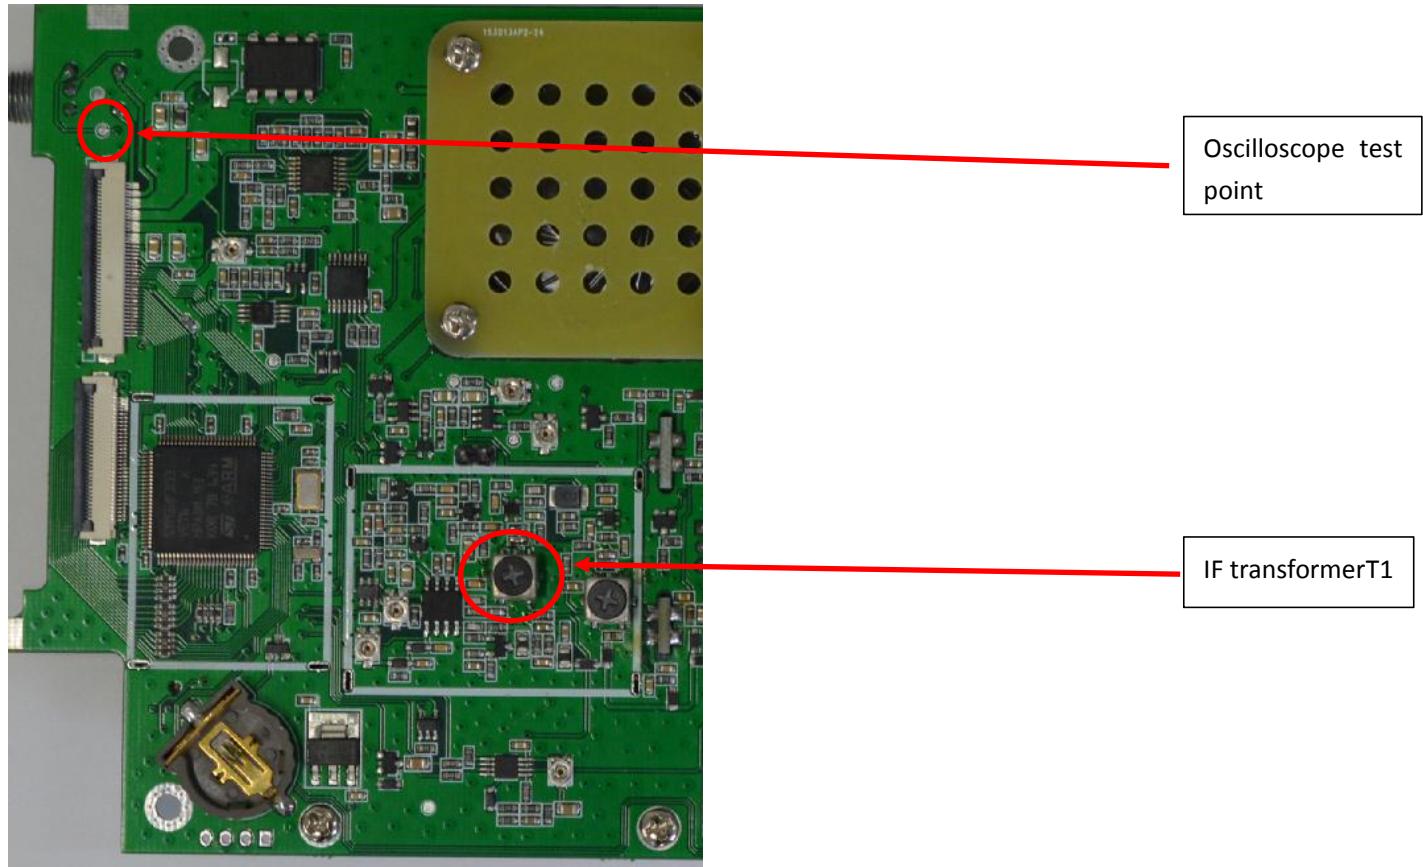

Required machines and its settings

Machine	Setting specs
RF signal source	Frequency: 14.251MHz, output amplitude: -97dBm
Oscilloscope	the units on the X-axis: 1ms, the units on the Y-axis: 100mV

Note: During the test, do not turn-on the X108G to transmit, otherwise the RF signal source will be damaged!

- 1) Set the receiving frequency of X108G to be **14.25000MHz, [USB] mode.**
- 2) Open **[PRE]**, close **[ATT]** and **[AGC]** and **[SQL]**.
- 3) Adjust the volume to be 1/3.

- 4) Signal source output a signal, connect it to the antenna interface of X108G.
- 5) Use oscilloscope to observe the signal amplitude of test point(signal frequency:1kHz).
- 6) Adjust the 2nd IF transformerT1 to make the range of magnitude observed on the oscilloscope is the largest (normally it is more than 550mV-Vpp).

4.2.3 Receiving sensitivity test

Required machines and its settings

Machine	Setting specs
RF signal source	Frequency: 14.251MHz, initial output amplitude: 10uV
Audio analyzer	SINAD test

- 1) Set the receiving frequency of X108G to be 14.25000MHz, [USB] mode.
- 2) Open [PRE],close [ATT] and [AGC] and [SQL].
- 3) Connect the SPK interface to input port of audio analyzer.
- 4) adjust the volume of the X108G to make the amplitude of the signal measured by the audio analyzer is 2000mV.
- 5) Set the RF signal source output amplitude to be 0.35uV, and the SINAD test value of the audio analyzer should be greater than 12dB, which is regarded as qualified.

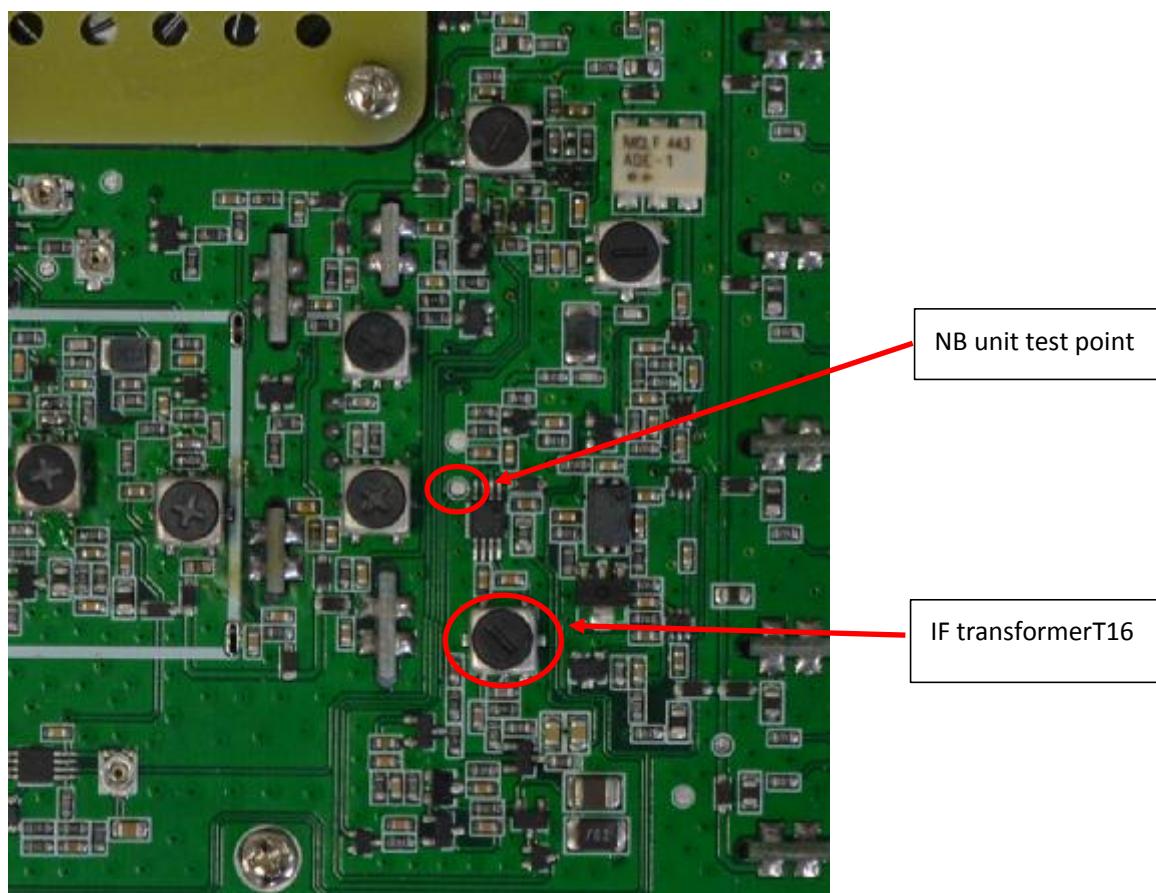

4.2.4 NB unit test

Required machines and its settings

Machine	Setting specs
RF signal source	Frequency: 14.251MHz, output amplitude: -80dBm
Digital multimeter	DC voltage test

Note: During the test, do not turn-on the X108G to transmit, otherwise the RF signal source will be damaged!

- 1) Set the receiving frequency of X108G to be 14.25000MHz, [USB] mode.
- 2) Open [PRE], close [ATT] and [AGC] and [SQL].
- 3) Measure the voltage of NB unit test point with digital multimeter.
- 4) Adjust NB amplify IF transformer T16 to make the test point voltage to be minimum (around 1.55V).
- 5) Turn off the signal source output, and the voltage value of the test point is about 4.15V.

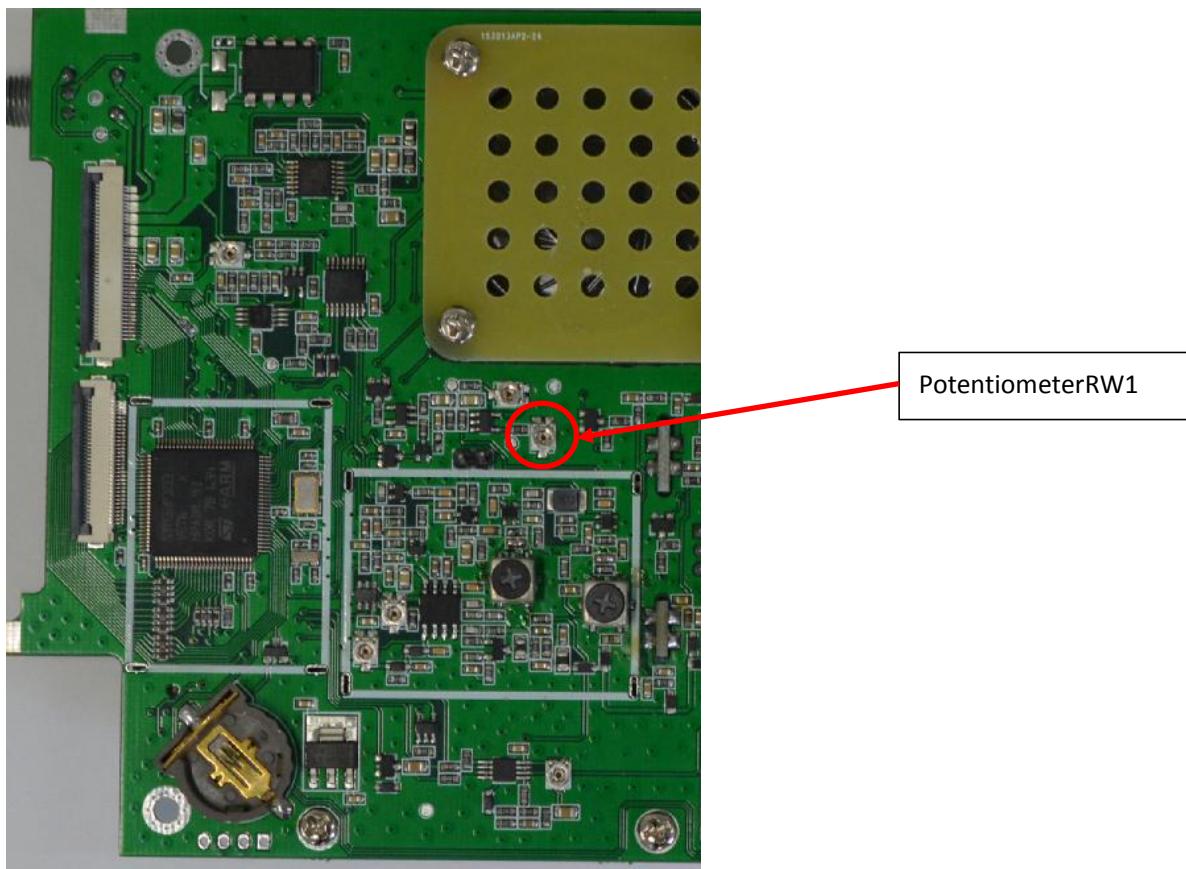

4.2.5 S table Parameter calibration

Required machines and its settings

Machine	Setting specs
RF signal source	Frequency: 14.251MHz

Note: During the test, do not turn-on the X108G to transmit, otherwise the RF signal source will be damaged!

- 1) Set the receiving frequency of X108G to be 14.25000MHz, [USB] mode.
- 2) Open [PRE], close [ATT] and [AGC] and [SQL].
- 3) Connect the output port of the RF signal source to the antenna interface of the X108G;
- 4) Turn off the RF signal source output, adjust the S table reference voltage PotentiometerRW1, make the -121dBm value of ADC on the screen is 2500, press the [SET] button to enter the next level signal setting.
- 5) Open the RF signal source, in turn, set up the signal source output signal amplitude by the each signal intensity as displayed on a screen, and then press the [SET] button to enter the next level of signal settings.
- 6) After setting all the signal levels, press the [SAVE] button to save and exit.

4.2.6 Overall gain adjustment of transmit channel

Required machines and its settings

Machine	Setting specs
Digital multimeter	DC voltage test

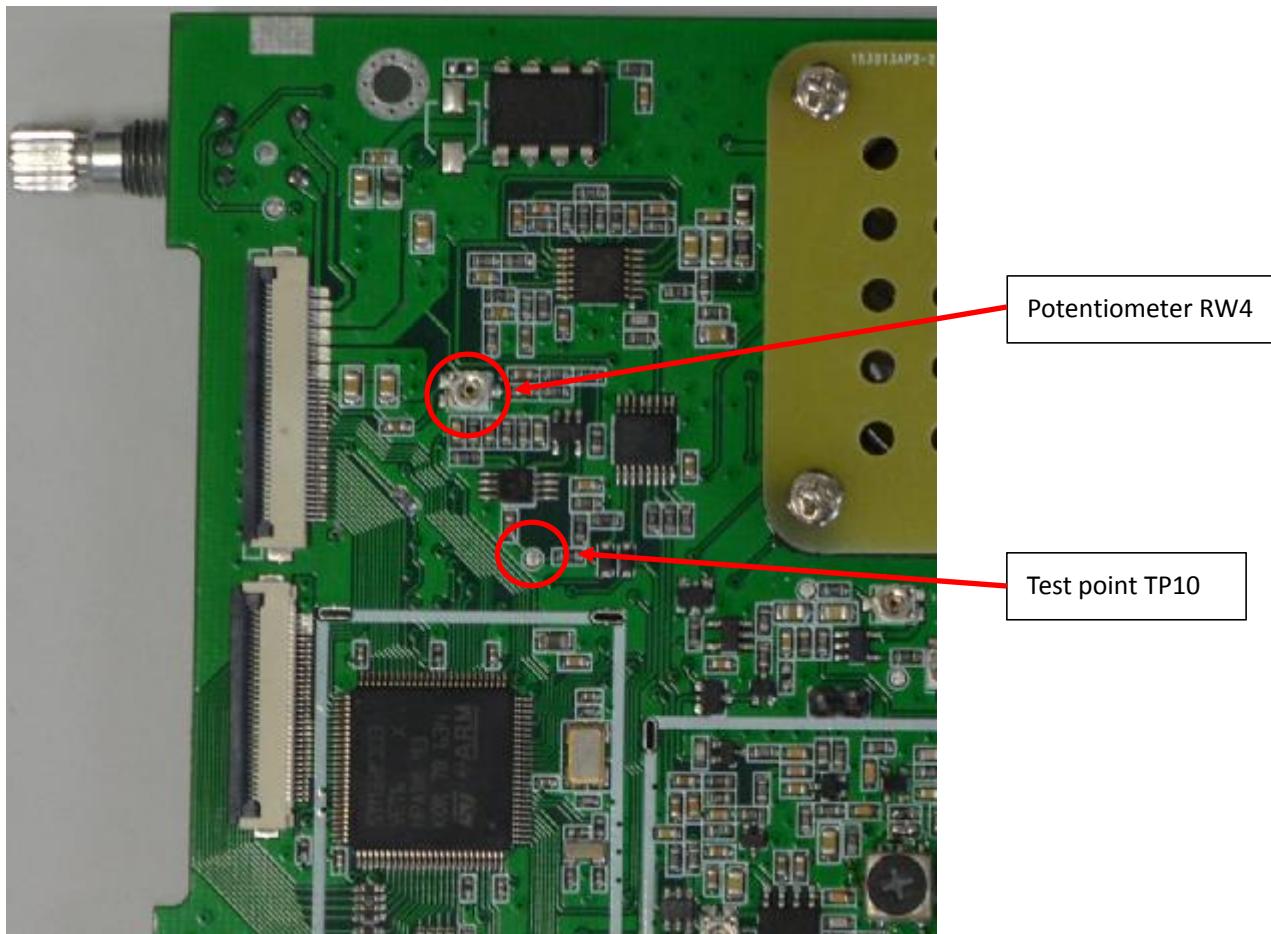

- 1) Set the receiving frequency of X108G to be 14.25000MHz, [CW] mode.
- 2) Pull out the TX signal plug of the small signal board.
- 3) Press the key to start the CW mode transmit.
- 4) Measure the voltage of the transmit gain test point TP11, and adjust the PotentiometerRW8 to make the voltage of the test point be 2V + 0.1V.

4.2.7 Modulation audio signal amplitude adjustment

Required machines and its settings

Machine	Setting specs
Audio frequency generator	Frequency:1kHz Amplitude:100mV-Vpp
50W RF load	

- 1) Set the receiving frequency of X108G to be 14.25000MHz, [USB] mode.
- 2) Connect the RF load to the antenna port of the X108G.
- 3) Unplug the TX signal line from small signal board to the power amplifier board.
- 4) Measure the amplitude of the test point TP10 with oscilloscope.
- 5) Press PTT of hand microphone, adjust Potentiometer RW4 to make the amplitude of test point be 50mV-Vpp.

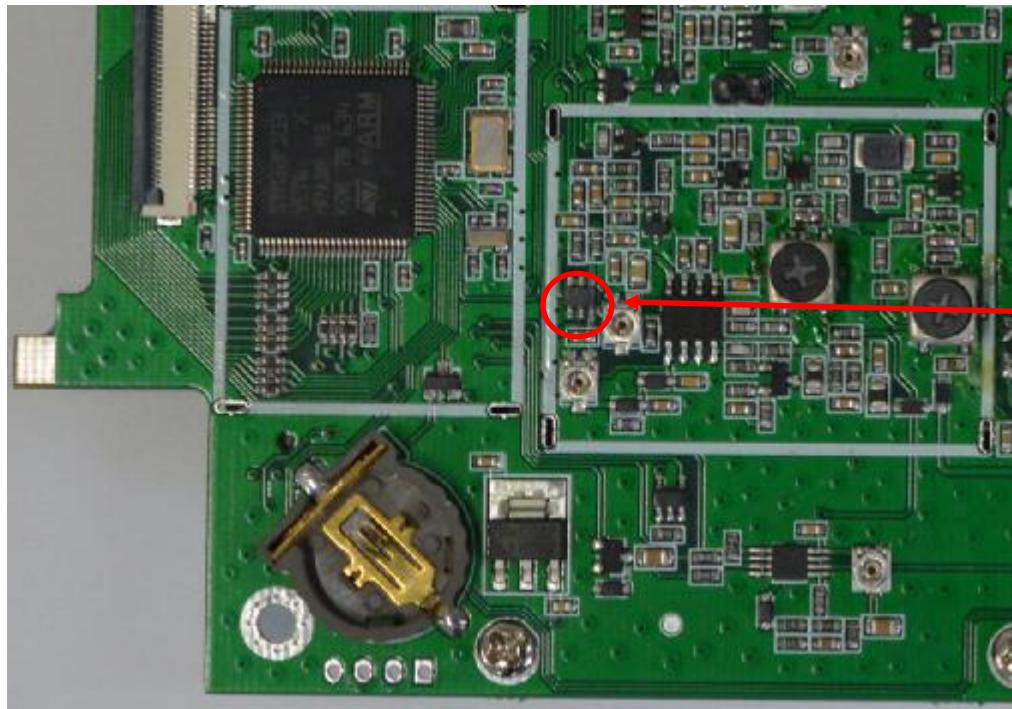

4.2.8 SSB mode carrier suppression debugging

Required machines and its settings

Machine	Setting specs
Audio signal generator	Frequency:1kHz Amplitude:100mV-Vpp
Spectrum analyzer	Central frequency:14.25MHz BW:10MHz
50W RF load	

- 1) Set the receiving frequency of X108G to be 14.25000MHz, [USB] mode.
- 2) Connect the RF load to the antenna interface of the X108G.
- 3) Connect the TX output signal of the small signal board RF spectrum analyzer.
- 4) The output signal of the audio signal source is connected to a special test microphone, and open the output of the audio signal source.
- 5) Press the PTT of speaker microphone to start the X108G transmitting, and observe the carrier output power measured by the spectrum analyzer.
- 6) Adjust PotentiometerRW6 to make the carrier power measured on the spectrum analyzer is minimum.

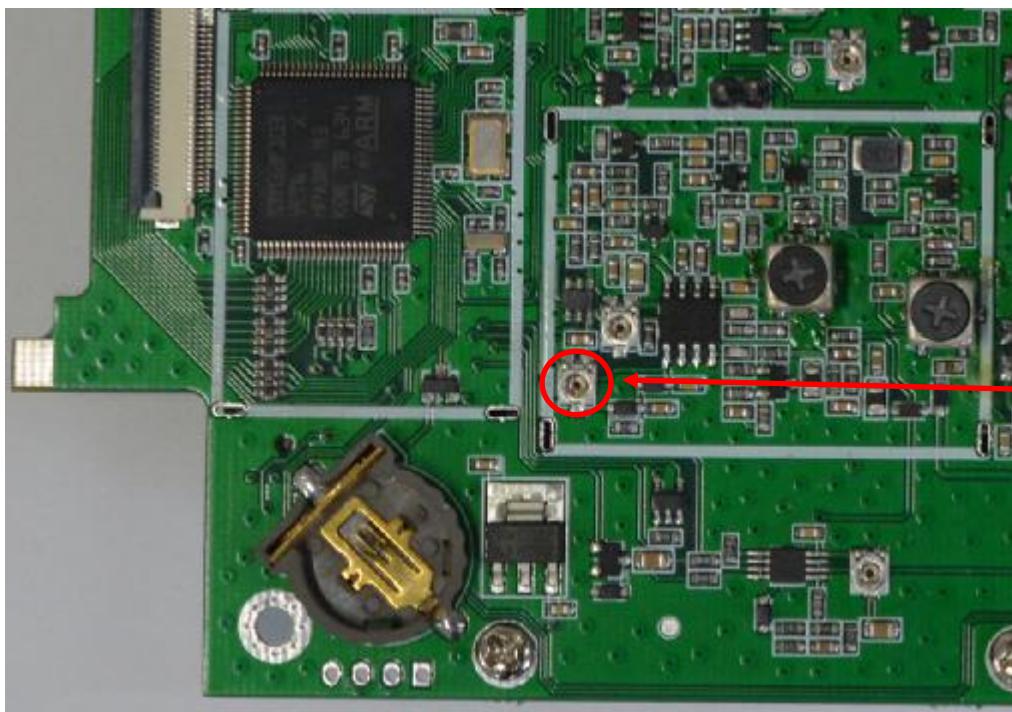

4.2.9 AM modulation debugging

Required machines and its settings

Machine	Setting specs
Audio frequency generator	Frequency:1kHz Amplitude:100mV-Vpp
Spectrum analyzer	Central frequency:14.25MHz BW:10MHz
50W RF load	

- 1) Set the receiving frequency of X108G to be 14.25000MHz, [AM] mode;
- 2) Connect the RF load to the antenna interface of the X108G.
- 3) Connect the TX output signal of the small signal board RF spectrum analyzer.
- 4) The output signal of the audio signal source is connected to a special test microphone, and open the output of the audio signal source.
- 5) Press the PTT of speaker microphone to start the X108G transmitting, and observe the power difference between carrier and envelope which are measured by spectrum analyzer
- 6) Adjust PotentiometerRW5, to make the carrier power is higher than the envelope power 14dB + 1dB.

4.2.10 Transmit closed loop debugging

Required machines and its settings

Machine	Setting specs
Digital multimeter	DC voltage test gear
Spectrum analyzer	Central frequency:14.25MHz BW:5MHz
50W RF load	

- 1) Set the receiving frequency of X108G to be 14.25000MHz, [CW] mode, power 20W
- 2) Connect the RF load to the antenna interface of the X108G.
- 3) Press the CW key to start the transmit, measure G2 voltage of the transmitting amplifier Q3 by digital multimeter.
- 4) Adjust the IF transformerT8 to make the test voltage value be minimum.

4.2.11 Power amplifier unit static debugging

Required machines and its settings

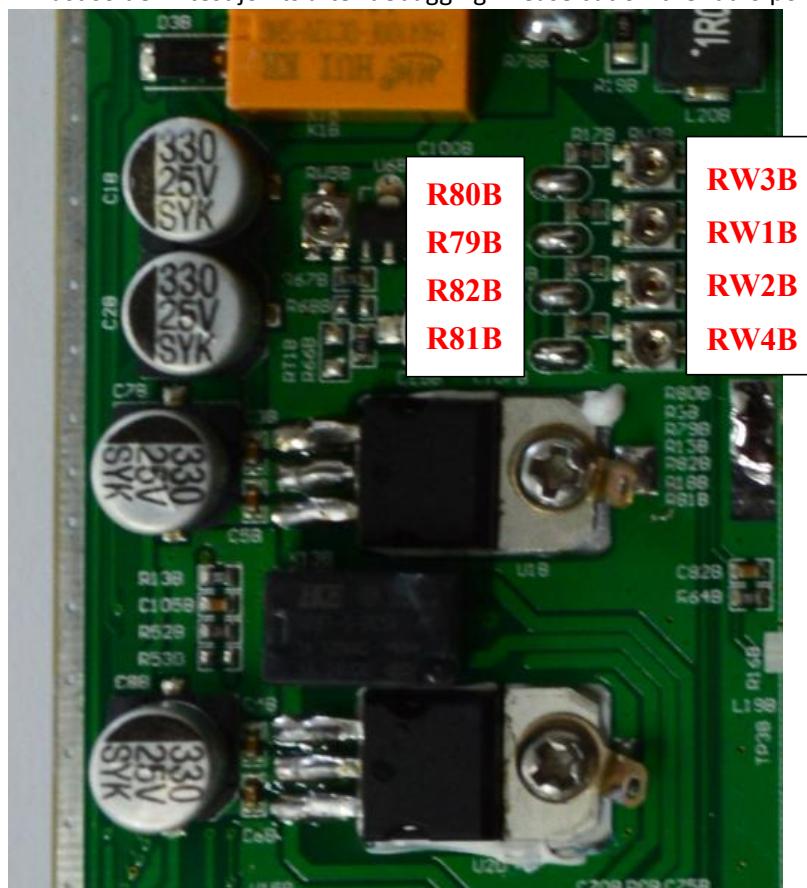

Machine	Setting specs
Digital ammeter	DC voltage test gear
50W RF load	

- 1) Set the receiving frequency of X108G to be 14.25000MHz, [USB] mode.
- 2) Unplug the TX signal line from small signal board to the power amplifier board.
- 3) Connect the RF load to the antenna interface of the X108G.
- 4) Disconnect R81B、R82B、R79B、R80B solder joints.
- 5) Connect a dedicated test microphone to X108(disconnect the microphone input), then press PTT to start the transmitting, and record the current ammeter value as a baseline reading.
- 6) Solder four debug solder joints, adjust the corresponding Potentiometer, start the transmitting to make the value of additional current are as follows:

Solder joints	Potentiometer	Additional current
R81B	RW4B	30mA
R82B	RW2B	250mA
R79B	RW1B	300mA
R80B	RW3B	300mA

Notes:

- When debug a joint, other 3 joints must be cut off.
- Must solder 4 test joints after debugging. Please cut off the radio power when soldering.

Part 5 Parts List

Power amplifier board

NO.	Item	SPECS	PACKAGE	BRAND	MPN	Designator
1	Aluminum solid cap	100uF		Würth	875105359010	C1B, C2B, C7B, C8B, C90B, C110B, C113B
2	capacitor	100nF	0603	Murata	GRM188R71H104KA93	C3B, C4B, C5B, C6B, C40B, C45B, C46B, C56B, C59B, C60B, C61B, C62B, C66B, C67B, C68B, C69B, C70B, C73B, C74B, C75B, C76B, C77B, C81B, C82B, C83B, C84B, C87B, C97B, C98B, C100B, C102B, C105B, C106B, C107B, C109B, C111B, C114B, C115B, C120B, C130B, C133B
3	capacitor	100pF	0805	Murata	GRM21A5C2D101JW01	C9B, C10B, C18B, C21B, C24B, C47B, C49B, C55B
4	capacitor	1nF	0805	Murata	GRM21AR72D102KW01	C11B, C19B, C63B, C64B, C79B, C80B
5	capacitor	330pF	0805	Murata	GRM21A5C2D331JW01	C12B, C28B, C31B, C36B
6	capacitor	680pF	0805	Murata	GRM21A7U2D681JW31	C13B, C15B, C27B
7	capacitor	470pF	0805	Murata	GRM21A7U2D471JW31	C16B, C17B
8	capacitor	1.5nF	0805	Murata	GRM21AR72D152KW01	C20B
9	capacitor	1.2nF	0805	Murata	GRM21A7U2D122JW31	C22B, C23B
10	capacitor	47pF	0805	Murata	GRM21A5C2D470JW01	C25B, C32B
11	capacitor	75pF	0805	Murata	GQM2195C2E750GB12	C26B, C52B
12	capacitor	30pF	0805	Murata	GQM2195C2E300GB12	C29B
13	capacitor	150pF	0805	Murata	GRM21A5C2D151JW01	C30B
14	capacitor	27pF	0805	Murata	GRM21A5C2D270JW01	C33B, C50B, C139B
15	capacitor	100nF	0805	Murata	GRM21BR72A104MAC4	C34B
16	capacitor	68pF	0805	Murata	GRM21A5C2D680JW01	C35B, C54B

103	Resistance	56k	0603	Yageo	RC0603FR-0756K	R189
104	Resistance	0R jumper	0402	Yageo	-	R198
105	Exclusion	33R	0603X4/8P	Yageo	YC164FR-0733R	RP1
106	Exclusion	100R	0603X4/8P	Yageo	YC164FR-07100R	RP2, RP3, RP4
107	Adjustable Resistance	10k	3x3 SMT	domestic	-	RW1, RW3, RW4, RW5, RW6, RW8
108	Potentiometer	R09	Rachis centre-vent	domestic	-	RW2
109	IF transformer	1402	5x5 SMT		-	T1, T3, T4, T6, T8
110	Transformer	744242510	WE-SLM	Würth	744242510	T2, T11
111	IF transformer	1802	5x5 SMT		-	T5, T16
112	IF transformer	1404	5x5 SMT		-	T7
113	Single Pin Header	2.54mm spacing	SIP2	domestic	-	TP3, TP8
114	IC	BU4S66G2	SOT-23-5	ROHM	BU4S66G2	U1
115	IC	LM321MF	SOT-23-5	TI	LM321MF	U2, U11, U14
116	IC	UPC3218GV	TSSOP-8	CEL	UPC3218GV	U3
117	IC	AS179-92LF	SC-70-6	SKYWORKS	AS179-92LF	U4, U12, U15, U18
118	Ring mixer	ADE-1	SMT	MINI	ADE-1	U5
119	IC	NE602A	SO-8	Philips	NE602A	U6
120	IC	MC33204DTB	TSSOP-14	ON	MC33204DTB	U7
121	IC	AT24C32N-10SC-2.5	SO-8	ATMEL	AT24C32N-10SC-2.5	U8
122	IC	LM386N	DIP-8	NS	LM386N	U9
123	IC	AD831AP	PLCC-20	ADI	AD831AP	U10
124	IC	CD4051BPWR	TSSOP-16	TI	CD4051BPWR	U13
125	Optical coupler	PC817	DIP-4	domestic	-	U16, U28
126	IC	STM32F103VET6	QFP-100	ST	STM32F103VET6	U17
127	IC	LM1117MP-3.3/NOPB	SOT-223	TI	LM1117MP-3.3/NOPB	U19
128	IC	74HC245PW	TSSOP-20	NXP	74HC245PW	U20
129	IC	74HC238PW	TSSOP-16	NXP	74HC238PW	U21
130	IC	MC33202DM	TSSOP-8	ON	MC33202DM	U22
131	IC	LM4040AIM3-3.0	SOT-23	TI	LM4040AIM3-3.0	U24
132	IC	MCP6001U	SOT-23-5	MICROCHIP	MCP6001U	U25
133	IC	74V1G14C	SC-70-5	ST	74V1G14C	U26
134	IC	TC4W53FU	SSOP8-P-0.65	Toshiba	TC4W53FU	U27
135	Crystal	8MHz	5032-4PIN	domestic	-	X1

	oscillator					
136	Crystal oscillator	32.768kHz	3215-2PIN	EPSON		X2
137	Crystal filter		49U	SUNNY	-	XF1
138	Xiegu module	80m/160m	module	Xiegu	-	XGM1
139	Xiegu module	40m/60m	module	Xiegu	-	XGM2
140	Xiegu module	20m/30m	module	Xiegu	-	XGM3
141	Xiegu module	15m/17m	module	Xiegu	-	XGM4
142	Xiegu module	10m/12m	module	Xiegu	-	XGM5
143	Xiegu module	SSB Crystal filter	module	Xiegu	-	XMD1
144	Xiegu module	CW Crystal filter	module	Xiegu	-	XMD2
