COMPACT SYNTHESIZED UHF FM TWO-WAY RADIO

TK-805D

SERVICE MANUAL

KENWOOD

B51-8108-00 (O) 1139

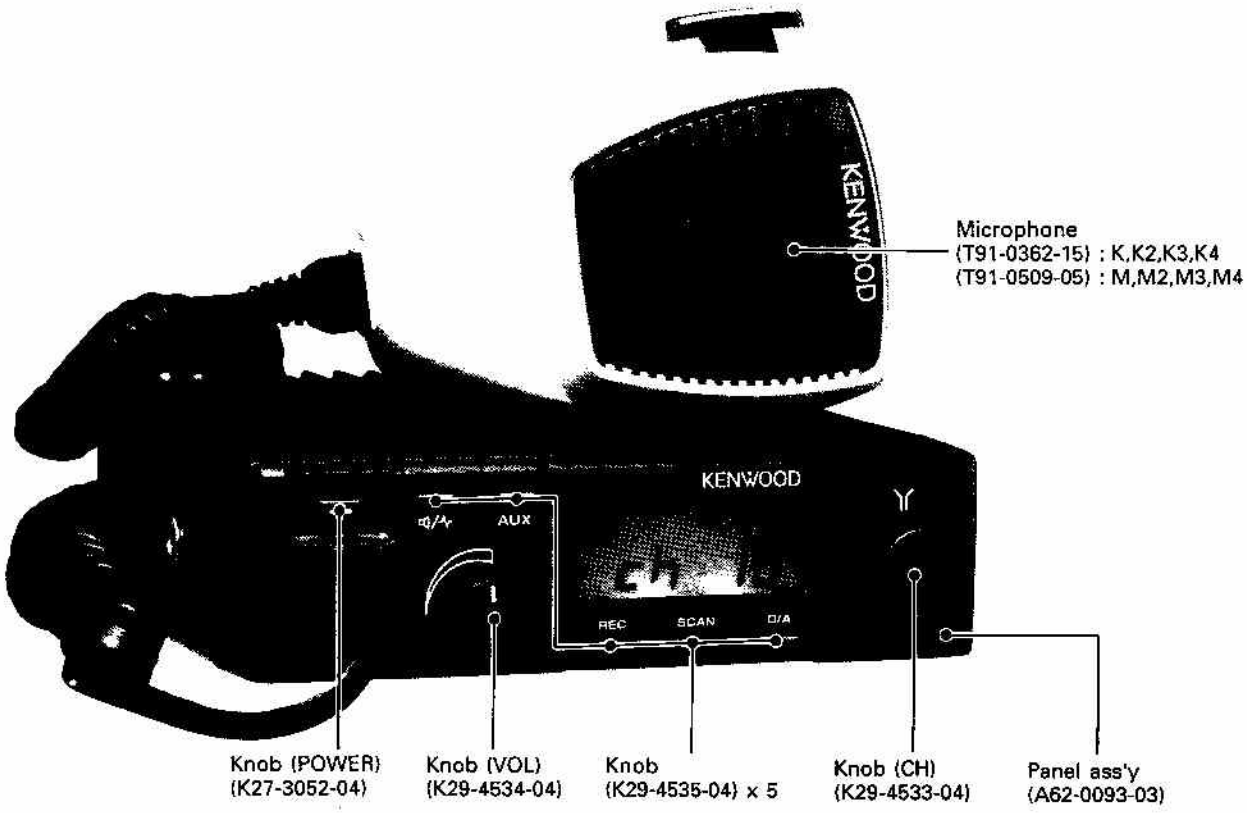

Photo is K,K2,K3,K4 type.

CONTENTS

GENERAL

INTRODUCTION

SCOPE OF THIS MANUAL

This manual is intended for use by experienced technicians familiar with similar types of commercial grade communications equipment. It contains all required service information for the equipment and is current as of the publication date. Changes which may occur after publication are covered by either Service Bulletins or Manual Revisions. These are issued as required.

ORDERING REPLACEMENT PARTS

When ordering replacement parts or equipment information, the full part identification number should be included. This applies to all parts: components, kits, or chassis. If the part number is not known, include the chassis or kit number of which it is a part, and a sufficient description of the required component for proper identification.

PERSONNEL SAFETY

The following precautions are recommended for personnel safety:

- DO NOT transmit if someone is within two feet (0.6 meter) of the antenna.
- DO NOT transmit until all RF connectors are verified secure and any open connectors are properly terminated.
- SHUT OFF and DO NOT operate this equipment near electrical blasting caps or in an explosive atmosphere.
- All equipment should be properly grounded before power-up for safe operation.
- This equipment should be serviced by a qualified technician only.

FCC COMPLIANCE AND TYPE ACCEPTANCE NUMBERS

Type acceptance number	Frequency range	Compliance
ALHTK-805D-1	450~470MHz	Parts 22, 74, 90 and 95
ALHTK-805D-2	470~490MHz	Parts 22, 74 and 90
ALHTK-805D-3	490~512MHz	Parts 22, 74 and 90
ALHTK-805D-4	406~430MHz	Parts 22, 74 and 90

1. POWER-UP

To turn on the radio, press the power switch (IO). The channel indicator will illuminate to indicate power is ON.

2. TO RECEIVE

Operation	Procedure
1. Disable QT, DQT (if so equipped)	Remove microphone from its hanger.
2. Unsquelch radio	Press the MONITOR switch (🔊 /∿). Keep the key down for 2 seconds.
3. Set VOLUME control	Adjust VOLUME control for a normal listening level.
4. Set SQUELCH control	Press the MONITOR switch (🔊 /∿) again.
5. Select operating frequency. (Multichannel models only)	Rotate CH selector switch to desired channel.
The radio will now receive all traffic on the selected channel.	
6. Enable QT, DQT (if so equipped)	Insert microphone back into its hanger.
You will now hear messages for your system only.	

3. TO TRANSMIT

Operation	Procedure
1. Disable QT, DQT (if so equipped)	Press the MONITOR switch (🔊 /∿) or remove microphone from hanger.
2. Select operating frequency. (Multichannel models only)	
3. LISTEN	DO NOT TRANSMIT if channel is in use.
4. Key transmitter	Press and hold the microphone PTT switch. The LCD on the front panel will indicating the transmitter is ON ( ).
5. Transmit message	Hold microphone at about 2 inches distance and speak at a normal voice level. Keep transmissions brief.
6. Receive reply	Release the microphone PTT switch.
7. Enable QT, DQT at end of the conversation. (if so equipped)	Press the MONITOR switch (🔊 /∿) and replace the microphone into its hanger.

GENERAL

PRE-INSTALLATION CONSIDERATIONS

1. UNPACKING

Unpack the radio from its shipping container and check for accessory items. If any item is missing, please contact KENWOOD immediately.

2. LICENSING REQUIREMENTS

Federal regulations require a station license for each radio installation (mobile or base) be obtained by the equipment owner. The licensee is responsible for ensuring transmitter power, frequency, and deviation are within the limits permitted by the station license.

Transmitter adjustments may be performed only by a licensed technician holding an FCC first, second or general class commercial radiotelephone operator's license. There is no license required to install or operate the radio.

3. PRE-INSTALLATION CHECKOUT

3-1. Introduction

Each radio is adjusted and tested before shipment. However, it is recommended that receiver and transmitter operation be checked for proper operation before installation.

3-2. Testing

The radio should be tested complete with all cabling and accessories as they will be connected in the final installation. Transmitter frequency, deviation, and power output should be checked, as should receiver sensitivity, squelch operation, and audio output. QT equipment operation should be verified.

4. PLANNING THE INSTALLATION

4-1. General

Inspect the vehicle and determine how and where the radio antenna and accessories will be mounted.

Plan cable runs for protection against pinching or crushing wiring, and radio installation to prevent overheating.

4-2. Antenna

The favored location for an antenna is in the center of a large, flat conductive area, usually at the roof center. The trunk lid may also provide a good antenna location. If the trunk lid is prefered, bond the trunk lid and vehicle chassis using ground straps to ensure the lid is at chassis ground.

4-3. Radio

The universal mount bracket allows the radio to be mounted in a variety of ways. Be sure the mounting surface is adequate to support the radio's weight. Allow sufficient space around the radio for air cooling. Position the radio close enough to the vehicle operator to permit easy access to the controls when driving.

4-4. DC Power and wiring

1. This radio may be installed in negative ground electrical systems only. Reverse polarity will cause the cable fuse to blow. Check the vehicle ground polarity before installation to prevent wasted time and effort.
2. Connect the positive power lead directly to the vehicle battery positive terminal. Connecting the Positive lead to any other positive voltage source in the vehicle is not recommended.

CAUTION:

If DC power is to be controlled by the vehicle ignition switch, a switching relay should be used to switch the positive power lead. The vehicle ignition switch then controls DC to the relay coil.

---

3. Connect the ground lead directly to the battery negative terminal.
4. The cable provided with the radio is sufficient to handle the maximum radio current demand. If the cable must be extended, be sure the additional wire is sufficient for the current to be carried and length of the added lead.

5. INSTALLATION PLANNING – CONTROL STATIONS

5-1. Antenna system

Control station. The antenna system selection depends on many factors and is beyond the scope of this manual. Your KENWOOD dealer can help you select an antenna system that will best serve your particular needs.

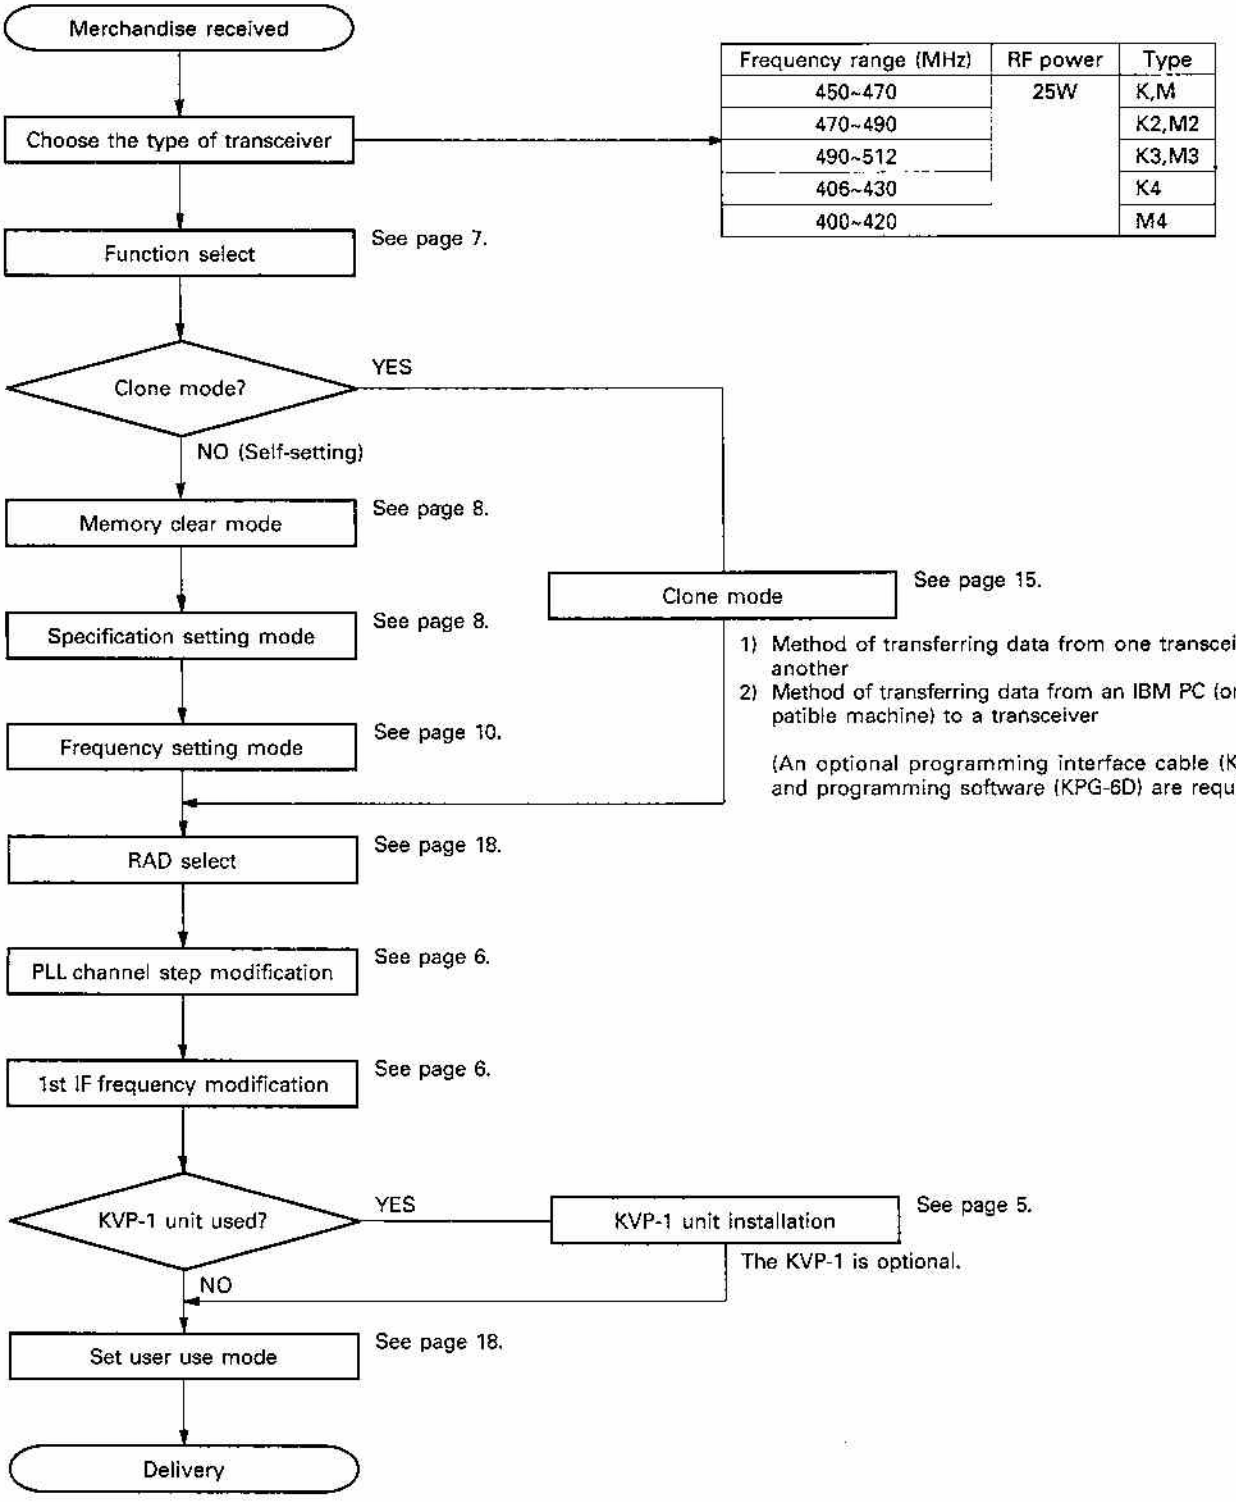
5-2. Radio location

Select a convenient location for your control station radio which is as close as practical to the antenna cable entry point. Secondly, use your system's power supply (which supplies the voltage and current required for your system). Make sure sufficient air can flow around the radio and power supply to allow adequate cooling.

SERVICE

This radio is designed for easy servicing. Refer to the schematic diagrams, printed circuit board views, and alignment procedures contained in this manual.

SYSTEM SET-UP

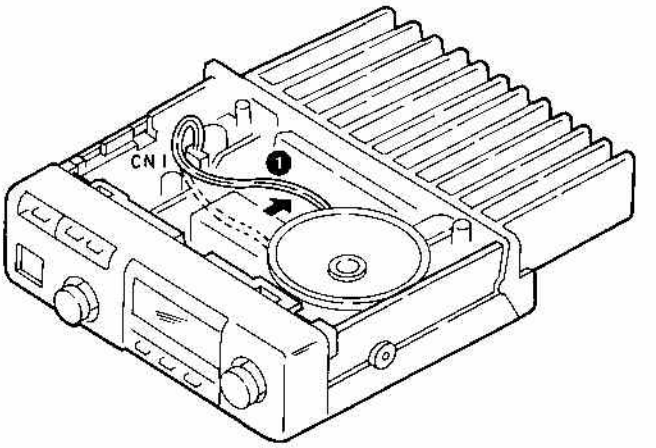


Frequency range (MHz)	RF power	Type
450~470	25W	K,M
470~490		K2,M2
490~512		K3,M3
406~430		K4
400~420		M4

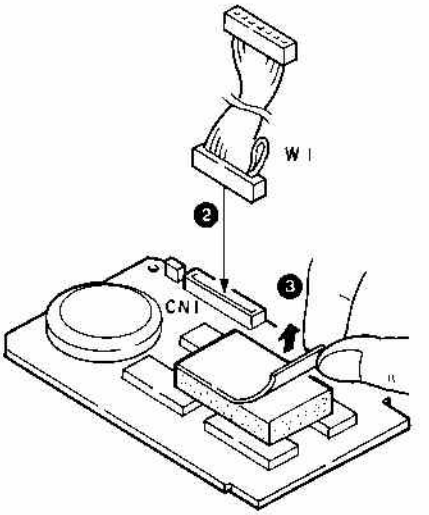
INSTALLATION

KVP-1 Unit Installation

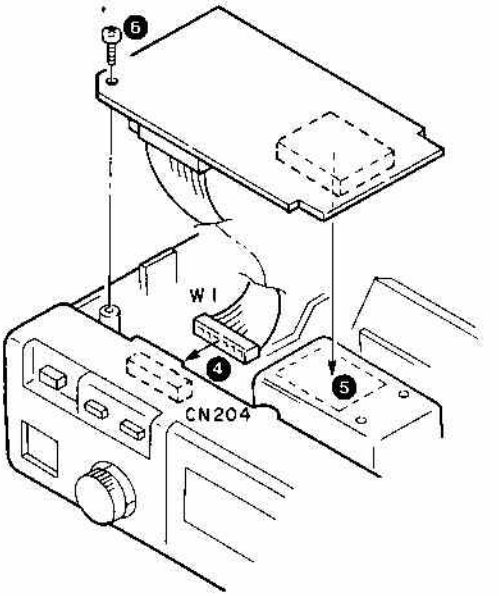
1. Remove the top cover of the radio.
2. Shift the connector with a lead going to the speaker toward the final module (❶).



3. Insert the supplied W1 (E37-0151-05) connector (❷) with lead into CN1 of the unit.
4. Remove the double-sided adhesive pad (❸) from the unit.



5. Insert the W1 connector (❹) with lead into CN204 of the radio.
6. Put the unit on the radio shield case (❺) and secure it to the radio frame with a single screw (❻).
7. Push the unit from above (❼) until it touches the shield case.
8. Put the top cover of the radio back on.



MODIFICATION

PLL Channel Step Modification

The PLL channel step frequency can be changed to 5kHz (6.25kHz) or 10kHz (12.5kHz). (It can be changed in four steps.)

Switching between 5 and 6.25kHz or between 10 and 12.5kHz is done each time the SCAN key is pressed in the receive/transmit frequency setting mode. (see page 10.)

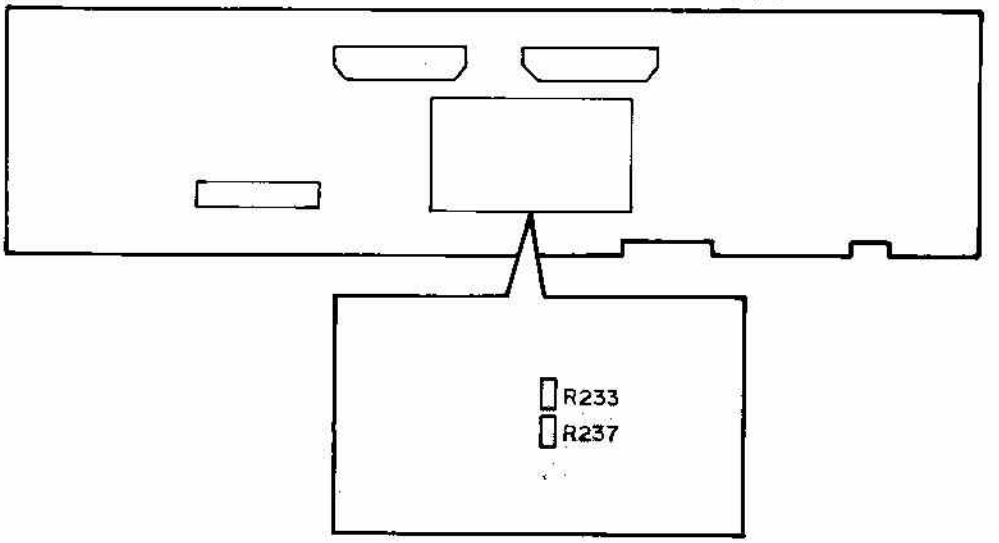
Switching between 5 (6.25) and 10 (12.5) kHz can be done by setting R233 (RK73FB2A473J: 47kΩ) and R237 (R92-0670-05: 0Ω) of the TX-RX unit (B/2).

	R233	R237
5KHz, 6.25KHz	X	○
10kHz, 12.5kHz	○	X

X : Removed, ○: Installed

(A chip is installed where R233 goes at the factory.)

TX-RX UNIT (B/2) Foil side view



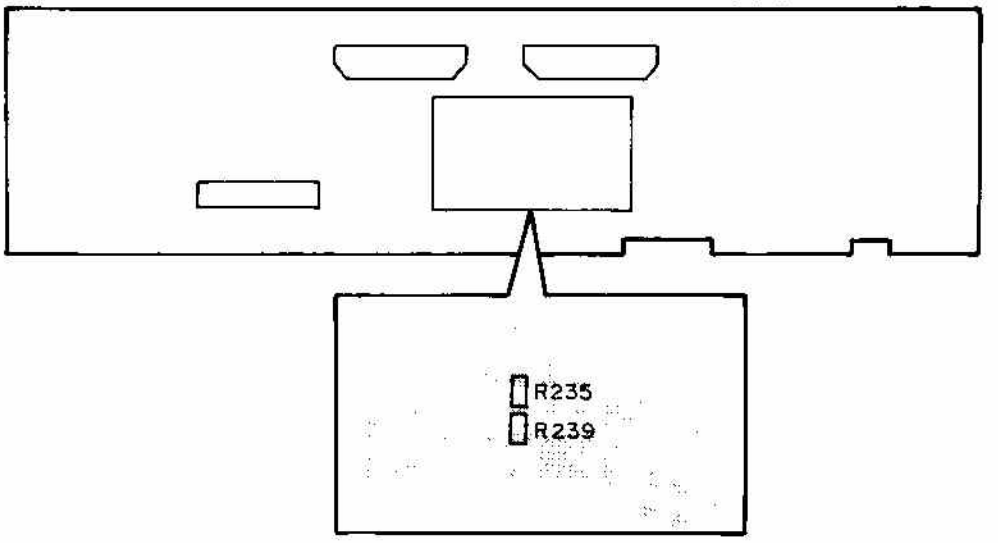
1st IF Frequency Modification

1st IF frequency is set by changing the chip resistors on the TX-RX unit (B/2).

IF	R235 (47kΩ)	R239 (0Ω)
30.3MHz	X	○
34.4MHz	○	X

X : Removed, ○: Installed

TX-RX UNIT (B/2) Foil side view



REALIGNMENT

Function Select

Function select has SET and USE. One of the modes 1 to 5 can be selected in either case.

Test data is stored in the EEPROM of the TK-805D at the factory. If new data (channel frequencies, signaling, AUX, scan, etc.) needs to be written into the EEPROM, use the specification setting mode or frequency setting mode. Select another mode as required.

1. Modes

1) Setting

Function (CN8)		Modes	Setting
SET	USE		
○	–	EEPROM clear mode	Clear all EEPROM data and enter the specification setting mode.
○	–	Specification setting mode	Specify items. (*1)
○	–	Frequency setting mode	Set each channel frequency, signaling, AUX, and scan data.
○	○	Clone mode	Transfer data from the transceiver to another transceiver, or from an IBM PC to a transceiver. (*2)
○	○	User use mode	The user operates the transceiver. (*3)

○ : The mode can be entered. – : The mode cannot be entered.

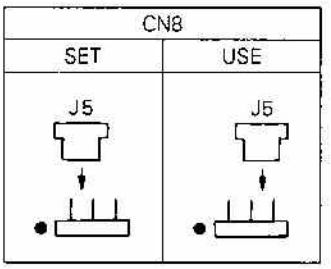
*1 : The initial frequency (band to be used), time-out timer, busy channel lockout, D/A key operation on/off, microphone hook, and priority are set.
*2 : The data specified in the specification and frequency setting modes is transferred.
*3 : After items have been confirmed or set in each mode, set this mode for shipment.

2) After SET or USE has been set, each mode can be entered by the following operation.

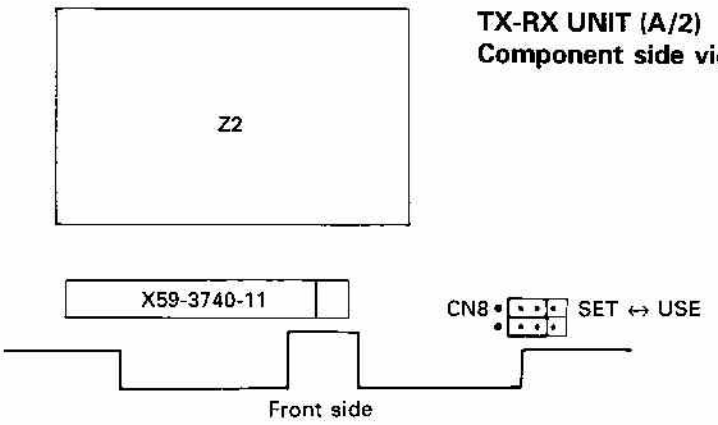
Mode	Operation
User use mode	Switch the power on without pressing a key.
Clone mode	Hold down the AUX and MONI keys, switch the power on, and keep the keys down for two seconds. A beep is heard. If the AUX key is released, data can be transferred from one transceiver to another. If the MONI key is released, data can be transferred from an IBM PC to a transceiver.
Specification setting mode	Hold down the AUX and SCAN keys, switch the power on, and keep the keys down for two seconds.
Frequency setting mode	Hold down the AUX and D/A keys, switch the power on, and keep the keys down for two seconds.
EEPROM clear mode	Hold down the AUX, D/A and SCAN keys, switch the power on, and keep the keys down for two seconds.

2. Setting function select SET and USE

To set the function to SET or USE, reconnect the shorting plug (J5) of connector CN8 on the TX-RX unit (A/2). (It is factory-set to SET.)



Note : Remove the plug (J5) from above.



TX-RX UNIT (A/2)
Component side view

REALIGNMENT

Memory Clear Mode

All the contents of the memory (EEPROM) are cleared in the memory clear mode.

- Confirm that the CN8 short connector is set to the SET side.
- Hold down the AUX, D/A, and SCAN keys, turn the POWER switch on, and keep the keys down for two seconds to clear all the contents of the EEPROM.
- After the EEPROM is cleared, the specification setting mode is entered.

Specification Setting Mode

1. In the specification setting mode, the initial frequency (the band to be used), time-out timer (TOT), busy channel lockout, D/A key on/off, microphone hooking, and priority are specified.
2. Each of these settings is selected by turning the encoder. When the PTT key is pressed, data is written into the EEPROM. To correct data, switch the power off and set new data again. (If data is corrected midway through entry, the setting before switching the power off remains in the EEPROM.)
3. All the items should be set in the specification setting mode until End is displayed.
4. To enter the specification setting mode, make sure that connector CN8 is set to the SET position (• mark). Hold down the AUX and SCAN keys, turn the POWER switch on, and keep the keys down for two seconds. Three beeps are heard and this mode is set.

1. Write method (See the flowchart.)

Each mode can be set in order while observing the LCD, as shown in the flowchart.

1) Initial frequency setting mode

In this mode, the initial band display changes as follows when the encoder is turned. Set the frequency to 450,000.

→150MHz↔250MHz↔350MHz↔450MHz←

When the PTT key is pressed, the TOT setting mode is entered.

2) TOT setting mode

When the encoder is turned, the TOT time setting changes as follows. Set the necessary time.

→ OFF ↔ 30sec ↔ 60sec ↔ 90sec ←
→ 180sec ↔ 120sec ←

When the PTT key is pressed, the next busy channel lockout setting mode is entered.

3) Busy channel lockout setting mode

When the encoder is turned, the busy channel lockout function toggles on and off as follows. Set it on or off.

ON ↔ OFF

ON : Busy channel lockout function is available.
OFF : Busy channel lockout function is not available.

When the PTT key is pressed, the mode changes to the next D/A key operation on/off mode.

4) D/A key on/off setting mode

- The D/A key sets whether to receive the receive frequency written in the channel during scanning.
- The channel with a priority set can be set to the DELETE or ADD state, but the DELETE operation does not take place. (The priority channel operation is given precedence.)
- When the encoder is turned, the D/A key display changes as follows. Set the necessary function.

ON ↔ OFF

ON : User can change the setting.
OFF : User cannot change the setting.

When the PTT key is pressed, the next microphone hooking on/off setting mode is entered.

5) Microphone hooking on/off setting mode

- **Function when ON is set**

When the microphone is offhook, the monitor mode is set regardless of whether the MONI key is on or off. The monitor indicator ◁ on the LCD shows whether the MONI key is on or off; it does not indicate whether the microphone is onhook or offhook.

Transmission does not take place when the PTT key is pressed with the microphone onhook.

- **Function when OFF is set**

Transmission takes place whether the microphone is onhook or offhook.

When the encoder is turned, the microphone hooking display changes as follows. Set the necessary function.

ON ↔ OFF

When the PTT key is pressed, the next priority operation setting mode is entered.

REALIGNMENT

6) Priority operation setting mode

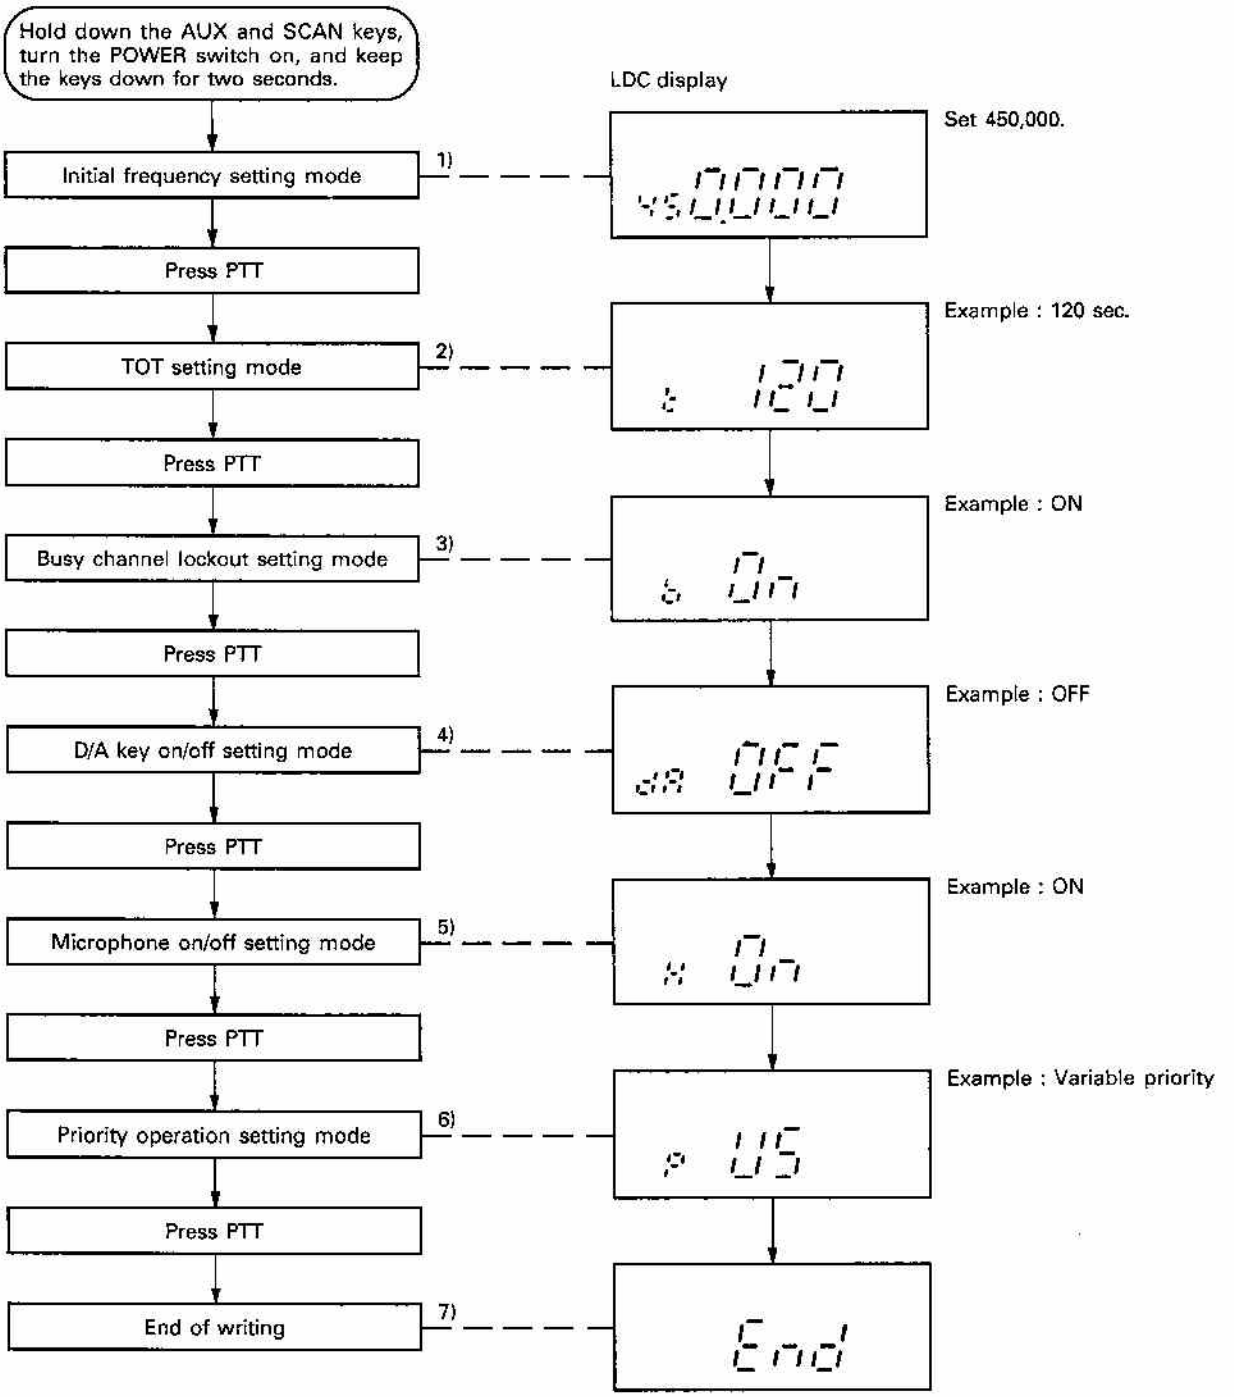
- There are two types of priority: fixed and variable. If the priority is fixed, a channel is determined in the frequency setting mode. (Only one channel can be specified.) If the priority is variable, the channel immediately before the SCAN switch is turned on becomes a priority channel.
- When the encoder is turned, the display changes as follows. Set the necessary function.

FI ↔ US

FI : Fixed priority
US : Variable priority

When the PTT key is pressed, End appears on the LCD, and the specification setting mode is terminated.

2. Flowchart of the specification setting mode

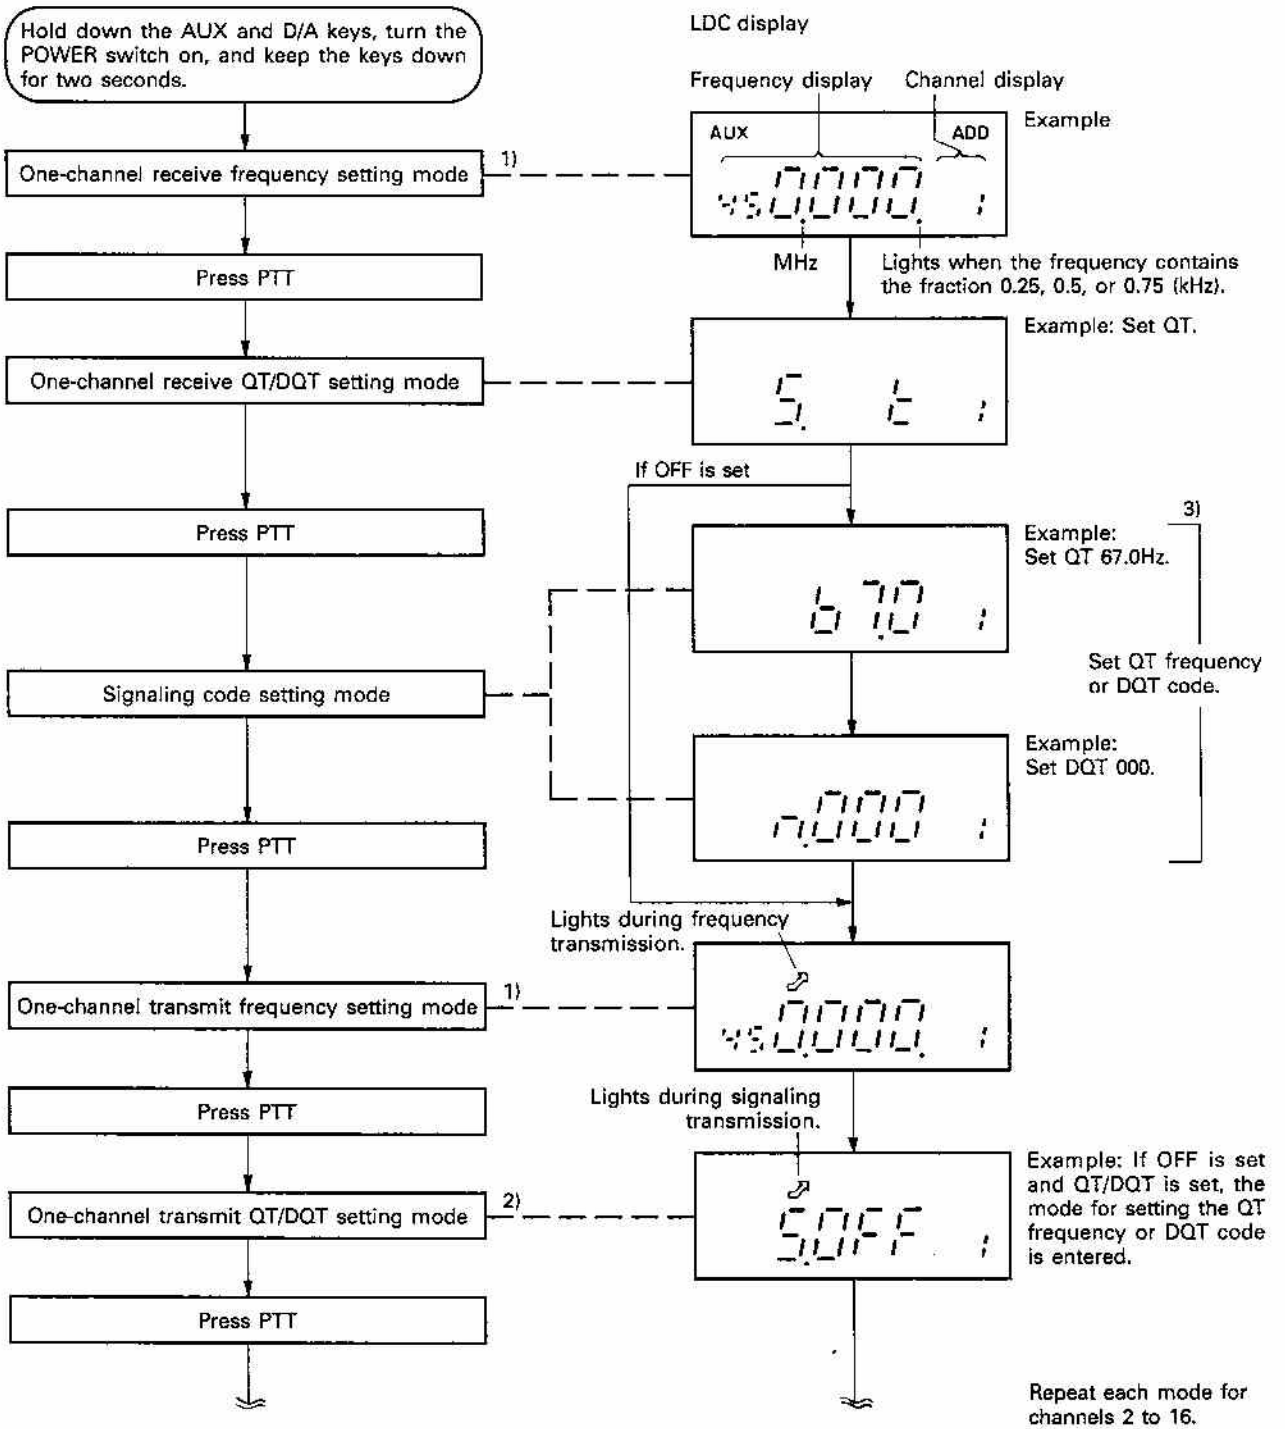


REALIGNMENT

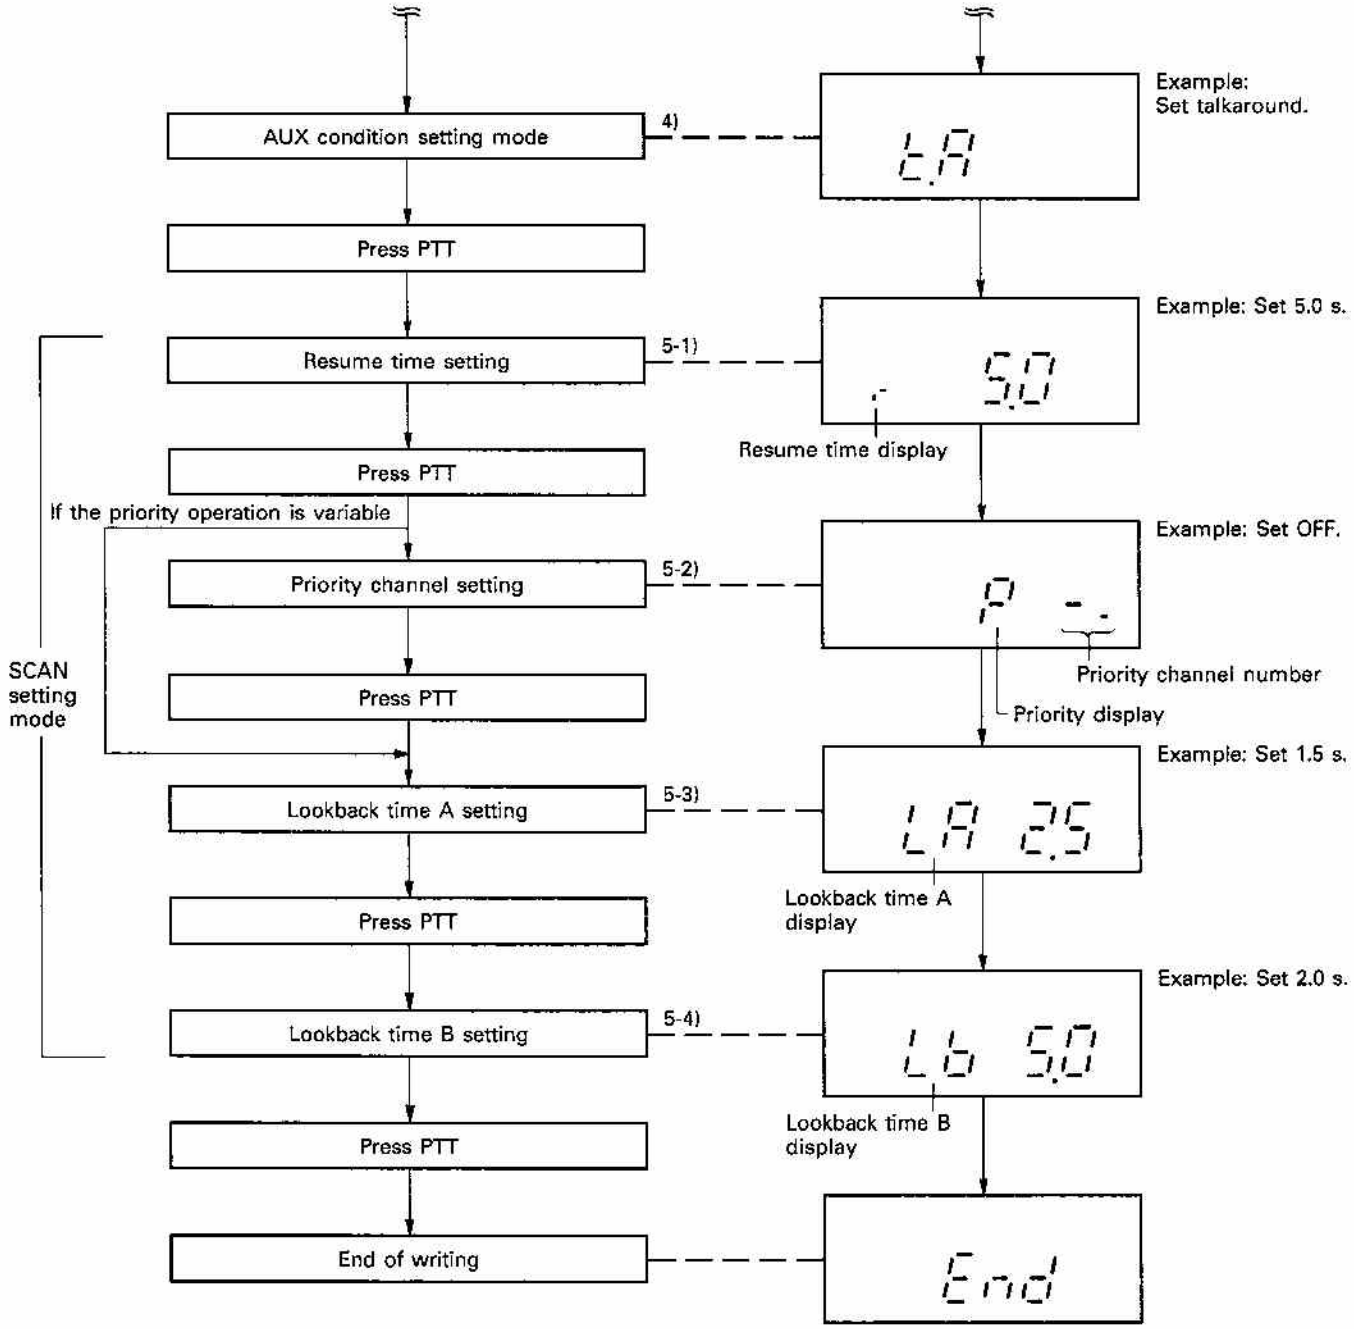
Frequency Setting Mode

1. In the frequency setting mode, the transmit/receive frequency, QT (CTCSS)/DQT, AUX condition, and SCAN condition are specified.
2. To enter the frequency setting mode, make sure that connector CN8 is set to the SET position (• mark). Hold down the AUX and D/A keys, turn the POWER switch on, and keep the keys down for two seconds. Four beeps are heard and the mode is set. When the mode is entered, the one-channel receive frequency setting mode is set first. Whenever the PTT key is pressed after setting a frequency, the mode changes as shown in flowchart.

1. Flowchart of frequency setting mode



REALIGNMENT



REALIGNMENT

2. Setting method (See the flowchart page 10)

The setting method in each mode is described below. Perform operations in the order given in the flowchart.

1) Receive/transmit frequency setting mode

• **LCD**

Channel display:

Channel number of the channel to be set

Frequency display:

(1) If there is data stored in the EEPROM
The frequency stored in the EEPROM is displayed.

(2) If there is no data stored in the EEPROM

RX If one channel is used, the initial frequency (450,000)
If one channel is not used, dots (_ _ – – – –) are displayed, and when the encoder is turned, the receive frequency of one channel is displayed.

TX Dots (_ _ – – – –) are displayed, and when the encoder is turned, the receive frequency of that channel is displayed.

Other display:

The transmit indicator ↗ lights only when transmit data is input.

• **Operation**

1. When the encoder is turned, the display frequency changes (in steps). When the encoder is turned while the AUX key is being held down, the display frequency changes in MHz units.
2. Each time the SCAN key is pressed, the frequency display step is changed.
   If port 30 is high : The frequency changes between 10kHz and 12.5kHz.
   If port 30 is low : The frequency changes between 5kHz and 6.25kHz.
3. RX only
   Each time the D/A key is pressed, the display toggles between ADD and DELETE.
   If ADD indicator is lit : ADD function
   If ADD indicator is off : DELETE function
   Each time the REC key is pressed, the auxiliary function toggles on or off.
   If AUX indicator is lit : Set
   If AUX indicator is off : Not set
4. When the PTT key is pressed, the displayed frequency is set as the receive or transmit frequency for that channel, and the next receive or transmit QT/DQT setting mode is set.

Note : When the step is changed between 6.25kHz and 12.5kHz, the dot lights if the frequency contains the fraction 0.25, 0.5, or 0.75kHz, and it can be set, but the frequency is not displayed.

2) Receive and transmit QT/DQT setting mode

QT (CTCSS), DQT, or signaling off (OFF) is selected in this mode.

• **LCD**

Channel display:

Channel number of the channel to be set

Frequency display:

(1) If there is data stored in the EEPROM
The signaling type stored in the EEPROM is displayed.

(2) If there is no data stored in the EEPROM
OFF is displayed.

Other display:

The transmit indicator ↗ lights only when transmit data is input.

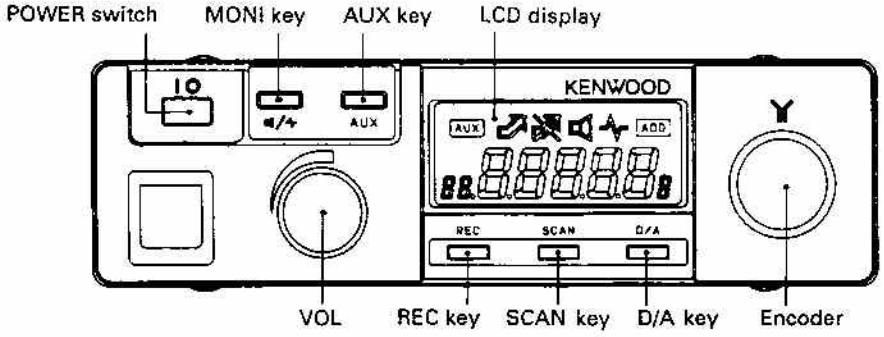
• **Operation**

1. When the encoder is turned, the display changes between QT, DQT, and signaling off (OFF). Set the necessary type.

→ **DQT** (dc) ↔ **QT** (c) ↔ **OFF** (OFF) ←

The letters in parentheses are displayed on the LCD.

2. If OFF is selected for signaling and then the PTT key is pressed, the transmit or receive frequency setting mode is entered. The transmit QT/DQT setting mode ends after 16 channels, and the AUX condition setting mode is entered.
   If QT/DQT is selected and then the PTT key is pressed, the next receive and transmit QT frequency or DQT setting mode is entered.



REALIGNMENT

3) QT frequency/DQT code setting

- **LCD**

Channel display:
Channel number of the channel to be set

Frequency display:
(1) If there is data stored in the EEPROM
The QT frequency/DQT code stored in the EEPROM is displayed.
(2) If there is no data stored in the EEPROM
QT ..... 67.0 (Hz) is displayed.
DQT ..... 000 is displayed.

Other display:
The transmit indicator lights only when transmit data is input.

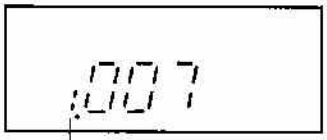
- **Operation**

1. Each time the encoder is turned,
QT .....The frequency changes from 67.0 to 250.3Hz in 0.1-Hz steps.
DQT.....The code changes from 000 to 777 (octal) in digits.
2. Hold down the AUX key and turn the encoder.
QT .....The frequency changes by 1Hz or more.
DQT.....The two or more digits of the code change.
3. Hold down the REC key and turn the encoder.
QT .....The frequency changes by 10Hz or more.
DQT.....The third digit of the code changes.
4. Each time the SCAN key is pressed, the DQT code changes between normal and inverse.

LCD display

Example: Normal code of 007

Normal display



Example: Inverted code of 007

Inverted display

5. When the PTT key is pressed, the displayed QT frequency/DQT code is set as the QT frequency/DQT code for that channel, and the next transmit or receive frequency setting mode is set.

4) AUX condition setting mode

In the AUX condition setting mode, talkaround, digital recording system (DRS), 2TONE, or DTMF is selected.

- **Initial LCD display**

1. If there is AUX data stored in the EEPROM
The AUX data stored in the EEPROM is displayed.
2. If there is no data stored in the EEPROM
Talkaround is displayed.

- **Operation**

1. When the encoder is turned, the display changes between talkaround, DRS, 2TONE, and DTMF. Set the necessary type.

The letters in parentheses are displayed on the LCD.

2. When the PTT key is pressed, the displayed AUX condition is set, and the next SCAN setting mode is entered.

5) SCAN setting mode

In the SCAN setting mode, the resume time, priority channel, lookback time A, and lookback time B are written in the order listed.

5-1) Resume time setting

- **Initial LCD display**

1. If the resume time is stored in the EEPROM
The resume time stored in the EEPROM is displayed.
2. If there is no data stored in the EEPROM
1.0 (sec) is displayed.

- **Operation**

1. When the encoder is turned, the resume time can be selected. Set the necessary data.
15 steps: 1.0, 1.5, 2.0, 2.5, 3.0, 3.5, 4.0, 4.5, 5.0, 5.5, 6.0, 6.5, 7.0, 7.5, 8.0 (seconds)
2. When the PTT key is pressed, the displayed resume time is set, and the next priority channel can be set.

Note : If the priority is set to variable (US) in the specification setting mode, lookback time A can be set.

REALIGNMENT

5-2) Priority channel setting

- **Initial LCD display**

1. If a priority channel is stored in the EEPROM
   The priority channel stored in the EEPROM is displayed.
2. If there is no data stored in the EEPROM
   Dots (– _) are displayed without priority channel specification.

- **Operation**

1. When the encoder is turned, the priority channel can be selected. Select the appropriate channel.
   Channels **1** to **16**, no specification (– _)
   (The channel in which no receive frequency is set cannot be set as a priority channel.)
2. When the PTT key is pressed, the displayed priority channel is set, and the next lookback time A can be set.

Notes :

If a priority channel is set in the frequency setting mode and the setting is changed to variable priority in the specification setting mode, a variable priority operation is performed regardless of the priority channel set or no priority specification.

No priority channel specification means no priority specification during a fixed priority operation. If no priority channel is specified during a variable priority operation, priority specification must be present.

5-3) Lookback time A setting

- **Initial LCD display**

1. If lookback time A is stored in the EEPROM
   The lookback time A stored in the EEPROM is displayed.
2. If there is no data stored in the EEPROM
   1.0 (sec) is displayed.

- **Operation**

1. When the encoder is turned, the lookback time A data can be selected. Set the necessary data.
   15 steps: 1.0, 1.5, 2.0, 2.5, 3.0, 3.5, 4.0, 4.5, 5.0, 5.5, 6.0, 6.5, 7.0, 7.5, 8.0 (seconds)
2. When the PTT key is pressed, the displayed lookback time A is set, and the next lookback time B can be set.

5-4) Lookback time B

- **Initial LCD display**

1. If lookback time B is stored in the EEPROM
   Lookback time B stored in the EEPROM is displayed.
2. If there is no data stored in the EEPROM
   1.0 (sec) is displayed.

- **Operation**

1. When the encoder is turned, the lookback time B data can be selected. Set necessary data.
   15 steps: 1.0, 1.5, 2.0, 2.5, 3.0, 3.5, 4.0, 4.5, 5.0, 5.5, 6.0, 6.5, 7.0, 7.5, 8.0 (seconds)
2. When the PTT key is pressed, the displayed lookback time B is set, and End is displayed to indicate the end of writing.

3. Confirmation of written data

- Written data can be confirmed by holding down the MONI key and turning the encoder clockwise or counterclockwise in the frequency setting mode.
- When the encoder is turned one step clockwise or counterclockwise, the data can be confirmed as follows.

- **When the encoder is turned clockwise**

RX frequency
↓
RX signaling type setting
↓
RX QT frequency/DQT code setting
↓
TX frequency

- **When the encoder is turned counterclockwise**

TX frequency
↓
RX signaling type setting
↓
RX QT frequency/DQT code setting
↓
RX frequency

- When data is confirmed with the MONI key and encoder, the encoder, PTT, AUX, and D/A keys are still valid, and data can be rewritten.

Option Setting

Options can be set on and off for each channel. If an option is not on, DRS and talkaround do not function. (The receive frequency is set in the frequency setting mode.)

REALIGNMENT

Clone Mode

There are two clone modes. Select the appropriate mode as required.

- Connect two transceivers, and transfer the contents of the EEPROM of one transceiver to the the EEPROM of the other.
- Transfer data from an IBM PC or compatible machine to the EEPROM of a transceiver.

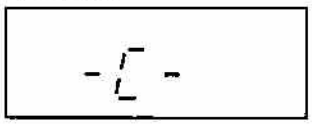
Note : This mode is valid regardless of whether CN8 is set to SET or USE.

1. Operation

1) Data transfer from one transceiver to another

1. Hold down the AUX and MONI keys on the two transceivers, turn the POWER switch on, and keep the keys down for two seconds. One beep is heard, then, when the AUX key is released, the LCD indicates the clone mode.

LCD display



2. Connect two transceivers in the clone mode with a microphone cable.

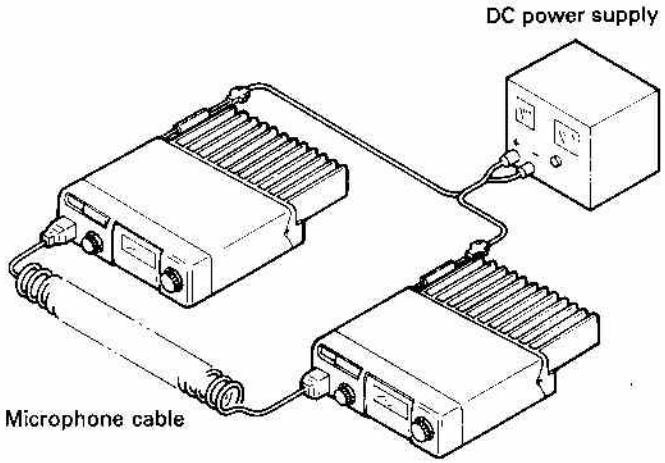


Fig. 1

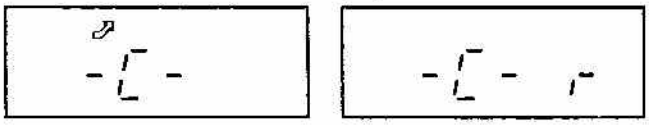
3. When the MONI key on the transceiver ~~to which data is to be transmitted~~ is pressed, the LCD shows the transmit indicator ( ), and data is transferred to the receiving transceiver.

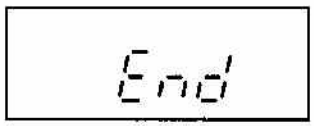
LCD display



Transmitting transceiver | Receiving transceiver

4. When the data transfer ends (about 40 seconds), both transceivers beep and display End.

LCD display



5. If the MONI key is pressed while End is displayed, the condition in 1 returns.

REALIGNMENT

2) Data transfer from IBM PC to transceiver

- **Preface**

The TK-805D transceiver is programmed by using a personal computer, programming interface (KPG-4), and programming software (KPG-6D).

The programming software can be used with an IBM PC or compatible. Figure 2 shows the setup of an IBM PC for programming.

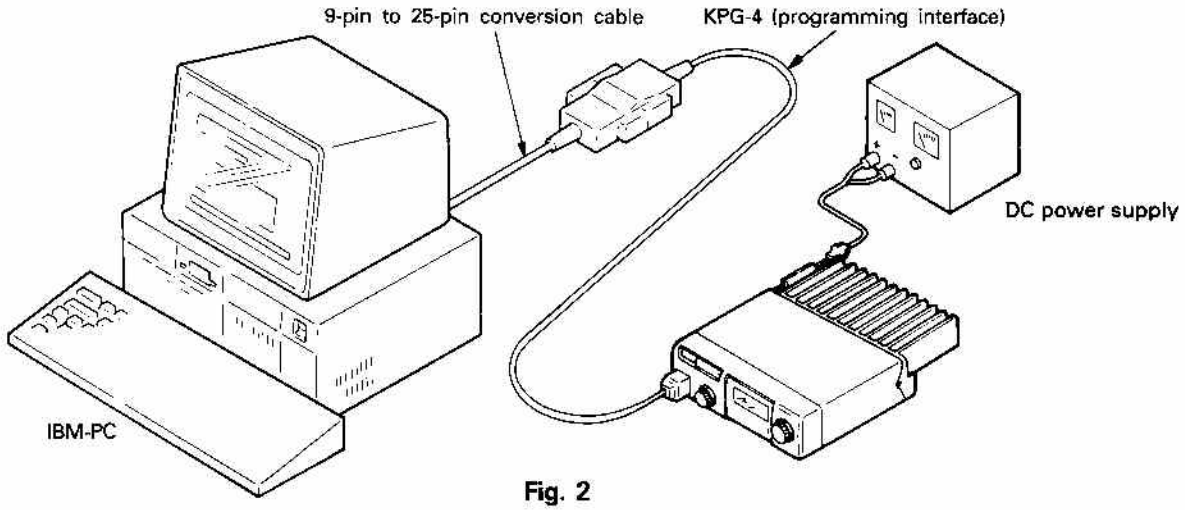


Fig. 2

- **KPG-4 description**
  (P.C. programming interface cable : Option)

The KPG-4 is required to interface the TK-805D to the computer. It has a circuit in its D-subconnector (25-pin) case that converts the RS-232C logic level to the TTL level.

The KPG-4 connects the front panel modular microphone connector of the TK-805D to the computers RS-232C serial port.

- **Programming software description**

The KPG-6D Programming Disk is supplied in 5-1/4" and 3-1/2" disk format. The Software on this disk allows a user to program TK-805D radios via Programming Interface cable (KPG-4)

1. LOADING

This program assumes the user has a basic working knowledge of their particular IBM or IBM compatible computer. Consult your computer and DOS manual for detailed explanations.

2. COMPUTER SETUP (A one time setup procedure - go to step 1, if this has been done.)

This program needs the device driver file ANSI.SYS, in order to run properly. In DOS versions 3.1 and later, the ANSI.SYS file is located as either a file in DOS sub-directory or in the root(main) directory of your hard disk. The computer must be told to install ANSI.SYS at the time DOS is located, i.e., "booted up". This DOS looks for and "executes" during the boot process. It should be located in the directory of your hard disk, or the disk you use to boot up DOS. If a CONFIG.SYS file does not exist, one can either create one, or, add the directive line to an existing CONFIG.SYS file. These can be accomplished by using the EDLIN text editor command discussed below (these processes are identical). The main objective is to have a CONFIG.SYS file that contains a directive to install the ANSI.SYS file.

Ex. : Dos is on C-drive, hard disk. Bring up C-drive prompt C : \ on your computer display.

STEP 1.
The first step is to look at your CONFIG.SYS file to see if a "DEVICE=...ANSI.SYS" line may already exist there. To list your CONFIG.SYS file, type the following : TYPE CONFIG.SYS <enter>
If found here, your computer is setup: insert the KPG-6D in drive A and type: KPG6D, then hit <enter> to start the program.
If no CONFIG.SYS file exists, or the CONFIG.SYS file did not contain a "DEVICE = ...ANSI.SYS" line, then find the location of your ANSI.SYS file by using the DOS directory command, DIR and chose the appropriate device driver line for STEP 2.

if found in the root directory use :
DEVICE = C : \ ANSI.SYS
if found in the DOS sub-directory use:
DEVICE = C : \ DOS \ ANSI.SYS

(i.e. specify a path in which CONFIG.SYS can find ANSI.SYS)

REALIGNMENT

STEP 2.
Create or edit the CONFIG.SYS file with as follows:

	Hit:	-Remarks-
2-a type: EDLIN CONFIG.SYS	<enter>	
2-b type: 1i	<enter>	
2-c type: DEVICE = (from STEP 1)	<enter>	
2-d hold (<Ctrl>) + press Z key, release		(^Z appears)
	<enter>	
2-e type: E	<enter>	(C:\prompt re-appears)

(NOTE : This will in no way erase anything or cause harm to the operation of your computer or other software. This only has to be done once.)
*To re-check the CONFIG.SYS file for errors in the "Device=.....ANSI.SYS "line:

	Hit
type: TYPE CONFIG.SYS	<enter>

This will list the contents of the file. If an error is found:

	Hit
type: EDLIN CONFIG.SYS	<enter>
type: 1d	<enter>

This will "delete" the erroneous line 1. Now proceed from STEP 2-b through 2-e and enter the correct "DEVICE=.....ANSI.SYS" line in STEP 2-c
*ALTERNATIVE METHODS FOR EDITING AND/OR CREATING THE CONFIG.SYS FILE:

1. (Easiest) Use your Word Processor software : Load in the CONFIG.SYS file and add the "DEVICE=....ANSI.SYS" line (determined in STEP 1) as line 1, just as if you were interesting a line of text in a letter or memo. Then save the file back to its appropriate drive and/or path.
2. Use the "COPYCON" DOS command to add the "DEVICE=.....ANSI.SYS" line.
   In this case, your whole CONFIG.SYS file must be re-typed letter-for-letter, symbol-for symbol, space-for-space.....BE CAREFUL!!! - as your PC may have quite an extensive CONFIG.SYS file.

Notes : + The above methods should be attempted by an experienced PC user.
+ The "DEVICE=....ANSI.SYS" line does not necessarily have to be line 1 of the CONFIG.SYS file (this is chosen just for convenience), but it MUST BE placed before any "DEVICE = ...DISPLAY.SYS...." line.

STEP 3.
Re-boot DOS for the ANSI.SYS installation to be accomplished.
[TO START THE PROGRAMMING SOFTWARE]

STEP 4.
Insert the KPG-6D disk in drive A or appropriate drive and type : KPG6D. hit <enter>, to start the program.
The main menu of the KPG-6D should appear. Consult the "HELP" screens by pressing F1 to familiarize yourself with the software features.

Note : If STEP 2 and 3 are not done, the main menu display of the KPG-6D will contain random ASCII graphic characters at the top and/or the bottom of the screen. Also the program will "freeze-up" and not function.

To escape from this :
i) hold <Ctrl> + press C key
ii) press "Y" for the "terminate batch file Y/N" query. The drive prompt should appear.
iii) Re-check that STEP 2 and 3 were done correctly.

3. TO INSTALL ONTO ANOTHER FLEXIBLE OR HARD DISK:
The KPG-6D program disk contains a batch file that will automatically copy the entire KPG-6D disk from one disk to anther by typing in one command. This is useful when installing the KPG-6D into your hard disk or making a back-up copy. After DOS is booted up, insert the KPG-6D disk into an appropriate "source" drive and:

	Hit
type: `source drive`	<enter>
Example: a:	<enter>
type: KPG6DINS (space) `target drive`	<enter>
Example: KPG6DINS b:	<enter>

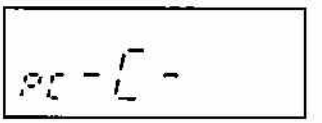
The program and all data files will be loaded into a new sub-directory structure starting at:
\KPG6D\

If the software does not work properly, please see INSTALLATION and proceed the installation again, or Call our Customer service.

- **Programming method**

1. Hold down the AUX and MONI keys on the TK-805D, turn the POWER switch on, and keep the keys down for two seconds. One beep is heard. When the MONI key is released, the LCD indicates the PC clone, and the IBM PC mode is entered.

LCD display



2. Transmit the data created by the IBM PC.
3. ⌐ is indicated on the display of the TK-805D.
   (If data is being transmitted from the TK-805D to the IBM PC, ⌐ is displayed.)
4. After the data transfer ends, the TK-805D is ready to receive data as in 2.

REALIGNMENT

User Use Mode

In this mode, the user uses the transceiver.

After writing all data, set the CN8 short connector to the USE side, and switch the power on to enter this mode.

1. Initial condition

CH : If the last channel number is backed up, that channel becomes ready to receive. If the last channel number is not backed up, channel 1 becomes ready to receive.
MONI : OFF
SQ OFF : OFF
SCAN : OFF
AUX : OFF
REC : OFF

2. Function

Encoder : Channel up/down
MONI : MONI ON/OFF (When this key is held down for two seconds, SQ is set to OFF.)
PTT : Transmit/receive
Microphone hook
: Microphone hook function (This function works by setting.)
AUX : Option ON/OFF
REC : Option ON/OFF
SCAN : SCAN ON/OFF
D/A : Change between ADD and DELETE (This function works after the SCAN key is pressed. It works only when available in the specification setting mode.)

RAD Selection

There are two RAD selection modes: RA and RD. Either can be selected, according to your purpose.

1. Modes

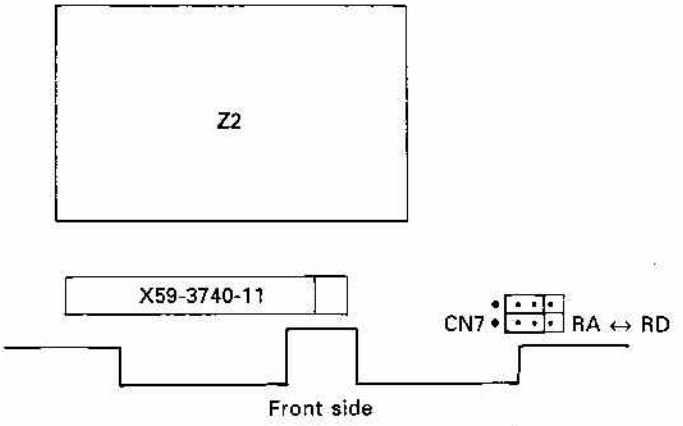
RA : The audio signal, muted or unmuted by the busy signal (IC204 port 23: pin 37), is obtained. (Factory setting: RA)
If DRS is set with AUX, set the mode to RA. (If the mode is set to RD, noise is recorded, not muted, and so is played back.)
RD : The audio signal is always obtained whether there is a busy signal or not. If 2TONE or DTMF is set with AUX, set the mode to RD. (If the mode is set to RA, the voice signal may be muted if the radio signal is weak.)

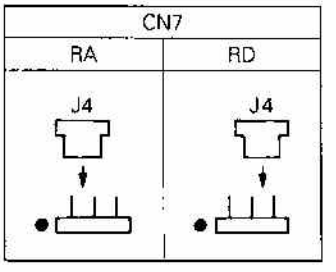
If AUX is not set, or if talkaround is set, either RA or RD can be selected.

2. Switching between RA and RD

To set the RAD signal to RA or RD, reconnect the shorting plug (J4) of connector CN7 on the TX-RX unit (A/2). (It is factory-set to RA.)

TX-RX UNIT (A/2)
Component side view





Note : Remove the plug (J4) from above.

REALIGNMENT

CN204 pin functions when AUX is set (DRS/2TONE/DTMF)

1. Digital recording system (DRS)

- When the REC key is pressed, the RA signal can be recorded, and CN204 pin 2 (PO1) goes high. CN204 pin 3 (PO2) goes high in synchronization with the busy signal, and recording starts and continues for about 32 seconds.
- When the AUX key is pressed, CN204 pin 2 (PO1) goes low, pin 3 (PO2) goes high, the recorded signal is output to RA, and playback starts.
- When the DRS is recording or playing back, CN204 pin 6 (PI2) goes low. When the operation ends, pin 6 goes high to indicate the state to the microprocessor. If the AUX key is pressed in the middle, PO3 goes high, and the operation stops.
- When recording starts, $\overline{\text{ACL}}$ goes low, and all is cleared to record data for 32 seconds from the beginning.

2. 2TONE

- When CN7 to is reconnected to RD, the receive signal for 2TONE decoding is supplied from CN204 pin 9 (RAD) regardless of whether there is a busy signal or not.
- The 2TONE decode latch is connected to CN204 pin 6 (PI2) so that it is low if the code matches and high if it does not.
- Horn alert is selected so that a high signal is output from CN204 pin 4 (PO3) when it is on, and a low signal is output when it is off, whenever the AUX key is pressed. This signal is used to control the decode momentary signal.
- The 2TONE reset signal is output from CN204 pin 10 (PO4). Normally, the same logic as hook is used: low when hook is on, and high when it is off. The reset signal changes from low to high, and back to low when the channels are switched with the encoder.
- The same logic as PTT (high: RX, low: TX) is output to CN204 pin 3 (PO2).

3. DTMF

- When CN7 is reconnected to RD, the receive signal for DTMF decoding is supplied from CN204 pin 9 (RAD) regardless of whether there is a busy signal or not.
- The DTMF decode latch is connected to CN204 pin 6 (PI2) so that it is low if the code matches, and high if it does not.
- Horn alert is selected so that a high signal is output from CN204 pin 4 (PO3) when it is on, and a low signal is output when it is off, whenever the AUX key is pressed. This signal is used to control the decode momentary signal and the relay.
- The DTMF reset signal is output from CN204 pin 10 (PO4). Normally, the same logic as hook is used: low when the hook is on, and high when it is off. The reset signal changes from low to high, and back to low when the channels are switched with the encoder.
- TRANSPOND PTT is connected to CN204 pin 1 (PI1). When this pin is low, transmission takes place (normally high). The TRANSPOND TONE signal is sent to CN2 pin 2 (ABTO: answer back tone).
- The ALERT TONE signal is sent to CN2 pin 4 (ALERT). The signal is sent to CN2 pin 5 (DBD) only when the DEADBEAT DISABLE function is used (normally high; low when transmission is inhibited).

REALIGNMENT

4. CN204 pin functions

If AUX is set to DRS, 2TONE, or DTMF, the CN204 pin functions change as shown in Table.

IC204 port/pin	CN204 pin	Pin name	Option setting DRS	2TONE	DTMF
P81/20	1	PI1	(VCX) : Unused	NC : Unused	TPT : When transpond tone is transmitted (TX : "L", Normally : "H")
P93/22	2	PO1	P3 : For KVP-1 (Recording mode : "H", Playback mode : "L")	NC : Unused	NC : Unused
P92/24	3	PO2	P0 : For KVP-1 (Recording or playback starts : "H", Normally : "L")	PTT logic output (RX : "H", TX : "L")	("H" output) : Unused
P91/25	4	PO3	P1 : For KVP-1 (Recording or playback stops : "H", Normally : "L")	PHA : Horn alert switch (ON : "H", OFF : "L")	PHA : Horn alert switch (ON : "H", OFF : "L")
	5	8C	(8C) : Unused	8C	8C
P80/21	6	PI2	EOS : For KVP-1 (During recording/playback : "L" Wait for recording or playback : "H")	DL : Decode latch (Match : "L", No match : "H")	DL : Decode latch (Match : "L", No match : "H")
	7	5C	5C	(5C) : Unused	(5C) : Unused

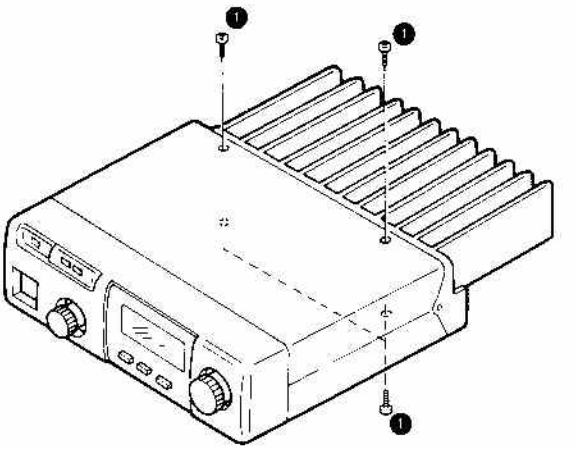
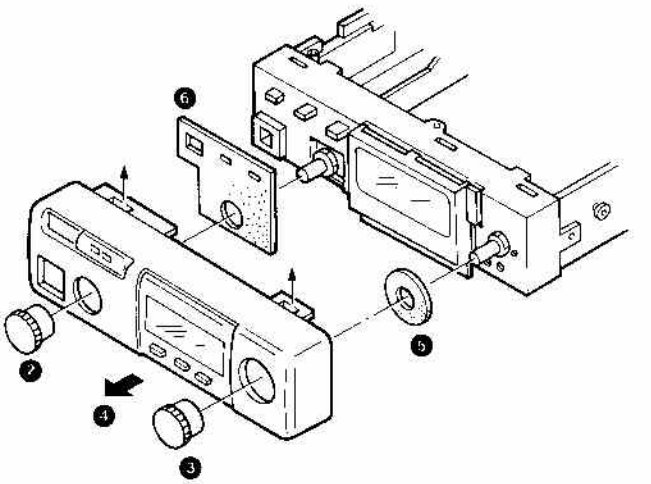
DISASSEMBLY FOR REPAIR

Removing the Front Panel

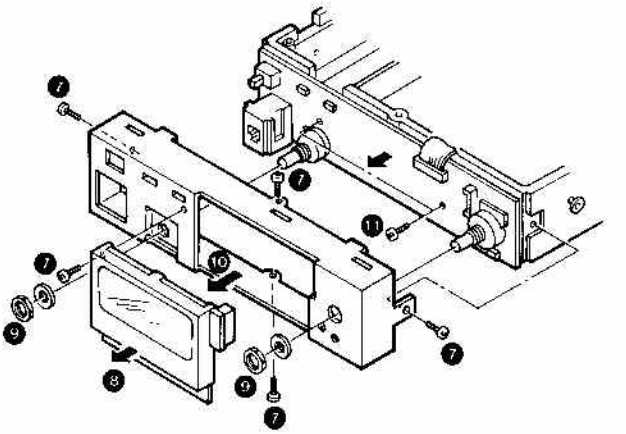
1. Remove the four screws holding the upper and lower cases (❶).



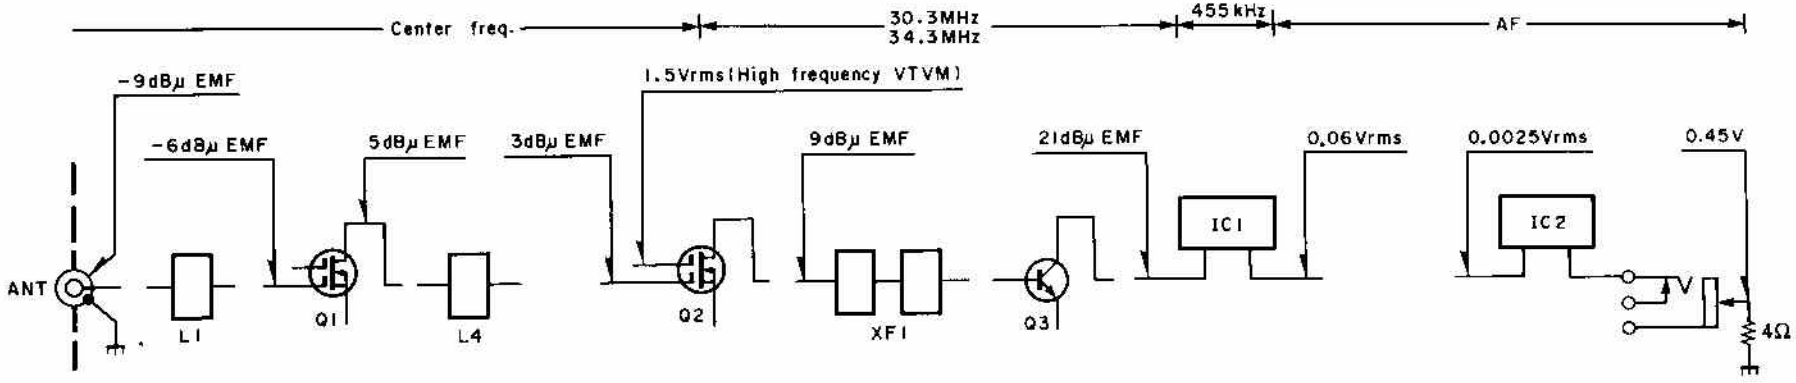
2. Pull out the CHANNEL selector knob (❷) and volume control knob (❸).
3. Slightly lift the stoppers holding the top and bottom of the front panel and pull out the front panel (❹).
4. Remove the cushions (❺ , ❻).



5. Remove the four screws on the sub-panel (❼).
6. Pull the display section forward (❽).
7. Remove the hexagonal nuts of the CHANNEL selector and volume controls (❾).
8. Pull the sub-panel forward (❿).
9. Remove the two screws holding the TX-RX unit (B/2), and remove the unit (⓫).



Receiver section

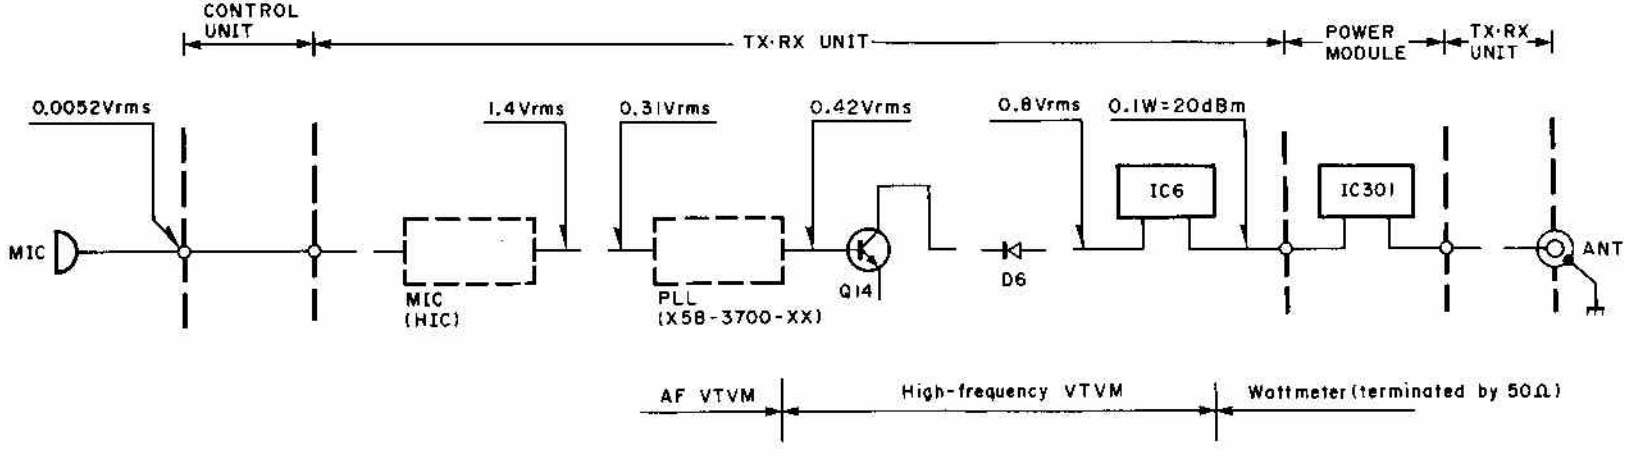


SG input level for 12dB SINAD are obtained. Measured by connecting the SG to each point via a 0.01μF capacitor.

AF VTVM

AF level obtained when the AF output level is adjusted for 0.45V/4Ω with the front panel AF VOL control. Measured with AF voltmeter connected to the external speaker jack, receiving a 40dB EMF SSG signal modulated at 1kHz, DEV 3kHz.

Transmitter section



1. AG is set so that MIC input becomes 3kHz DEV at 1kHz mod.
2. Transmitting frequency : Center frequency

CIRCUIT DESCRIPTION

Circuit Configuration By Frequency

The TK-805D incorporates a PLL synthesizer which uses a digital VFO to allow any channel step of 10 and 12.5kHz to be selected (See Figure 1).

The receiving system utilizes double-conversion techniques. That is, an incoming signal is mixed down to the 1st intermediate frequency (IF), using a 1st local oscillator frequency. The 1st IF signal is then mixed with the 2nd local oscillator frequency of 30.3MHz or 34.3MHz to generate the 2nd IF of 455kHz.

The transmitting system consists of a PLL circuit which allows direct modulation and direct frequency division. Signals from the PLL circuit are amplified by a linear amplifier for transmission.

	①	②
K,M	450.000 ~ 469.9875	415.700 ~ 435.6875

Fig. 1 Frequency configuration

Receiving System

• Overview

Incoming signals from the antenna pass through a low-pass filter in the final block of the transmitter system, and are switched to the front-end of the receiver system via a receive/transmit switching diode.

The signals are then passed through two-pole helical resonator, where the high-frequency components are amplified by a GaAs FET. The signals are then fed into a three-pole helical resonator. The resulting signal from the second resonator is fed into the 1st mixer. The 1st mixer uses the same GaAs FET that are used in the RF stage to obtain better two-signal characteristics. The 1st mixer mixes the signal with the 1st local oscillator frequency and converts it to the 1st IF. The signal then passes through two monolithic crystal filters (MCFs) to remove unnecessary near-by frequency components. The signal from the MCFs is used as the 1st IF signal.

The 1st IF signal is amplified and fed into IC1 (KCD04) in the FM IF HIC. The IF signal is then mixed with the 2nd local oscillator frequency to generate the 2nd IF of 455kHz. The 455kHz signal is then passed through a six element ceramic filter (CFWM455F), and fed back into IC1 for additional amplification. The output signal from the IC1 is then fed into a power amplifier via the audio volume control for application to the speaker.

Item	Rating
Nominal center frequency	30.3MHz
Pass band width	±7.5kHz or less at 3dB
Attenuation band width	±28kHz or less at 40dB
Ripple	1.5dB or less
Insertion loss	3dB or less
Guaranteed attenuation	60dB or more within ±1MHz (Spurious : 40dB or more)
Terminating impedance	1.2kΩ/0.5pF

CIRCUIT DESCRIPTION

Transmitting System

• Overview

The transmitter produces the target frequency thru the use of direct FM-modulation via a varactor diode.

• Modulation circuit

Audio signals from the microphone are fed into the mic amplifier HIC IC3 (KCA03) for amplification, and then into two operational amplifiers. The operational amplifiers form a splatter filter for pre-emphasis, amplification, limiting, and removal of unnecessary high-frequency components.

The FM modulation circuit directly FM-modulates the VCO signals, using a varactor diode.

• Pre-amplifier stage circuit

Signals from the VCO are applied to the drive HIC IC6 (KCB06). The amplifier always operates in a linear mode so that signals can be amplified without degradation. Additionally, the amplifier is designed to cover a wide range of frequencies and can produce stable output without adjustment. The APC (Automatic Power Control) controls collector voltage from the last stage of the pre-amplifier.

• Power amplifier circuit

The drive signal is amplified to the required level by the power module.

• APC circuit

The APC circuit for automatic transmit output control detects part of the power module output, and amplifies it to provide a control voltage for output control. The output control voltage is in inverse proportion to the output from the power module, so it is maintained at the same level.

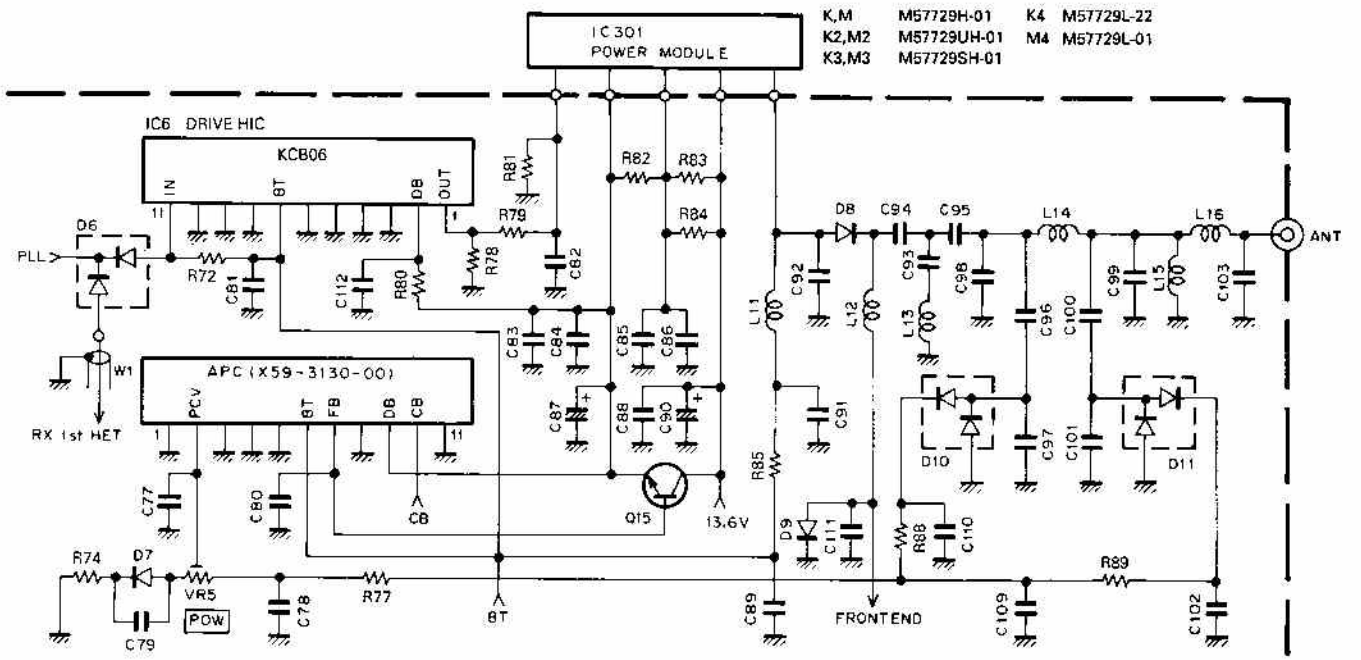

Fig. 2 Pre-amplifier stage, power amplifier, and APC circuits

CIRCUIT DESCRIPTION

PLL Synthesizer System

• Overview

Figure 3 is the PLL and VCO block diagram. In the TK-805D, the PLL system is implemented as a sub-unit which is divided into the upper VCO and lower PLL blocks. The sub-unit is shielded to prevent external interference.

There are two reference frequencies, 6.25kHz and 5 kHz, available to allow 10 or 12.5kHz-step operation. The 6.25kHz is obtained by dividing the reference oscillator frequency of 12.8MHz by 2048, and the 5kHz is obtained by dividing it by 2560. The VCO directly generates the requirement frequency. This requirement frequency is amplified once and then fed into a pulse swallow-type PLL IC for frequency division and phase comparison, in order to lock the frequency.

The PLL system is locked without switching between transmit mode and receive mode. By using a signal ("H" in transmit mode) from pin 10 of the PLL IC (M54959FP), the LPF is deactivated-activated by Q4 only for the moment when the TK-805D enters transmit mode. This helps produce lock more rapidly than previous methods.

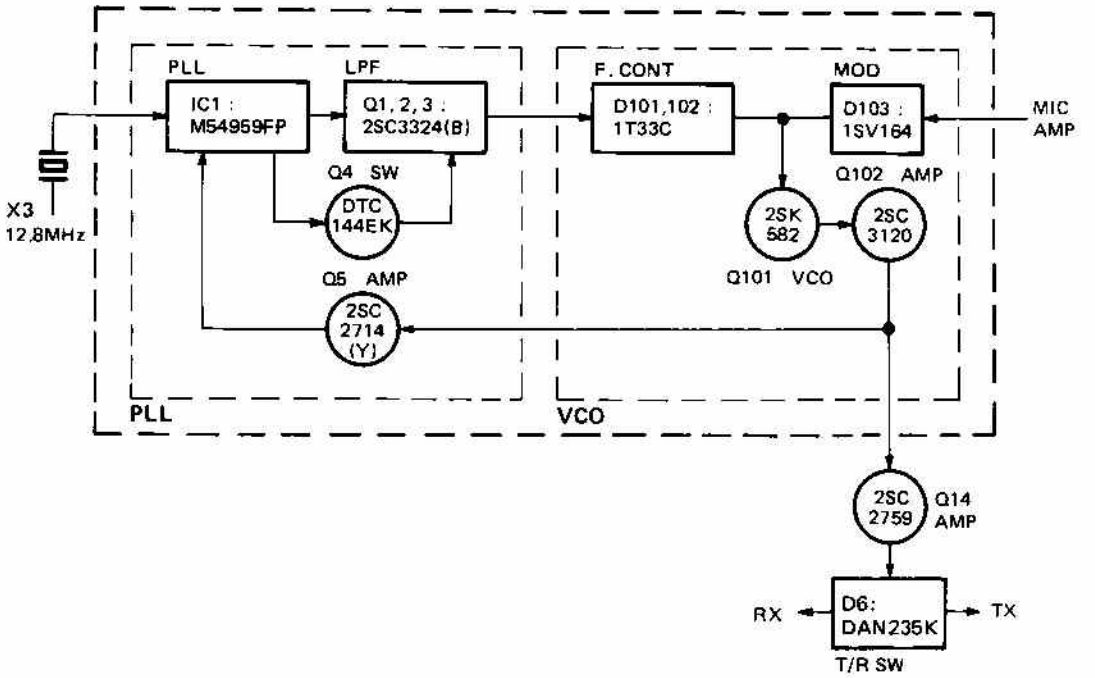

Fig. 3 PLL block diagram

CIRCUIT DESCRIPTION

• 8T (8V in transmit mode) and unlock circuits

In receive mode, the base of Q9 has 0.7V. As a result, Q9 is on, and Q7and Q6 are off, and the collector of Q6 (8T) provides no voltage.

When the PTT switch is depressed. As a result, P21 of CPU (IC204) becomes "L", turning Q9 off, and Q7 and Q6 on. The 8T line is therefore supplied with 8V.

The unlock circuit operates only in transmit mode. Q10 is a PLL unlocking switching transistor. Usually, the base of Q10 is supplied with 0V ("L"), and the collector is supplied with 8V ("H").

When the PLL is unlocked, the base of Q10 is supplied with 0.7V, turning Q10 on. As a result, the collector of Q10 becomes "L" (0V). This turns Q7 off and the collector of Q6 becomes 0V, turning it off. Therefore, when the PLL is unlocked, Q6 is off removing bias voltage from the 8T line. Without the 8T voltage no transmit signal is generated.

If the DBD (dead beat disable) function is used for DTMF control, a signal that is normally high (or open), going low during a DBD operation, is applied to CN2 DBD pin 5. This turns Q18 on, and Q10 is controlled by the PLL unlock signal only. Q18 turns off during a DBD operation, and Q10 turns on regardless of the PLL unlock signal. The collector of Q10 goes low, 8T is not output as described previously, and transmission is inhibited. If DBD is not used, do not connect it.

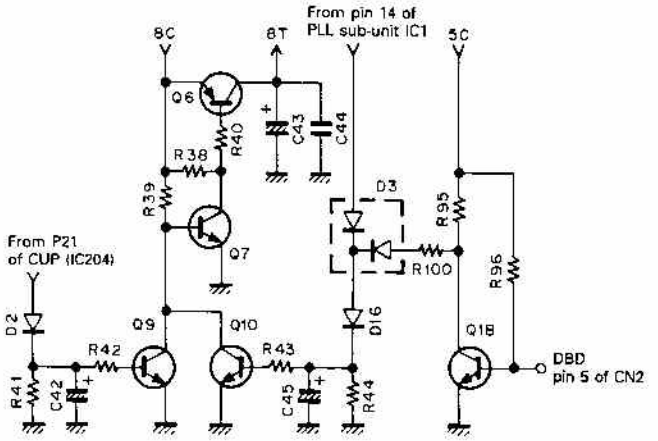

Fig. 4 8T and unlock circuits

Digital Control System

• Overview

The control system consists of a 8 bit micro-controller (IC203), a 4 bit micro-controller (IC204), a reset IC (IC206), and an Electronically Erasable Read Only Memory (EEROM) (IC205).

• Frequency programming of transmit and receive

Transmit and receive frequencies are programmed by using the channel selector and the PTT switch on the transceiver when an internal jumper is installed.

After the internal jumper is removed, the transceiver reverts to the user mode and the channel selector only selects those frequencies already programmed into the EEROM.

• Reset circuit

Micro-controller reset and memory back-up are enabled by RST (IC206).

At initial power on (if the voltage rises slowly), the output RST of IC206 is detected by IC203, 204 and reset is initiated internally.

If 5C voltage exceeds 4.8V, the output RST of IC206 becomes high, causing the micro-controller to go to the reset mode.

• Display circuit

The display circuit is contained in the LCD assembly. It consists of a LCD driver, its peripheral circuits, and an LCD. The LCD is dynamically operated at a 50% duty cycle. The LCD driver receives LCD data from P61, P72, and P73 of the CPU (IC204).

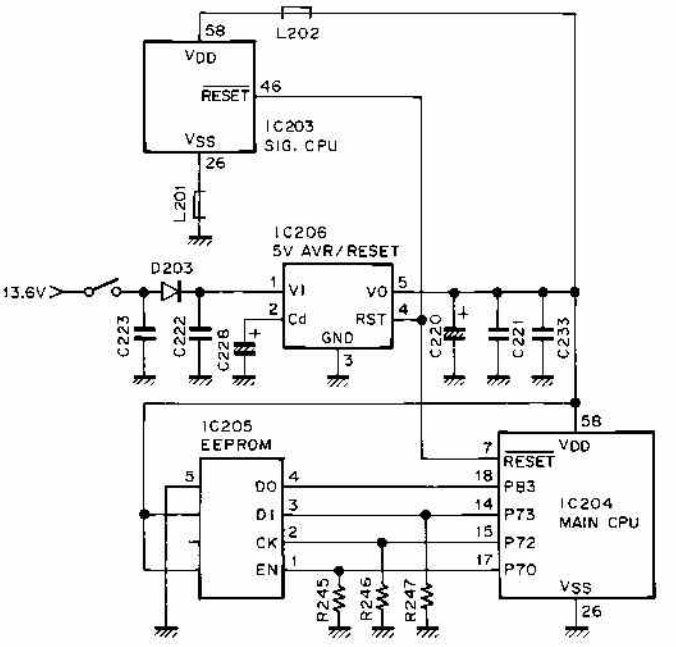

Fig. 5 Reset circuit

CIRCUIT DESCRIPTION

• PLL data output

PLL data is available from P72 (CK), P73 (DT), and P71 (EN) of the CPU (IC204). Figure 6 is a timing chart for PLL data transfer, and Figure 7 shows the format of PLL data.

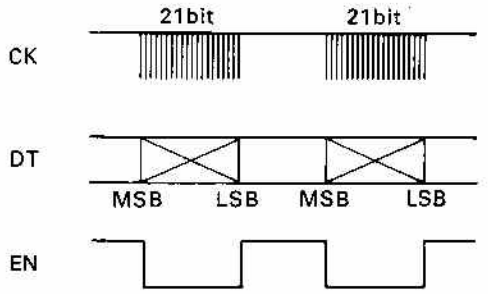

Fig. 6 timing chart for PLL data transfer

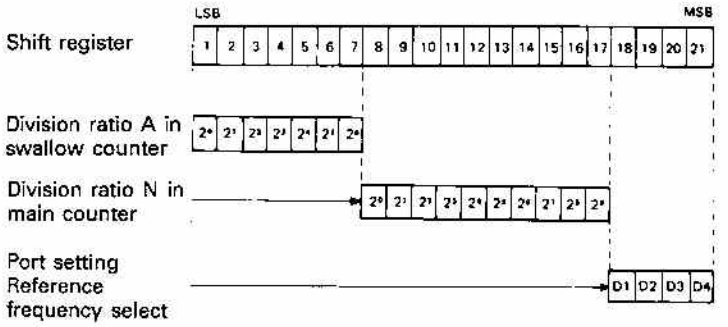

The 21-bit data is made up of the following:

1. Reference frequency (ref) select (2 bits)

Data		Phase reference frequency	
D1	D2		
L	L	5kHz	10kHz step mode
H	L	6.25kHz	12.5kHz step mode

2. Switch select (2 bits)

Data		Output port		
D3	D4	SW1	SW2	
L	H	L	H	RX mode
H	L	H	L	TX mode

Fig. 7 PLL data format

Signaling/squelch

The IC1 DET output is amplified by about 26dB by the IC201 (2/2) amplifier, and divided into the QT/DQT signal and the SQ (noise squelch) signal. The QT/DQT signal is limited to 300Hz or less by the IC201 (1/2) low-pass filter, and sent to AN0 (pin 27) of the microprocessor (IC203) for signaling. The SQ signal is limited to 30kHz or more by the IC202 (1/2) high-pass filter, and rectified by the IC202 (2/2) comparator. A signal in the range 0 to 5V is produced by level shifter Q202, and sent to IC203 P30 (pin 20). The microprocessor checks whether the DQT/QT signaling matches. If it does, IC203 P14 DTSS (pin 7) outputs a low signal; otherwise, it outputs a high signal. If there is an SQ signal, IC203 P16 SSQ (pin 9) outputs a low signal; otherwise, it outputs a high signal.

D205 quickly stabilizes the potential on the positive side of C224 to the mid-point bias of IC201 (2/2) when the power is switched on or when transmission changes to reception. Q203 mutes only during scanning, so that signaling is detected correctly while the PLL is unlocked.

For transmission, the QT and DST signals are output as PWM (pulse width modulation) signals from the output pin (P34, pin 33) of the digital-to-analog converter (IC203). They pass through a CR filter, and a modulation signal is sent to the TO pin.

16	P71	PPLLEP	EN	O	PLL IC LE.
17	P70	PROMCS		O	EEPROM CS.
18	P83	PROMDO		I	EEPROM DO.
19	P82			I	
20	P81	POPTX		I	DTMF transpond tone transmission signal.
21	P80	POPDET/PEOS		I	2TONE, DTMF detection. 0 : Match, 1 : Mismatch/DRS EOS signal input. 0 : Stop, 1 : Operate
22	P93	PREC		O	Record/playback switching during DRS. 1 : Record, 0 : Playback
23	P92	PSTART/POPPTT		O	Start during DRS/PTTSW logic output during 2TONE.
24	P91	PRAY/PSTOP		O	Stop during DRS/2TONE, DTMF horn alert switch.
25	P90	POPRET/PACL		O	2TONE, DTMF reset.
26	Vss			I	GND.
27	INT3/P13			–	Unused, GND connection.
28,29	INT2/P12, INT1/P11			I	Encoder.
30	INT0/P10	PSET		I	Setting/use mode switching. 0 : Setting, 1 : Use
31~34	PTH03~PTH00			–	Unused, GND connection.
35	TI0	P2CH		–	2-/16-channel switching. Low : 16 channels
36	TI1		HOOK	I	IBM PC connection start bit interrupt input.
37	P23	PSMUTE		O	Voice sub mute.
38	PCL/P22	PMUTE		O	Voice mute.
39	PTO1/P21	PTXB		O	Transmission circuit switch. 1 : Reception, 0 : Transmission
40	PTO0/P20		BEEP	O	Beep.
41	SI/P03			–	Unused, VDD connection.
42	SO/P02	PPTTSW	PTT	I/O	Output PTT key input, IN/OUT in clone mode.
43	SCK/P01			–	Unused, open.
44	INT4/P00			–	Unused, VDD connection.
45	P123			I	Unused, VDD connection.
46	P122			–	Unused.
47	P121	PHOOK	HOOK	I/O	In when the microphone is hooked, data out when IBM PC is connected.
48	P120	PAUX1	AUX1	I	AUX key input.
49	P133	PMONI	MONI	I	MONI key input.
50	P132	PAUX2	REC	I	REC key input.
51	P131	PSCAN	SCAN	I	SCAN key input.
52	P130	PDA	D/A	I	D/A key input.
53~56	P143~P140			–	Unused.
57	NC			I	VDD.
58	VDD			I	5V.
59,60	P33, P32			I	IF setting.
61	P31	PSB1		I	Channel setting. 1 : 48 channel, 0 : 16 channel
62	P30	PSB0		I	Step setting. 1 : 10-, 12.5kHz, 0 : 5-, 6.25kHz
63	P43	PSUCOMBS	BUSY	I	Communication busy signal. 1 : Enabled, 0 : Disabled
64	P42	PSSQ	SSQ	I	Slow squelch signal. 1 : Present, 0 : Absent

DESCRIPTION OF COMPONENTS

TX-RX UNIT (X57-3850-XX) -10 : K,M -11 : K2,M2 -12 : K3,M3 -13 : K4 -24 : M4

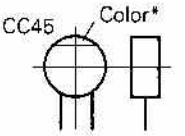
Component	Use/Function	Operation/Condition/Compatibility
IC1	2nd local oscillator, IF amplification, detection, low-frequency amplification, noise amplification, noise detection, squelch switching	1 : 1st IF signal input. 3,4 : 2nd local oscillator. 9 : Busy input. 11 : S-meter output. 12 : DET output. 14 : RD output 15 : Low-frequency output.
IC2	AF amplification	1 : AF input. 6 : AF output.
IC3	MIC amplification	Mic amplification and splatter filter.
IC4	5V AVR	
IC5	10V AVR	For PLL.
IC6	Transmit drive	
IC7	8V AVR	
IC201	Amplification, LPF	
IC202	HPF, comparator	
IC203	Microprocessor	Signaling.
IC204	Microprocessor	Main control.
IC205	EEPROM	
IC206	5V AVR	
IC301	RF power amplification	
Q1	High-frequency amplification	Operates in receive mode.
Q2	1st mixer	
Q3	1st IF amplification	
Q4	AF mute	
Q5	8R switching	On in receive mode.
Q6	8T switching	On in transmit mode.
Q7	8T switching control	On in transmit mode.
Q8	8R switching control	On in receive mode.
Q9	8T switching control	Off in transmit mode.
Q10	8T switching control	Off when PLL locked.
Q11	Mic line mute	Off in transmit mode.
Q12	Mic mute	On when DTMF power output and receive mode.
Q13	PLL 8V ripple filter	
Q14	PLL output amplification	
Q15	TX power control (APC)	
Q16	DC switch	
Q17	DC switch control	On when power switch is on.
Q18	8T switching control	For DTMF DBD switch.
Q201	UL line buffer	Off when PLL locked.
Q202	Limiter	
Q203	DET line mute switch	OFF when SCAN UL, normally ON.
D1	Transmit/receive switching	
D2~4	Switch	
D6	VFO output switch	
D7	Temperature compensation	
D8, 9	Transmit/receive switching	
D10, 11	Power detection	For APC.
D12	Reverse current prevention	
D13	Switch	
D14	RF limiter	
D15	Surge absorber	
D16	Switch	
D202	Microprocessor protection	
D203	Reverse current prevention	
D205	Limiter	

PARTS LIST

CAPACITORS

CC 45 TH 1H 220 J
1 2 3 4 5 6

1 = Type ... ceramic, electrolytic, etc.
2 = Shape ... round, square, ect.
3 = Temp. coefficient
4 = Voltage rating
5 = Value
6 = Tolerance



• Capacitor value

010 = 1pF
100 = 10pF
101 = 100pF
102 = 1000pF = 0.001μF
103 = 0.01μF

2 2 0 = 22pF
0 : Multiplier
2 : 2nd number
2 : 1st number

• Temperature coefficient

1st Word	C	L	P	R	S	T	U
Color*	Black	Red	Orange	Yellow	Green	Blue	Violet
ppm/°C	0	-80	-150	-220	-330	-470	-750

2nd Word	G	H	J	K	L
ppm/°C	±30	±60	±120	±250	±500

Example : CC45TH = -470 ± 60ppm/°C

• Tolerance

Code	C	D	G	J	K	M	X	Z	P	No code
(%)	±0.25	±0.5	±2	±5	±10	±20	+40 -20	+80 -20	+100 -0	More than 10μF -10 ~ +50 Less than 4.7μF -10 ~ +75

Less than 10pF

Code	B	C	D	F	G
(pF)	±0.1	±0.25	±0.5	±1	±2

• Voltage rating

1st word \ 2nd word	A	B	C	D	E	F	G	H	J	K	V
0	1.0	1.25	1.6	2.0	2.5	3.15	4.0	5.0	6.3	8.0	–
1	10	12.5	16	20	25	31.5	40	50	63	80	35
2	100	125	160	200	250	315	400	500	630	800	–
3	1000	1250	1600	2000	2500	3150	4000	5000	6300	8000	–

• Chip capacitors

(EX) C C 7 3 F S L 1 H 0 0 0 J — Refer to the table above.
1 2 3 4 5 6 7

(Chip) (CH, RH, UJ, SL)

(EX) C K 7 3 F F 1 H 0 0 0 Z
1 2 3 4 5 6 7

(Chip) (B, F)

Dimension

Dimension code	L	W	T
Empty	5.6 ± 0.5	5.0 ± 0.5	Less than 2.0
E	3.2 ± 0.2	1.6 ± 0.2	Less than 1.25
F	2.0 ± 0.3	1.25 ± 0.2	Less than 1.25

Dimension

Dimension code	L	W	T	Wattage
E	3.2 ± 0.2	1.6 ± 0.2	0.57	2B
F	2.0 ± 0.3	1.25 ± 0.2	0.45	2A

RESISTORS

• Chip resistor (Carbon)

(EX) R D 7 3 E B 2 B 0 0 0 J
1 2 3 4 5 6 7

(Chip) (B,F)

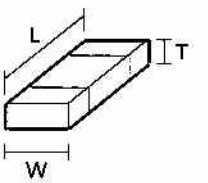
Rating wattage

Code	Wattage	Code	Wattage	Code	Wattage
2A	1/10W	2E	1/4W	3A	1W
2B	1/8W	2H	1/2W	3D	2W
2C	1/6W				

• Carbon resistor (Normal type)

(EX) R D 1 4 B B 2 C 0 0 0 J
1 2 3 4 5 6 7

Dimension



1 = Type ... ceramic, electrolytic, etc.
2 = Shape ... round, square, ect.
3 = Dimension
4 = Temp. coefficient
5 = Voltage rating
6 = Value
7 = Tolerance

ADJUSTMENT

Test Equipment Required for Alignment

No.	Test Equipment	Major Specifications	
1	Standard Signal Generator (SSG)	Frequency Range Modulation Output	100 to 500MHz. Frequency modulation and external modulation. 0.1μV to greater than 1mV.
2	Power Meter	Input Impedance Operation Frequency Measurement Capability	50Ω. 100 to 500MHz or more. Vicinity of 60W.
3	Deviation Meter	Frequency Range	100 to 500MHz.
4	Digital Volt Meter (DVM)	Measuring Range Accuracy	1 to 30V DC. High input impedance for minimum circuit loading.
5	Oscilloscope		DC through 30MHz.
6	High Sensitivity Frequency Counter	Frequency Range Frequency Stability	10Hz to 500MHz. 0.2ppm or less.
7	Ammeter		15A.
8	AF Volt Meter (AFVTVM)	Frequency Range Voltage Range	50Hz to 10kHz. 3mV to 3V.
9	Audio Generator (AG)	Frequency Range Output	50Hz to 5kHz or more. 0 to 1V.
10	Distortion Meter	Capability Input Level	3% or less at 1kHz. 50mV to 10Vrms.
11	Voltmeter	Measuring Range Input Impedance	1.5 to 30V DC or less. 50kΩ/V or greater.
12	4Ω Dummy Load		Approx. 4Ω, 3W.
13	Regulated Power Supply		13.6V, approx. 15A (adjustable from 9 to 17V). Useful if ammeter equipped.
14	Tracking Generator		

The set has been adjusted for the frequencies shown in the following table. When required, re-adjust them following the adjustment procedure to obtain the frequencies you want in actual operation.

	RX freq' fR( ) MHz			TX freq' fT( ) MHz		
	L	M	H	L	M	H
K,M	450.050	460.050	469.950	450.000	460.000	469.9875
K2,M2	470.050	480.050	489.950	470.000	480.000	489.9875
K3,M3	490.050	500.050	509.950	490.000	500.000	509.9875
K4	410.050	420.050	429.950	410.000	420.000	429.9875

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
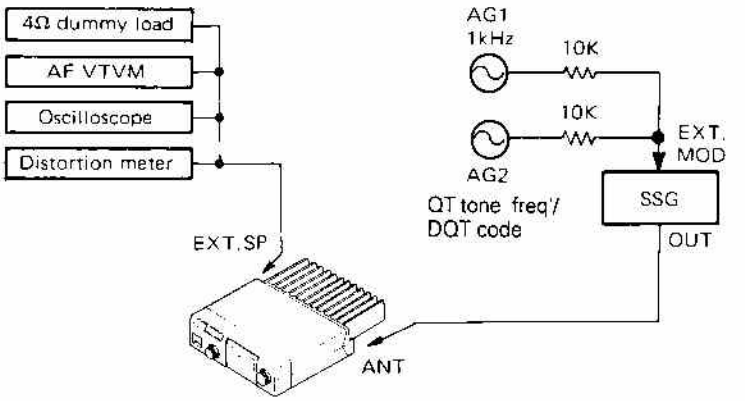
4. Squelch	1) CH : Channel with RX center FREQ' (f_{RM}). MONI SW : ON SSG output : Turn the SSG output 3dB down so that the SINAD sensitivity becomes 12dB.	LCD			TX-RX	VR1	Set to the point at which squelch just close.	Busy indicator ( ) should off.
	2) SSG output : OFF						Check	Squelch should close.
	3) SSG output : 0.25μV/−119dBm							Squelch should open.
5. Check decoder sensitivity for signaling squelch	1) CH : Set the channel selector to the channel with which QT, DQT is used. SSG FREQ' : Set it to the FREQ' of the channel mentioned above. SSG output : Turn the SSG output so that the SINAD sensitivity becomes 10dB.							
	2) SSG MOD SW : EXT. MOD AG1 FREQ' : 1kHz AG2 FREQ' : QT tone freq' or DQT code							
	3) AG1 : Power switch OFF. AG2 output : Adjust the output level of AG2 so that the SSG deviation becpmes 0.75kHz.							
	4) AG1 : Power switch ON. AG1 output : Adjust the output level of AG1 so that the SSG deviation becomes 3.75kHz. (i.e., QT tone frequency or DQT code/0.75kHz deviation, +1kHz/3kHz deviation) MIC hook : ON hook MONI SW : OFF	Rear panel	EXT. SP				Check	Open.



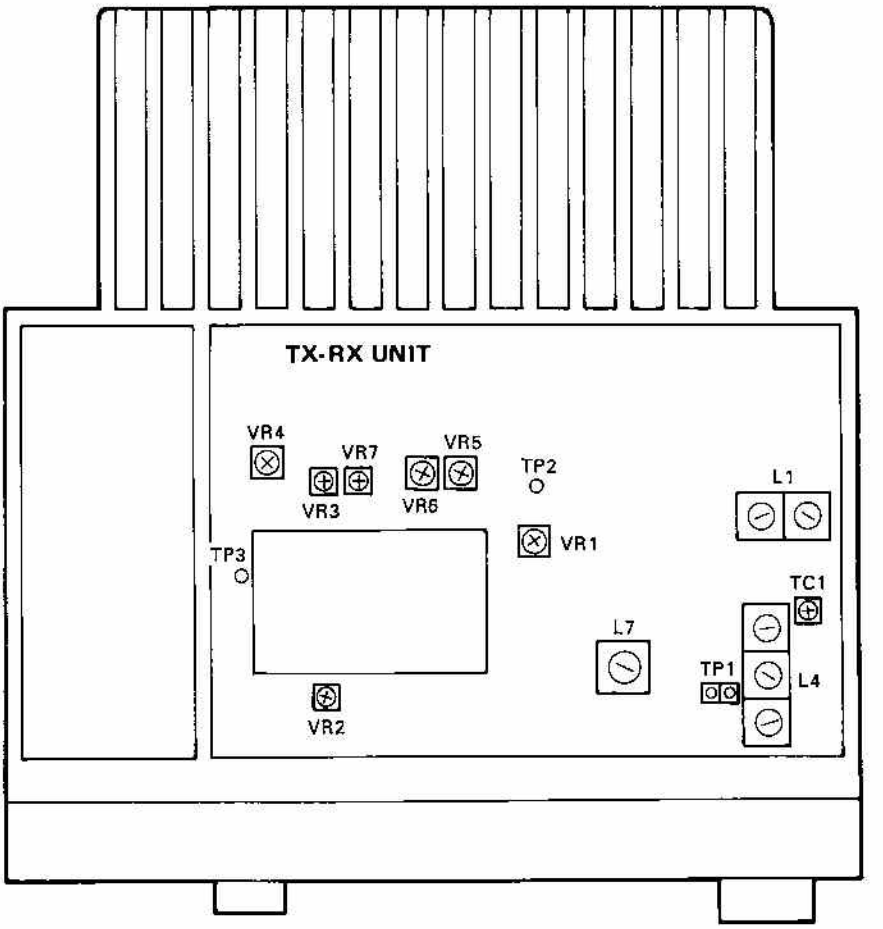
Transmitter Section Adjustment

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
1. APC	1) CH : Channel with TX center FREQ' (f_{TM}). PTT : ON	Power meter Ammeter	Rear panel	ANT			Check	30W or more.
					TX-RX	VR5	27W	±1W, 7.5A or less.

ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
2. DQT waveform correction	1) CH : Set the channel selector to the channel with which DQT is used. Deviation meter filter HPF : OFF LPF : 3kHz PTT : ON	Power meter Deviation meter Oscilloscope	Rear panel	ANT	TX-RX	VR7	Make the de-modulation waveform neat.	
3. QT	1) CH : Set the channel selector to the channel with which QT is used. Deviation meter filter HPF : OFF LPF : 3kHz De-emphasis : 750µs PTT : ON				TX-RX	VR6	±0.75kHz	±100Hz
4. Maximum deviation adjustment	1) AG : 1kHz/50mV at MIC in Deviation meter filter HPF : OFF LPF : 15kHz De-emphasis : OFF PTT : ON		Front panel	MIC	TX-RX	VR4	±4.2kHz ADJ. (±4.9kHz ADJ. when using a QT/DQT) Adjust one more than the other by switching between −p and +P.	±100Hz
5. MIC sensitivity adjustment	1) AG : 1kHz/5mV at MIC in PTT : ON				TX-RX	VR3	±3kHz ADJ. (±3.75kHz ADJ. when using a signaling)	±100Hz

Adjustment Point (Top View)



TERMINAL FUNCTIONS

Connector No.	Terminal No.	Terminal Name	Terminal Function
TX-RX UNIT (X57-3850-XX) (A/2)			
CN1	1	SP	Speaker input.
	2	E	GND.
CN2	1	SIG	Pre detection.
	2	ABTO	Transpond tone input during DTMF.
	3	E	GND.
	4	ALERT	Alert tone input during DTMF.
	5	DBD	Deadbeat disable input during DTMF.
	6	MIC MUTE	Pre microphone mute.
CN3	1	E	GND.
	2	EN	PLL enable input.
	3	CK	PLL clock input.
	4	DT	PLL data input.
	5	TX	TX control input.
	6	8C	Common +8V output.
	7	DET	RX detection signal output.
	8	SET	Function select output.
	9	SQ	Squelch adj. level setting output.
	10	UL	Unlock signal output.

SPECIFICATIONS

GENERAL

Frequency Range	450 to 470MHz (K,M type) 470 to 490MHz (K2,M2 type) 490 to 512MHz (K3,M3type) 406 to 430MHz (K4 type) 400 to 420MHz (M4 type)
Number of Channels	16 semi-duplex channels
Channel Spacing	25kHz (PLL channel step 12.5kHz)
Input Voltage	13.6V DC negative ground
Current Drain	0.3A on standby 0.7A on receive 6.0A on transmit
Duty Cycle	Receiver 100%, Transmitter 20%
Temperature Range	–30°C to +60°C (–22°F to +140°F)
Dimensions and Weight	5.51" (140mm) W x 1.58" (40mm) H x 34" (161mm) D, 2.20lbs. (1.0kg)

RECEIVER

(Measurements made per EIA standard EIA-204-C)

RF Input Impedance	50Ω
Sensitivity	
EIA 12dB SINAD	0.2μV
20dB Quieting	0.3μV
Squelch Sensitivity	0.25μV threshold
Modulation Acceptance	±7kHz
Selectivity	–80dB
Intermodulation	–75dB
Spurious and Image Rejection	–85dB
Audio Power Output	4W at 4Ω less than 5% distortion
Frequency Stability	±0.0005% from –30°C to +60°C
Channel Frequency Spread	20MHz

TRANSMITTER

(Measurements made per EIA standard EIA-152-B)

RF Power Output	25W adjustable to 5W
RF Output Impedance	50Ω
Spurious and Harmonics	–75dB
Modulation	F3E, ±5kHz for 100% at 1000Hz
FM Noise	–50dB
Microphone Impedance	Low impedance
Audio Distortion	1.0% at 1000Hz
Frequency Stability	±0.0005% from –30°C to +60°C
Channel Frequency Spread	20MHz
