

# RP70U

## 12 Watt UHF/FM Repeater/ Base Station

### Contains:

- Specifications
- FCC Information
- Operation
- Installation
- Theory of Operation
- Performance Tests
- Alignment Procedure
- Complete Drawings
- Parts Lists

### Service Manual

# **RP70U**

## **Twelve Watt UHF/FM Repeater/Base Station**

This manual intended for use by qualified technicians and includes all necessary information pertaining to RP70U operation, installation, circuit design, and maintenance. Information on the installation of the TN34 tone board is also included. Changes which occur after the printed date will be incorporated.

## 1.1 Description

The RP70U is a full duplex switchable repeater/base station designed for use in the frequency range of 450 to 470 MHz. It requires 120 VAC and develops an adjustable RF power output of 2W to 12W.

The RP70U is designed for desk-top use. Incorporated into the RP70U electronics are a time out timer and carrier drop out timer. The time out timer may be set from 1 to 10 minutes. The carrier drop out time is adjustable from .1 to 10 seconds.

The RP70U is all solid-state and is shipped ready for operation in the transmit and receive frequencies of the user's choice. One or two tone boards may be installed. Features include "POWER," "BUSY," and "TX" indicators, TONE selector switches, volume and squelch controls, an external terminal strip, and an accessory receptacle hole.

## 1.2 SPECIFICATIONS

Performance specifications are nominal, unless otherwise indicated, and are subject to change without notice.

### 1.2.1 General

Frequency Range .....	F3 450-470 MHz
Number of Channels .....	1
Input Voltage .....	120 VAC
Current Drain:	
Standby .....	100 mA max.
Receive .....	0.2 A max.
Transmit .....	1 A max.
Channel Spacing .....	25 kHz
TX/RX Separation .....	5 MHz only
Dimensions .....	3.18-H x 12.59-W x 12.55-D in.
Weight .....	16.75 lbs.
Compliance .....	FCC Parts 21, 22, 90, 95
FCC Type Acceptance Numbers ....	APV9T20484
DOC Approval .....	363-192-3881

### 1.2.2 Transmitter

Measurements are made in accordance with EIA Standard RS-152-B.

RF Power Output .....	2W to 12W Adjustable
Spurious and Harmonic Emissions .....	-65 dB
FM Hum and Noise .....	-45 dB
Modulation .....	16F3
Audio Distortion .....	3% max.
Frequency Stability -30° to +60°C .....	±2.5 ppm max.

### 1.2.3 Receiver

Measurements are made in accordance with EIA Standard RS-204-B

Sensitivity:	
-12 dB SINAD .....	0.3 µV
-20 dB Quieting .....	0.4 µV
Squelch Sensitivity:	
Threshold .....	0.3 µV max.
Modulation Acceptance Bandwidth ..	±7.0 kHz
Selectivity .....	-75 dB
Spurious and Image Rejection ....	-75 dB
Intermodulation Rejection .....	-75 dB
Audio Power Output at 5% Distortion .....	4 W min.
Frequency Stability -30° to +60°C .....	±2.5ppm max.

### 1.2.4 Time Out Timer

Blocking/Desensitization .....	1 dB
Time Out Timer (adjustable) .....	1 to 10 min.
Carrier Dropout Timer (adjustable) .....	0.1 to 10 sec.
Auto Squelch .....	10 dBQS

## 1.3 LICENSING REQUIREMENTS

### 1.3.1 FCC Information

The RP70U complies with the Federal Communications Commission (FCC) requirements that regulate Business Radio Service and other services within the 450 to 470 MHz range. The user must know and comply with all applicable parts of the FCC Rules and Regulations. Rules applicable to each service may be ordered from:

SUPERINTENDENT OF DOCUMENTS  
Government Printing Office  
Washington, D.C. 20402

A valid station license and call sign are required before operating the RP70U. It is the user's responsibility to apply for and obtain an FCC radio license. The following data pertaining to the RP70U will be included on the FCC license application

Type Accepted ..... FCC Parts 21, 22, 90, 95  
Output Power ..... 12 Watts  
Emission ..... 16F3  
Frequency Range ..... 450 to 470 MHz  
Type Number ..... APV9T20484

### 1.3.2 FCC Requirements

The FCC requires that the modulation deviation and transmit frequency of the transmitter be checked annually.

---

## 2.1 General

1. Ensure that the following connections are made (see Figure 1):

- a. The power cord is connected to an appropriate AC power source.
- b. The antenna is connected to the jack marked "ANT" on the back of the repeater. SCC recommends selecting an antenna whose radiation pattern best matches the desired area of coverage. For maximum coverage, locate the antenna at the top of a high tower, hill or mountain. Use a low loss coaxial cable to connect the antenna to the repeater.
- c. The microphone is connected to the 5-prong jack on the front of the repeater. Either an MP601 base station microphone or an MP568 microphone may be used.

2. Ensure that nothing is placed directly on top of the repeater and that ample ventilation space exists above the repeater to allow for cooling.

## 2.2 Optional Instructions

The RP70U Repeater can accommodate one or two TN34 tone boards. For the installation of the TN34(s) into the RP70U repeater, perform the following procedures:

1. Remove the repeater bottom cover.
2. Use the two screws provided with each TN34 to secure the tone board atop the posts within the repeater's chassis. Install the tone board so that the crystal is closer to the power supply (see Figure 2).
3. This step is to be performed one or two ways depending on the number of tone boards installed in the RP70U.
  - When only one tone board is installed in the repeater, connect the shorter of the two repeater tone board connectors to the tone board connector in position A.
  - When two tone boards are installed do as follows:

- a. Connect the longer of the two repeat tone board connectors to the tone board connector in position B.

- b. Remove QD15 from the RP70U switch PC board (PD02).

4. Program the tone board according to table in Figure 22. See the tone board adjustment instructions in Section 5.4.4.

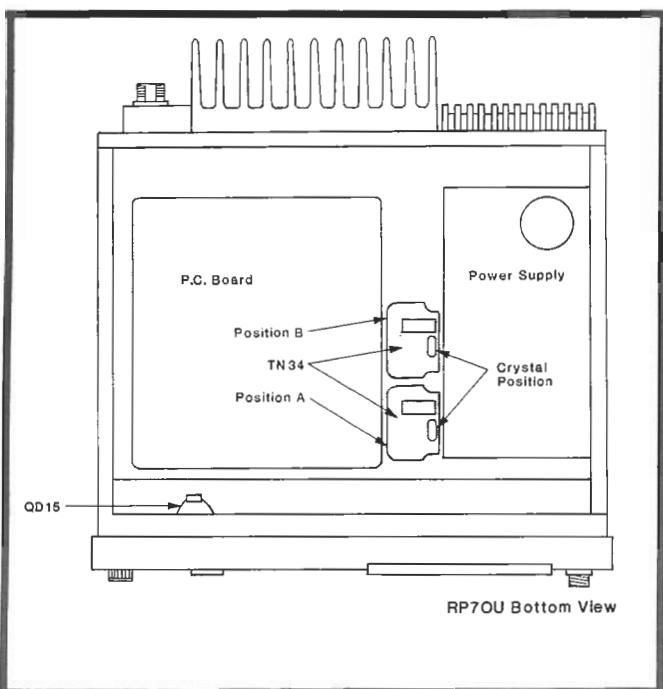

FIGURE 2. TONE BOARD INSTALLATION

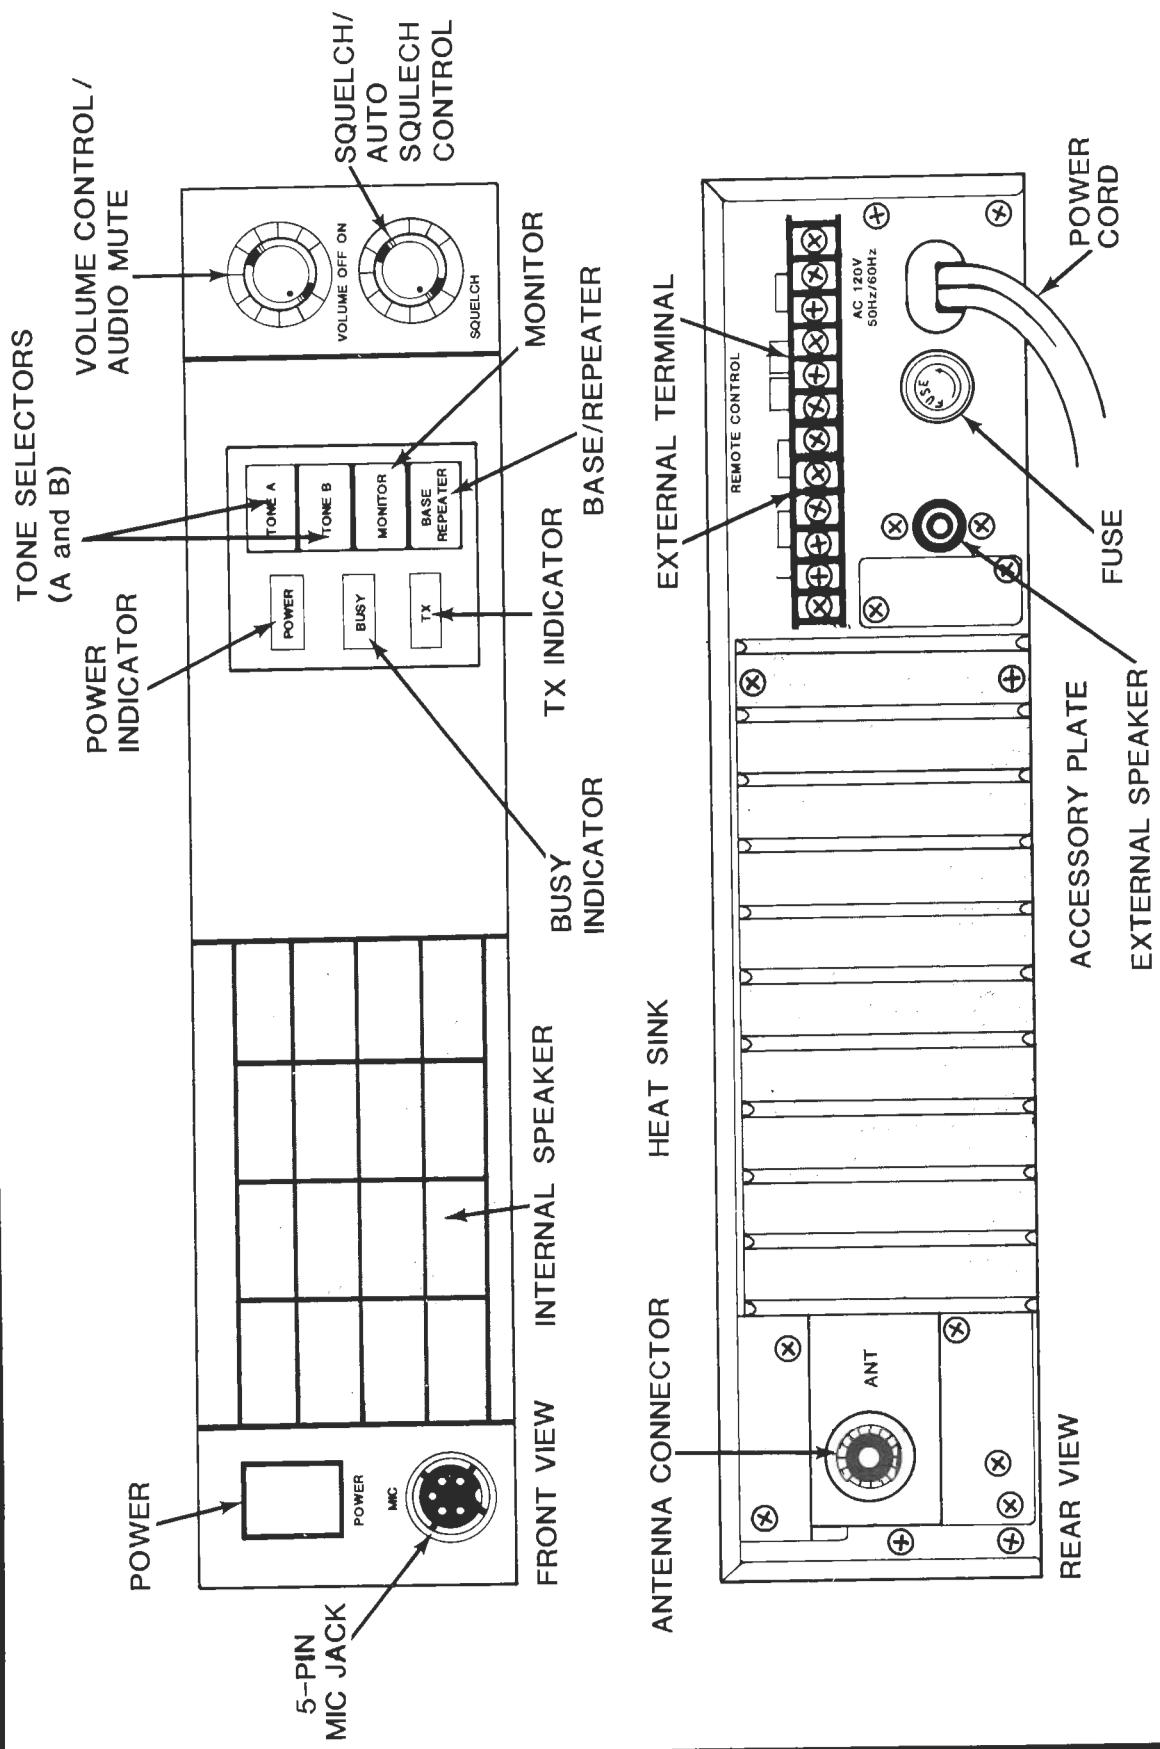

FIGURE 1. RP70U CONTROLS AND CONNECTIONS

### 3.1 CONTROLS AND CONNECTIONS

#### 3.1.1 Repeater Mode

1. Select Repeater mode by releasing the Base/Repeater button to its outer position.
2. If CTCSS tone boards are installed:
  - a. Depress the "TONE A" button to enable the tone board in position A.
  - b. Depress the "TONE B" button to enable the tone board in position B.
  - c. Depress both buttons to enable both tone boards.

*NOTE: If no CTCSS tone board is installed, release both buttons. This will cause the repeater to re-transmit any signal on the repeater input frequency.*

3. Press the MON key to monitor (only if CTCSS boards are installed.)
4. If desired, connect an external speaker to the jack on the back of the repeater labeled "EXT SPKR".
5. Adjust the volume control to the desired volume.
6. Turn the squelch control clockwise to the point where the static disappears.
7. With the squelch set to any point, you may select the auto squelch control by depressing the squelch control button. This sets the squelch to the threshold point.
8. Depress the volume control button if monitoring of the repeater input frequency is not desired.
9. The Time Out Timer will cut off transmission after it has exceeded the set time limit.
  - a. The time limit has been factory-set for 3 minutes.
  - b. This may be adjusted within the range of 1 to 10 minutes.

10. The Carrier Drop Out Timer will cause the transmitter carrier to remain on for specified time after the reception of a signal has stopped.

- a. The time limit has been factory-set for 5 seconds.
- b. This may be adjusted within the range of .1 to 10 seconds.

#### 3.1.2 Base Mode

1. Select Base mode by depressing the Base-Repeater button to its inner position.
2. If CTCSS tone boards are installed:
  - a. Press the "TONE A" button to enable the tone board in position A.
  - b. Press the "TONE B" button to enable the tone board in position B.
  - c. Press both buttons to enable both tone boards.

*NOTE: If no CTCSS tone board is installed, release both buttons.*

3. The FCC requires that a channel be monitored before transmitting. Press the MON button to monitor. Release the button when finished monitoring.

*NOTE:* 1. If a CTCSS tone board is not installed, monitoring is constant and automatic.  
2. If a base station microphone is used, the microphone's monitor button will not work. Use the MON button on the repeater.

#### 3.1.3 External Battery

The RP70U has external battery terminals for emergency power or field use.

1. Connect a heavy duty type battery with a capacity of at least 5 ampere/hour and a voltage of no less than 13.8 V.
2. When AC power is lost, the repeater automatically switches to the emergency power source.

### 3.1.4 Phone Patch Capabilities

The back terminal is used for the following functions (specifications given are for an open circuit):

1. RPT Audio:

- a. 30 to 50 mV at 3 kHz deviation (1 kHz AF)
- b. impedance: 560 ohms

2. RX audio:

- a. 120 to 160 mV at 3 kHz deviation (1kHz AF)
- b. Impedance: 120 ohms

3. External Mic

- a. Impedance: 47 k ohms
- b. Input: 30 to 60 mV at 3 kHz deviation  
60 to 100 mV at 5 kHz deviation

4. External battery

5. CTCSS defeat

---

## 4.1 RECEIVER

### 4.1.1 RF Stage

The incoming RF signal from the antenna passes through the duplexer and then the bandpass filter, and is amplified by RF amp Q103. The amplified signal passes through two more bandpass filters and is applied to the first mixer (Q104) (see Figure 3).

### 4.1.2 First Local Oscillator

The first local oscillator is an overtone circuit, comprised of Q105, a crystal, and other components. The first local oscillator produces the third harmonic of the original crystal frequency.

The frequency is then amplified by buffer Q106 and tripled again by Q107. The bandpass filter (L116 and L117) tunes the frequency to the third harmonic. This frequency then is fed to the first mixer Q104.

### 4.1.3 First Intermediate Frequency (IF)

The heterodyning action of the first mixer produces a 21.4 MHz intermediate frequency (first IF). This frequency passes through crystal filters F101 and F102, is amplified by Q111 and Q112, and then fed to Q119.

### 4.1.4 Second Local Oscillator

Crystal X101 generates a second local oscillator signal of 20.945 MHz.

### 4.1.5 Second Mixer, Second IF

The input signal of 21.4 MHz is mixed with the 20.945 MHz signal from the second local oscillator. Ceramic filters F103 and F104 extract the difference of the two signals producing a 455 kHz second IF.

### 4.1.6 Limiter Amplifier

After going through the limiter amplifier, this signal is detected by the quadrature detector circuit comprised of L126 and other components. The signal then leaves through pin 9 of Q119 as a low-frequency signal.

### 4.1.7 Recovered Audio

The low frequency signal is then divided into the audio/tone signal and the noise signal. The audio and tone signal is applied to the Q237 (1/4) de-emphasis circuit and then separated into the audio signal and the tone signal.

The audio signal passes through hi pass filter Q237 (2/4) and Q237 (3/4) to eliminate the tone signal. This audio signal is then fed to the TX AUDIO terminal on the terminal board (JG02 in the back of the unit).

The noise signal passes through hi pass filter Q118 and is fed to the noise amplifier within Q119. This amplifier also acts as a bandpass filter. Q118 and Q119 eliminate the audio signal. Noise output is detected by Q116 and Q117 and converted to direct current.

### 4.1.8 Squelch Circuit

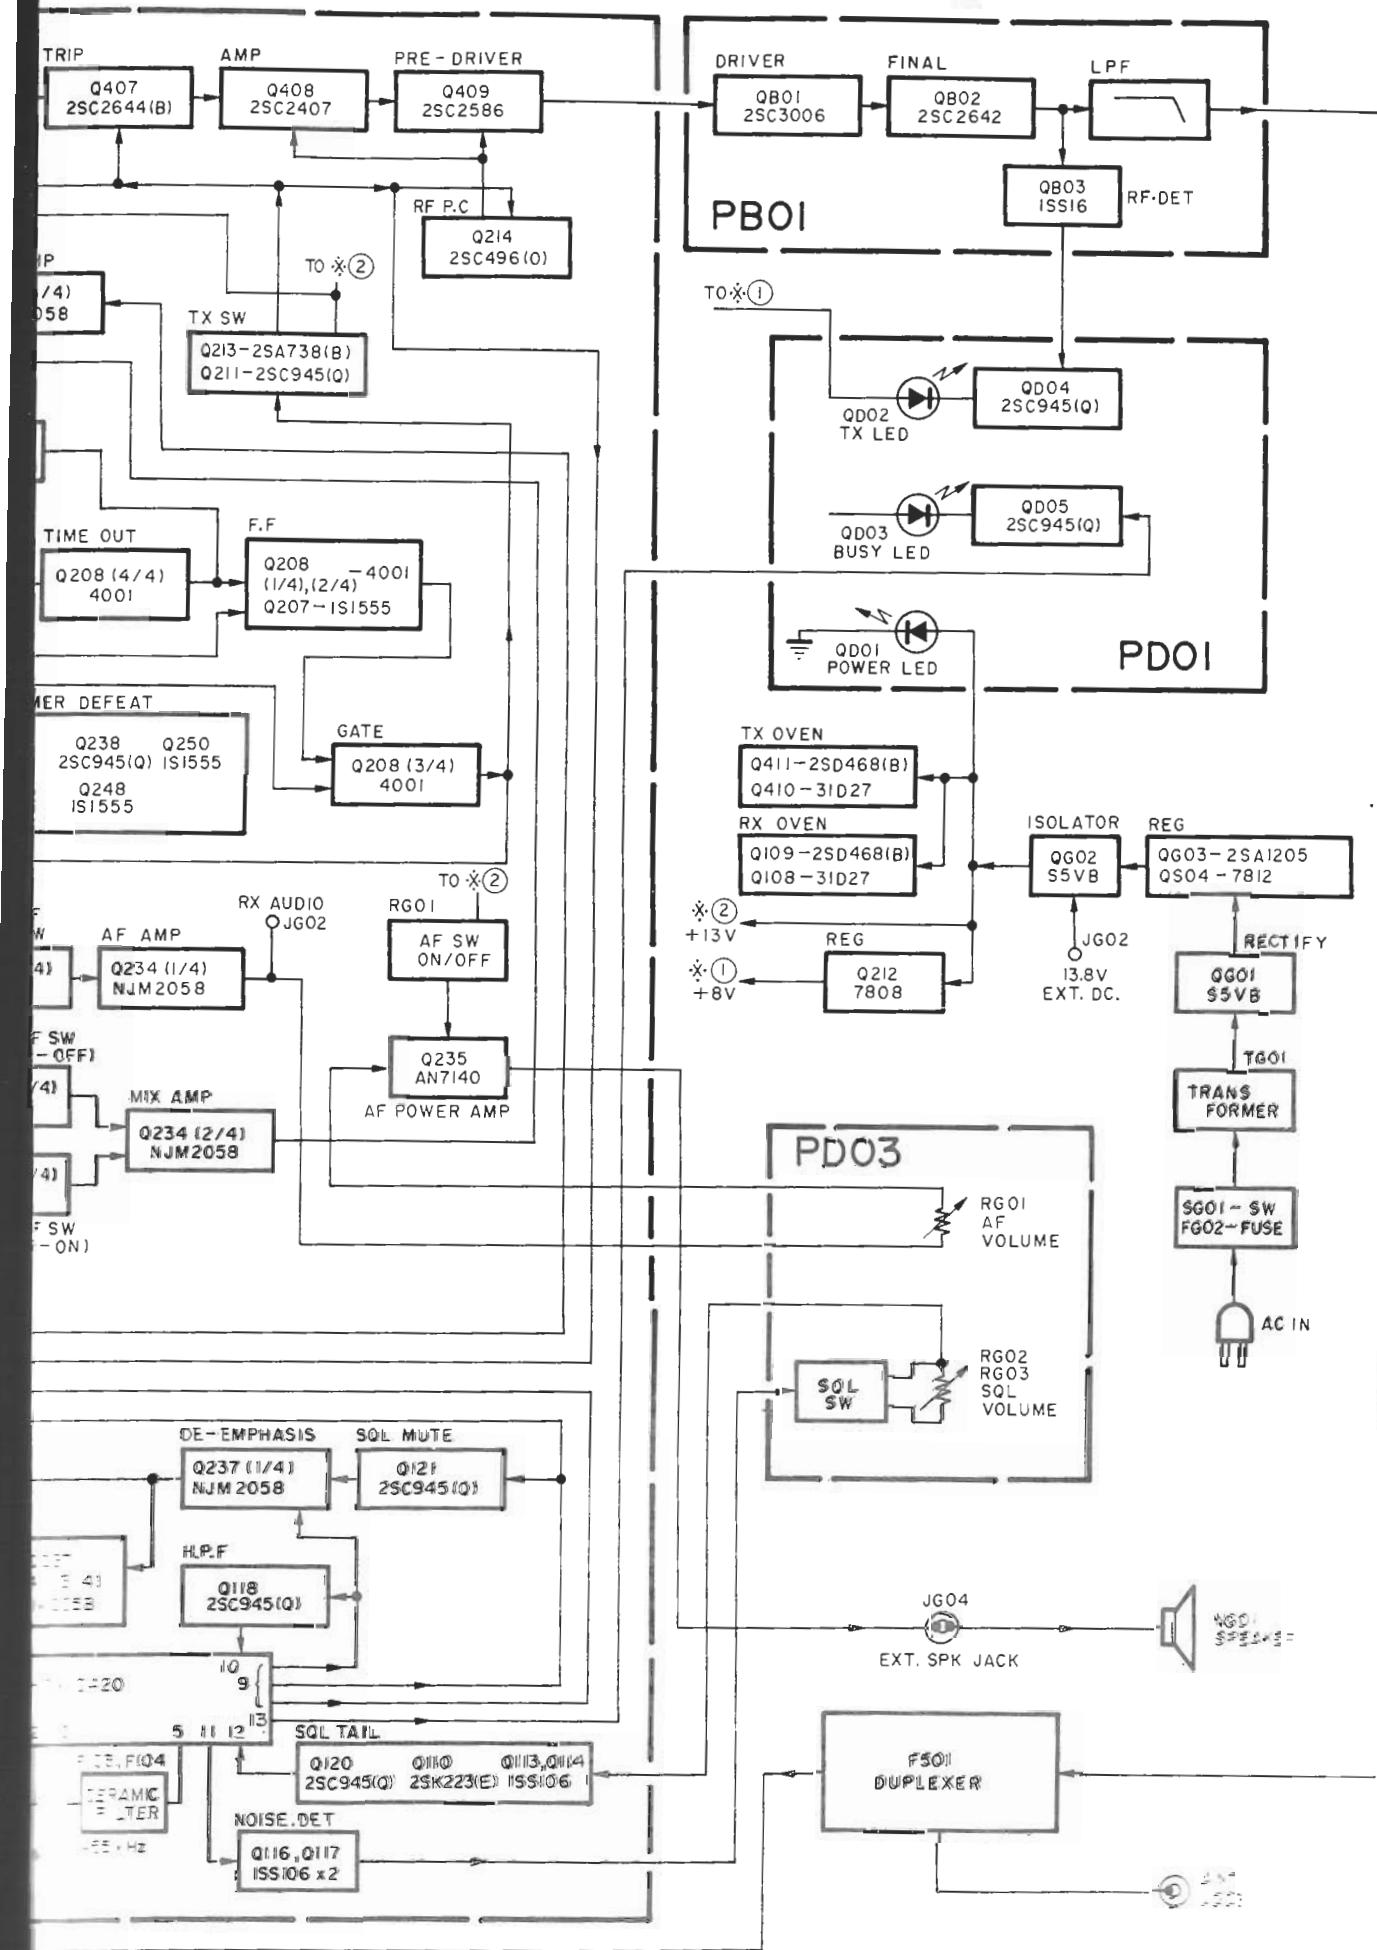

The voltage level is adjusted by the variable resistor RG02 or RG03 to the noise squelch control, and then fed to the variable squelch tail circuit (Q110, Q113, Q114, Q120, and other peripheral components).

The tail is altered by shifting the recharging time of C153, since the resistance between the drain-source varies depending on the voltage between the gate-source. C151 holds the squelch tail during a momentary absence of the received signal. This allows C153 to recharge the gate and source voltage corresponding to the received signal level.

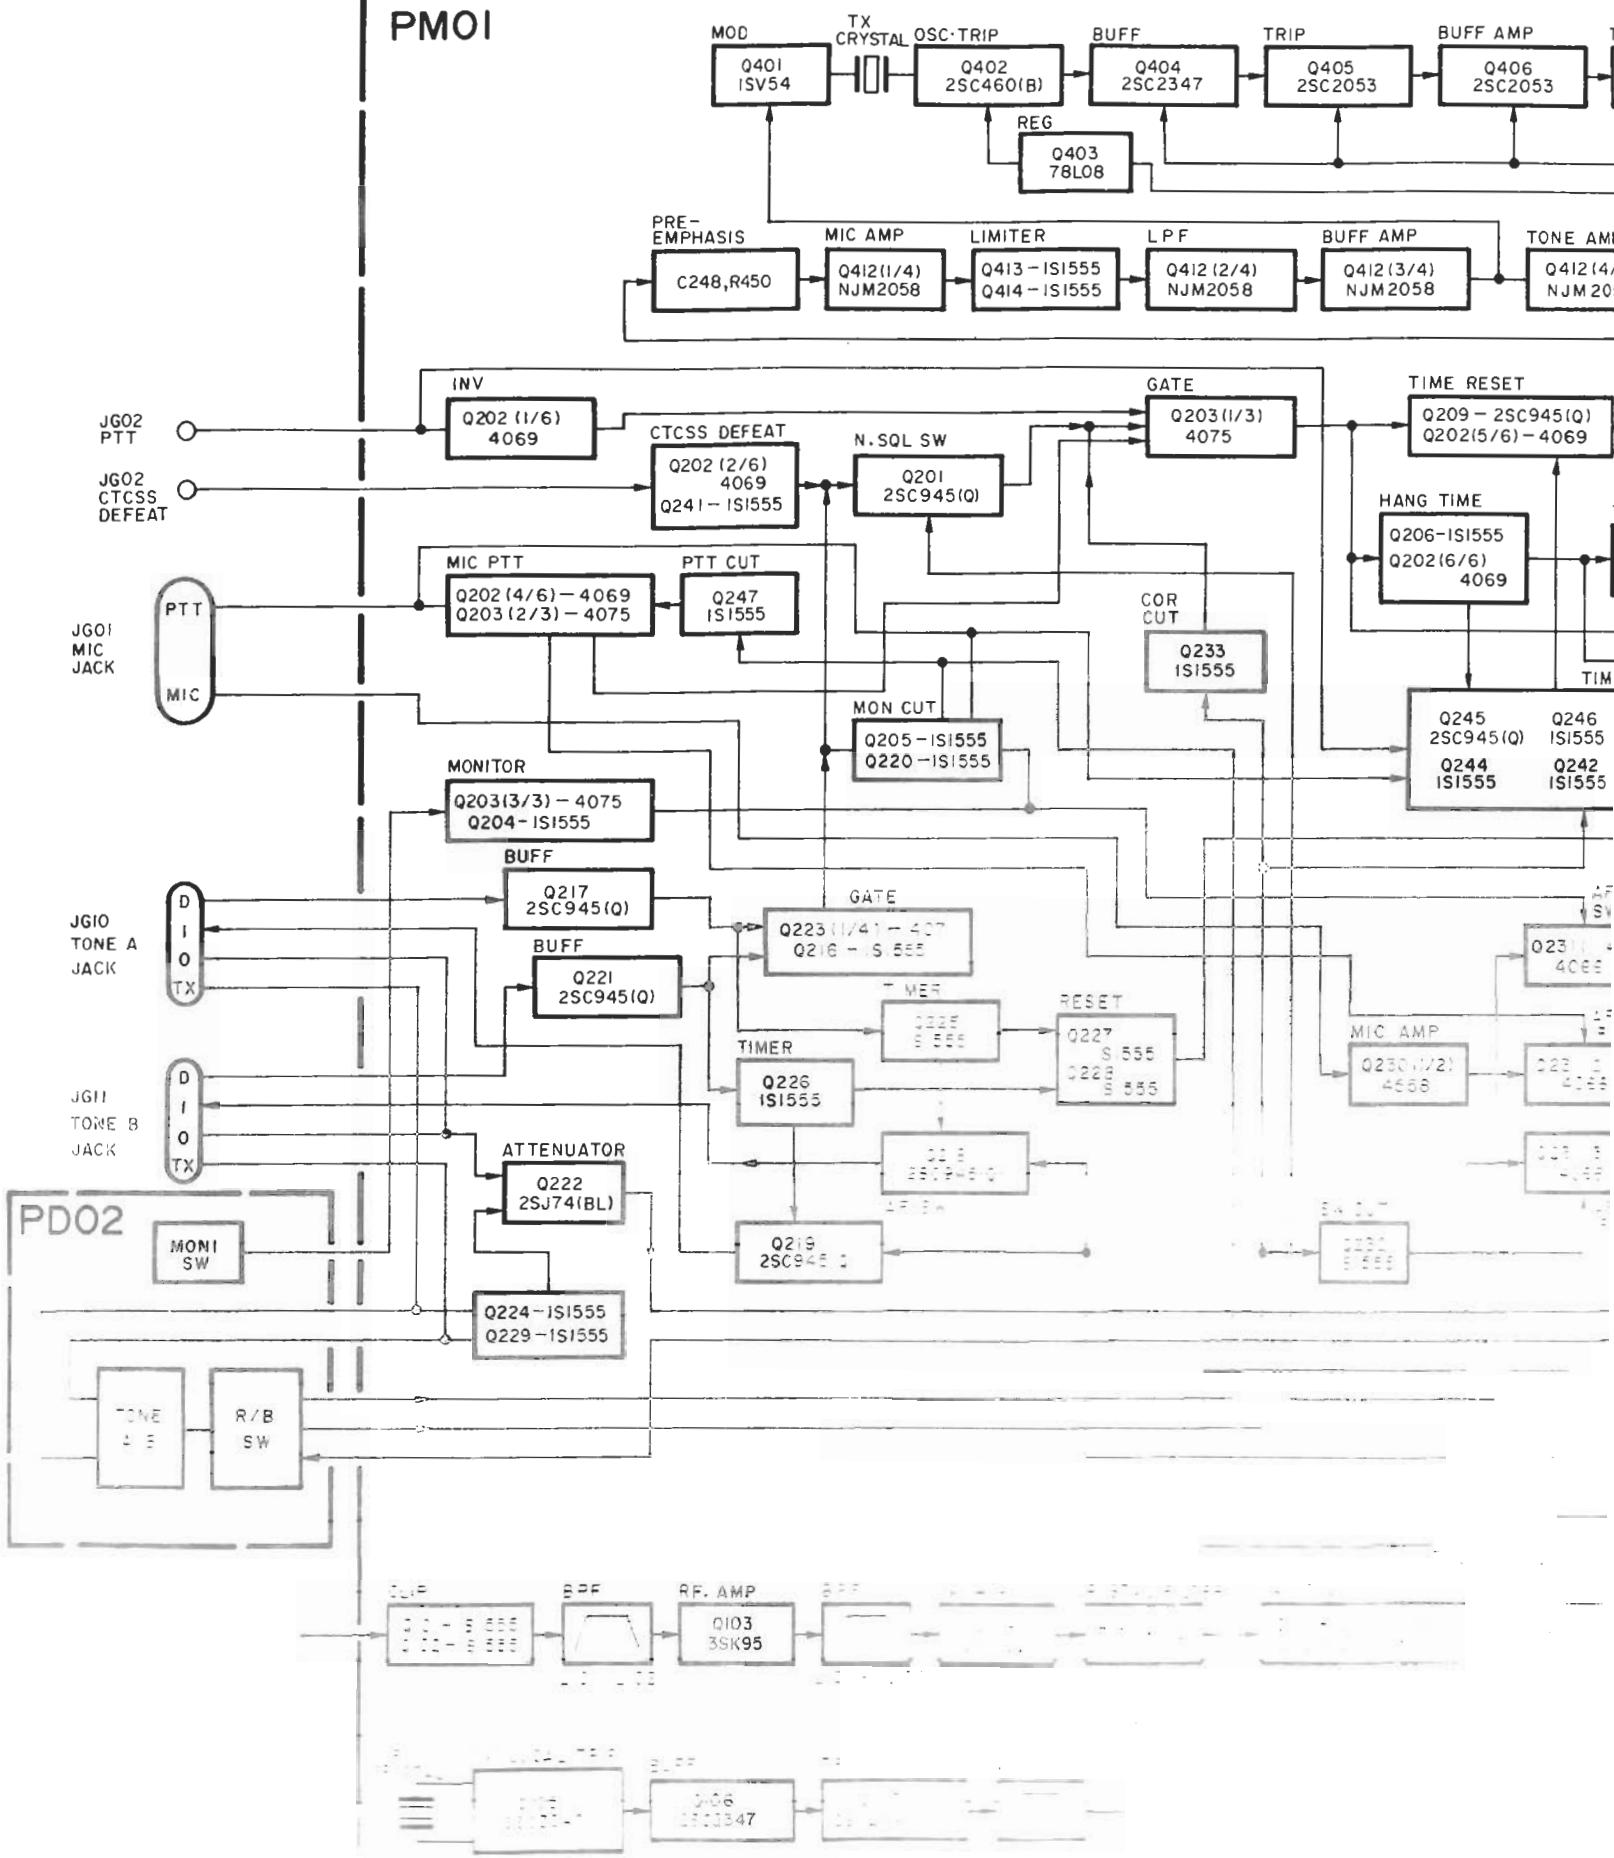

Q120 connects the C153 negative terminal to ground on a weak signal and disconnects it on a strong signal.

### 4.1.9 Schmitt Circuit

The positive terminal of C153 is connected to the input terminal of the IC's Schmitt Circuit (Pin 12 of Q119). Pins 13 and 14 of Q119 are the two points of output. Pin 13 controls the busy-indicator lamp. Pin 14 selects TX and RX of the tone circuit during the BASE mode operation. Also, pin 14 controls the transmission and monitor circuits through the noise squelch control circuit.

# PM01

#### 4.1.10 AF Switching Local Mic Audio

When the microphone PTT switch is pressed a low will be placed on Pin 3 of Q202 (4/6) producing a high on pin 4 which will turn on Q231 (2/4) allowing microphone audio to pass to the microphone amplifier. When the BASE/RPT switch is in the RPT mode Q247 will be biased on preventing Q231 (2/4) from passing any audio.

During the repeat mode, the RX audio from the high pass filter Q237 (3/4) will be routed out to the back terminal strip JG02 then applied to the AF switch Q231 (3/4). In the repeat mode this switch will be turned on. In the base mode audio will be prevented from passing due to Q232's cathode being pulled low by the BASE/RPT switch.

The audio signal is sent to the monitor amplifier Q234 (1/4), via analog SW Q231 (1/4). This is activated by any one of the following conditions:

- monitor is switched on
- when noise squelch circuit is on
- CTCSS is defeated

During the local PTT Q220 is turned on muting any front panel audio during transmit to prevent feedback. When the radio is squelched Q121 will be biased on pulling pin 6 of Q231 (1/4) low via diode Q251 shutting off any audio.

During RPT Mode RX Audio from HPF Q237 (3/4) will be routed out to back terminal strip JG02 and back in, then it will be applied to AF SW Q231 (3/4). In RPT Mode this switch will be turned on. In Base Mode audio will be prevented from passing due to Q232's cathode being pulled low by Base/RPT SW.

#### 4.1.11 CTCSS Circuit

The AF signal from pin 9 of Q119 is applied to the de-emphasis circuit Q237 (1/4). Part of the output of the de-emphasis circuit is further amplified by Q237 (4/4). It is then separated into tone A and tone B, after the level of each tone is aligned and its noise components are reduced at clipping circuits Q239 and Q240.

Each tone system is then fed to the AF IM terminal of its tone board via AF switch circuits Q219 and Q218, respectively. The decoder output of each tone board is connected to the base of Q217 and Q221, respectively. In the absence of a tone input, the collectors of Q217 and Q221 remain low in potential, and there is no output from the OR GATE Q223 (1/4).

If there is an input of tone A while both switches for tone A and tone B are on, the voltage of the collector of Q217 increases by about 8 V. This recharges C213 via diode Q225 and then activates Q218 through Q223 (3/4) to cut off the input of tone B.

As the positive terminal of C213 is connected to the output end of the power control circuit Q208 (3/4), via diode Q228 and resistor R247, it discharges when the transmission power is turned off. Therefore, when there is tone A input, or during the hangtime when there is no tone A input, tone B is cut off and only the tone A signal is accepted.

While the circuit is on and the tone signal is being received, the cathode of diode Q216 registers a voltage of about 7 V.

#### 4.1.12 CTCSS ENCODE BASE MODE

When tone A or B is selected, B+ is supplied to pin 2 of the tone Board thru J007 pin 4, QD12 will be biased to turn on QD14, causing cathode of QD216 to be held low. Preventing noise squelch switch Q201 from turning on AF switch Q231 (1/4) in base mode when the PTT circuit turns on the Q213 TX switch. Approximately 6 volts is passed thru the BASE/REP switch to the tone board on pin 3 enabling the tone boards output. QB17 will be based on pulling Q203 low turning off local RX audio switch Q231.

With the tone board on, its output will be collected together by resistor R279, R280 and other resistors. The output of the tone board is higher during the BASE mode than during REP mode. Therefore, FET Q222 functions as an attenuator and lowers the output level to the equivalent of the output during the REP mode. During the BASE mode, the drain source in Q222 is off, and the signal is sent to the tone amplifier Q412 via resistor R276, C251, and R281.

This high of 7 V is applied to Q203 (3/3) pin 4 thus turning on AF switch Q231 (1/4) and opening up the local audio.

#### 4.1.13 CTCSS REP MODE

In the REPEAT mode with tone A or B selected when correct tone is received and decoded, the tone boards pin 8 will go low, turning off Q217 or Q218 putting a high on Q223 (1/4), Q216 cathode registers about 7 volts which is applied to Q203 (1/3) PTT circuit and Q203 (3/3) local AF switch.

## 4.2 TRANSMITTER

### 4.2.1 Modulation

Clipping distortion is eliminated by a roll-off filter Q412 (2/4), and the output is applied to modulation varicap Q401 together with the tone signal, via buffer amplifier Q412 (3/4).

### 4.2.2 Oscillator Circuit

The oscillator circuit is comprised of a crystal fitted to J401, J402, and Q402, modulation varicap Q401, and other components. The circuit oscillates at the fundamental crystal frequency. The collector of Q402 is fitted with a resonance circuit that produces the third harmonics of the fundamental frequency.

### 4.2.3 UHF Signal

The frequency is amplified by Q404 and Q405, and tuned to the third harmonics again by the collector of Q405. The frequency is amplified again by Q406 and then tuned to the third harmonics once more to reach the required frequency. The frequency is 27 times higher than the fundamental crystal frequency. This UHF is amplified by Q408 and Q409 and then fed to the booster amplifier.

The booster amplifier (QB01 and QB02) amplifies the UHF signal to 15 W, and a low pass filter eliminates the harmonics. The signal is then sent to the antenna terminal via the duplexer.

The UHF signal is applied to the booster amplifier (PB01) where it is amplified to 15W by QB01 and QB02. The signal is then sent through a low pass filter which eliminates the harmonics and then through a duplexer to the antenna. QB03 rectifies a portion of the TX signal which is used to turn on the TX lamp.

### 4.2.4 Exciter and Final Stage

The signal from the VCO is applied to the exciter stage Q202, Q203, and Q204 which are controlled by TX +6V. The TX +6V is synchronized to the PLL unlock circuit to prevent transmission when the VCO is unlocked.

The signal amplified by Q204 is further amplified by the power module Q205. The Q207 output power is controlled by adjusting C217, C215, and R215.

Higher harmonics are attenuated by 30 dB in the final circuit of C205. It is further attenuated by 60 dB at the two-stage pi-type filter of L209, C229, L210, L211, and C228.

### 4.2.5 Crystal Stability

Crystal X301 is the temperature controlled crystal oscillator circuit. The frequency drift of X101 is kept within  $\pm 2.5$  ppm.

### 4.2.6 Antenna Switching

The antenna is connected to a low pass filter applied directly to the output of the transmitter final. A quarter inch length matching coil L208 connects the transmitter output to the receiver. The bottom of this coil is grounded by Q207 in transmit making high impedance connections whenever TX +6V is present. In the receive mode, the ground is removed from the bottom of L208 and the receive signal is directed to the RF amplifier.

## 4.3 Control Circuits

The direct current from the cathode of the tone board diode Q216 is fed to the collector of noise squelch switching circuit Q201 via R213.

During received signal input, Q201 cuts the connection between the collector and the emitter. Q201 closes this connection during the absence of signal input.

During REPEATER mode operation, the direct voltage is fed to Q203 (1/3) via R208. The output of Q203 (1/3) is sent to the hang time circuit, the time out time circuit, and the transmitter power source control circuit. (See Figure 5).

The PTT circuit consists of four control lines: external push to talk; base microphone push to talk; COR and tone board detect. When either the base microphone or the external PTT is activated and inverted, the PTT circuit inverts the low to a high state. In the External PTT circuit, the circuit sends this voltage to pin 12 of OR GATE Q203 (see Figure 4). In the BASE MIC circuit, it sends this high state to pin 2 of OR GATE Q203, then to pin 11 of Q203 when in the Repeat mode. The COR control line is activated by the noise detector switch. If no tone boards are used, the COR line is held low until a tone of the correct frequency is decoded in which the PTT switches this line high.

When in the BASE mode the RPT/BASE switch grounds the cathode of Q233 thus pulling low the COR line and making it inoperable.

### 4.3.1 CTCSS Defeat

If the CTCSS DEFEAT terminal on the rear terminal board is connected to the ground, R207 and diodes Q202 (2/6) and Q241 supply voltage to the collector of the noise squelch switching circuit (Q201), just as when the tone circuit is activated.

### 4.3.2 TX Power Supply

When the PTT switch of JG02 is connected to the ground, voltage is applied to another input terminal of Q203 (1/3) via Q202 (1/6). This activates the transmitter power supply circuit.

The output of Q203 (1/3), a pulse voltage, enters and sets flip-flop circuit Q208 (1/4) and Q208 (2/4). At the same time, C203 is charged via diode Q206, reducing the output of Q202 (6/6) to zero. This in turn increases the voltage by approximately 8 V, activates the TX SW Q211 and Q213, and turns on the transmitter power supply.

### 4.3.3 Hang Time Circuit

The absence of a reception signal reduces Q203 (1/3) output to "0". This in turn causes C203 to discharge slowly via variable resistor R217 until its voltage is lowered to the threshold voltage of Q202 (6/6). At this point, the Q202 (6/6) output turns to "1". The Q208 (3/4) output therefore turns to "0" and switches off the transmitter power supply. This hang time is adjusted by R217.

### 4.3.4 Time Out Timer Circuit

During the continuous reception of a signal input, Q208 (4/4) output is "1". This slowly charges C204 via R298 and R219. When the C204 voltage has increased sufficiently, it reverses the flip-flop circuit, setting the Q208 (2/4) output at "1" and Q208 (3/4) at "0". This switches off the transmitter power supply.

During the absence of the received signal, the collector-emitter of Q209 turns on, C204 discharges via R304 to return to the original condition.

Q244, Q245, Q246, Q250, and related components stop the time out timer circuit during the BASE mode operation. When the PTT switch on the rear terminal board is switched on, the time out time circuit is stopped by Q238, Q243, and related components.

When in the REPEAT mode with no signal present which means the unit is in standby operation, these conditions prevail:

1. Ext PTT, PTT, COR lines are low.
2. Lines A, B, and C are floating.

Pin 10 of IC Q202 is high, so Q209 is on and the time out timer is reset via the discharge of C204. When a signal is detected or when either the EXT PTT or the base microphone PTT is activated a high output on Q203 pin 10 exists. This shuts off the time out timer and the reset circuit allowing the time out timer function to operate. When a high exists on pin 10 of Q203 capacitor, C203 charges via diode Q206. The output of Q202 pin 8 is low which is tied to one of the two inputs of Q208 pin 13.

When the high condition first appears on pin 10 of Q203, pin 16 of capacitor C202 charges via resistor R216. As a result, a positive pulse is sent to pin 1 of Q208 to reset the flip-flop. At the same time, Q208 pins 8, 9, and 10 act as inverters, making a high on pin 10. Then C204 begins to charge via fixed resistor R219 and variable resistor R298 at a rate of the R298/C204 time constant. When the voltage of C204 builds up to a "high" condition on pin 6, the flip-flop is toggled into a set mode. This provides a "high" condition on pin 3 of Q208 and pin 12 of Q208, thus turning Q211 off.

When the BASE mode point C is low to keep the time out timer reset function on, point C disables the time out timer. When point B is low and the BASE microphone point A is high, Q245 turns on and disables the hang time function.

### 4.3.5 Power Supply Circuit

The two primary windings of the power transformer (TG01) are connected in parallel for a 115V and 120V power source. They are connected in series for a 230V and 240V power source.

The supplied power is rectified by diode bridge QG01, and is fed to the voltage regulator circuit. Fitted with a 3-lead regulator (QS04) for 12V use, and with the ground terminal grounded by diodes QS01, QS02, and QS03, the circuit produces 13.7 VDC. To increase the current capacity, a current booster circuit is used. Booster transistor QG03 is enclosed within the transmission booster shield to facilitate the heat discharge.

A terminal for an external battery is located on the rear terminal board. The power is supplied to the main unit circuits via diode bridge QG02. This prevents reverse current. QS05 and QS06 prevent reverse battery connection. When connected incorrectly, fuse FS01 cuts off the connection.

To increase current capacity during high current usage QG03 will be biased on allowing more current to be drawn through QG03.

# RP70U

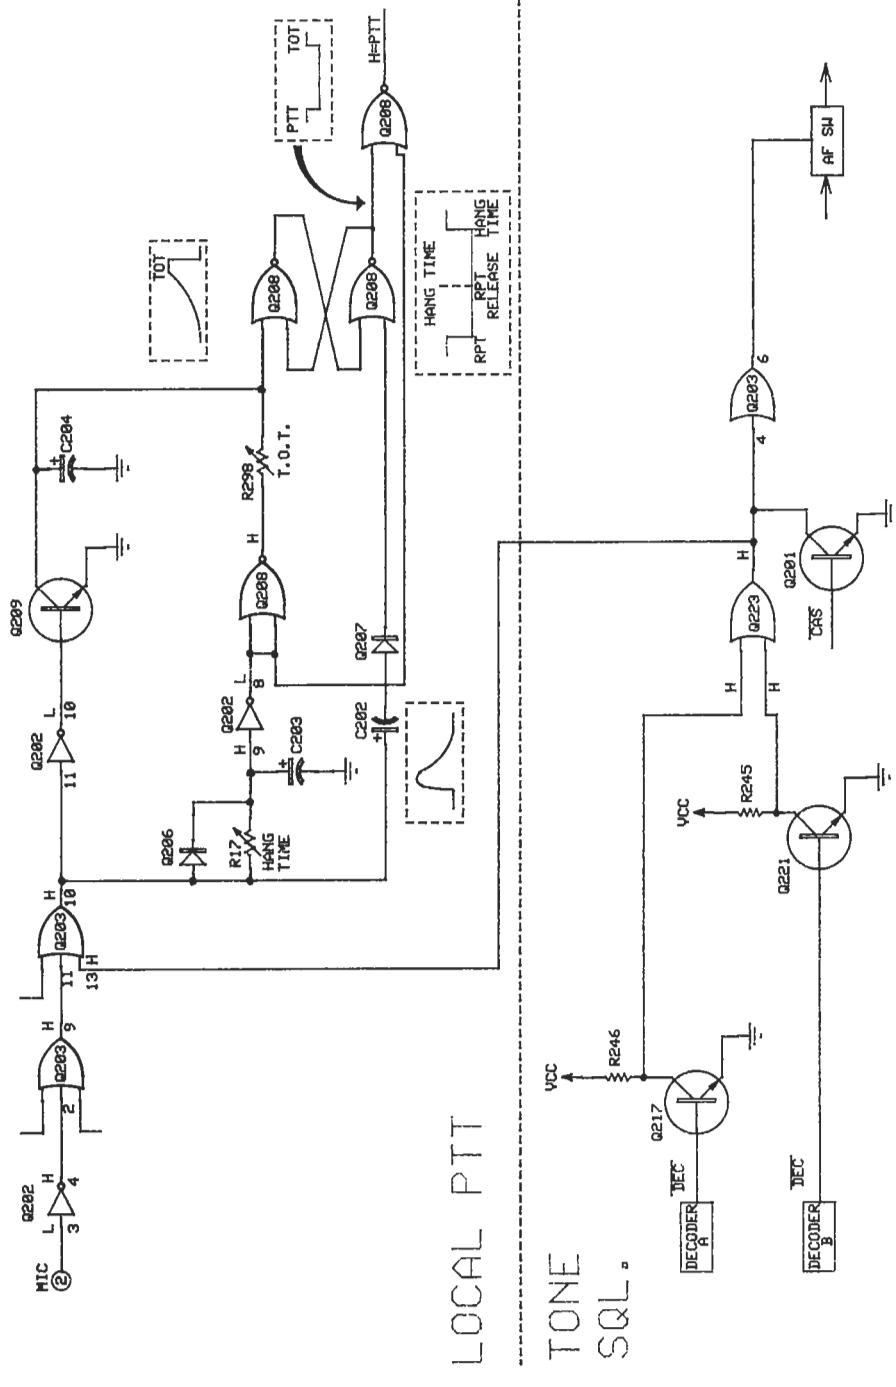

FIGURE 4. LOCAL PTT AND TONE SQUELCH CIRCUITS

## 5.1 Precautions

The inherent quality of the solid-state components used in this transceiver will provide many years of continuous use. Take the following precautions to prevent damage to the transceiver.

1. Never key the transmitter unless an antenna or suitable dummy load is connected to the transceiver's antenna receptacle.
2. Ensure that the input voltage is 120 VAC.

## 5.2 Test Applications

- Performance test: conducted to check overall transceiver operation. This should be performed before transceiver sale/installation.
- Alignment: conducted if the transceiver fails the performance test or if a critical electrical component has been replaced. SCC recommends that alignment be performed whenever maintenance is performed.
- Troubleshooting: conducted in the event of a failure to isolate to isolate a fault in the transceiver.

## 5.3 Test Equipment

The following test equipment, or its equivalent is necessary for RP70U maintenance.

FM Communications Monitor (service monitor) .....	IFR1200
RF Wattmeter with	
50 load.....	Bird 6154
Tone Generator .....	Service Monitor
Voltmeter .....	Fluke Model 73/77
Frequency Counter .....	Hewlett Packard 5314A
Oscilloscope .....	Dual Trace, 20 MHz
Digital Voltmeter .....	Fluke Model 73/77

## 5.4 Alignment Procedure

The RP70U alignment points are shown in Figures 5 and 6. After connecting the test equipment, ensure that the supply voltage is 120 VAC.

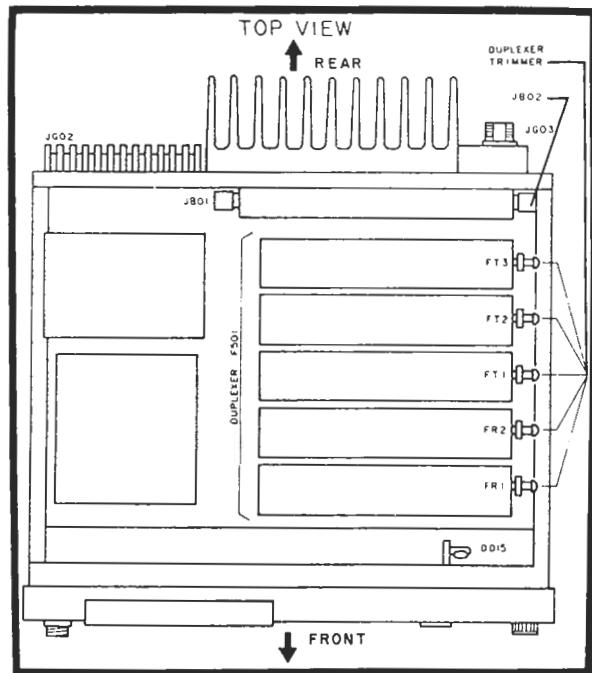

FIGURE 5. RP70U ALIGNMENT POINTS  
(TOP VIEW)

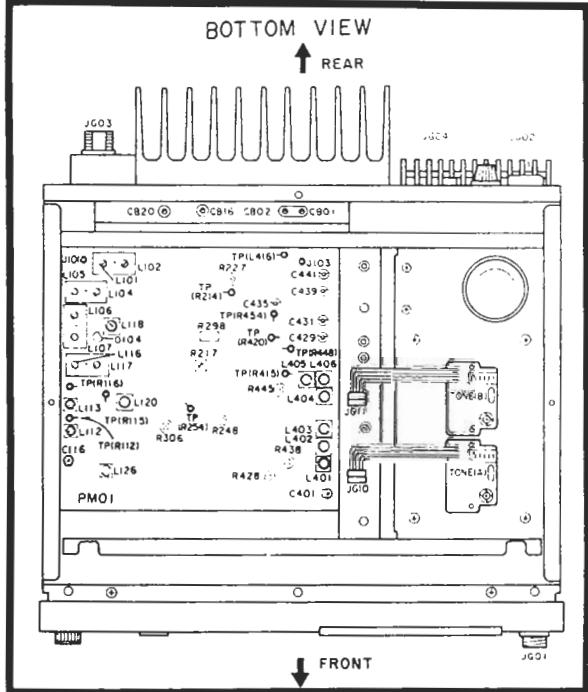

FIGURE 6. RP70U ALIGNMENT POINTS  
(BOTTOM VIEW)

#### 5.4.1 Receiver

1. Connect the test equipment as shown in Figure 7.

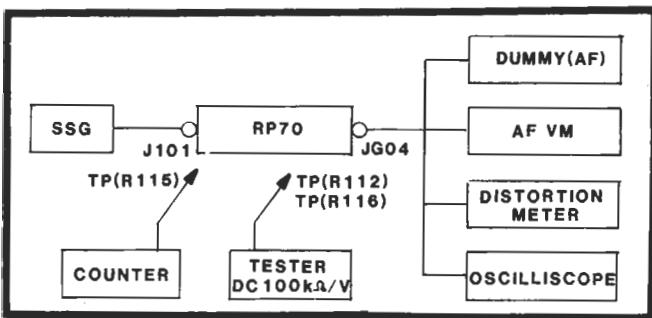

FIGURE 7. RX TEST SETUP

2. Turn the squelch control fully counterclockwise.
3. Attach the Standard Signal Generator (SSG) to RX jack J101, and set the standard signal generator output to the RX frequency. Set the output for slight RF quieting.
4. Select base mode with the Base/Repeater button.
5. Connect a voltmeter between TPR112 and the chassis.
6. Adjust L112 for a maximum meter reading (voltage is approximately 1V  $\pm 10\%$ ).
7. Connect a voltmeter between TPR116 and the chassis.
8. Adjust L113 for a maximum meter reading (voltage is approximately 1V  $\pm 10\%$ ).
9. Connect a frequency counter to TPR115.
10. Adjust C116 until the desired frequency is indicated.
11. Confirm the maximum meter readings of Steps 6 and 8.
12. Set the standard signal generator to the RX frequency and raise the output of the standard signal generator (at standard modulation) until an AF signal is heard.
13. Adjust L126 for maximum AF output and minimum distortion.
14. Obtain the best possible S/N ratio by adjusting L120, L118, L116 and L117, and then L107, L106, L105, L104, L102, and

L101. Lower the standard signal generator output during adjustment to maintain the S/N ratio at around -12 dB.

15. Readjust L126 as in Step 13.

16. Set the standard signal generator modulation to OFF and adjust L101, L102, L104, L105, L106, L107, L116, and L117 for maximum QS level.

#### 5.4.2 Transmitter

1. Connect the test equipment as shown in Figure 8. (Remove the coaxial cable which goes to the power stage).

*NOTE: J403 is the TX Pre-Driver output jack in Figure 8.*

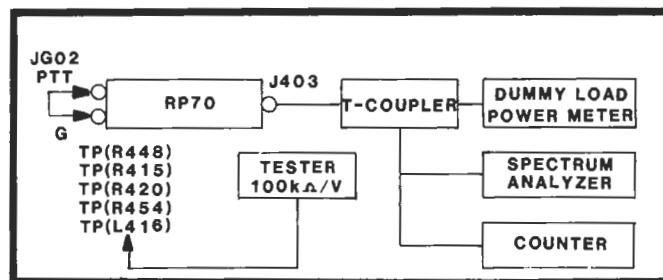

FIGURE 8. TX TEST SETUP

2. Rotate the power control (R227) fully clockwise.
3. Set the Repeater to the BASE mode.
4. Connect the PTT terminal of the JG02 10-pin connector (located on the rear of the RP70U) to the GND terminal or the chassis (key the transmitter).
5. Connect a voltmeter between TPR415 and ground.
6. Adjust L402, L403, and L404 for a minimum meter reading.
7. Adjust L405 for a maximum meter reading.
8. Connect a voltmeter between TPR420 and ground.
9. Adjust L406 for a minimum meter reading.
10. Connect a voltmeter between TPR454 and ground.
11. Adjust C429 and C431 for a minimum meter reading.

12. Repeat step 11 several times.
13. Connect a power meter to J403.
14. Adjust C435, C439, and C441 for a maximum power meter reading at J403. (The power will be 800 mW to 1.2 W).
15. Repeat Step 14 several times.
16. Connect the frequency counter to the TX-coupler.
17. Set trimmer C401 to the mechanical center.
18. Pre-tune L401 approximately to a desired frequency
19. Fine tune C401 to the exact frequency desired.
20. Turn the power supply off and connect the measurement equipment as shown in Figure 9.

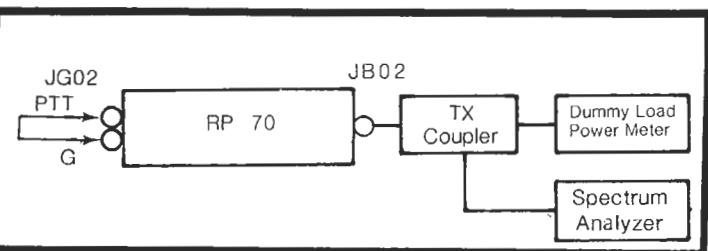

FIGURE 9. MODIFIED TX TEST SETUP

21. Connect JB01 (Booster Input) and J403 (TX Pre-Driver out) with the coaxial cable (WG11).
22. Turn the power on again, and adjust CB01, CB02, CB16, and CB20 for the maximum power indication (wattage is 16 W to 18 W).
23. Connect the Duplexer cable between J101 (RX) and JB02 (TX).
24. Connect the measurement equipment as shown in Figure 13.
25. Rotate R227 to set the power output to 12 W.

#### 5.4.3 Modulation

1. Connect the test equipment as shown in Figure 10.
2. Set the variable resistors R428, R438, R306, R248, and R445 to the center position.

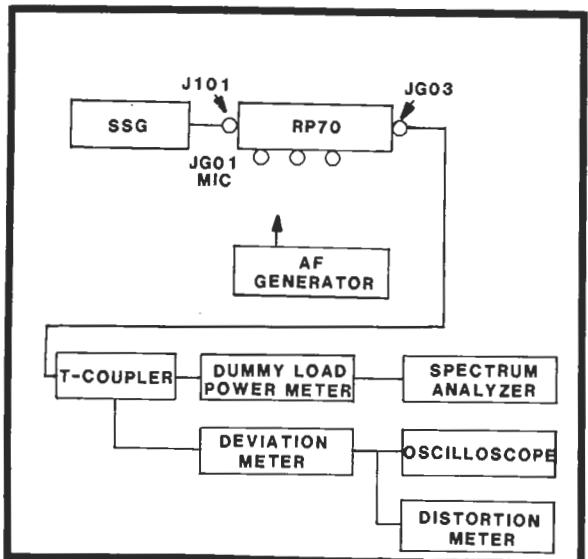

FIGURE 10. MODULATION TEST SETUP

3. Set the Repeater/Base button to the base station position.
4. Apply a 5 mV, 1kHz sine-wave signal to the MIC input of the handheld microphone input terminal of JG01.
5. Connect PTT (terminal # 2) of JG01 MIC jack to the GND terminal or the chassis.
6. Adjust R428 to obtain a deviation of  $\pm 3.0$  kHz.
7. Set the audio generator output to 50 mV.
8. Adjust R438 to obtain a deviation of  $\pm 4.5$  kHz.
9. Repeat Steps 4 through 8 several times.
10. Set the Base/Repeater button to the Repeater position.
11. Rotate the squelch control fully clockwise.
12. Modulate the standard signal generator output level by  $\pm 3$  kHz with a 1 kHz tone.
13. Set the standard signal generator output level to -60 dBm.
14. Connect J101 (RX) to the standard signal generator.
15. Turn off the TONE A and TONE B switches.
16. Adjust R306 to obtain a TX deviation of  $\pm 3$  kHz.

#### 5.4.4 Tone

##### Encoder Alignment

**NOTE:** When only one tone board is used, use Tone A. When both tone boards are used, remove QD15 (ISI555) on the switch P.C. Board.

1. Connect the test equipment as shown in Figure 11. Ensure that the power supply is set to 120 VAC.

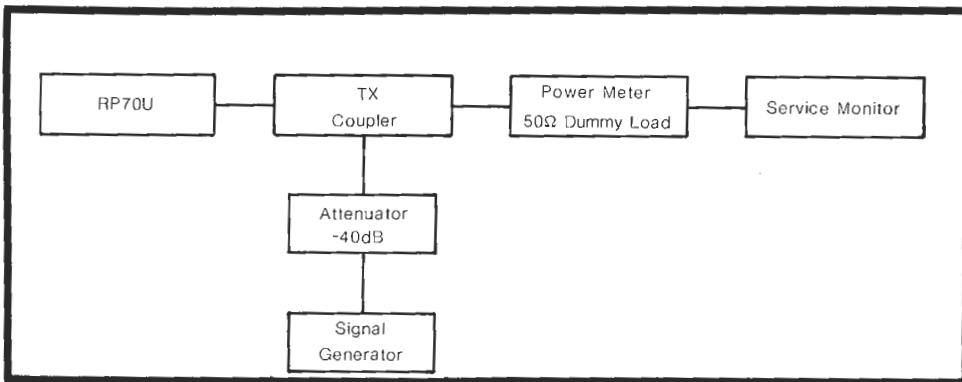

FIGURE 11. TN34 ENCODER TEST SETUP

2. Connect the tone board to tone connectors JG10 and JG11.
3. Set the Base/Repeater button to the Repeater position.
4. Set the standard signal generator output to -60 dBm. The modulation is the tone frequency of the tone board with a  $\pm 600$  Hz deviation.
5. Turn on the power supply and confirm that the Repeater is set to the TX mode.
6. Adjust the tone board potentiometer RA07 to obtain a  $\pm 600$  Hz deviation.
7. When one of the two tones is lower than  $\pm 600$  Hz, adjust repeater potentiometer R445 to obtain a deviation of  $+600$  Hz for the lower level tone board.
8. Perform Steps 4 through 7 for both Tone A and Tone B.
9. Set the Base/Repeater button to the Base position.
10. Turn off the standard signal generator output.

11. Key the transmitter and confirm that the deviation is within  $\pm 600$  to  $\pm 750$  Hz. Set the tone board switch to either A or B.

##### Decoder Test

1. Connect the test equipment as shown in Figure 12.

2. Set the controls on the RP70U as follows:

Power Switch ..... ON

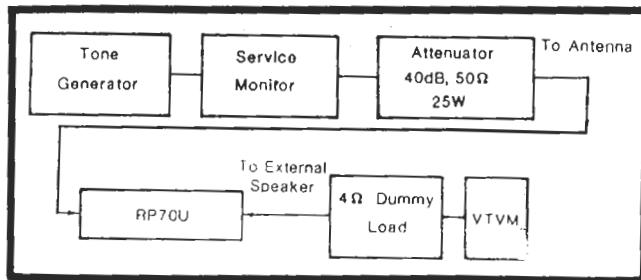

FIGURE 12. TN34 DECODER TEST SETUP

Mode ..... BASE  
Volume Control ..... 3rd Line Mark  
Squelch Control ..... Threshold Point  
Tone Switch ..... A or B according to the TN34 location  
Monitor Switch ..... ON

3. Set the tone generator to the TN34 frequency.
4. Set the standard signal generator to the RP70U RX frequency.
5. Set the standard signal generator output level to -60 dBm.
6. Adjust the tone generator level and confirm that the squelch opens with tone deviation of  $\pm 50$  Hz to  $\pm 300$  Hz.

#### 5.4.5 Hang Time

1. Set the Base/Repeater button to the Repeater position.
2. Rotate the squelch control fully clockwise.
3. Connect the clip lead between TPR254 and TPR214 to turn on the transmit mode. Removing the clip turns off the transmit code after a determined length.
4. Remove the clip lead.
5. Adjust R217 to stop the transmit signal at the desired time.
  - a. Each mark on the R217 designates approximately one second.
  - b. Rotating R217 fully counterclockwise increases the desired time.
  - c. The hang time is pre-set to 5 seconds.

#### 5.4.6 Time out Timer

1. Set the Base/Repeater button to the Repeater position.
2. Rotate the squelch control fully clockwise.
3. Connect the clip lead between TP(R254) and TP(R214) to turn on the transmit mode. Confirm that the time out timer turns off the transmit mode after a determined length of time.
4. Adjust R298 to stop the transmit signal to the desired time.
  - a. Each rotation of R298 designates to approximately 45 seconds.
  - b. Rotating R298 counterclockwise increases the desired time.
5. Repeat Step 3.

#### 5.4.7 Duplexer Alignment With Spectrum Analyzer

The frequency is assumed to be the following:

- o RX: 462.5 MHz
- o TX: 457.5 MHz

1. Turn off the repeater power.
2. Remove the plugs from the duplexer which is connected to the RX jack (J101) and to the booster output jack (JB02) (see Figure 13).
3. Connect the standard signal generator to the repeater antenna connector.
4. Connect a spectrum analyzer or an RF voltmeter to the RX side of the duplexer.
5. Connect a 50 ohm dummy load to the TX side of the duplexer.
6. Set the standard signal generator output approximately 100 dB and the TX frequency to 457.500 MHz.
7. Adjust duplex trimmers FT1, FT2, and FT3 several times for the minimum reading on the spectrum analyzer or RF voltmeter.
8. Connect a spectrum analyzer or an RF voltmeter to the TX side of the duplexer.
9. Connect a 50 ohm dummy load to the RX side of the duplexer.
10. Set the standard signal generator output to 100 dB and the RX frequency to 462.500 MHz.
11. Adjust duplex trimmers FT1, FT2, and FT3 several times for the minimum reading on the spectrum analyzer or RF voltmeter.

### 5.5 PERFORMANCE TEST

#### 5.5.1 Transmitter

1. Connect a wattmeter with a 50 ohm load to the antenna receptacle, and set the repeater/base button to the base position.
2. Key the transmitter by pressing the microphone PTT switch.

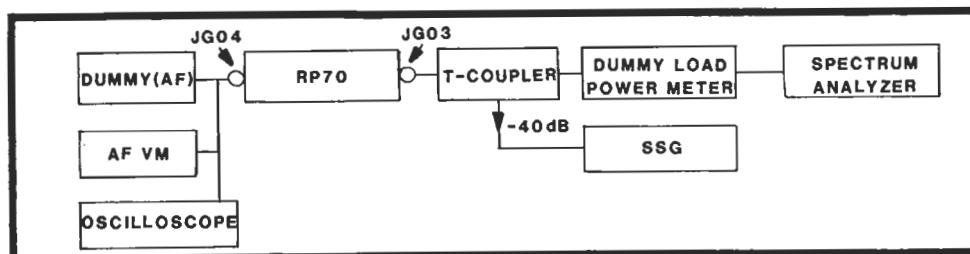

FIGURE 13. DUPLEXER TEST SETUP

3. Verify that the power output is at least 12 Watts.
4. Set the FM communications monitor to measure the exact transmitter frequency of the unit.
5. Key the transmitter and verify that the FM monitor indicates the exact transmitter frequency  $\pm 500$  Hz.
6. Set the FM communications monitor to measure transmitter deviation.
7. Key the transmitter and speak into the microphone. Deviation must not exceed  $\pm 5.0$  kHz.
8. If tone boards are installed, check tone deviation and frequency (when the tone button is out, the tone is disabled; when the tone button is in, the tone is enabled.)

#### 5.5.2 Receiver

1. Connect an FM standard signal generator to the antenna receptacle.
2. Connect an AC voltmeter to the speaker jack with an 8 ohm, 2 watt resistor in parallel.
3. Turn the squelch control counterclockwise for maximum noise. The squelch control must be in the out position.
4. Adjust the volume control for a voltmeter reading of 2.0 VAC. The volume control must be in the out position.
5. With the standard signal generator set at the receive frequency (no modulation), slowly increase the signal level until the voltmeter reading is reduced to 0.2 VAC (20 dB decrease). Verify that the signal generator output does not exceed 0.5  $\mu$ V.
6. Reduce the standard signal generator output to zero.
7. Adjust the squelch control to the point where the speaker noise just cuts out (threshold).
8. Set the standard signal generator modulation to  $\pm 3$  kHz with a 1 kHz tone.
9. Increase the standard signal generator output until speaker noise returns.
10. Turn the squelch control fully clockwise (maximum quieting).

11. Increase the standard signal generator output until the audio is recovered at the speaker again. Verify that the signal level of the standard signal generator is below 5  $\mu$ V.
12. Depress the squelch control to the in position. Ensure that speaker noise returns with a standard signal generator input no more than 0.3  $\mu$ V.
13. If the tone boards are installed, select board A or B by depressing the appropriate tone button. Ensure that audio is only passed to the speaker upon injection of approximately  $\pm 300$  Hz of the appropriate tone.

#### 5.5.3 Repeater Operation

1. Connect a wattmeter with a 50 ohm load to the antenna receptacle.

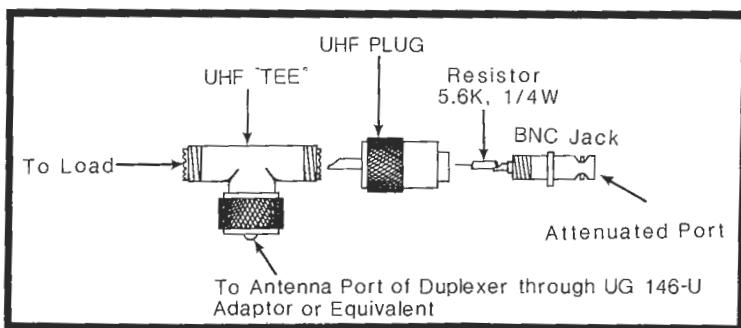

FIGURE 14. "DESENSE T" ASSEMBLY

2. Set the Repeater/Base button to the Repeater position and select a tone if applicable.
3. Air-couple the standard signal generator to the antenna line by using a "desense T." Figure 14 and the following steps describe the assembly of the "desense T".
  - a. Cut one resistor lead to 3/16" and cut the other to 1/2".
  - b. Insert a 3/16" resistor lead into the BNC jack and solder.
  - c. Screw the BNC jack flange to the UHF plug.
  - d. Solder the BNC jack flange to the UHF plug.
  - e. Solder the resistor lead to the UHF plug center pin.
  - f. Screw the above assembly into the UHF "Tee".

**WARNING:** If these steps are not followed precisely, the transceiver may be damaged.

4. Inject a signal at the repeater receive frequency with  $\pm 600$  Hz of the appropriate tone deviation. Ensure that the repeater keys up.
5. Disconnect injected signal and ensure that the repeater stays keyed-up for the designated hang up time.

#### 5.5.4 Desense Check

1. Connect the test equipment as shown in Figure 15.

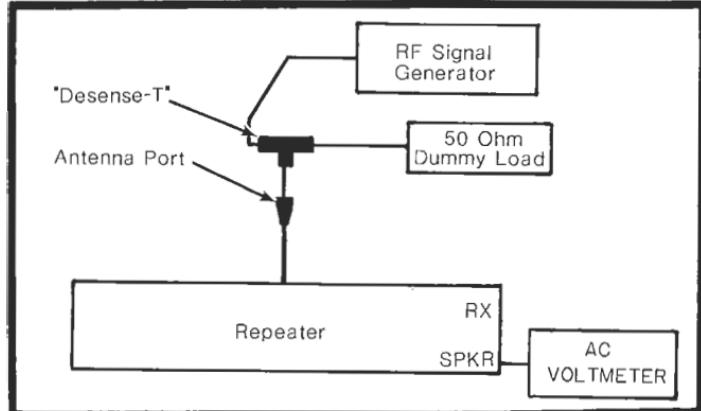

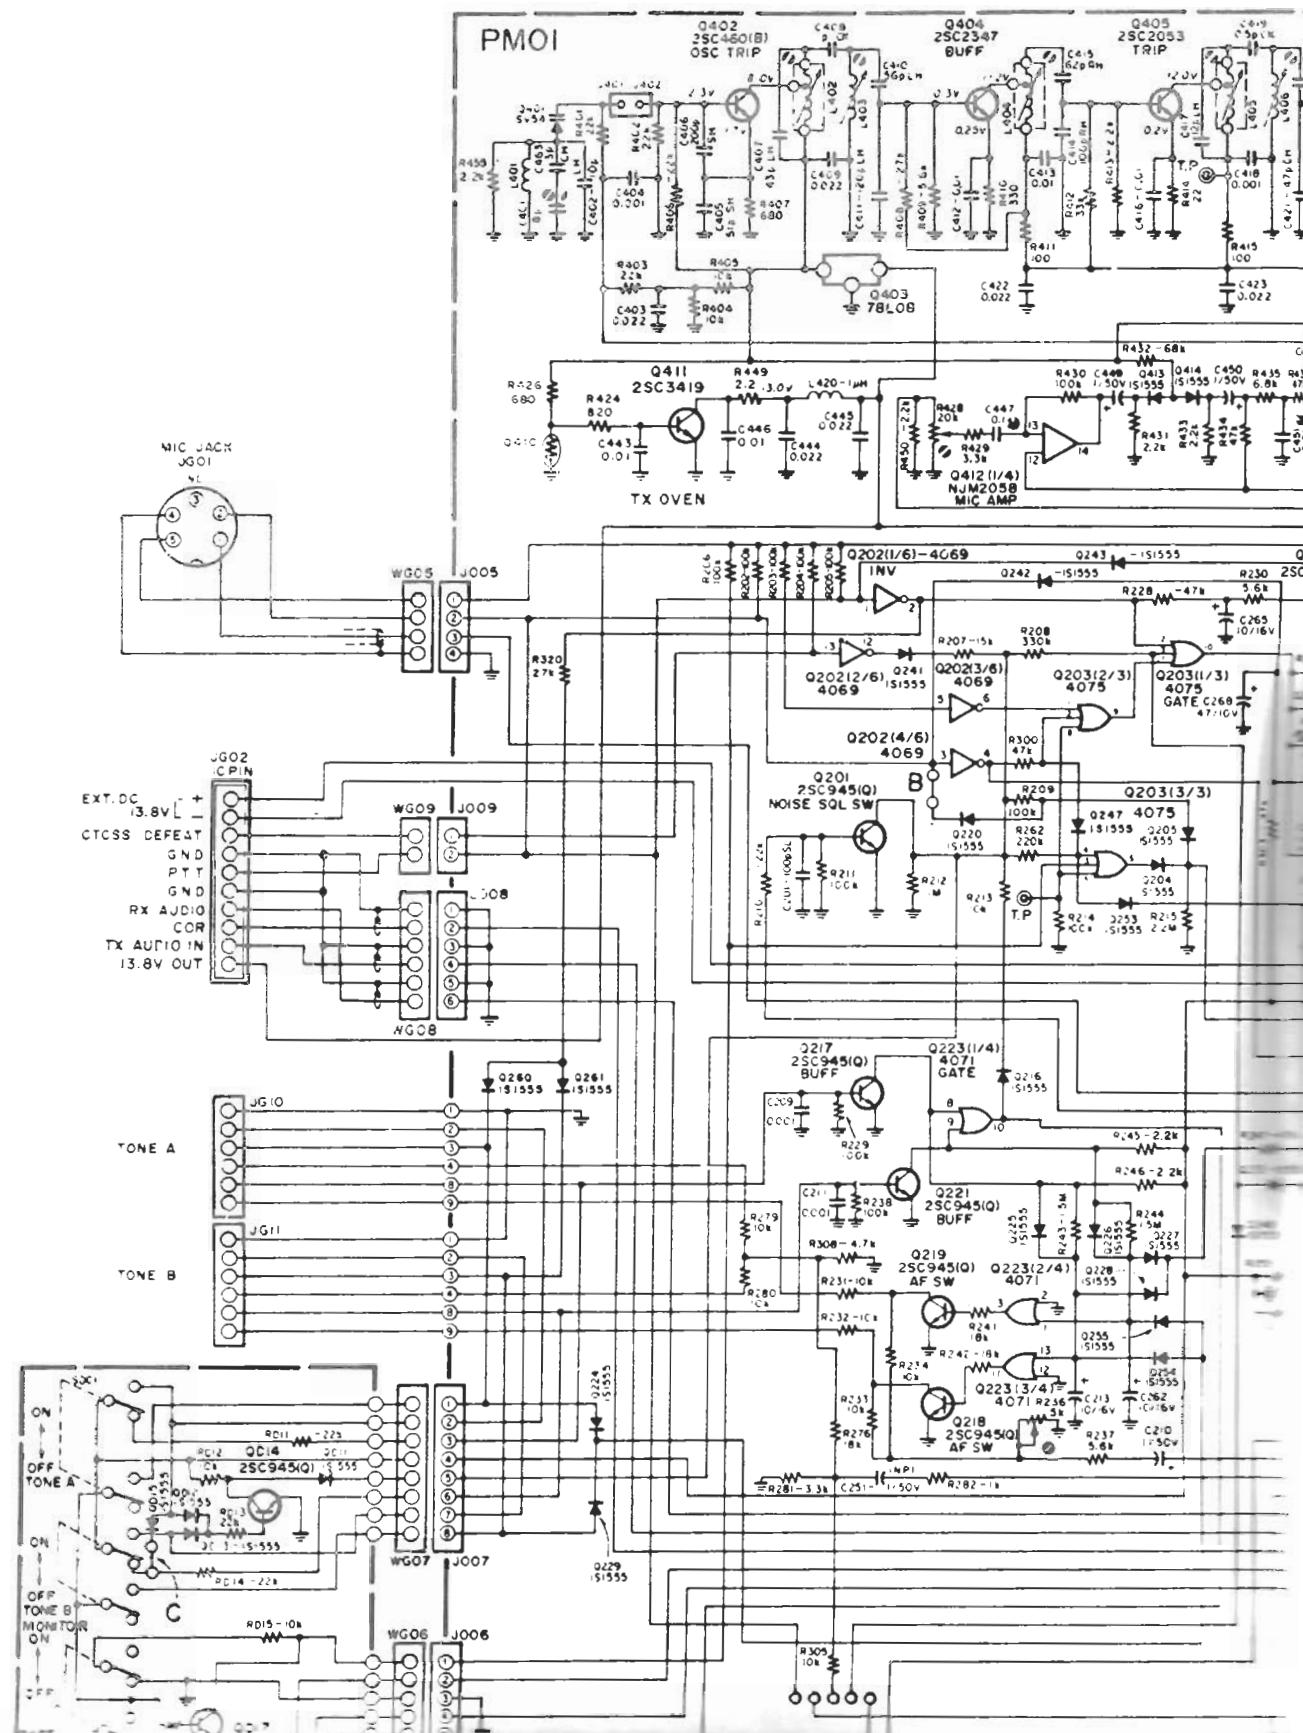

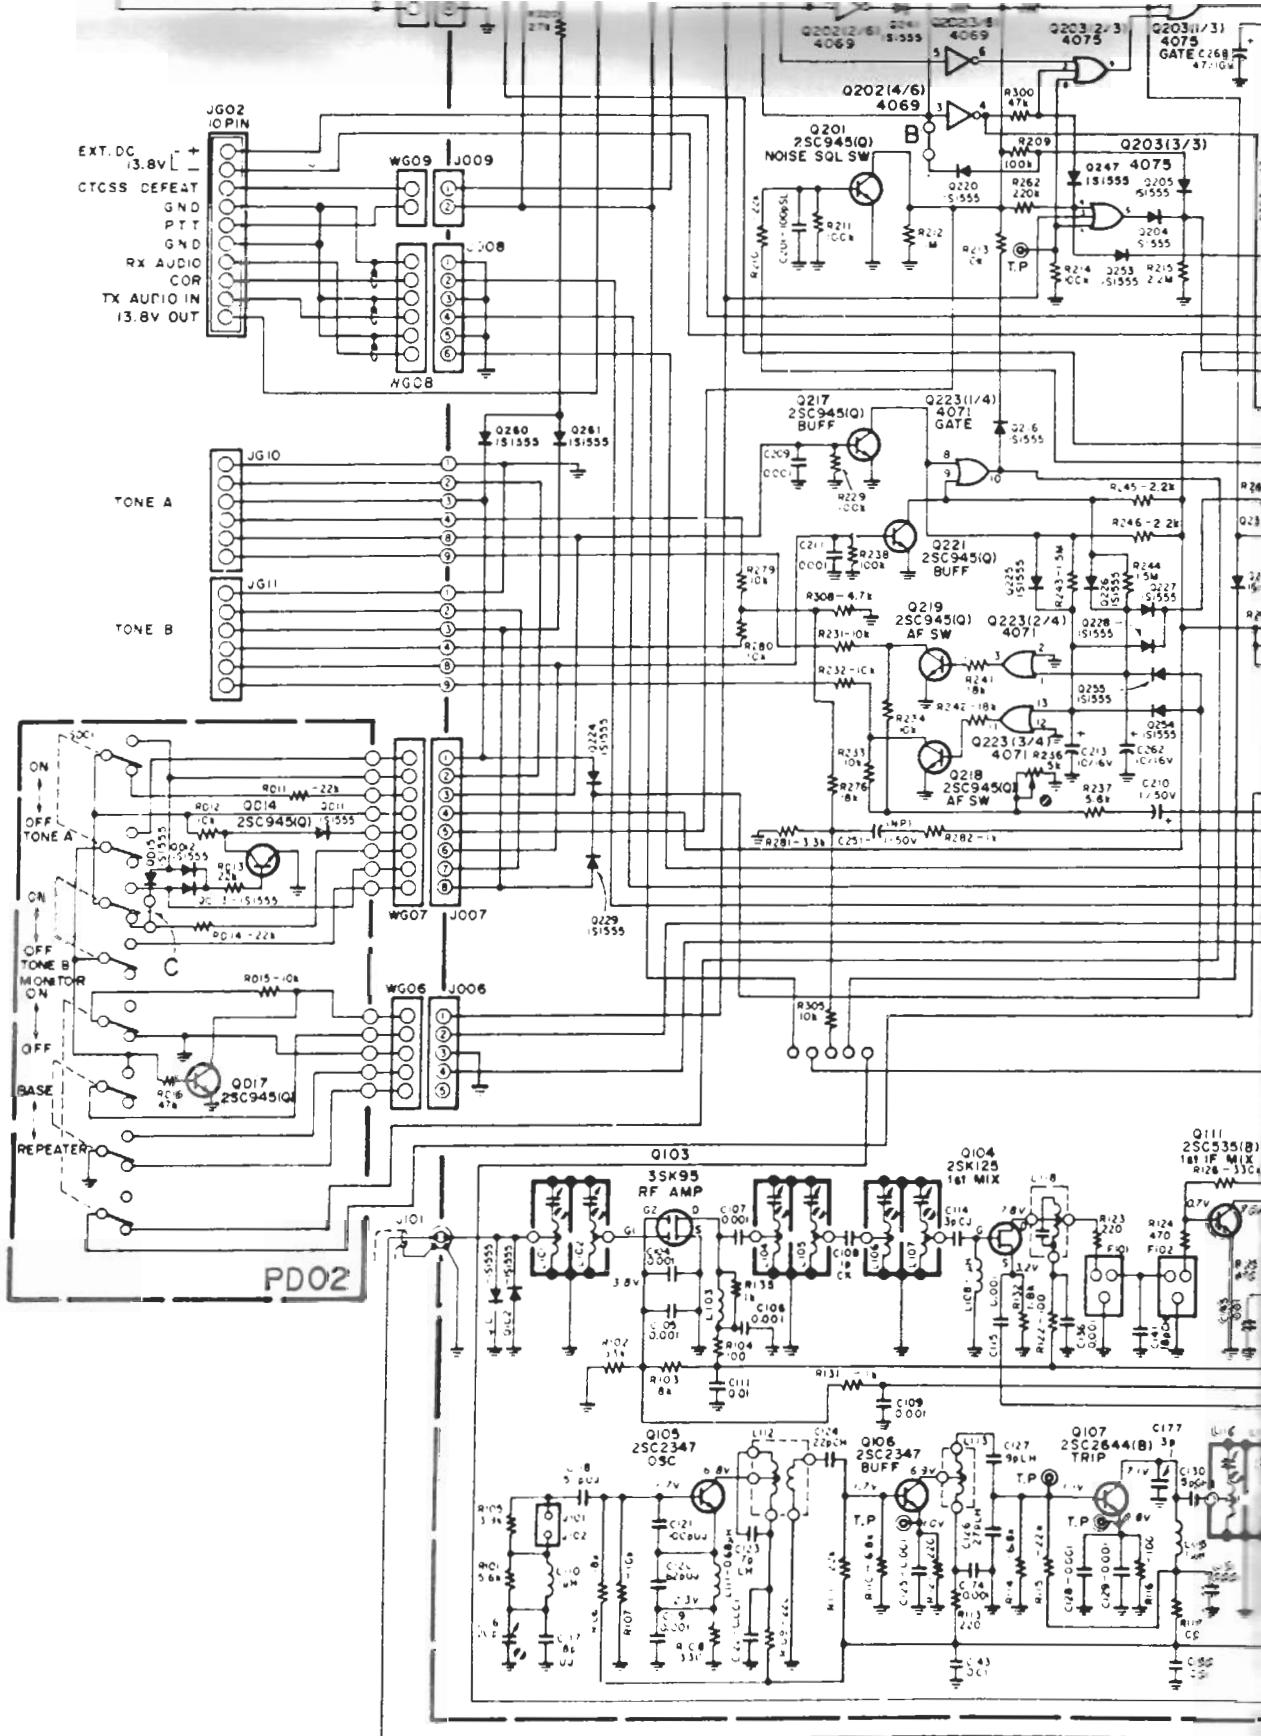

FIGURE 15. DESENSE TEST SETUP

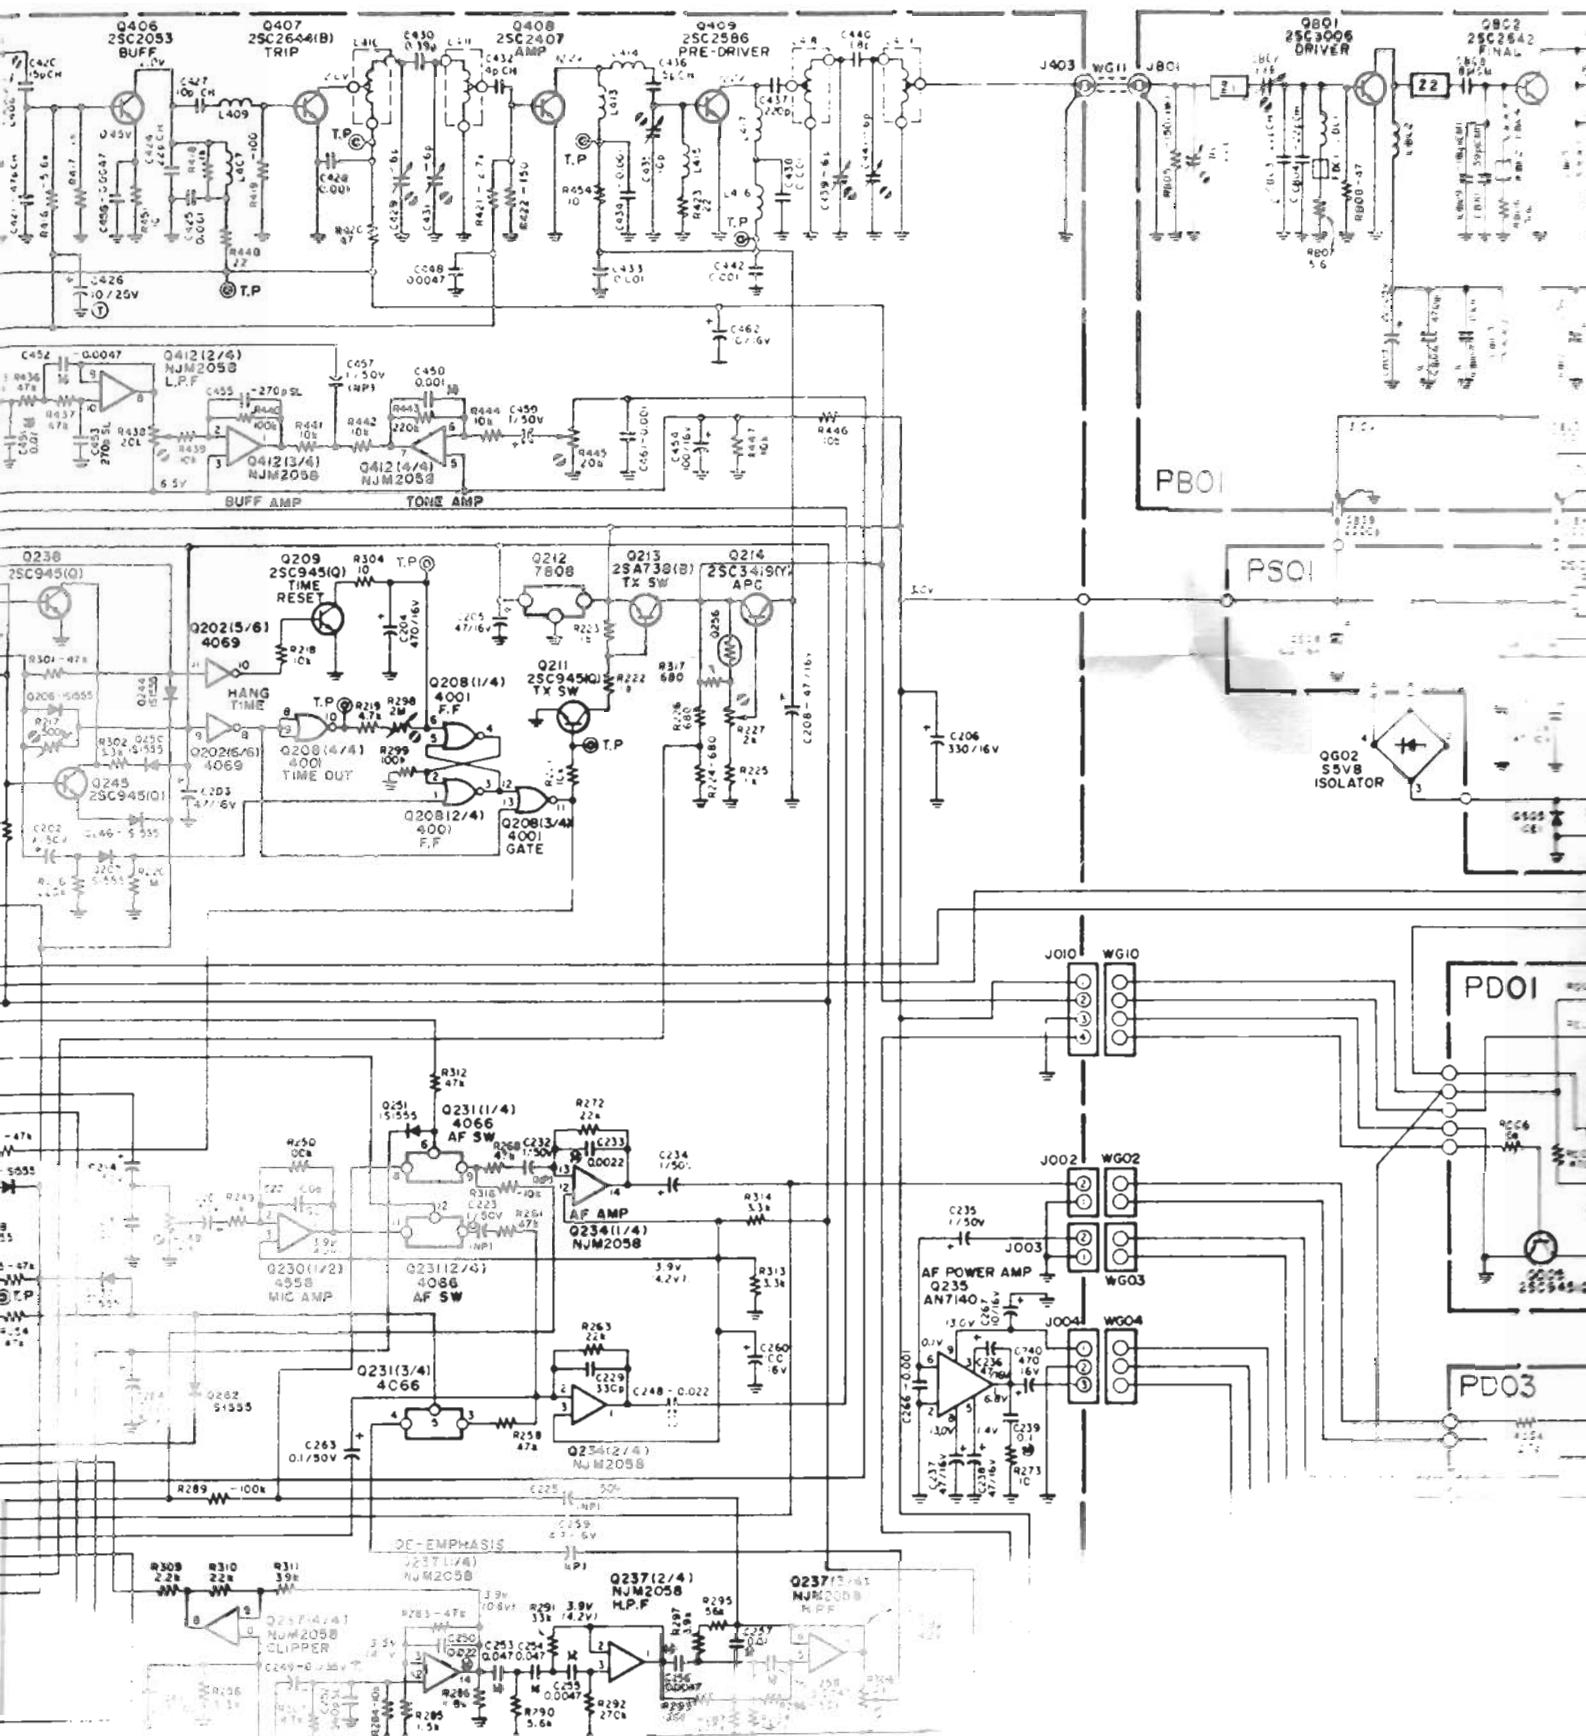

2. Set the Repeater/Base button to the base position.
3. Connect an AC voltmeter to the speaker.
4. Inject a sufficient signal to give 10 dB quieting. The volume control must be in the out position.
5. Set the Repeater/Base button to the Repeater position. Receive sensitivity should not drop more than 2 dB.

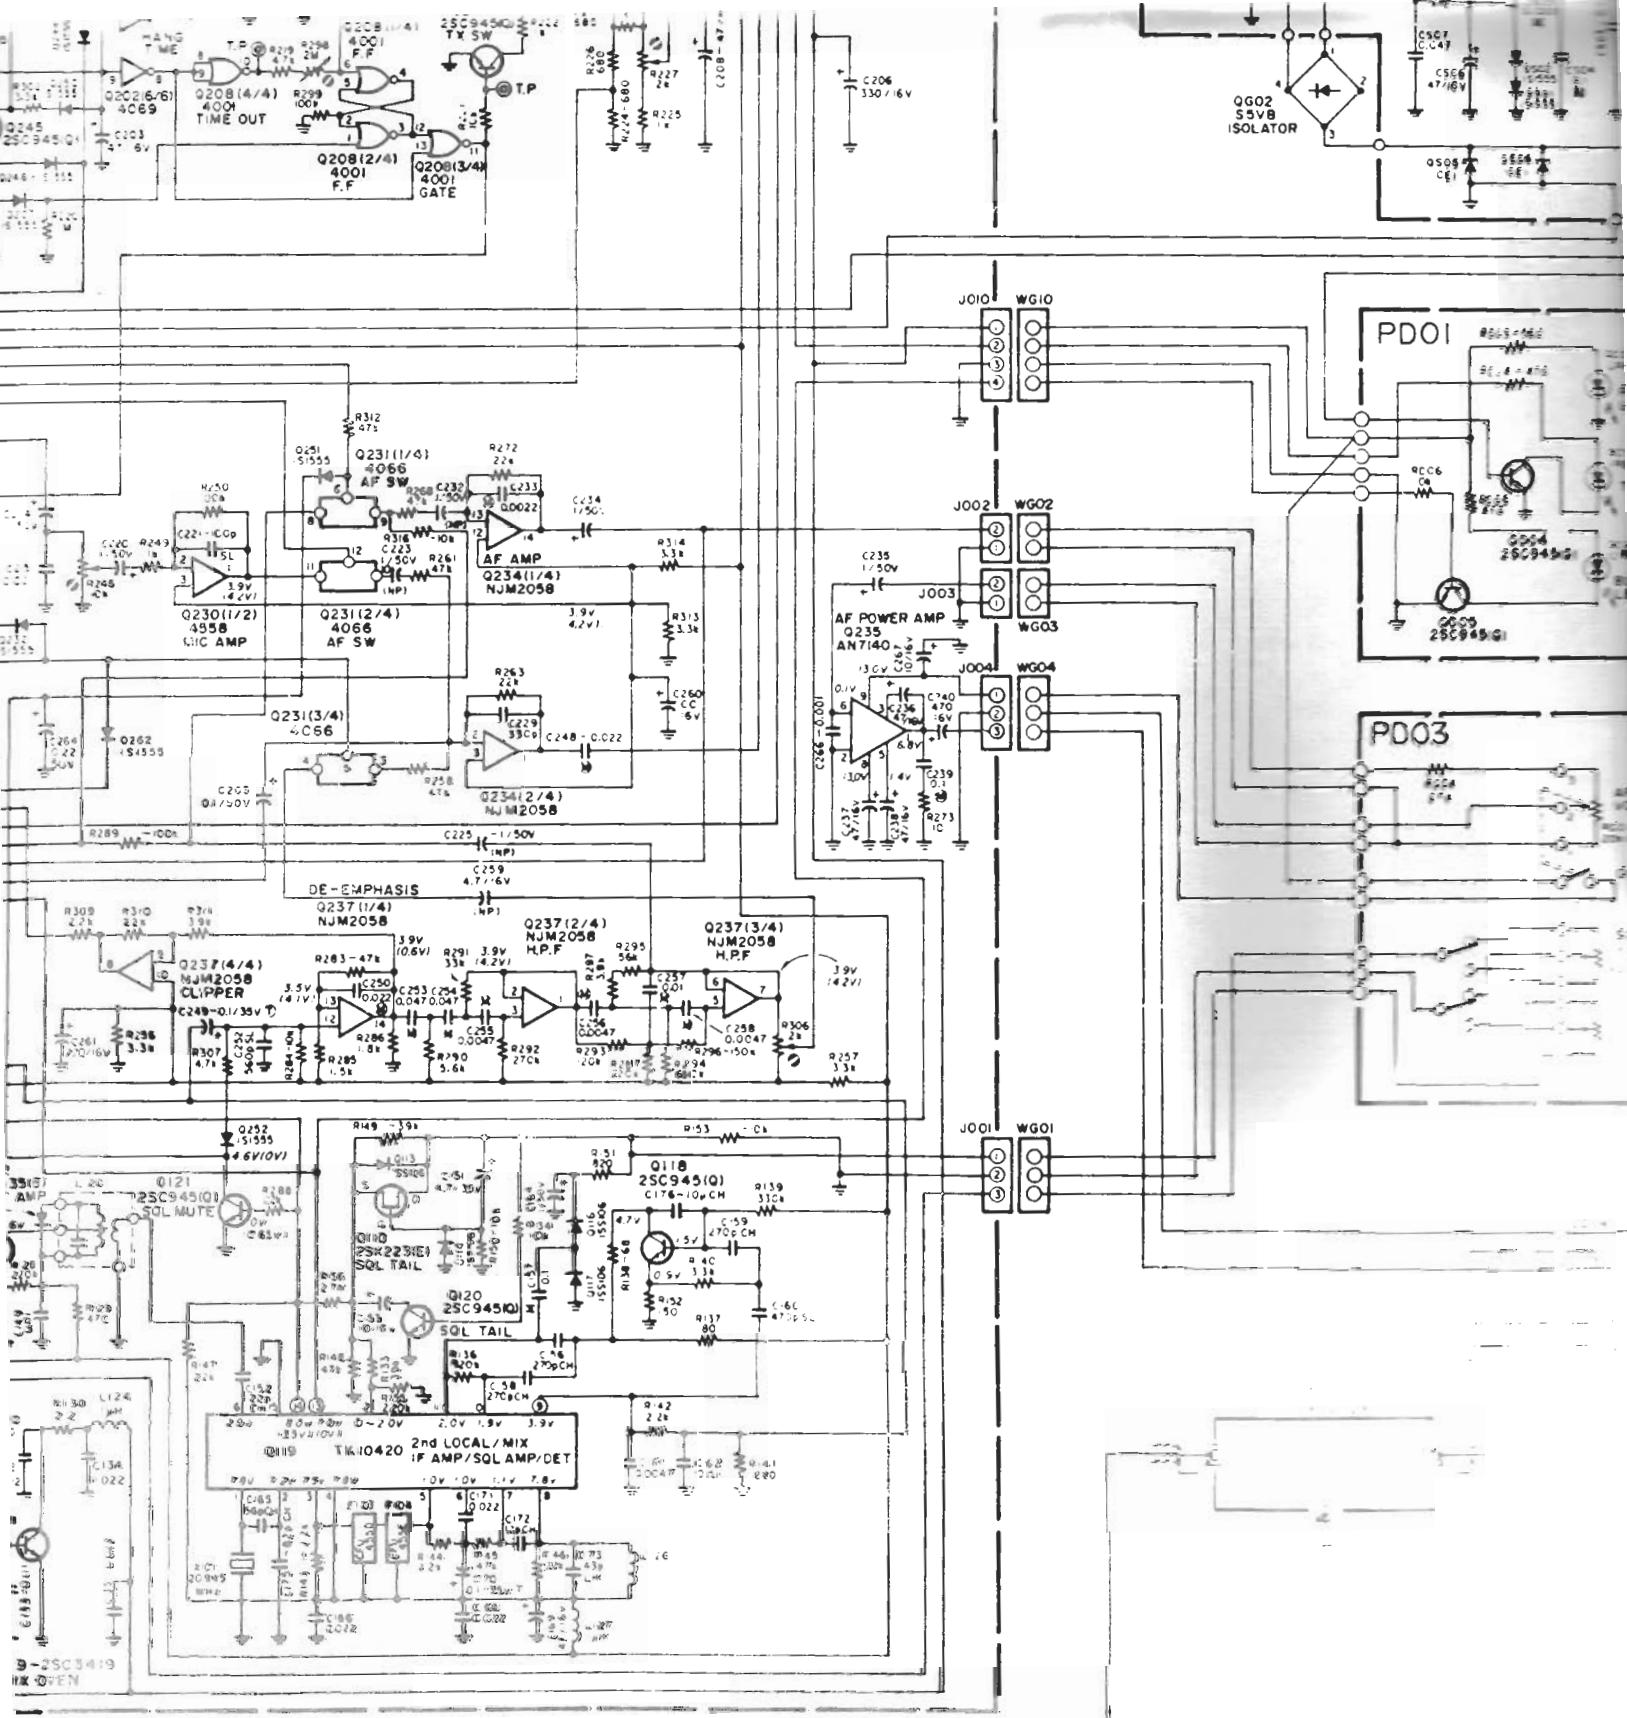

## 6.1 Drawings

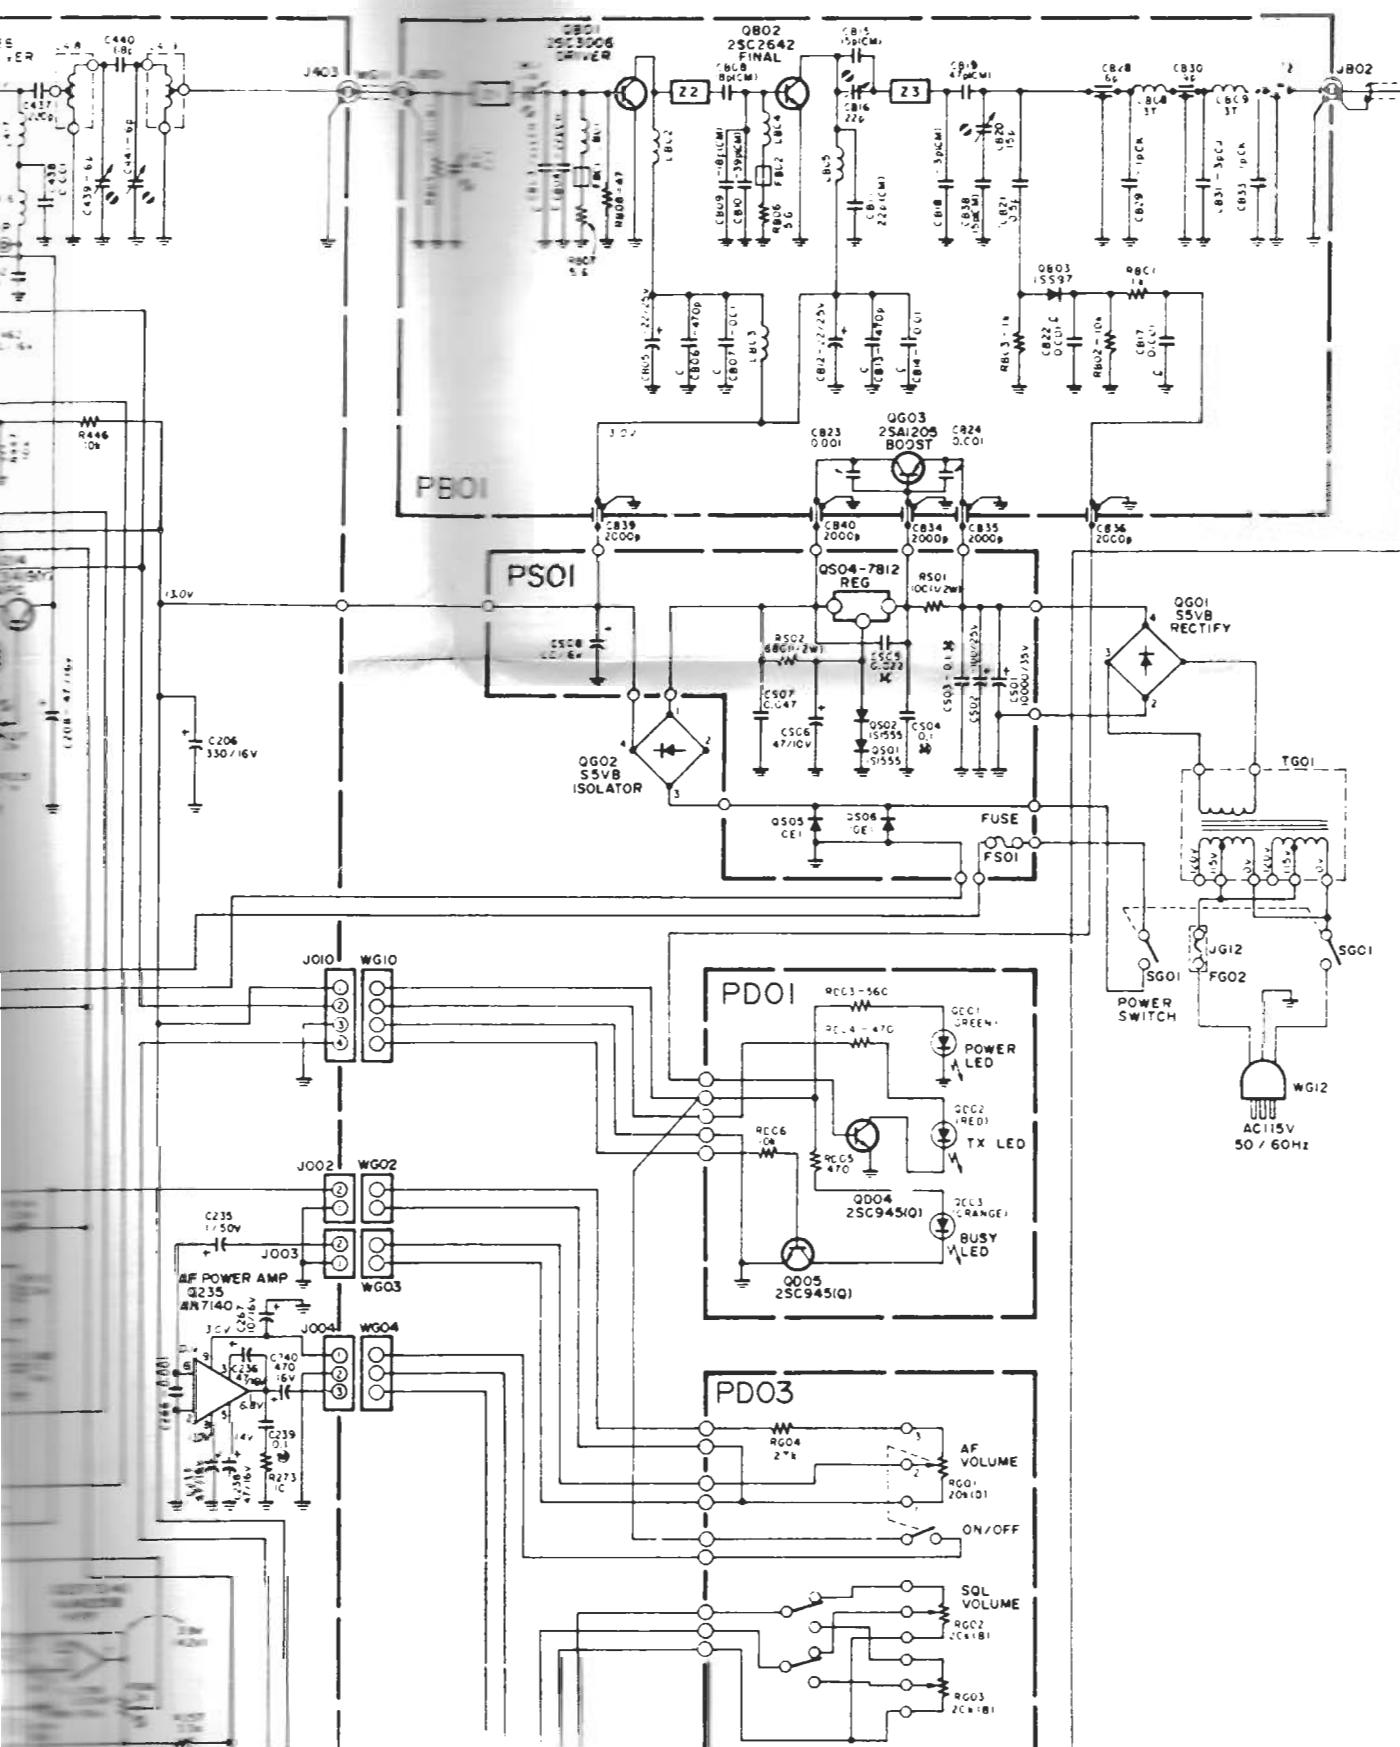

The drawings in this section show the electrical and mechanical parts locations and interconnections of the RP70U. The values of most electrical parts are indicated on the schematic diagrams.

## 6.2 Parts List

### 6.2.1 General

Information on most electrical and mechanical parts is included in the parts lists. The parts are listed by reference designators in alphanumeric order.

### 6.2.2 Ordering Replacement Parts

Crystal orders should be referred to the Frequency Management Department at (213)532-5300 ext. 251, or write:

Standard Communications Corp.  
Frequency Management Department  
P. O. Box 92151  
Los Angeles, CA 90009-2151

All other parts orders should be referred to the Parts Department at (213) 532-5300 ext. 248, or you may write to:

Standard Communications Corp.  
Parts Department  
P. O. Box 92151  
Los Angeles, CA 90009-2151

Please note that SCC may not be able to fill replacement parts orders without such identifying information as:

- reference designator
- value
- description
- part number
- unit model number
