PRODUCT SAFETY NOTICE

Many electrical and mechanical parts in this chassis have special safety characteristics. These characteristics often pass unnoticed and the protection afforded by them cannot necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. Replacement parts that have these special safety characteristics are identified in this manual and its supplements; electrical components having such features are identified by \triangle in the schematic diagram and the parts list.

Before replacing any of these components, read the parts list in this manual carefully. The use of substitute replacement parts that do not have the same safety characteristics as specified in the parts list may create shock, fire, or other hazards.

BLOCK DIAGRAM

PRINCIPLES OF OPERATION

The PRO-2035 is a PLL (Phase-Locked Loop) synthesized VHF/UHF, FM/AM receiver, controlled by a CPU (Central Processing Unit) via a keyboard.

The receiving mode and search step are initially set to correspond with the frequencies entered. When a frequency within the FM broadcast band is keyed in, the receiving mode is set to wideband FM (WFM). When a frequency in the active radio band, such as police, fire, and ham radio, is keyed in, the mode is set to narrowband FM (NFM), and when a frequency in the aircraft and CB band is keyed in, it sets to AM mode. Also, the receiving mode and frequency step can be changed by the MODE and STEP keys.

All functions, such as the receiving frequency range, frequency determination, scanning, and delay time, are controlled by the CPU. The CPU is able to do only the assigned functions and no modification of the CPU is feasible.

The following paragraphs explain the operation of the circuit in terms of the functional blocks:

The RF input circuit consists of bandpass filters (BPF). A signal generated by VCO1, VCO2, or VCO3 is applied to the double balanced mixer (DBM) and mixed with the RF signal. The DBM is employed to facilitate 25 MHz to 1300 MHz mixing.

The 1st IF (Q7 and Q8) is 609.005-613.5 MHz, and the signal is mixed with the VCO4 frequency at the 2nd mixer (Q9) to produce a 48.5 MHz signal, which is applied to the 2nd WFM IF (Q11) or 2nd NFM/AM IF (Q15, Q16). Corresponding with input from the keyboard, the CPU selects VCO1, VCO2, or VCO3 and determines the WFM/NFM/AM data of the PLL circuit that will function; then it outputs the necessary data.

A signal entered to NFM/AM IF is mixed with crystal oscillation frequency 48.045 MHz at the 3rd mixer (IC2) and converted to a 455 kHz signal. A signal entered to WFM IF is mixed with crystal oscillation frequency 37.8 MHz at the 3rd mixer (Q13) and converted to a 10.7 MHz signal. The signal is further amplified to be detected as an AF signal.

The AF signals of WFM, NFM, and AM are controlled by the CPU and applied to the AF power amplifier (IC7) via the switching circuit. The squelch signal is comprised of noise produced from WFM/NFM detector output, and amplified by IC2 to the switching signal, which controls AF mute and the CPU.

Any unstable supply voltage to the CPU can produce a CPU malfunction, such as wrong data processing, wrong data transfer, etc. To overcome this, the CPU can be initialized when necessary. Initialization is done when you press the RESTART switch. Figure A shows the initializing waveform.

CX501 (8 MHz) is a clock which is used for CPU control. Figure B shows the clock waveform at IC501 pin 39.

The CPU output data displays the frequency and function on the LCD. The LCD is back-lighted with nine LEDs.

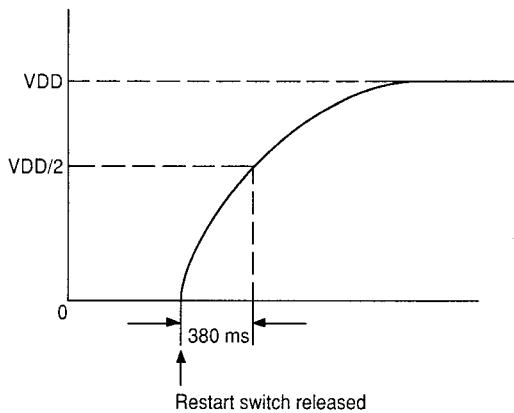

Figure A

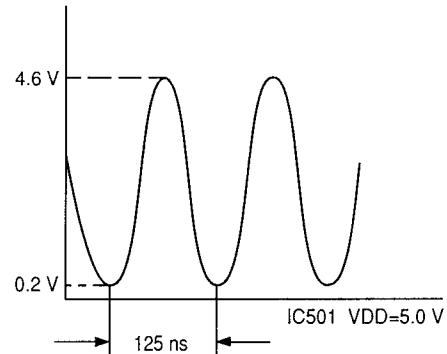

Figure B

Refer to Figures C,D, and E as you read the following.

Pulse A advances against Pulse B when the tuning knob turns clockwise; the opposite takes place when the tuning knob turns counterclockwise.

The CPU checks the status of Pulse B at the falling edge of Pulse A and judges the direction of the tuning knob rotation. If Pulse B is high, the knob is turned clockwise for higher frequency; if it is low, the knob is turned counterclockwise for lower frequency.

The CPU also counts the number of pulses to determine the magnitude of the frequency/channel change. One pulse represents one notch rotation of the tuning knob.

Note: The width of the pulse is irrelevant to the operation. It only shows how fast the knob is turned.

RECEPTION CHECK

MEMORY CHECK

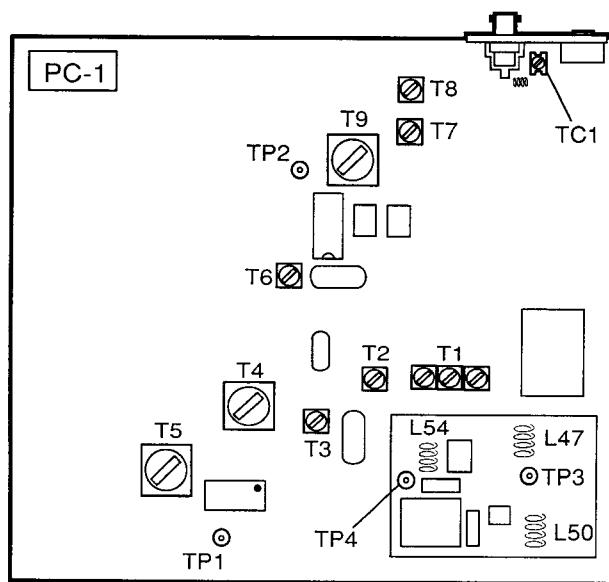

Notes:

- Prior to checking the CPU system, measure the supply voltage to the ICs. (See the schematic diagram.)
- While checking the following items, the ICs can "latch up." If this happens, push the restart switch for about one second and then continue checking. Be sure that power is present when doing this check.

ALIGNMENT AND ADJUSTMENT

ALIGNMENT AND TEST POINTS

ALIGNMENT PREPARATION

Test Equipment Required

- Oscilloscope
- AC SSVM
- DC SSVM
- 8-ohm dummy load

Notes:

- Use non-metallic tuning tools.
- The test equipment and receiver should be warmed up for at least 10 minutes before proceeding with alignment.
- The signal level from the generator should be kept as low as possible to obtain a usable output.

Channels 1 through 8 are as follows:

Channel	Frequency (MHz) and Mode	Channel	Frequency (MHz) and Mode
1	473.500 (NFM)	5	520.000 (WFM)

OFF/VOLUME control: ON. SQUELCH control: CCW. Select channels 2, 3, and 4.	Connect DC SSVM to TP3. See Figure 2 on Page 14.	L47 L50	<ol style="list-style-type: none"> Select channel 2 and adjust L47 for 20 volts on the DC SSVM. See Table 2. Select channel 3 and be sure the DC SSVM reads 9-13 volts (no adjustments are necessary for the coil). Select channel 4 and adjust L50 for 22 volts on the DC SSVM. Repeat above 1 to 3 until no further improvement is observed. See Table 2.

How to Adjust Coils L47, L50, and L54

Each of the coils should be adjusted by changing the pitch of the coil little by little by carefully using a non-metallic tuning tool as shown in Figure 3.

Increase the pitch of the coil when the measured voltage at TP3 or TP4 is higher than the voltage specified in the result column for "PLL2 VCO Alignment" and "PLL1 VCO Alignment."

Decrease the pitch of the coil when the measured voltage at TP3 or TP4 is lower than the voltage specified in the result column for "PLL2 VCO Alignment" and "PLL1 VCO Alignment."

Notes:

Be very careful when doing coil pitch adjustment because it greatly affects the frequency.

Secure the coil with glue after alignment. Be sure the glue is dry and the coil is secured. Also, be sure that the environmental temperature is normal. Then, repeat VCO (PLL2 and PLL1) alignments above.
