FTV-707

VHF/UHF TRANSVERTER

GENERAL

The FTV-707 is a mono-band transverter for the FT-707 series. The basic unit comes equipped with complete control circuitry and any of three bands (50 MHz, 144 MHz or 430 MHz) may be installed.

For satellite operators, three satellite bands are provided, allowing full duplex operation through the transceiver, using an external receiver in addition to the FTV-707. The operator may transmit on 145 MHz while listening on 29 MHz or 435 MHz, or transmit on 435 MHz while listening on 145 MHz.

The FTV-707 includes repeater splits on all repeater bands within its operating range, for operation with the many SSB repeaters that are emerging on the market. Fully solid state, the FTV-707 provides protection for the final amplifier transistors against damage caused by high SWR antenna connections.

The owner is urged to read this manual in its entirety, so as to become better acquainted with the exciting new FTV-707. With proper care in operation, this equipment will provide many years of trouble-free operation.

SPECIFICATIONS

TRANSMITTER:

Input frequency:
28 MHz to 30 MHz

Input level:
0.22 volts (rms) max.

Input impedance:
50 ohms

Power input:
20 watts DC (SSB, CW)
5 watts DC (AM)

Transmit frequency range:
50 MHz to 54 MHz*
144 MHz to 148 MHz*
430 MHz to 440 MHz*

Output impedance:
50 ohms

Spurious radiation:
Better than 60 dB down

RECEIVER:

Receiver frequency range:
50 MHz to 54 MHz*
144 MHz to 148 MHz*
430 MHz to 440 MHz*

Antenna input impedance:
50 ohms

Sensitivity:
0.25 μ V for S/N 10 dB (SSB, CW)**
1.0 μ V for S/N 10 dB (AM)**

Output frequency range:
28 MHz to 30 MHz

Output impedance:
50 ohms

POWER SUPPLY:

Power requirement:
13.5V \pm 10% Negative ground

Current consumption:
3.5 amps

GENERAL:

Size:
238 (W) x 55 (H) x 236 (D) mm

Weight:
2 kg.

* 50, 144, 430 MHz units optional.
** When used with FT-707.

ACCESSORIES

The following accessories are included with your FTV-707:

Cable "A"	(T9100071A)	1 pc.
Cable "B"	(T9100160A)	1 pc.
Speaker cord	(T9101272)	1 pc.
Screw	(U00310001)	2 pcs.
Spacer	(R6052652)	1 pc.
Spare Fuse 5A	(Q0000005)	1 pc.

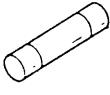

SCREW FOR CONVERTER UNIT FIX

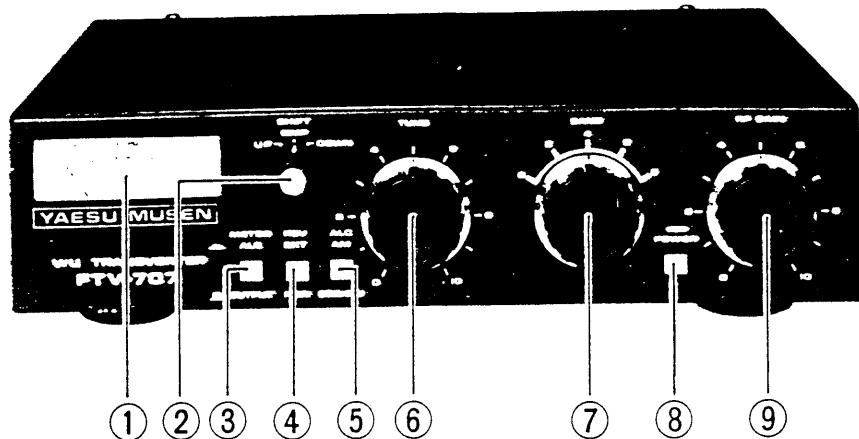

SPACER

Use for 430MHz UNIT

FUSE

FRONT PANEL CONTROLS AND SWITCHES

(1) METER

Depending on the position of the METER switch, the front panel meter will display either the ALC or output relative power level.

(2) SHIFT

This switch selects the UP/DOWN repeater shift or simplex operation.

(3) METER (SWITCH)

This switch selects indication of either the relative output power or the ALC level on the front panel meter.

(4) RCV

This switch allows selection of the receive operation using the FT-707 transceiver (NOR) or an external receiver (EXT) for satellite work, etc.

(5) ALC

This switch selects ALC for SSB/CW or AM. Select this switch according to your operation mode.

(6) TUNE

For 50 or 144 MHz operation, this control peaks the transmit and receive circuits for maximum performance. On 430 MHz, the tuned circuits of the transverter are preset, and no further tuning is required.

(7) BAND

For 6 or 2 meter operation, two bands are provided. These bands allow a coverage of 4 MHz, in conjunction with the four 500 kHz ranges of the FT-707 10 meter band. For 430 MHz operation, 5 bands are provided, allowing operation on the 10 MHz range of 430 – 440 MHz.

(8) POWER

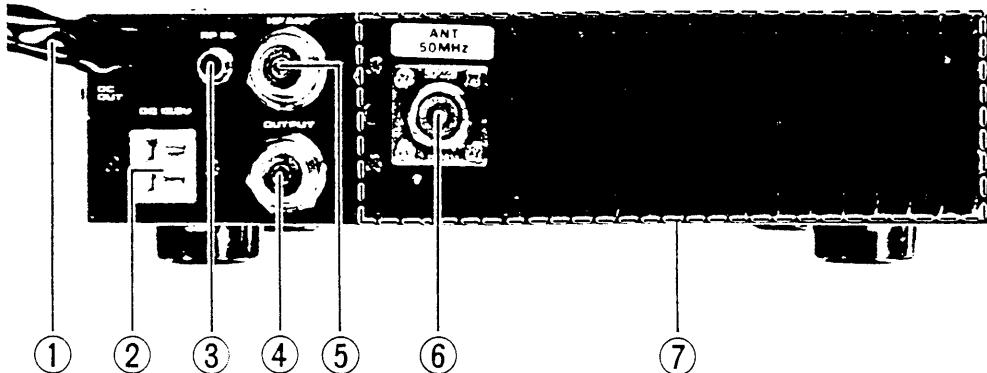

This is the main power ON/OFF switch. When the switch is set to OFF, the HF antenna is automatically fed through the transceiver.

(9) RF GAIN

For 50 or 144 MHz operation, this control varies the gain of the RF amplifier stage.

On 430 MHz, this control has no effect as the RF amplifier is always set for maximum gain.

REAR APRON

(1) DC OUT

This lead provides DC voltage to the FT-707 transceiver. When the FTV-707 is switched off, the DC voltage is automatically fed to the final stage of the FT-707.

(2) DC 13.5V

This is the power jack of the FTV-707. Connect the plug of the FP-707 DC power supply at this point.

(3) RF IN

This RCA jack is for connection to the FT-707 RF OUT jack. Use the supplied "Cable A" for this connection.

(4) OUTPUT

This jack should be connected to the FT-707 ANT jack, providing converted receive signals to the transceiver. When the FTV-707 is off, the HF ANT is connected through this jack to the FT-707. For this connection, use the supplied "Cable B".

(5) HF ANT

Connect your HF antenna to this jack. When using a linear amplifier for the HF bands, connect a coaxial cable between this jack and the amplifier RF input jack. The switching circuit is not designed to handle the high power output from an amplifier.

(6) ANT JACK

Connect your VHF or UHF antenna, matched to your operation band, to this jack. For 144 and 50 MHz units, a PL-259 plug is suitable for this jack. For 430 MHz units, a "Type N" plug may be used.

(7) 50/144/430 UNIT (Option)

This rack is for installation of the 50, 144 or 430 MHz unit, depending on your desired band.

INSTALLATION

INSTALLATION

Open the packing carton carefully and save the packing material for possible use at a later date. Inspect the FTV-707 for any signs of damage that may have occurred during shipment. If there is any visible damage, contact the shipping company immediately, and document the damage thoroughly.

Refer to the drawings for details of the proper interconnection procedure for the FTV-707 and your station equipment. Note that the input impedance for the FTV-707 is 50 ohms, and the maximum permissible input level is 0.22 V RMS. Therefore, if you are using a transceiver other than the FT-707, be certain not to exceed these specifications.

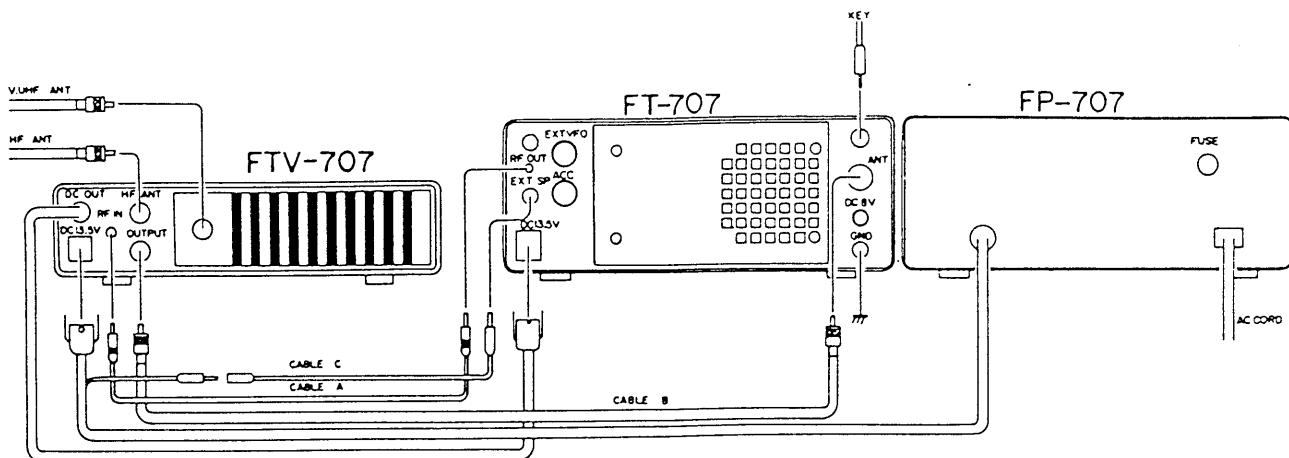

The transceiver may be installed in any position without loss of performance. The only constraints regarding installation involve air circulation: the transceiver should be located where there is free passage of air around the cabinet and heat sink.

ANTENNA CONSIDERATIONS

The antenna installation is of critical importance in VHF and UHF bands. Furthermore, the power loss at the coaxial cable is markably higher than that of the HF bands. To minimize loss, use the shortest length possible of low-transmission-loss cable, so that the maximum performance of the FTV-707 will be obtained.

In most cases, coverage is a function of antenna height. The antenna for base station operation should be located as high and in the clear as possible. For operation a long distance away, a gain antenna such as Yagi or other high gain directional array may be required. If you contact your nearest Yaesu dealer, he will be happy to recommend the most suitable antenna for your requirements.

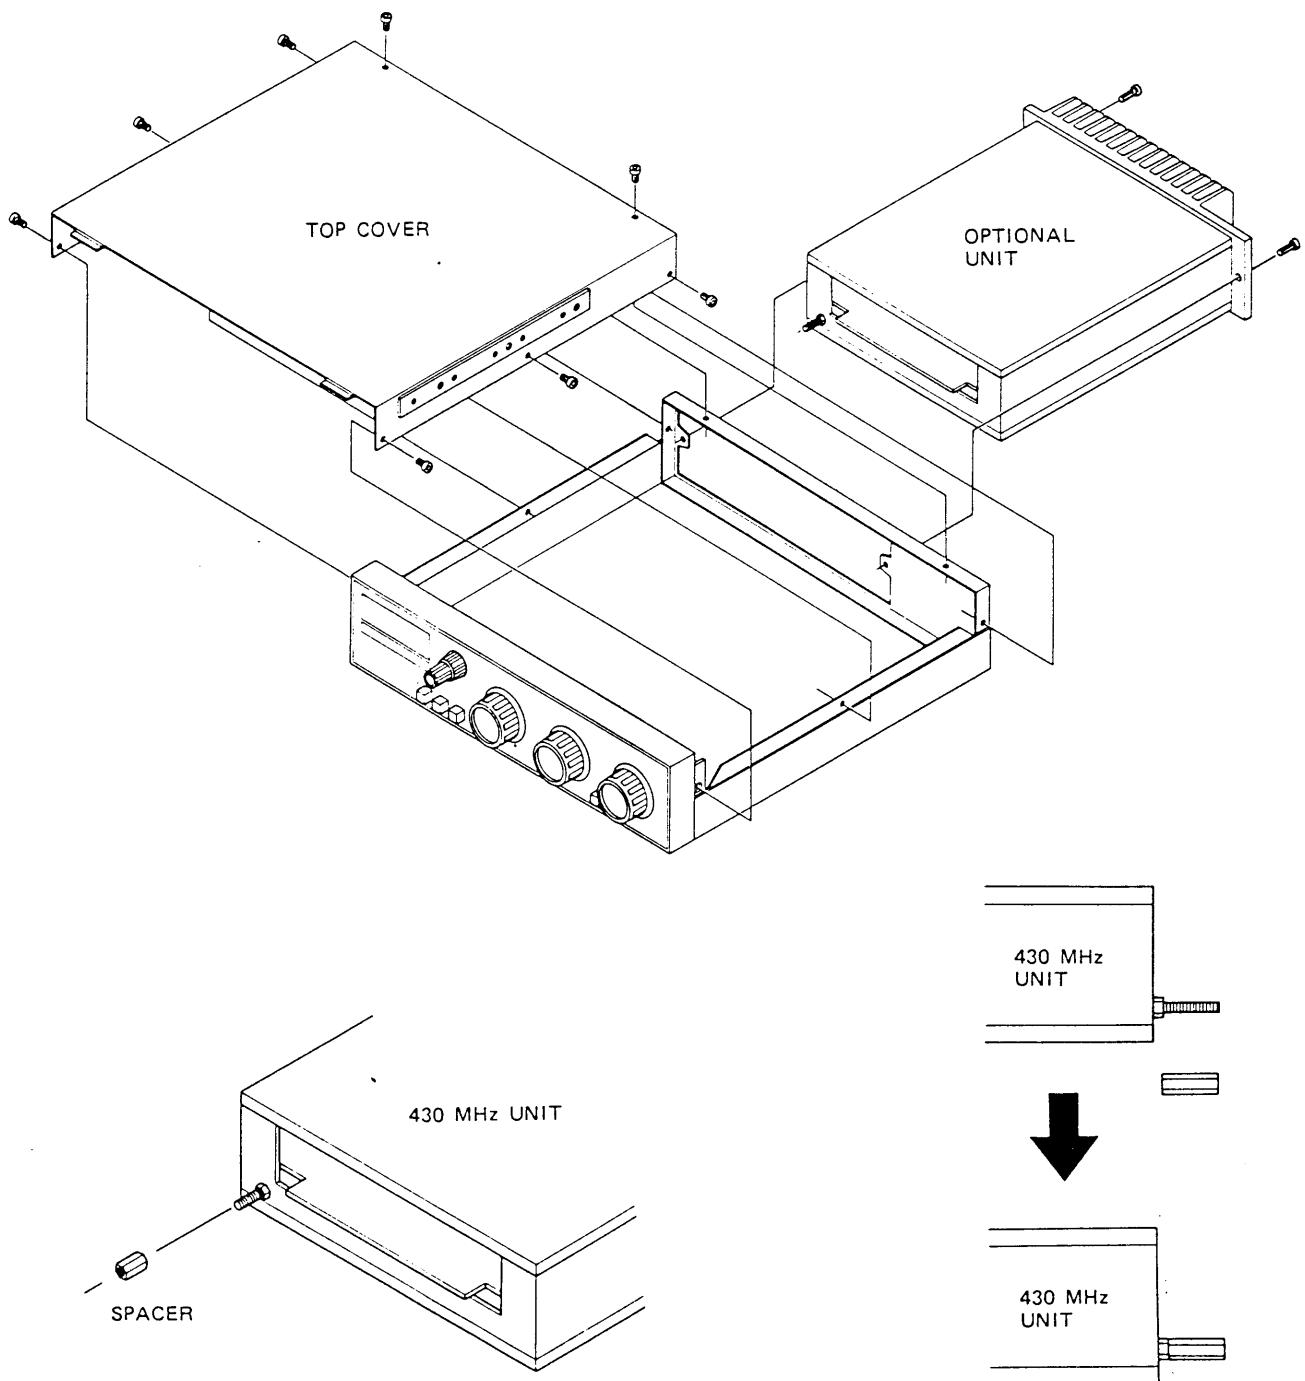

INTERCONNECTIONS

For Service Manuals

Fax (01844) 352554
email:- sales@mauritron.co.uk

INSTALLATION OF OPTIONAL MODULES

1. Remove the top cover of the transverter to allow precise installation.
2. Carefully slide the module into the correct position. Do not force the connection. For the 430 MHz unit, install a spacer into the screw at the rear of the 430 MHz unit, as shown below, and then install the unit into the rack.
3. Replace the cabinet cover. Installation is now complete.

OPERATION

The tuning procedure for the FTV-707 is not complicated. However, care should be observed in operation, so as not to exceed the ratings of the transverter and the HF transceiver. It is assumed that the proper interconnections have been performed, as described on page 6.

The reader should note that the plug-in units are optional on the standard FTV-707. The word “option” will hereafter be omitted in the interest of brevity.

INITIAL CHECK

Before turning the FTV-707 and FT-707 on, check all switches for normal, smooth action. Recheck the interconnections between the HF equipment, the antenna system, and the transverter.

FREQUENCY SELECTION

The operating frequency is determined by the position of the main tuning dial and bandswitch of the transceiver, as well as the position of the transverter bandswitch. Please refer to the frequency chart below.

For example, with the FT-707 bandswitch set to 10A, and the FTV-707 bandswitch set to “4”, operation will take place on 144.0–144.5 MHz. By setting the FT-707 main tuning dial to 28.250 MHz, operation will take place on 144.250 MHz.

FREQUENCY COVERAGE CHART

FT-707 BANDSWITCH		10A	10B	10C	10D

	4	434–436	434.0–434.5	434.5–435.0	435.0–435.5	435.5–436.0	
	6	436–438	436.0–436.5	436.5–437.0	437.0–437.5	437.5–438.0	
	8	438–440	438.0–438.5	438.5–439.0	439.0–439.5	439.5–440.0	... Down shift available

NORMAL TUNE UP

- (1) Set the FTV-707 SHIFT switch to SIMP, the RCV switch to NOR, the METER switch to ALC, the ALC switch to SSB/CW, and the BAND switch to the desired band. Set up the FT-707 for operation on the section of the 10 meter band appropriate for the VHF or UHF frequency to be worked.
- (2) Set the FTV-707 POWER switch to ON.
- (3) Set the transceiver CAR control fully counter-clockwise, and close the PTT switch. For 50 or 144 MHz operation, apply a key-down signal, and advance the transceiver CAR control until the ALC meter needle reaches the right-hand side of the ALC scale (the ALC scale is the lowermost range on the meter). Now set the FTV-707 METER switch to OUTPUT, and rotate the TUNE control for maximum power output as indicated on the transverter meter.
- (4) For 430 MHz operation, there is no peaking procedure for the transverter. The only adjustment that must be made is to set the input level to the transverter. As with 50 or 144 MHz operation, the drive level should be adjusted so that the meter needle rests within the ALC scale on the meter.
- (5) For CW operation, set the ALC switch to SSB/CW. Do not advance the CAR control of the FT-707 so that the ALC meter needle goes beyond the ALC scale on the meter.
- (6) For SSB operation, adjust the FT-707 MIC GAIN so that the meter needle stays within the ALC meter scale on voice peaks.
- (7) For AM operation, set the ALC switch to AM. Set the METER switch to OUTPUT, and advance the FT-707 CAR control until the meter needle reaches .3 on the output scale. Now advance the transceiver MIC GAIN control until the output meter just begins to move on voice peaks.

- (8) Advancement of the drive level beyond that stated above will not increase the power output. However, component life will be shortened drastically if these input levels are exceeded.
- (9) For 50 or 144 MHz operation, rotation of the FTV-707 RF GAIN control will provide adjustment of the receive converter gain level. For 430 MHz operation, this control has no effect, as the converter is always set for maximum gain.

REPEATER OPERATION

For operation on SSB repeaters, standard repeater shifts are provided on the FTV-707. Alternatively, when using a transceiver equipped for FM operation, FM repeater operation is possible. Note that the FT-902DM/FT-101ZD transceivers may not be used directly with the FTV-707, because the RF OUT jack on the FT-902DM/FT-101ZD is connected to the control grid of the final amplifier tubes, thus presenting a high impedance at the RF OUT jack. The FTV-707 requires a 50 ohm input from the transceiver.

For 50 MHz, repeater splits of -1 MHz are provided, while on 144 MHz, splits of ± 600 kHz are provided. For 70 cm, 1.6 MHz down shift will occur on the 434.6–434.825 MHz European band, or 7.6 MHz down shift can be provided on the 438.6–439.05 MHz European band (note that only one shift capability can be installed in the FTV-707). The 70 cm repeater shift crystal is an option, available from your Yaesu dealer. The 6 and 2 meter crystals are included with all plug-in units for those bands.

SATELLITE OPERATION

Operation on the amateur satellites is possible, using an external receiver in addition to the FT-707 transceiver. The FT-707 provides the transmit signal, while the external receiver monitors the downlink, on full duplex.

For OSCAR Mode A, transmission takes place on 145.850–145.950 MHz, with reception on 29.400–29.500 MHz. Set the FTV-707 BAND switch to the 4 position, and set the FT-707 BAND switch to 10D. Tune the transceiver between 29.850 and 28.950 MHz for uplink transmission, and tune the external receiver to 29.4–29.5 MHz for downlink monitoring.

Please note that, because of Doppler effect and other reasons, the frequency translation may not be precisely linear, as might be inferred from the above discussion. Some precise zeroing using the external receiver may be necessary. The full duplex feature of the FT-707 makes this a simple matter.

AUXILIARY REPEATER SPLIT INFORMATION

Should you require a repeater split other than the standard ones included with your FTV-707, you may install an optional crystal to cover the desired split. See your Yaesu dealer for details.

To align the split frequency, set the RPT split to DWN, and couple a frequency counter lightly to the transmission line (a one-turn loop is usually sufficient). Close the PTT switch, and adjust the trimmer capacitor for the crystal for exactly the correct transmit frequency. Alternatively, the frequency counter may be connected to the LOCAL OUT terminal of the board under test, and the local oscillator frequency may then be read on the counter. The local oscillator chart shown on page 11 will show you how to calculate the frequency.

CIRCUIT DESCRIPTION

The circuit description to follow should help you understand the operation of the FTV-707 transverter. Follow the block diagrams while reading this discussion, and refer to the schematic diagram for specific details.

FTV-707 BLOCK DIAGRAM

F T V - 707
CIRCUIT DIAGRAM

50 MHz UNIT

The 50 MHz signal from the antenna is fed through a low-pass filter, consisting of C_{323} , C_{324} , L_{312} and L_{313} , to RL_{301} . On receive, the signal is amplified by Q_{205} (3SK51) and fed through a selective bandpass filter, which is tuned to the operating frequency by varactor diodes D_{210} and D_{211} (1S2209). The second gate of Q_{205} is connected through a large resistor to the front panel RF GAIN control, allowing variation in the gain of the RF amplifier.

The signal is then fed to the mixer, Q_{206} (3SK51), where the 50–54 MHz signal is mixed with a local signal of 22 or 24 MHz, producing an IF signal of 28–30 MHz which is fed through a diode switch to the 10 M OUTPUT jack.

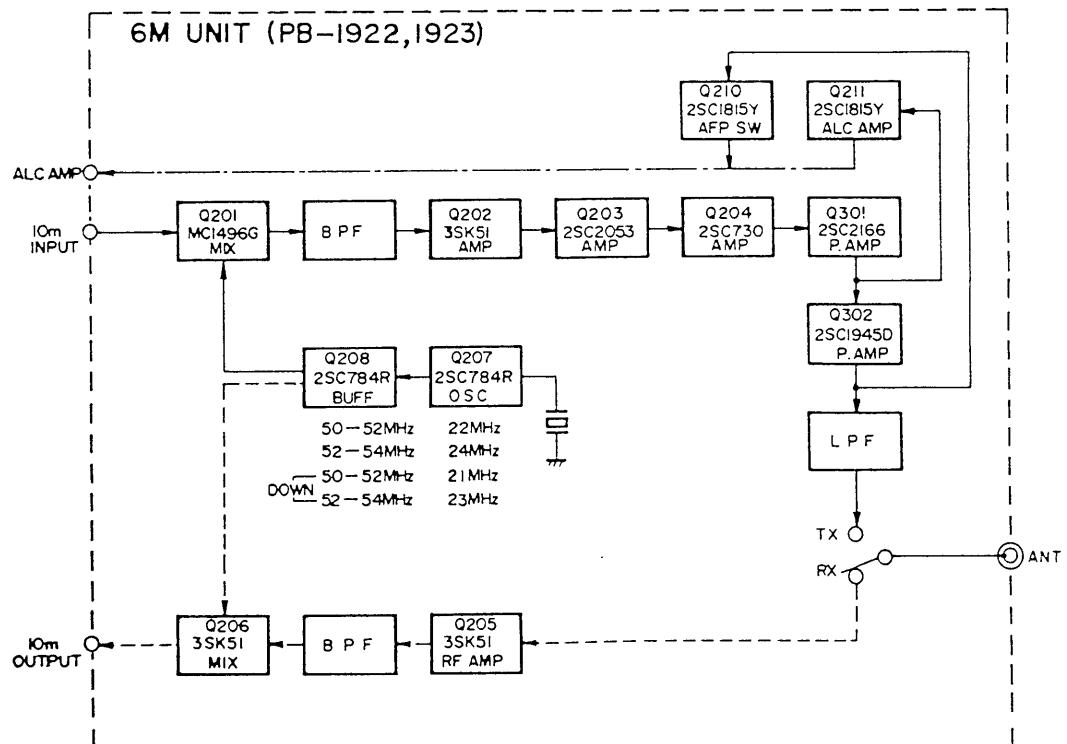

The local signal is generated by crystal oscillator Q_{207} (2SC784R), and amplified by Q_{208} (2SC784R). For repeater operation, the local signal is shifted down 1 MHz, according to the position of the front panel SHIFT switch.

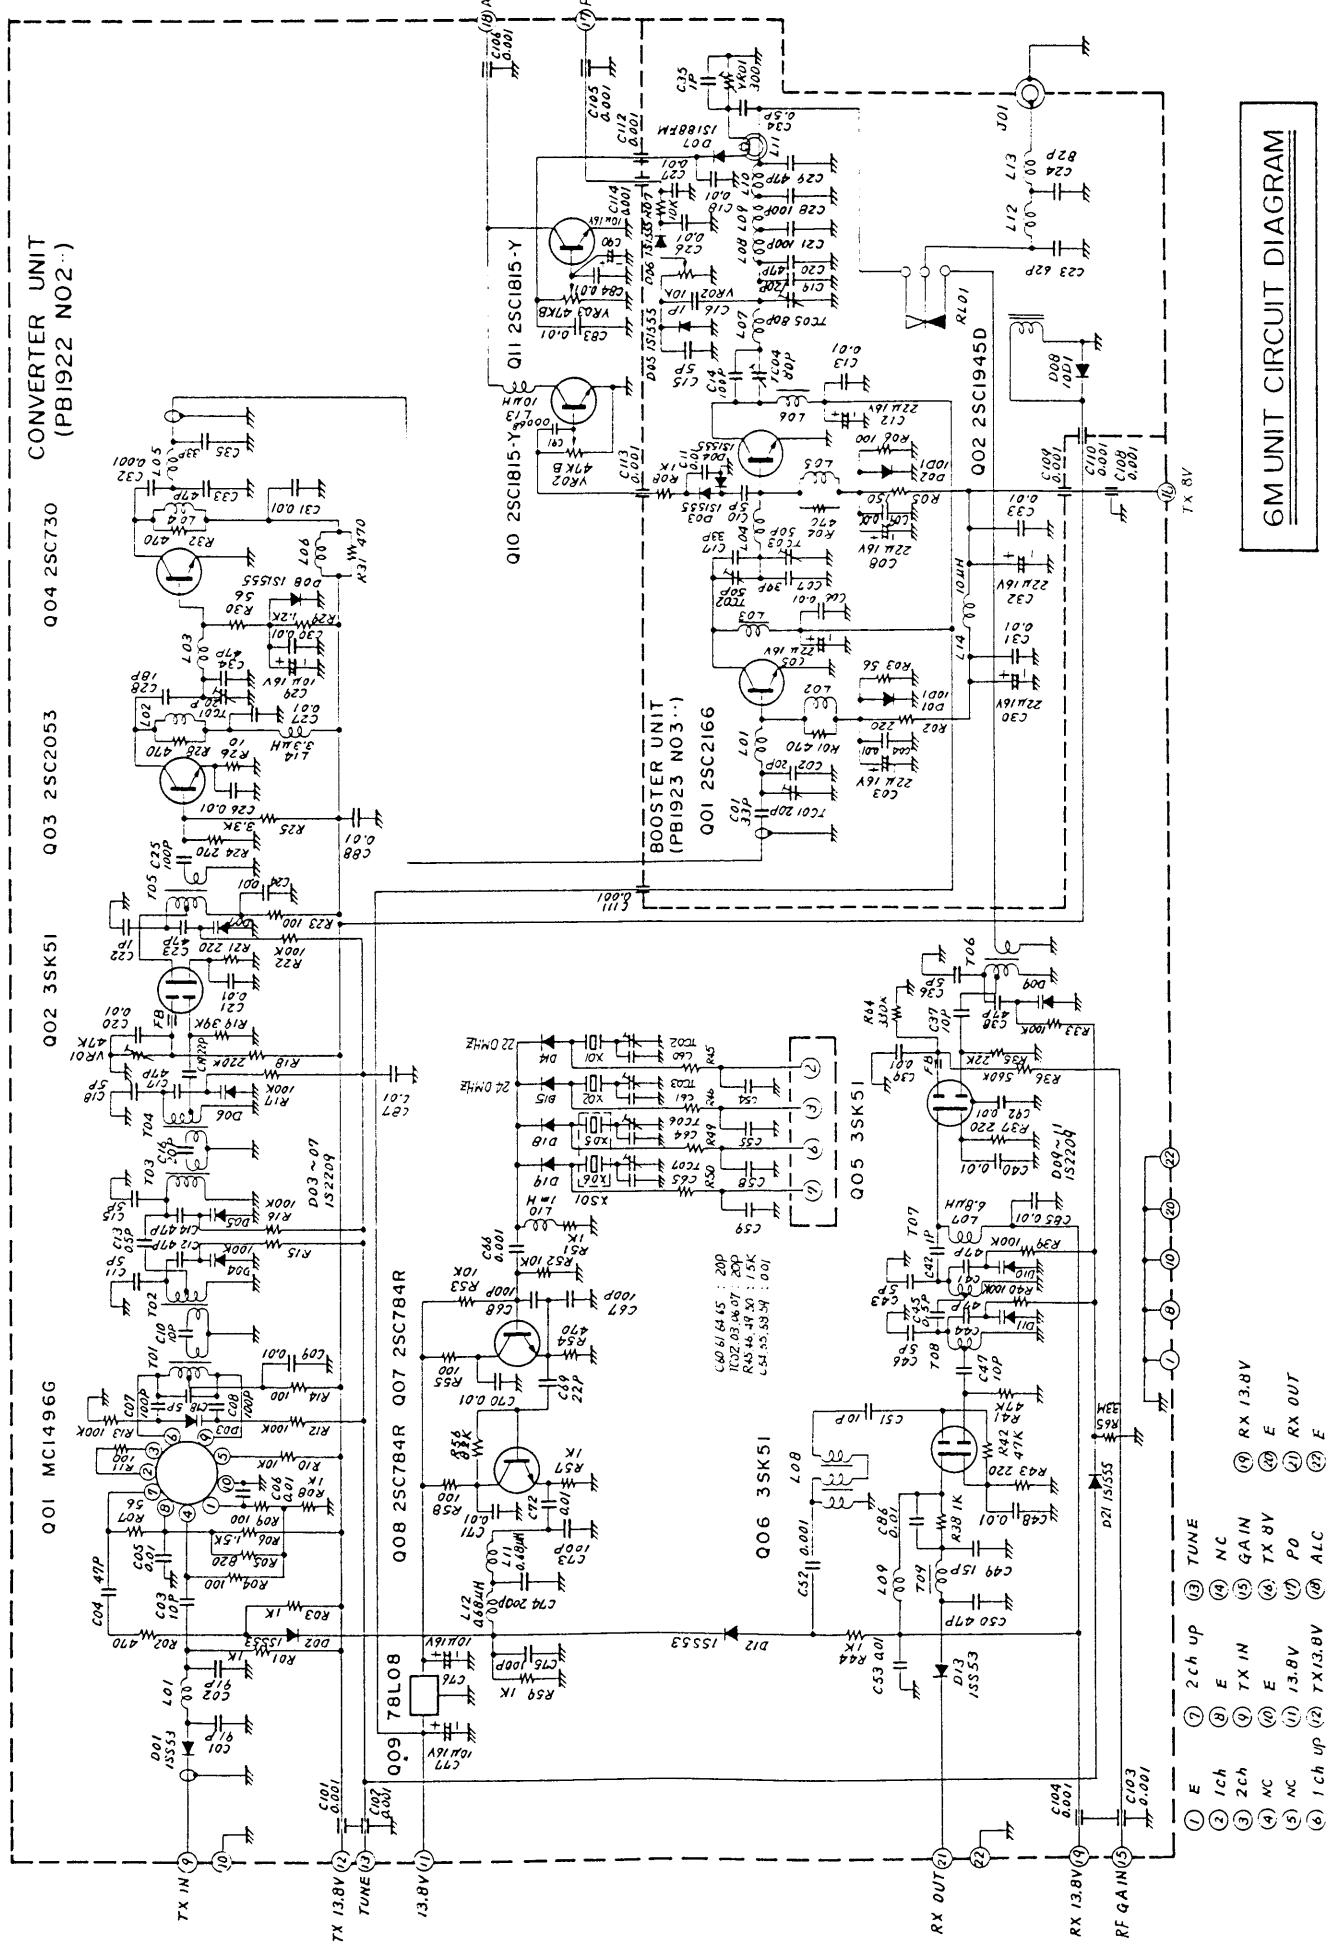

For transmission, the 28–30 MHz output signal from the transceiver is fed to the balanced mixer,

Q_{201} (MC1496G), where it is mixed with the local signal delivered from Q_{208} . The 50–54 MHz signal is then passed through a selective bandpass filter, which effectively eliminates spurious signals. The signal is then amplified by the amplifier chain, consisting of Q_{202} (3SK51), Q_{203} (2SC2053), Q_{204} (2SC730), Q_{301} (2SC2166), and Q_{302} (2SC1945D). The output signal of approximately 10 watts is then fed, via a low pass filter, to the ANT jack.

A portion of the output from Q_{301} is detected by D_{303} and D_{304} (1S1555), and the resulting DC voltage is amplified by Q_{210} (2SC1815Y) for ALC purposes. A portion of the output from L_{311} is detected by D_{307} (1S188FM) and fed to the base of Q_{211} , controlling the gain of ALC AMP (Q_{2001}). Q_{210} (2SC1815Y) works as a switch for the automatic final protection circuit, which will reduce the gain of the amplifier transistors in case of high SWR. A further portion of the output is detected by D_{305} (1S1555) and fed to the meter, for an indication of relative power output.

Q_{309} (78L08) regulates the supply voltage at 8 volts for the local oscillator circuit.

144 MHz UNIT

The incoming 144 MHz signal is fed through a low-pass filter, consisting of L_{708} , C_{716} , and C_{717} , to R_{L701} . On receive, the signal is amplified by Q_{605} (3SK51). The output from Q_{605} is fed through a 4-stage bandpass filter. Gate 2 of the RF amplifier is connected through a large resistor to the front panel RF GAIN control.

The signal is then fed to the mixer, Q_{606} (3SK51), where the incoming signal is heterodyned with a local signal of 116 or 118 MHz, producing an IF signal of 28–30 MHz which is fed through a diode switch to the 10 M OUTPUT jack.

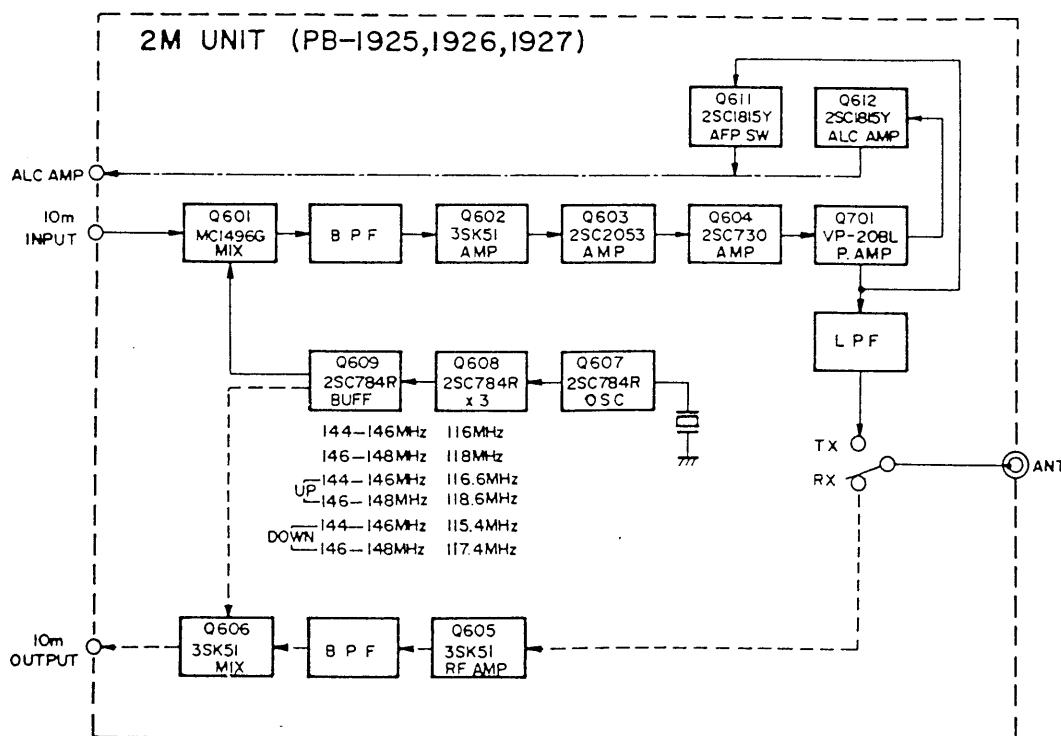

The local signal is generated at 38.666 MHz or 39.333 MHz by Q_{607} (2SC784R), then delivered to tripler Q_{608} (2SC784R), then delivered through buffer Q_{609} (2SC784R) to gate 2 of Q_{606} . For repeater operation, the local signal is shifted up or down 600 kHz, depending on the position of the front panel SHIFT switch.

For transmission, the 28–30 MHz input signal is fed to Q_{601} (MC1496G), where it is mixed with the local signal delivered from Q_{609} . The 144–148 MHz signal is then fed through a selective bandpass

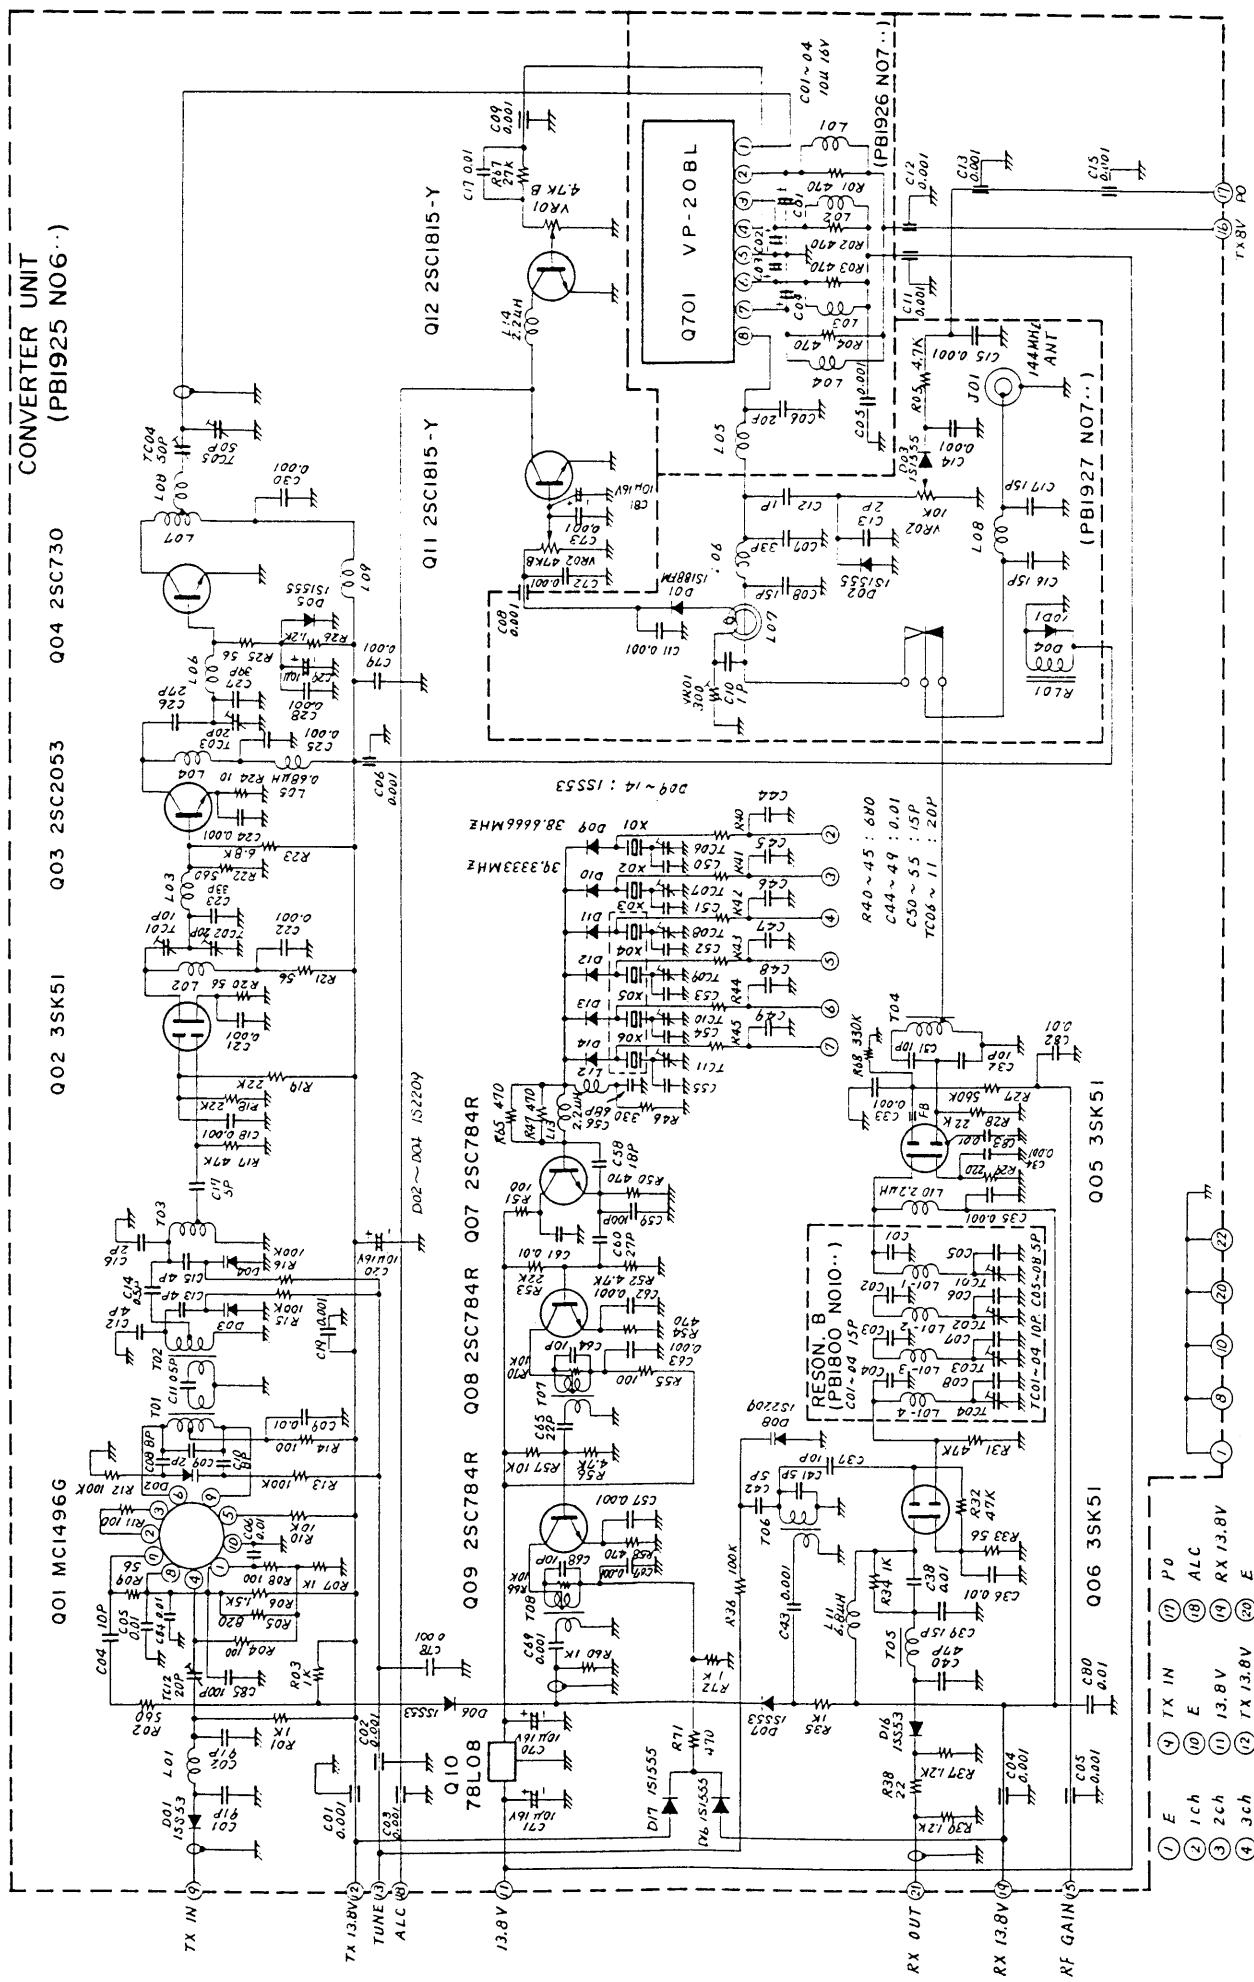

filter, which is tuned to the operating frequency by varactor diodes D_{602} , D_{603} , and D_{604} (1S2209), thus effectively eliminating spurious responses. The signal is then amplified by the amplifier chain, consisting of Q_{602} (3SK51), Q_{603} (2SC2053), Q_{604} (2SC730), and delivered to the final amplifier, Q_{701} (VP-20BL).

A portion of the output signal at the power module is amplified by Q_{612} (2SC1815Y) for ALC purposes. A portion of the output signal is also fed to Q_{611} (2SC1815Y), which acts as a switch for the AFP circuit, which will protect Q_{701} from damage caused by high SWR. A further portion of the output is detected by D_{702} (1S1555) and fed to the meter, for an indication of relative power output.

The 8 volt line is further stabilized by Q_{510} (78L08) for the local oscillator circuitry.

2M UNIT CIRCUIT DIAGRAM

430 MHz UNIT

The incoming signal is fed through R_{L1301} to the two stage RF amplifier, consisting of Q_{1201} and Q_{1202} (2SC2369), and then passed through a selective filter to the doubly balanced diode mixer, $D_{1503} - D_{1506}$ (ISS97) where the incoming signal is mixed with a 402–410 MHz local signal, producing a 28–30 MHz output signal which is fed to the 10 M OUTPUT jack.

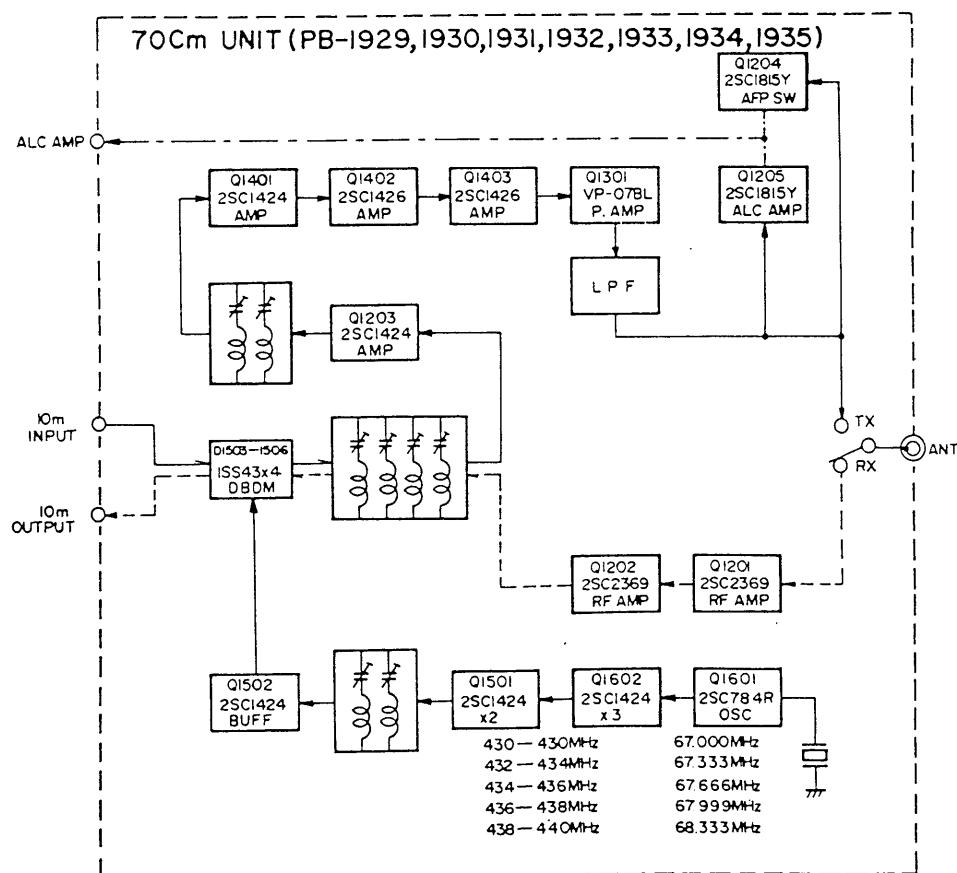

The local signal is generated at 67–68 MHz by oscillator Q_{1601} (2SC784R), then multiplied by Q_{1602} and Q_{1501} (2SC1424). The local signal at 402–410 MHz is then passed through a selective filter to buffer Q_{1502} (2SC1424), for delivery to the mixer.

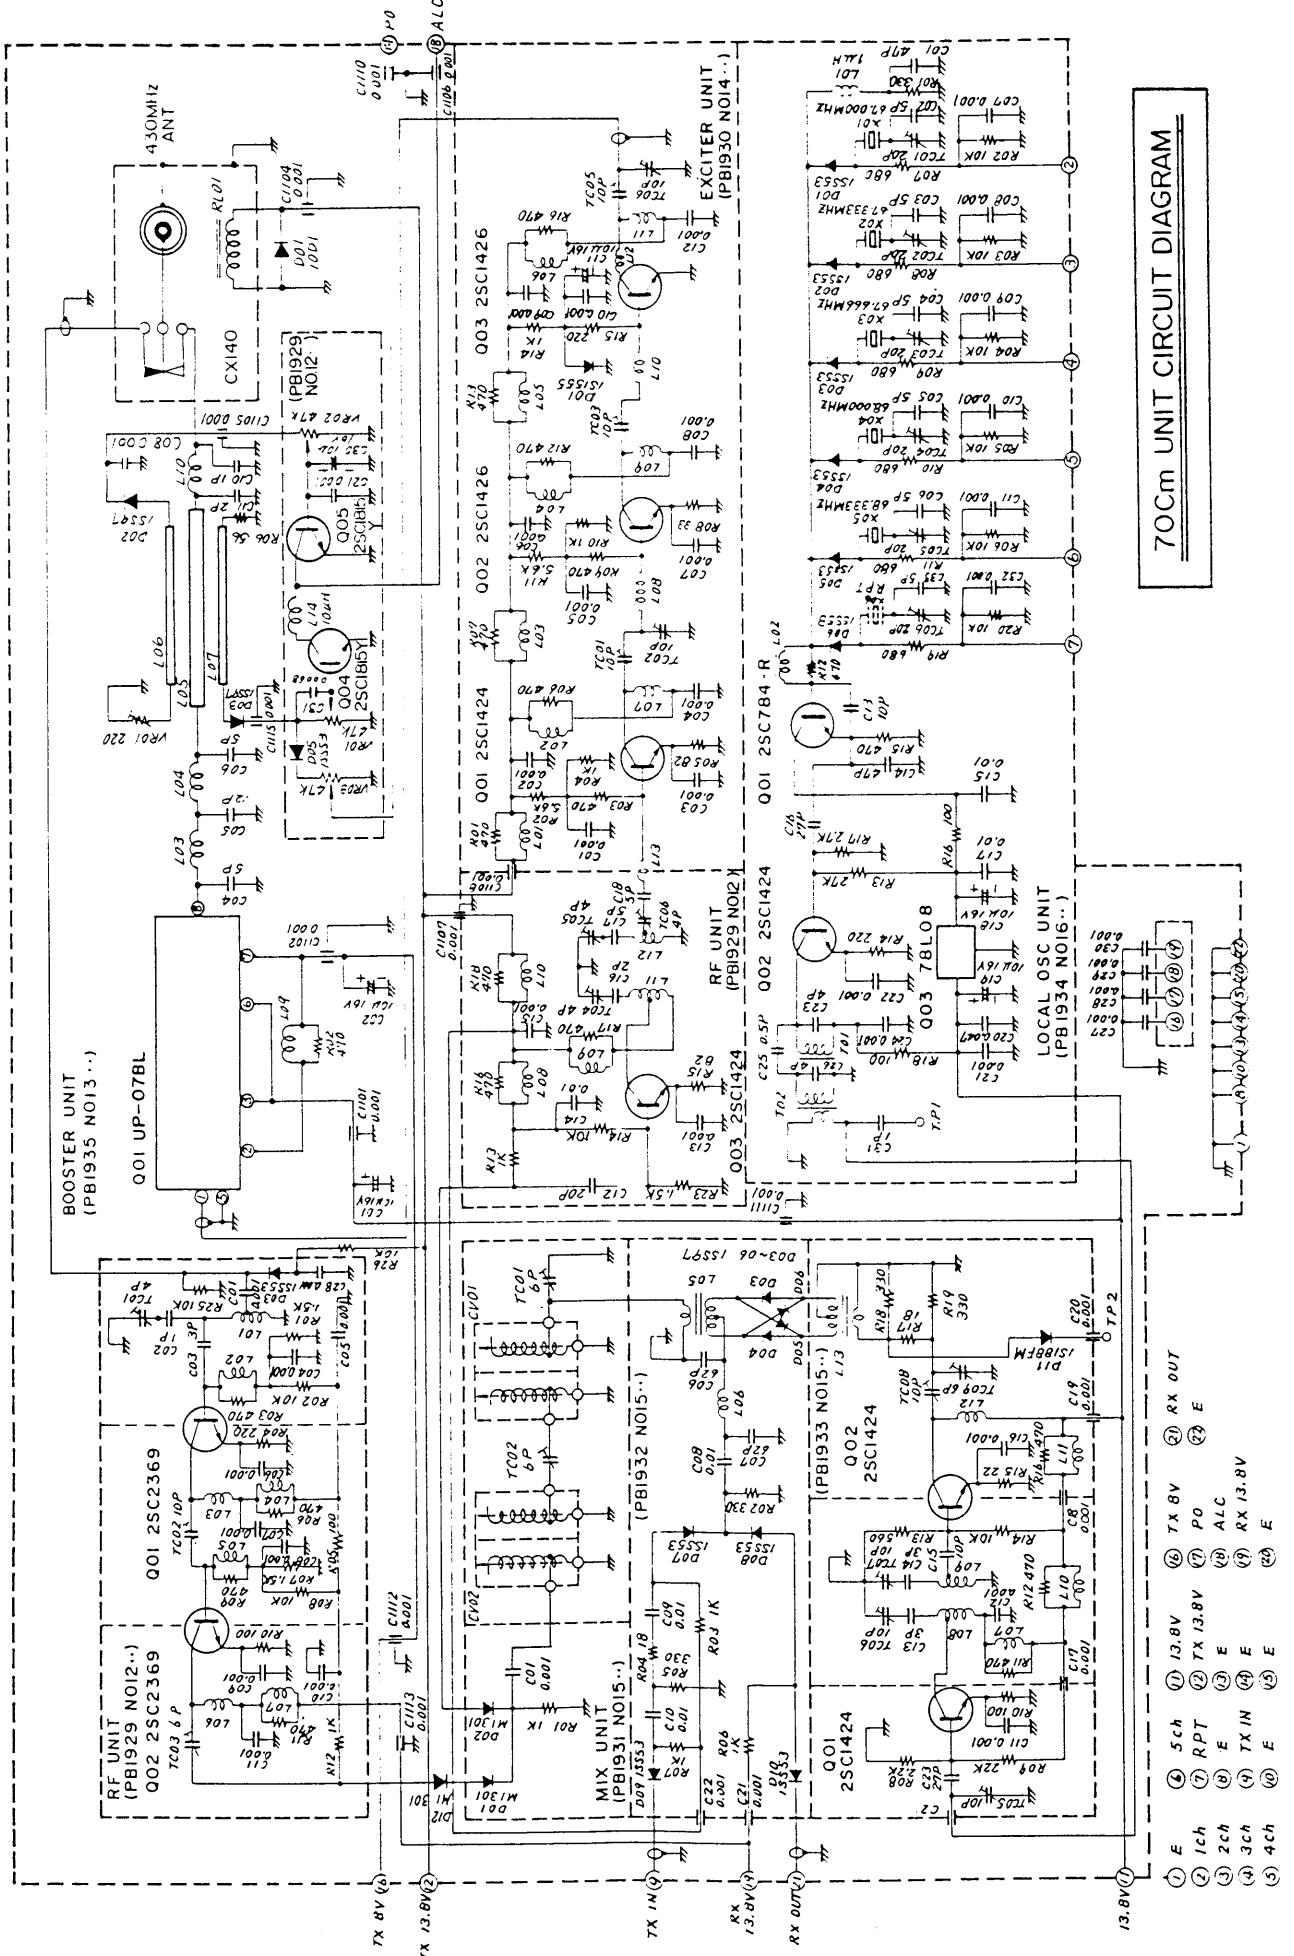

For transmission, the output from the transceiver is delivered to the diode ring mixer, where it is heterodyned with the local oscillator signal, resulting in a signal of 430–440 MHz. The signal is then fed through a selective filter, which effectively eliminates spurious responses. The signal is then

amplified by Q_{1203} (2SC1424), fed through another selective filter, then amplified by the amplifier chain, consisting of Q_{1401} (2SC1424), Q_{1402} (2SC1426), Q_{1403} (2SC1426), and final amplifier Q_{1301} (UP-07BL). The output signal from Q_{1301} is fed through a stripline filter, via RL_{1301} , to the ANT jack.

A portion of the output from L_{1306} is detected by D_{1302} (1S188FM) and fed to the base of Q_{1205} (2SC1815Y), controlling the gain of ALC AMP Q_{2001} . Q_{1204} (2SC1815Y) acts as a switch for the automatic final protection circuit. A further portion of the output signal is rectified by D_{1303} (1S188FM) and fed to the meter, providing indication of relative power output.

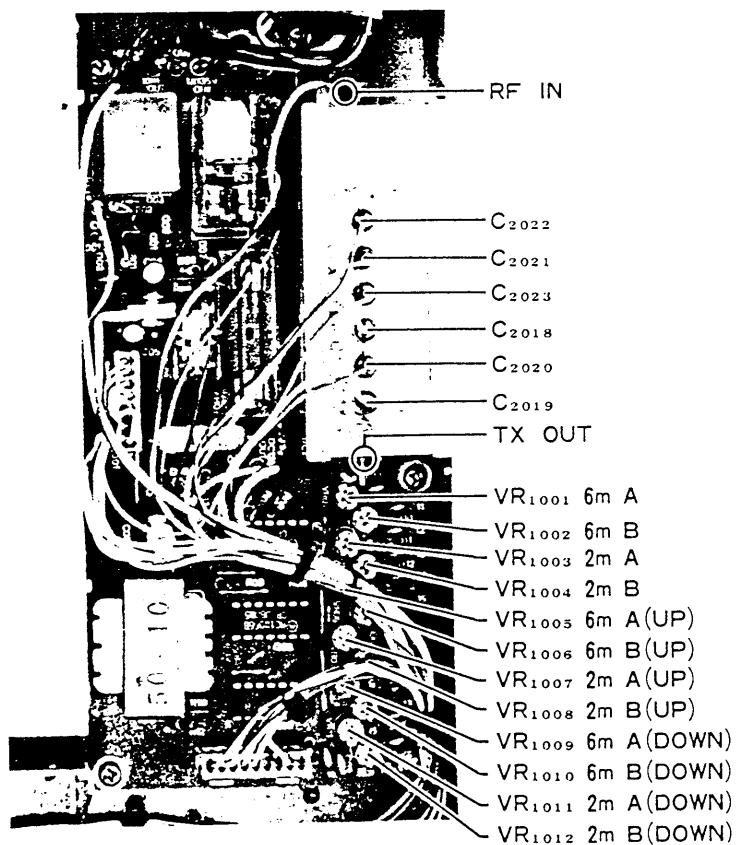

The supply voltage for the local oscillator circuit is regulated at 8 volts by Q_{1603} (78L08).

ALC AMP UNIT

The 28 MHz signal from the transceiver is fed through two sections of pi filter, and an attenuator to gate 1 of Q₂₀₀₁ (3SK59Y), where the signal is amplified and the amplitude of output is controlled so as not to exceed the level necessary to drive the 50, 144 or 430 MHz unit. The output level of Q₂₀₀₁ is controlled to correspond to the ALC voltage delivered from the ALC amplifier. The ALC voltage supplied from the modules is fed to gate 2 of Q₂₀₀₁ for gain control purposes. In the AM mode, the ALC level is fixed. A portion of the ALC signal is amplified by amplifiers Q₂₀₀₂ (2SK19GR) and Q₂₀₀₃ (2SA564Q), providing a DC voltage for the ALC meter.

MAINTENANCE AND ALIGNMENT

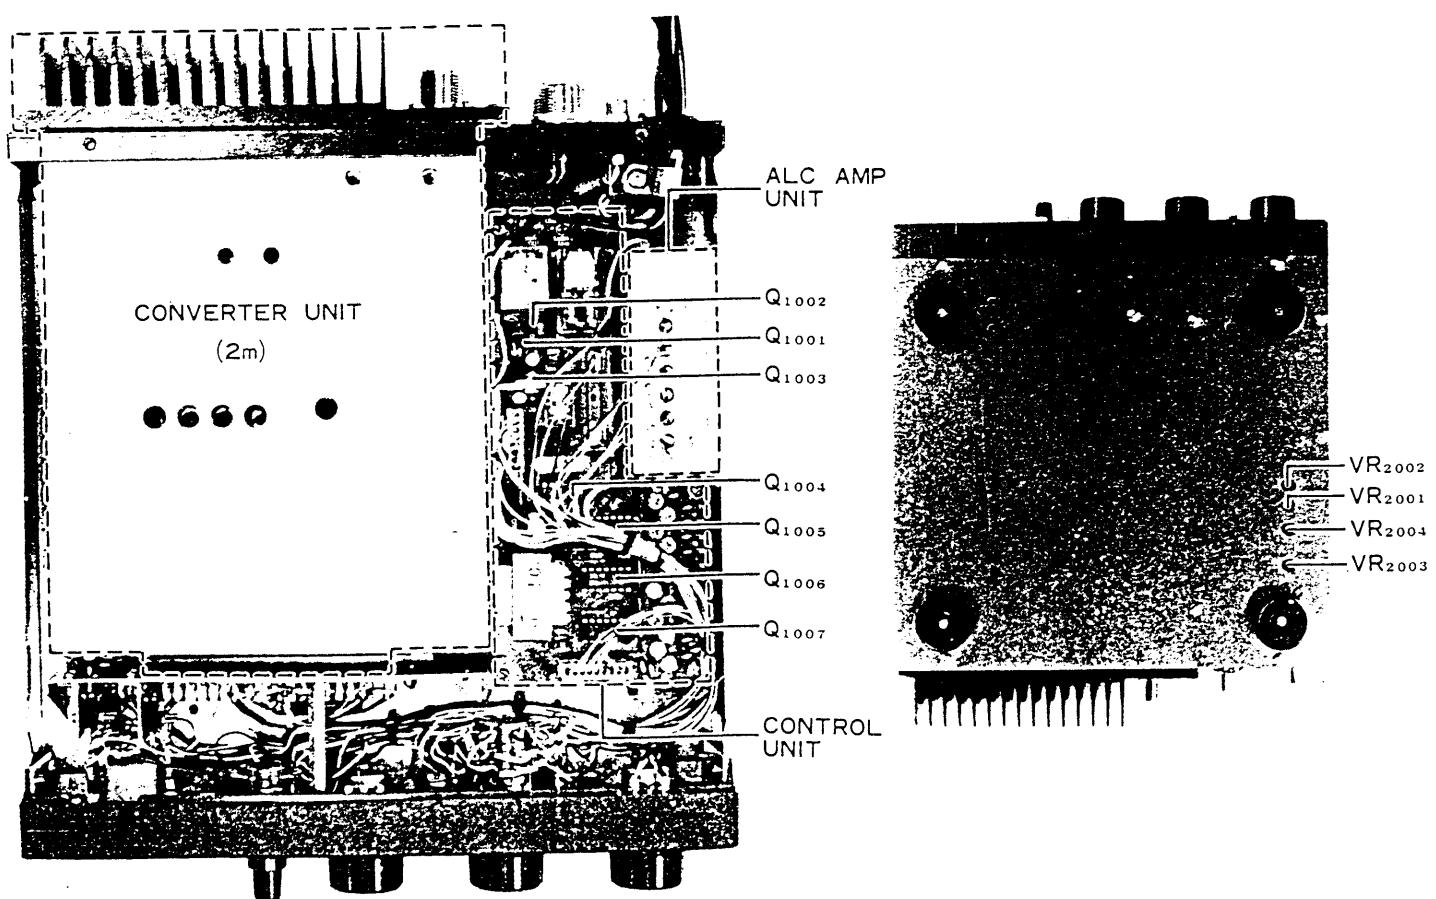

The FTV-707 has been carefully aligned and tested at the factory prior to shipment. With normal use, if the unit is not abused, the FTV-707 will provide many years of trouble-free operation.

Sudden difficulties are usually the result of part failures, rather than alignment problems. Therefore, alignment should not be undertaken unless the operation of the transverter is completely understood, the fault has been thoroughly diagnosed, and the trouble has been definitely traced to misalignment rather than part failure. Attempts to align this equipment by other than an experienced technician are discouraged.

For alignment purposes, a VTVM with RF probe good to 450 MHz is required. Also, a signal generator good to 450 MHz, and a frequency counter good to 250 MHz are required. A dummy load and wattmeter good to 450 MHz are also required.

ALC AMP UNIT (PB-2294)

1. Connect a 1/2 watt 50 ohm resistor to the output terminal of the ALC AMP Unit. Set the METER switch to the ALC position, and the ALC switch to the SSB/CW mode.
2. Connect the RF probe of a VTVM to the input terminal of the ALC AMP Unit.
3. Adjust the CAR control on the FT-707 front panel so that the VTVM shows 0.22V (rms).
4. Now remove the RF probe from the ALC AMP Unit input terminal and place it on the output terminal of the same unit. Note that this terminal is temporarily terminated by a 50 ohm resistor.
5. Adjust T_{2001} for maximum deflection on the VTVM, and then adjust VR_{2001} to the point where the VTVM reading is 0.11V (rms).
6. Adjust VR_{2004} so that the ALC meter deflects to the full-scale on position, then return to the receive condition and adjust VR_{2002} so that the ALC meter indicates exactly zero.

50 MHz UNIT

1. Local oscillator circuit

- (1) Connect the DC voltmeter to pin 2 of the edge connector for the 50 MHz unit. Confirm that 11 volts are present, with the BAND switch set to 0 (50–52 MHz). Switch to 2 (52–54 MHz), and check for 11 volts at pin 3 of the edge connector.
- (2) Connect the RF probe of the VTVM to the LOCAL OUT terminal. Confirm that the unit is oscillating.
- (3) Connect a frequency counter to the LOCAL OUT terminal. Set the BAND switch to 0 (50–52 MHz), set the SHIFT switch to SIMPLE, and adjust TC₂₀₂ for a reading of exactly 22.0 MHz. Switch to 2 (52–54 MHz), and adjust TC₂₀₃ for a reading of 24.0 MHz.

2. Receiver section

- (1) Set the HF transceiver up for operation on 29 MHz.
- (2) Connect the DC voltmeter to pin 19 of the edge connector, set the BAND switch to 0 (50–52 MHz), then 2 (52–54 MHz), and confirm that 13.5 volts is present.
- (3) Connect the DC voltmeter to pin 15 of the edge connector, and rotate the FTV-707 RF GAIN control fully counterclockwise. The voltmeter reading should be 0 volts. In the fully clockwise position, it should be 11 volts. After confirming these voltages, please leave the level at maximum gain.
- (4) Connect the DC voltmeter to pin 13 of the edge connector, and set the FTV-707 TUNE control to the center position (12 o'clock). With the BAND switch in the 0 (50–52 MHz) position, adjust VR₁₀₀₁ for a reading of 4 volts. Switch to 2 (52–54 MHz), and adjust VR₁₀₀₂ for a reading of 4 volts.
- (5) Connect a signal generator to the 50 MHz ANT jack, and set the FTV-707 BAND switch to 0 (50–52 MHz). Set the signal generator to 51 MHz, and tune the receiver to its output. Peak T₂₀₆, T₂₀₇, T₂₀₈, and T₂₀₉ for a maximum reading on the HF transceiver S-meter. Reduce the signal generator output, if necessary, to secure easy viewing of the peak point. Switch to the 2 (52–54 MHz) band, set the signal generator output to 53

MHz. and repeat these measurements again while tuned to the generator frequency. Then recheck the results at 51 MHz.

3. Transmitter section

- (1) Connect a dummy load/wattmeter to the 50 MHz ANT jack. Set VR₂₀₂ and VR₂₀₃ fully counterclockwise. Set the FTV-707 CAR control to the center of its range (12 o'clock). Set the BAND switch to 0 (50–52 MHz).
- (2) Connect the RF probe of the VTVM to the collector of Q₂₀₃. While transmitting, peak T₂₀₁, T₂₀₂, T₂₀₃, T₂₀₄, and T₂₀₅ for a maximum reading on the VTVM (0.4 volts RMS nom.).
- (3) Connect the RF probe to terminal A (TX OUT) on the 50 MHz unit. Peak TC₂₀₁ and L₂₀₅ for a maximum reading on the VTVM (4 volts RMS nom.).
- (4) While transmitting, peak TC₃₀₁, TC₃₀₂, TC₃₀₃, TC₃₀₄, and TC₃₀₅ for a maximum power output indication on the wattmeter.
- (5) Repeat steps (2) through (4) on the 2 (52–54 MHz) band. Then recheck the results at 0 (50–52 MHz).
- (6) Set the FTV-707 meter switch to the OUTPUT position, and set the transceiver CAR control for an output of 10 watts from the transverter. Set VR₃₀₂ for a reading of .8 on the FTV-707 meter.
- (7) Beginning at zero drive, gradually increase the transceiver CAR control until the output from the transverter does not increase more. Do not exceed this level.
- (8) Rotate VR₂₀₂ slowly clockwise, until an output of 10 watts is secured across the 50–54 MHz range.
- (9) Set VR₂₀₃ fully clockwise.
- (10) While transmitting, rotate VR₃₀₁ to secure maximum power output on the wattmeter.
- (11) Now rotate VR₂₀₃ fully counterclockwise. While transmitting, rotate VR₂₀₃ slowly clockwise, until the power output just begins to fall off. Do not go past the threshold point.
- (12) Remove the dummy load from the antenna jack. While transmitting, confirm that the FTV-707 meter indicates .2 with no load applied. If not, check the AFP circuit for malfunctioning parts.

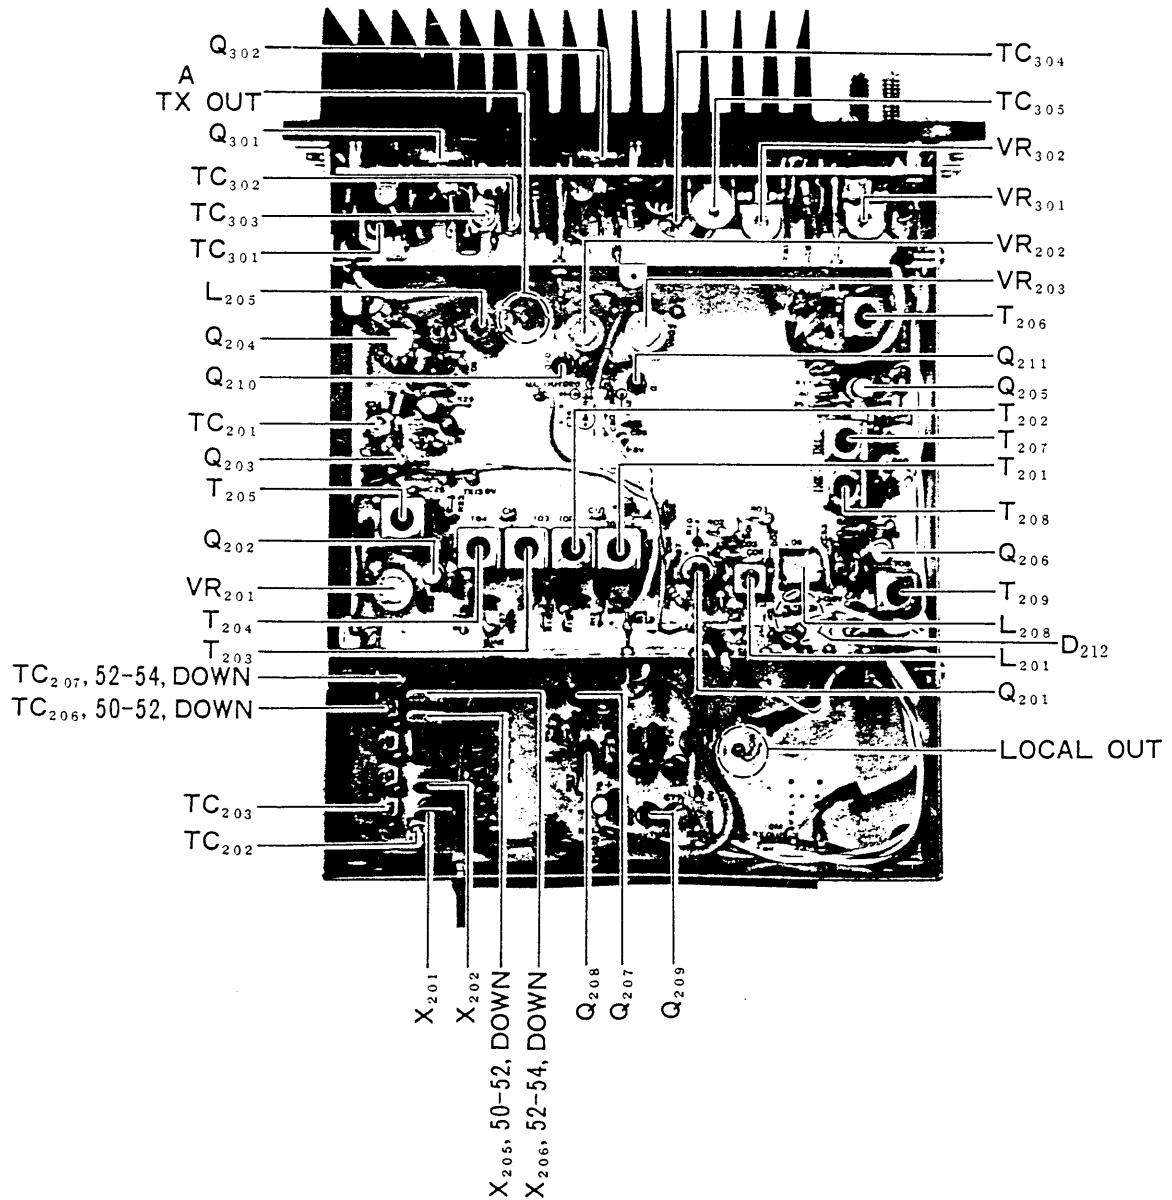

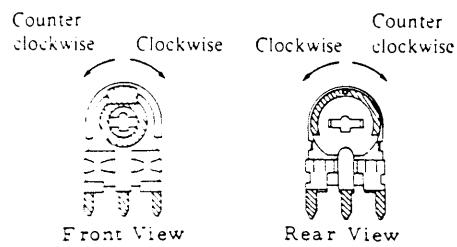

(13) Connect the RF probe of the VTVM to the LOCAL OUT terminal. Set the BAND switch to 0 (50–52 MHz), then switch the SHIFT switch to DOWN. Confirm that oscillation is taking place. Repeat on 2 (52–54 MHz).

(14) Connect the frequency counter to the LOCAL OUT terminal. Adjust TC_{204} – TC_{206} as shown in the chart below.

BAND SWITCH	SHIFT SWITCH	ADJUST	FREQUENCY
0	50–52	DOWN	TC_{206} 21.0 MHz
2	52–54	DOWN	TC_{207} 23.0 MHz

(15) Set the TUNE control to the center of its range. Adjust the potentiometers for maximum power output while transmitting into the dummy load, as shown in the chart below.

BAND SWITCH	SHIFT SWITCH	ADJUST	RESULT
0	50–52	DOWN	VR_{1009}
2	52–54	DOWN	VR_{1010}

144 MHz UNIT

1. Local oscillator circuit

- (1) Connect the DC voltmeter to pin 2 of the edge connector for the 144 MHz unit. Confirm that 11 volts is present, with the BAND switch set to 4 (144–146 MHz). Switch to 6 (146–148 MHz), and check for 11 volts at pin 3 of the edge connector.
- (2) Connect the RF probe of the VTVM to the LOCAL OUT terminal. Adjust T_{607} and T_{608} for a reading of 0.15 V RMS on the VTVM.
- (3) Connect a frequency counter to the LOCAL OUT terminal. Set the BAND switch to 4 (144–146 MHz), set the SHIFT switch to SIMP, and adjust TC_{606} for a reading of exactly 116.0 MHz. Switch to 6 (146–148 MHz), and adjust TC_{607} for a reading of 118.0 MHz.

2. Receiver section

- (1) Set the HF transceiver up for operation on 29 MHz.
- (2) Connect the DC voltmeter to pin 19 of the edge connector, set the BAND switch to 4 (144–146 MHz), then 6 (146–148 MHz), and confirm that 13.5 volts is present.
- (3) Connect the DC voltmeter to pin 15 of the edge connector, and rotate the FTV-707 RF GAIN control fully counterclockwise. The voltmeter reading should be 0 volts. In the fully clockwise position, it should be 11 volts. After confirming these voltages, please leave the level at maximum gain.
- (4) Connect the DC voltmeter to pin 13 of the edge connector, and set the FTV-707 TUNE control to the center position (12 o'clock). With the BAND switch in the 4 (144–146 MHz) position, adjust VR_{1003} for a reading of 4 volts. Switch to 6 (146–148 MHz), and adjust VR_{1004} for a reading of 4 volts.
- (5) Connect a signal generator to the 144 MHz ANT jack, and set the FTV-707 BAND switch to 4 (144–146 MHz). Set the signal generator to 145 MHz, and tune the receiver to its output. Peak TC_{1001} – TC_{1004} and T_{604} – T_{606} for a maximum reading on the HF transceiver S-meter.
Reduce the signal generator output, if necessary, to secure easy viewing of the peak point. Switch to the 6 (146–148 MHz) band, set the

signal generator output to 147 MHz, and repeat these transformers again while tuned to the generator frequency. Then recheck the results at 145 MHz.

3. Transmitter section

- (1) Connect a dummy load/wattmeter to the 144 MHz ANT jack. Set VR_{601} and VR_{602} fully counterclockwise. Set the HF transceiver CAR control to the center of its range (12 o'clock). Set the BAND switch to 4 (144–146 MHz).
- (2) Connect the RF probe of the VTVM to the collector of Q_{603} . While transmitting, peak T_{601} – T_{603} , TC_{601} , and TC_{602} for a maximum reading on the VTVM (0.9 volts RMS nom.).
- (3) Connect the RF probe to terminal A (TX OUT) on the 144 MHz unit. Peak TC_{604} and TC_{605} for a maximum reading on the VTVM (2.5 volts RMS nom.).
- (4) Repeat steps (2) and (3) on the 6 (146–148 MHz) band. Then recheck the results at 144–146 MHz.
- (5) Set the FTV-707 meter switch to the OUTPUT position, and set the transceiver CAR control for an output of 10 watts from the transverter. Set VR_{702} for a reading of .8 on the FTV-707 meter.
- (6) Beginning at zero drive, gradually increase the transceiver CAR control until the output from the transverter does not increase more. Do not exceed this level.
- (7) Rotate VR_{601} slowly clockwise, until an output of 10 watts is secured across the 144–148 MHz range.
- (8) Rotate VR_{602} fully clockwise.
- (9) While transmitting, rotate VR_{701} to secure maximum power output on the wattmeter.
- (10) Now rotate VR_{602} fully counterclockwise. While transmitting, slowly rotate VR_{602} clockwise, until the power output just begins to fall off. Do not go past the threshold point.
- (11) Remove the dummy load from the antenna jack. While transmitting, confirm that the FTV-707 meter indicates .2 with no load applied. If not, check the AFP circuit for malfunctioning parts.
- (12) Connect the RF probe of the VTVM to the LOCAL OUT terminal. Set the BAND switch to 4 (144–146 MHz), then switch the SHIFT

switch to UP and DOWN. Confirm that oscillation is taking place. Repeat on 146–148 MHz.

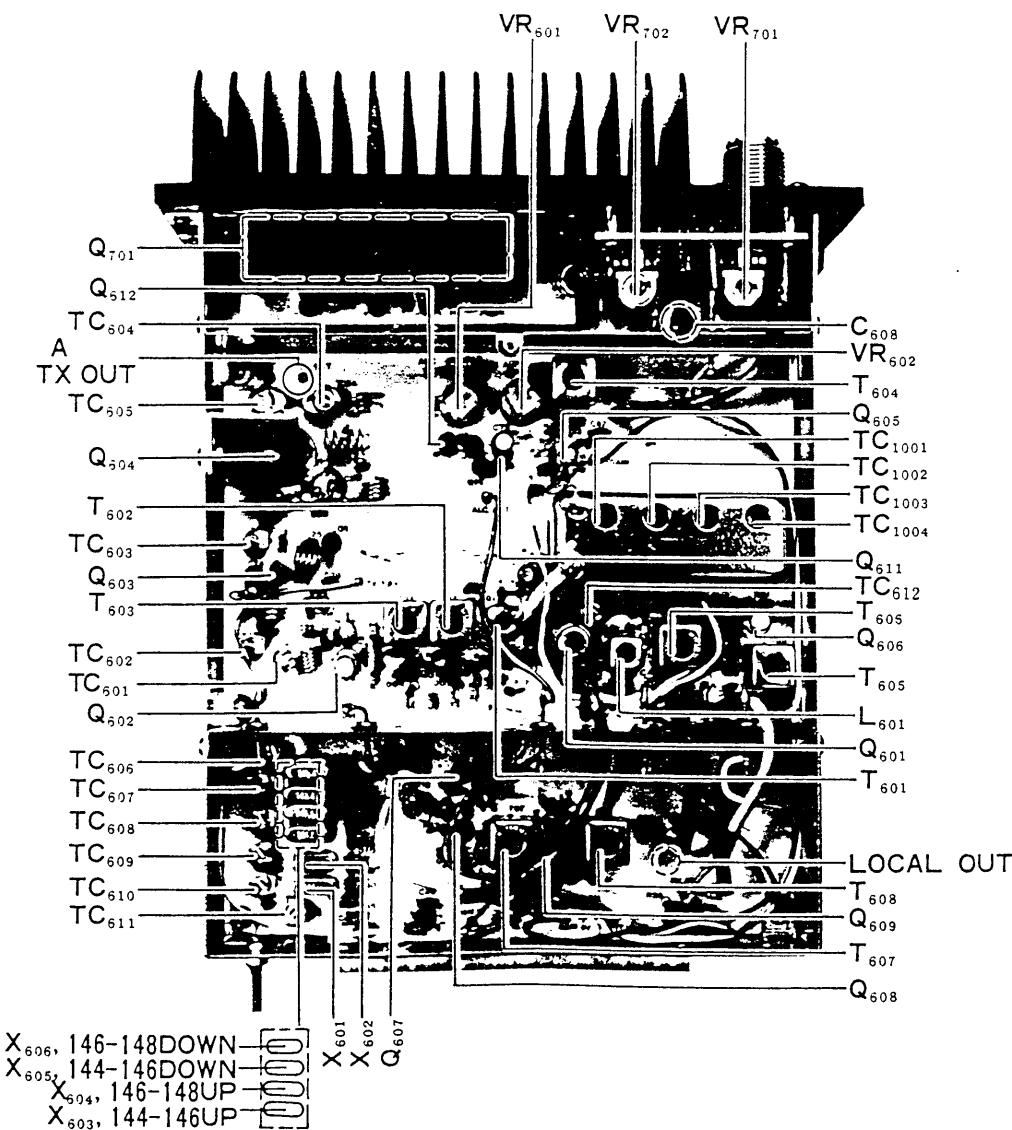

- (13) Connect the frequency counter to the LOCAL OUT terminal. Adjust TC₆₀₈–TC₆₁₁ as shown in the chart below.

BAND SWITCH	SHIFT SWITCH	ADJUST	FREQUENCY
4	144–146	UP	TC ₆₀₈ 116.6 MHz
		DOWN	TC ₆₁₀ 115.4 MHz
6	146–148	UP	TC ₆₀₉ 118.6 MHz
		DOWN	TC ₆₁₁ 117.4 MHz

- (14) Set the TUNE control to the center of its range. Adjust the potentiometers for maximum power output while transmitting into the dummy load, as shown in the chart below.

BAND SWITCH	SHIFT SWITCH	ADJUST	RESULT
4	144–146	UP	VR ₁₀₀₇
		DOWN	VR ₁₀₁₁
6	146–148	UP	VR ₁₀₀₈
		DOWN	VR ₁₀₁₂

- (15) Adjust T₆₀₇ and T₆₀₈ for identical power output with the SHIFT switch in the UP and DOWN position.

430 MHz UNIT

1. Local oscillator circuit

- (1) Connect a DC voltmeter to pin 2 of the edge connector for the 430 MHz unit. Set the BAND switch to 0 (430–432 MHz), and confirm that 11 volts is present. In turn, check pins 3, 4, 5, and 6 for 11 volts, while switched to the 2 (432–434 MHz), 4 (434–436 MHz), 6 (436–438 MHz), and 8 (438–440 MHz) bands, respectively.
- (2) Connect the RF probe of the VTVM to TP₁, and adjust L₁₆₀₂, T₁₆₀₁, and T₁₆₀₂ for maximum indication on the VTVM.
- (3) Connect the frequency counter to TP₁. Refer to the chart below, and adjust TC₁₆₀₁–TC₁₆₀₅ for local output readings as shown for the various positions of the BAND switch.

BAND	TRIMMER	FREQ.
0 (430–432 MHz)	TC ₁₆₀₁	201 MHz
2 (432–434 MHz)	TC ₁₆₀₂	202 MHz
4 (434–436 MHz)	TC ₁₆₀₃	203 MHz
6 (436–438 MHz)	TC ₁₆₀₄	204 MHz
8 (438–440 MHz)	TC ₁₆₀₅	205 MHz

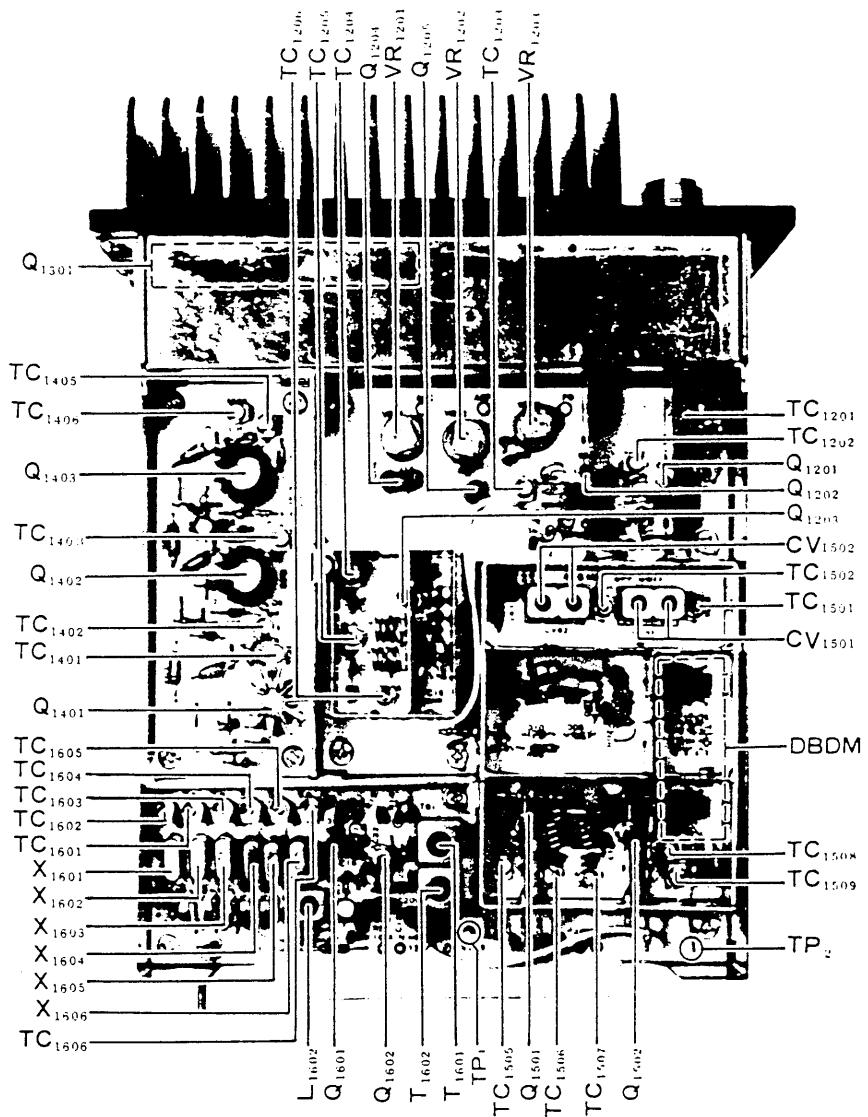

- (4) Connect the DC voltmeter to TP₂, and adjust TC₁₅₀₅–TC₁₅₀₉ for maximum indication on the voltmeter (1 volt nom.).

2. Receiver section

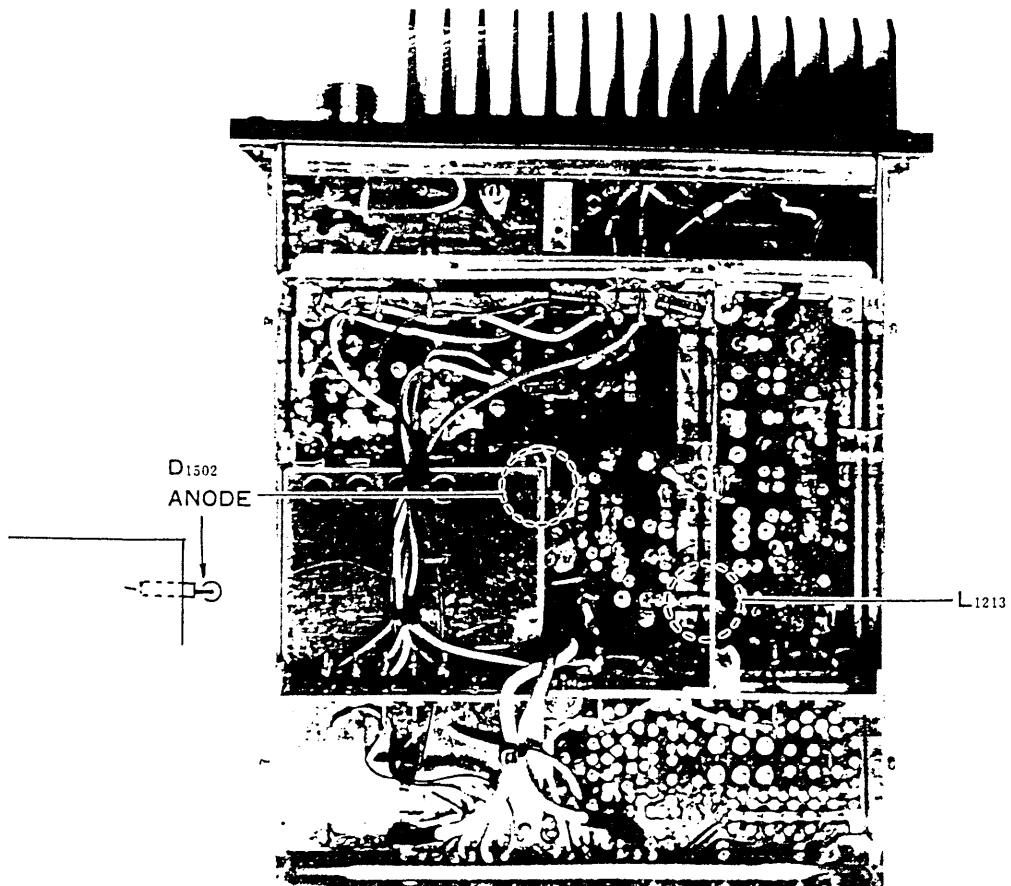

- (1) Set the transceiver up for operation on 29 MHz.
- (2) Connect the DC voltmeter to pin 19 of the edge connector, and check for 13.5 volts at each position of the BAND switch over 0–8 (430–440 MHz).
- (3) Connect the signal generator to the 430 MHz ANT jack, set its output to 431 MHz, and tune the receiver to the generator signal. Adjust TC₁₂₀₁–TC₁₂₀₃, TC₁₅₀₁–TC₁₅₀₄, and CV₁₅₀₁/CV₁₅₀₂ for a maximum S-meter indication on the HF transceiver. Repeat on 433 MHz, 435 MHz, 437 MHz, and 439 MHz. Recheck the results to ensure maximum response across the entire operating range.

3. Transmitter section

- (1) Connect the dummy load/wattmeter to the 430 MHz ANT jack. Set VR₁₂₀₁ and VR₁₂₀₂ fully counterclockwise. Set the transceiver CAR control to the center of its range (12 o'clock position).
- (2) Connect the RF probe of the VTVM to the anode of D₁₅₀₂. Peak TC₁₅₀₁–TC₁₅₀₄ and CV₁₅₀₁/CV₁₅₀₂ for a maximum indication on the VTVM while transmitting.
- (3) Connect the RF probe of the VTVM to the hot side of L₁₂₁₃. Peak TC₁₂₀₄–TC₁₂₀₆ for a maximum indication on the VTVM while transmitting.
- (4) Connect the RF probe of the VTVM to terminal A (TX OUT) on the 430 MHz unit. Peak TC₁₄₀₁–TC₁₄₀₆ for a maximum indication on the VTVM.
- (5) Confirm the results in steps (2) through (4) on the wattmeter.
- (6) Repeak the points in steps (2) through (5) on each position of the BAND switch, then recheck the results to ensure maximum performance over the entire range 430–440 MHz.
- (7) Set the meter switch to OUTPUT. Set the transceiver CAR control for an output of 10 watts. Adjust VR₁₂₀₃ for an indication of .8 on the FTV-707 meter.
- (8) Beginning at zero drive, increase the level of the CAR control on the transceiver until the transverter power output does not increase further.
- (9) Advance VR₁₂₀₁ slowly clockwise until equal power output is achieved across the 430–440 MHz range.
- (10) Rotate VR₁₂₀₂ fully clockwise.
- (11) While transmitting, rotate VR₁₃₀₁ to secure maximum power output on the wattmeter.
- (12) Now rotate VR₁₂₀₂ fully clockwise. While transmitting, slowly rotate VR₁₂₀₂ counterclockwise, until the power output just begins to fall off. Do not go past the threshold point.
- (13) Remove the dummy load from the 430 MHz ANT jack. While transmitting, check to be sure that the FTV-707 meter indicates .2 with no load applied. If not, check the AFP unit for malfunctioning parts.
