Introduction

This manual provides technical information necessary for servicing the Yaesu VR-500 Communications Receiver. Information on its installation and operation can be found in the VR-500 Operating Manual, which is provided with the receiver, and Accessory information may be found in the documents accompanying the optional equipment.

The VR-500 is a high-performance miniature communications receiver providing general coverage reception from 100 kHz to 1300 MHz on the CW, SSB (LSB and USB), AM, and FM (Wide and Narrow bandwidths) modes (this coverage includes the AM and FM broadcast bands, HF Short-wave Bands up to 16 MHz, VHF and UHF TV bands, the VHF AM aircraft band, and a wide range of commercial and public safety frequencies!).

Servicing this equipment requires expertise in handling surface mount chip components. Attempts by unqualified persons to service this equipment may result in permanent damage not covered by warranty. For the major circuit boards, each side of the board is identified by the type of the majority of components installed on that side. In most cases one side has only chip components, and the other has either a mixture of both chip and lead compo-

nents (trimmers, coils, electrolytic capacitors, packaged ICs, etc.), or lead components only.

While we believe the technical information in this manual is correct, VERTEX STANDARD assumes no liability for damage that may occur as a result of typographical or other errors that may be present. Your cooperation in pointing out any inconsistencies in the technical information would be appreciated. VERTEX STANDARD reserves the right to make changes in this receiver and the alignment procedures, in the interest of technological improvement, without notification of owners.

Circuit Description

The VR-500 circuitry includes three modules: (1) the RF Unit, (2) the CNTL Unit, and (3) the AF Unit.

The RF Unit is a module consisting of the front-end unit, 1st IF amplifier, 2nd IF amplifier, PLL circuit, and power supply. The AF Unit consists of the 3rd IF amplifier, detector circuit, audio amplifier, and power supply. The CNTL unit includes the CPU, LCD, LCD driver, and EEPROM.

RF Unit

Incoming RF signal from the antenna jack is fed through the ATT circuit to a diode switch, then to one of the nine band-pass filters and RF amplifiers selected by the receive frequency data from the microprocessor.

	Frequency Range	RF amplifier
Band 1	0.10000 ~ 1.99995 MHz	Q508 (2SC5006)
Band 2	2.00000 ~ 49.99995 MHz	Q513 (2SC4215Y)
Band 3	50.00000 ~ 109.99995 MHz	Q508 (2SC5006)
Band 4	110.00000 ~ 159.99995 MHz	Q518 (2SC5006)
Band 5	160.00000 ~ 259.99995 MHz	Q517 (2SC5006)
Band 6	260.00000 ~ 369.99995 MHz	Q523 (2SC5006)
Band 7	370.00000 ~ 469.99995 MHz	Q520 (2SC5006)
Band 8	470.00000 ~ 779.99995 MHz	Q524 (2SC5010)
Band 9	780.00000 ~ 1299.99995 MHz	Q526 (uPC2748T)

The amplified RF signal is delivered to the 1st IF mixer Q528 (**μPC2757T**) along with the 1st local signal from the PLL circuit, which produces the 248.45 MHz or 429.15 MHz 1st IF signal.

The 248.45 MHz 1st IF signal is fed through the roofing filter, F502 (**LSFB19-248-220K0**), to the 1st IF amplifier Q532 (**2SC5006**). In the case of the 429.15 MHz 1st IF, the signal is fed through filter F501 (**LSFB19-429-800K0**) to IF amplifier Q530 (**2SC5006**).

The filtered and amplified 1st IF signal is delivered to the 2nd IF mixer Q534 (**3SK318**) along with the 2nd local signal from the PLL circuit, which produces the 10.7 MHz 2nd IF signal. The 10.7 MHz 2nd IF signal is fed through ceramic filter F503 (**SFECV10.7MA5-Z**) and 2nd IF amplifier Q535 (**2SC4215Y**) to the IF subsystem IC Q302 (**TA31136FN**) on the AF Unit, which contains the 3rd IF mixer, 3rd local signal oscillator, and FM detector.

The 1st local VCO Q705 (**2SC5010**) and Q711 (**2SC5006**) oscillates between 371.55 and 880.90 MHz according to the programmed receiving frequency. The 1st local signal is fed through buffer amplifiers Q702 and Q709 (both **μPA811T**) to the 1st IF mixer Q528.

The 2nd local VCO Q537 (**2SC5006**) oscillates at 237.75 MHz or 259.15 MHz, according to the programmed receiving frequency. The 2nd local signal is fed through

buffer amplifier Q536 (**2SC5006**) to the 2nd IF mixer Q534.

PLL IC Q541 (**MB15F02PFV**) consists of a data shift register, reference frequency divider, phase comparator, and charge pump. Serial PLL data from the microprocessor is converted into parallel data by the shift register in the PLL IC and latched into the comparative frequency divider and reference frequency divider to set a frequency dividing ratio for each. A 15.2 MHz reference signal produced by X501 and Q542 (**2SC4617**) is delivered to the PLL IC. The internal reference frequency divider divides the 15.2 MHz reference by 3040 (or 2432) to obtain a reference frequency of 5 kHz (or 6.25 kHz), which is applied to the phase comparator for the 1st local PLL loop. Meanwhile, the internal reference frequency divider divides the 15.2 MHz reference by 1520 (or 1216) to obtain a reference frequency of 10 kHz (or 12.5 kHz), which is applied to the phase comparator for the 2nd local PLL loop.

AF Unit

The 10.7 MHz 2nd IF signal from the RF Unit is delivered to the 3rd IF mixer section in the IF subsystem IC Q302 along with the reference signal generated by 10.245 MHz crystal X301, which results in the 455 kHz 3rd IF signal.

If the signal is a (455 kHz) NFM signal, it is fed through ceramic filter F302 (**KBF-455RS-15A**), to strip away any unwanted mixer products, and is then applied to the discriminator in the IF subsystem IC Q302, which produces the demodulated audio.

In the case of a 455 kHz WFM signal, it is applied directly to the discriminator in the IF subsystem IC Q302, which produce the demodulated audio.

For AM signals, the IF energy is fed through ceramic filter F302 (**KBF-455RS-15A**), and is then applied to the 3rd IF amplifier Q343, Q311 and Q314 (all **2SC4617R**). The amplified 455 kHz AM signal is delivered to the AM detector Q315 (**MA729**), which produces the demodulated audio.

SSB/CW signals are fed through ceramic filter F301 (**KBF-455RS-4AS**), then applied to the 3rd IF amplifier Q343, Q311 and Q314 (all **2SC4617R**). The amplified 455 kHz SSB/CW signal is delivered to the ring demodulator Q319 and Q320 (both **MA729**) along with the 456.5 kHz (LSB/CW) or 453.5 kHz (USB) BFO local, generated by ceramic oscillator X302 and Q317 (**2SC4617R**), thus producing the demodulated audio.

The demodulated audio is fed through analog switch Q323 (**BU4094BCFV**) to the audio pre-amplifier Q333 (**UMX2N**).

Circuit Description

The amplified audio signal is fed through audio volume potentiometer R151 on the CNTL Unit to the AF amplifier Q336 (**2SA1588Y**), and the amplified audio signal is ultimately fed through the EAR jack to the internal speaker or an external earphone.

Required Test Equipment

The following test equipment (and thorough familiarity with its correct use) is necessary for complete realignment. Correction of problems caused by misalignment resulting from use of improper test equipment is not covered under the warranty policy. While most steps do not require all of the equipment listed, the interactions of some adjustments may require that more complex adjustments be performed afterwards. Do not attempt to perform only a single step unless it is clearly isolated electrically from all other steps. Have all test equipment ready before beginning, and follow all of the steps in a section in the order presented.

1. RF Signal Generator with calibrated output level at 1300 MHz
2. Deviation Meter (linear detector)
3. AF Millivoltmeter
4. SINAD Meter
5. Regulated DC Power Supply adjustable from 3 to 15 DC, 1A
6. Frequency Counter: >0.1 ppm accuracy at 1300 MHz
7. AF Signal Generator
8. DC Voltmeter: high impedance
9. DC Ammeter
10. 8 Ω AF Dummy Load
11. Spectrum Analyzer

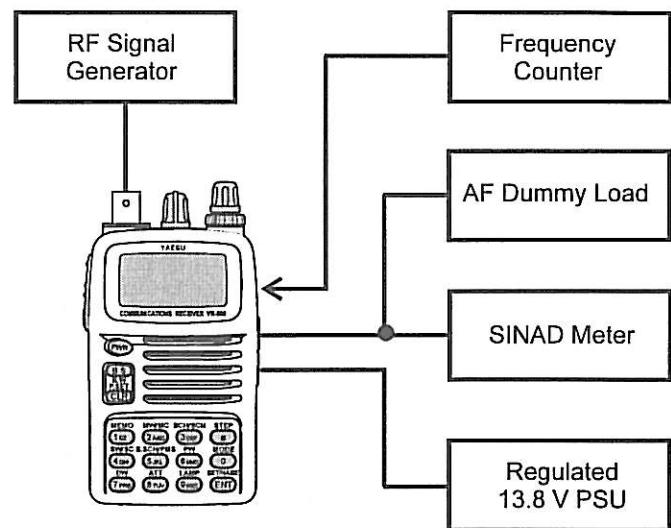

Alignment Preparation & Precautions

Correct alignment requires that the ambient temperature be the same as that of the receiver and test equipment, and that this temperature be held constant between 20° and 30° C (68° ~ 86° F). When the receiver is brought into the shop from hot or cold air it should be allowed some time for thermal equalization with the environment before alignment. If possible, alignments should be made with oscillator shields and circuit boards firmly affixed in place. Also, the test equipment must be thoroughly warmed up before beginning.

Note: Signal levels in dB referred to in this procedure are based on 0 dB μ = 0.5 μ V(closed circuit).

Test Setup

Set up the test equipment as shown below for receiver alignment.

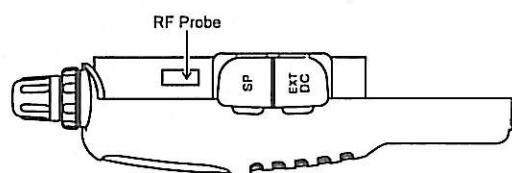

1st Local Frequency

- Set the VR-500 to 100.050 MHz, NFM mode.
- Connect the RF probe of the Frequency Counter to TP3, and adjust C620 for a reading 529.15 MHz (\pm 200 Hz) on the Frequency Counter.

3rd Local Frequency

- Set the VR-500 to 100.000 MHz, LSB mode.
- Insert the RF probe of the Spectrum Analyzer into the nest at the left side of the chassis, as shown below.

- Adjust R303 for a reading 10.2465 MHz (\pm 100 Hz) on the Spectrum Analyzer.

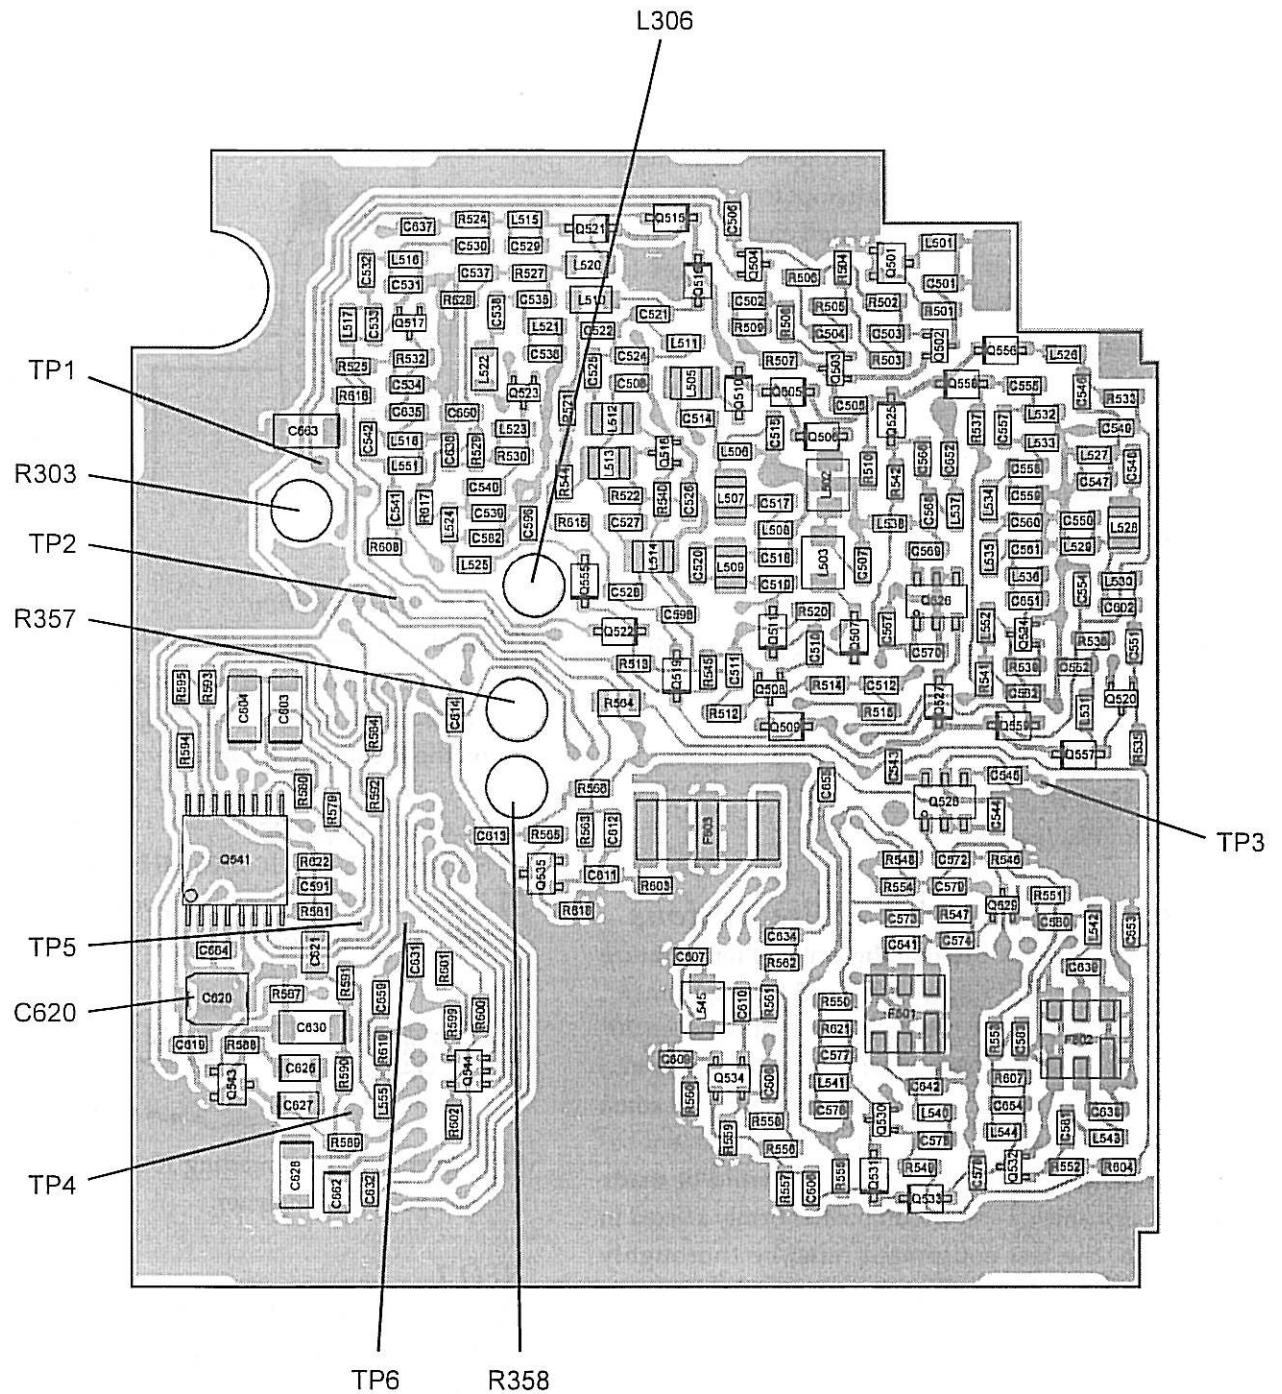

BFO 1

- Set the VR-500 to 10.050 MHz, LSB mode.
- Connect the RF Signal Generator to the Antenna jack.
- Inject a 100.050 MHz 10 dB μ signal from the RF Signal Generator, and adjust R358 to the point where the AF output level is minimized.

BFO 2

- Set the VR-500 to 10.050 MHz, USB mode.
- Connect the RF Signal Generator to the Antenna jack.
- Inject a 100.050 MHz, 10 dB μ signal from the RF Signal Generator, and adjust R357 to the point where the AF output level is minimized.

Alignment

Alignment

AF NFM Detector Coil

- Set the VR-500 to 100.050 MHz, NFM mode.
- Connect the RF Signal Generator to the Antenna jack.
- Inject a 100.050 MHz, 60 dB μ (1 kHz tone @ ± 3.5 kHz deviation) signal from the RF Signal Generator, and adjust L306 to the point where the AF output signal has minimum distortion.

RF Voltage

- Connect the DC voltmeter to TP1, and confirm a DC voltmeter reading of 2.9 ~ 3.2 V.
- Connect the DC voltmeter to TP2, and confirm a DC voltmeter reading of 2.7 ~ 3.0 V.
- Connect the DC voltmeter to TP6, and confirm a DC voltmeter reading of 9.7 ~ 10.7 V.

1st VCO VCV

- Connect the DC voltmeter to TP4, and referring to table below, tune the VR-500 to each frequency listed. Then confirm that the correct voltage is present.

Frequency	VCV Voltage
620.000 MHz	1.4 ~ 2.3 V
668.350 MHz	2.5 ~ 4.2 V
668.450 MHz	0.8 ~ 1.6 V
778.350 MHz	3.0 ~ 5.0 V
778.450 MHz	0.6 ~ 1.3 V
280.800 MHz	6.4 ~ 7.0 V
280.900 MHz	0.7 ~ 1.4 V
1299.500 MHz	3.2 ~ 3.9 V

Idle Current

- Connect the 3.0 VDC power source, via the DC ammeter, to the battery terminal (not the EXT DC jack) on the VR-500.
- Set the SQL knob fully clockwise, and set the radio to the NFM mode.
- Disable the Battery Saver via MENU #5 (Save).
- Referring to table below, tune the VR-500 to each frequency listed, then confirm that the correct Idle Current is present.

Frequency	Idle Current
1.050 MHz	less than 60 mA
10.050 MHz	less than 60 mA
100.050 MHz	less than 60 mA
150.050 MHz	less than 60 mA
200.050 MHz	less than 60 mA
300.050 MHz	less than 60 mA
400.050 MHz	less than 60 mA
600.050 MHz	less than 60 mA
1299.950 MHz	less than 65 mA

2nd VCO VCV

- Connect the DC voltmeter to TP5, and referring to table below, tune the VR-500 to each frequency listed. Then confirm that the correct voltage is present.

Frequency	VCV Voltage
320.000 MHz	0.7 ~ 1.4 V
1000.000 MHz	1.4 ~ 2.1 V

Sensitivity

- Connect the RF Signal Generator to the Antenna jack.
- Set the VR-500 to NFM mode.
- Referring to table below, tune the RF Signal Generator and VR-500 to each frequency listed, then confirm that at least 12 dB SINAD is observed at the level shown.

Frequency	12 dB SINAD
30.050 MHz	Better than -3dBu
51.050 MHz	Better than -3dBu
107.950 MHz	Better than -3dBu
137.950 MHz	Better than -3dBu
145.950 MHz	Better than -2dBu
159.950 MHz	Better than 0dBu
160.050 MHz	Better than -3dBu
180.050 MHz	Better than -3dBu
230.050 MHz	Better than -3dBu
250.050 MHz	Better than -3dBu
369.950 MHz	Better than +6dBu
459.950 MHz	Better than -1dBu
469.950 MHz	Better than 0dBu
779.950 MHz	Better than +8dBu
835.050 MHz	Better than +5dBu
859.950 MHz	Better than +5dBu
1299.950 MHz	Better than +6dBu

- Set the VR-500 to WFM mode.
- Referring to the table below, tune the RF Signal Generator and VR-500 to each frequency listed, then confirm that at least 12 dB SINAD is observed at the level shown.

Frequency	12 dB SINAD
107.950 MHz	Better than +8dBu
224.950 MHz	Better than +9dBu
459.950 MHz	Better than +12dBu
619.950 MHz	Better than +15dBu
769.950 MHz	Better than +25dBu
1259.950 MHz	Better than +20dBu

Alignment

- Set the VR-500 to the AM mode.
- Referring to the table below, tune the RF Signal Generator and VR-500 to each frequency listed, then confirm at least 10 dB S/N is observed at the frequency shown.

Frequency	10 dB S/N
0.285 MHz	Better than +20dBu
0.525 MHz	Better than +12dBu
2.050 MHz	Better than +15dBu
5.050 MHz	Better than +8dBu
49.950 MHz	Better than +7dBu
109.950 MHz	Better than +8dBu
138.050 MHz	Better than +7dBu
225.050 MHz	Better than +7dBu

- Set the VR-500 to the LSB mode.
- Referring to table below, tune the RF Signal Generator and VR-500 to each frequency listed, then confirm that at least 10 dB S/N is observed.

Frequency	10 dB S/N
2.050 MHz	Better than +6dBu
28.950 MHz	Better than -2dBu

- Set the VR-500 to the USB mode.
- Referring to table below, tune the RF Signal Generator and VR-500 to each frequency listed, then confirm that at least 10 dB S/N is observed.

Frequency	10 dB S/N
2.050 MHz	Better than +6dBu
28.950 MHz	Better than -2dBu

- Set the VR-500 to the CW mode.
- Referring to table below, tune the RF Signal Generator and VR-500 to each frequency listed, then confirm that at least 10 dB S/N is observed.

Frequency	10 dB S/N
2.050 MHz	Better than +6dBu
28.950 MHz	Better than -2dBu

S-meter & Squelch

Presetting (used in steps to follow)

- Disable the ATT function, if activated.
- Disable the Battery Saver, OFF Timer, and RF Squelch via MENU #5 (Save), MENU #6 (OFF Timer), and MENU #19 (RF Squelch) respectively, if these functions are activated.
- Set MENU # 1 (Receive Mode) to "MANUAL."
- Set these frequencies into the PMS memories:
Low band edge frequency (1:L): 1250.3750 MHz
Start Frequency (2:S): 123.1250 MHz
High Band edge Frequency (3:U): 448.2500 MHz
- Presetting is now completed; the "Battery" icon will blink.

NFM S-meter

- Preset the VR-500 via the previous steps.
- Set the VR-500 to 100.050 MHz, NFM mode.
- Connect the RF Signal Generator to the Antenna jack.
- Press the [9] key while pressing the [FUNC] key to activate the S-meter adjustment process ("S Meter Set" will appear).
- Inject a 100.050 MHz, 20 dB μ (1 kHz tone @ ± 3.5 kHz deviation) signal from the RF Signal Generator. Press the [1] key while pressing the [FUNC] key, then press the [B.S] key until the beep is heard; this saves the new setting. This routine is the S-meter "Full-Scale" adjustment.
- Reduce the RF Signal Generator output level to -1 dB μ . Press the [2] key while pressing the [FUNC] key, and then press the [B.S] key until the beep is heard; this saves the new setting. This routine is the S-meter "S-2" adjustment.
- Press the [CLR] key to return to normal operation.
- Increase the RF Signal Generator output level so that the VR-500 S-meter deflection is "Full-Scale," and confirm that the RF Signal Generator output level is 20 dB $\mu \pm 4$ dB.
- Reduce the RF Signal Generator output level so that the VR-500 S-meter deflection is just "S-2," and confirm that the RF Signal Generator output level is -1 dB $\mu \pm 4$ dB.

WFM S-meter

- Preset the VR-500 via the procedure described above.
- Set the VR-500 to 100.050 MHz, WFM mode.
- Connect the RF Signal Generator to the Antenna jack.
- Press the [9] key while pressing the [FUNC] key to activate the S-meter adjustment process ("S Meter Set" will appear).
- Inject a 100.050 MHz, 40 dB μ (1 kHz tone @ ± 75 kHz deviation) signal from the RF Signal Generator. Press the [1] key while pressing the [FUNC] key, and then press the [B.S] key until the beep is heard; this saves the new setting. This routine is the S-meter "Full-Scale" adjustment.
- Reduce the RF Signal Generator output level to 10 dB μ . Press the [2] key while pressing the [FUNC] key, then press the [B.S] key. This routine is the S-meter "S-2" adjustment.
- Press the [CLR] key to return to normal operation.
- Increase the RF Signal Generator output level so that the VR-500 S-meter deflection is "Full-Scale," and confirm that the RF Signal Generator output level is 40 dB $\mu \pm 4$ dB.

Alignment

- Reduce the RF Signal Generator output level so that the VR-500 S-meter deflection is just "S-2," and confirm that the RF Signal Generator output level is $10 \text{ dB}\mu \pm 4 \text{ dB}$.

AM S-meter

- Preset the VR-500 per the procedure described previously.
- Set the VR-500 to 1.050 MHz, AM mode.
- Connect the RF Signal Generator to the Antenna jack.
- Press the [9] key while pressing the [FUNC] key to activate the S-meter adjustment process ("S Meter Set" will appear).
- Inject a 1.050 MHz, $25 \text{ dB}\mu$ (1 kHz tone @ 30% modulation) signal from the RF Signal Generator. Press the [1] key while pressing the [FUNC] key, and then press the [B.S] key until the beep is heard; this saves the new setting. This routine is the S-meter "Full-Scale" adjustment.
- Reduce the RF Signal Generator output level to $-2 \text{ dB}\mu$; press the [2] key while pressing the [FUNC] key, then press the [B.S] key. This routine is the S-meter "S-2" adjustment.
- Press the [CLR] key to return to normal operation.
- Increase the RF Signal Generator output level so that the VR-500 S-meter deflection is "Full-Scale," and confirm that the RF Signal Generator output level is $25 \text{ dB}\mu \pm 4 \text{ dB}$.
- Reduce the RF Signal Generator output level so that the VR-500 S-meter deflection is just "S-2," and confirm that the RF Signal Generator output level is $-2 \text{ dB}\mu \pm 4 \text{ dB}$.

SSB S-meter

- Preset the VR-500 using the procedure described previously.
- Set the VR-500 to 10.050 MHz, LSB mode.
- Connect the RF Signal Generator to the Antenna jack.
- Press the [9] key while pressing the [FUNC] key to activate the S-meter adjustment process ("S Meter Set" will appear).
- Inject a 10.050 MHz, $30 \text{ dB}\mu$ signal from the RF Signal Generator. Press the [1] key while pressing the [FUNC] key, and then press the [B.S] key to until the beep is heard; this saves the new setting. This routine is the S-meter "Full-Scale" adjustment.
- Reduce the RF Signal Generator output level to $-2 \text{ dB}\mu$, then press the [2] key while pressing the [FUNC] key. This routine is the S-meter "S-2" adjustment.
- Press the [CLR] key to return to normal operation.

- Increase the RF Signal Generator output level so that the VR-500 S-meter deflection is "Full-Scale," and confirm that the RF Signal Generator output level is $30 \text{ dB}\mu \pm 4 \text{ dB}$.

- Reduce the RF Signal Generator output level so that the VR-500 S-meter deflection is just "S-2," and confirm that the RF Signal Generator output level is $-2 \text{ dB}\mu \pm 4 \text{ dB}$.

NFM Squelch

- Preset the VR-500 using the procedure described previously.
- Set the VR-500 to 100.050 MHz, NFM mode.
- Connect the RF Signal Generator to the Antenna jack.
- Press the [8] key while pressing the [FUNC] key to activate the S-meter adjustment process ("Squelch Set" will appear).
- Inject a 100.050 MHz, $0 \text{ dB}\mu$ (1 kHz tone @ $\pm 3.5 \text{ kHz}$ deviation) signal from the RF Signal Generator. Press the [2] key while pressing the [FUNC] key, and then press the [B.S] key; this routine is the Squelch "Tight" adjustment.
- Reduce the RF Signal Generator output level to $-15 \text{ dB}\mu$. Press the [1] key while pressing the [FUNC] key, and then press the [B.S] key; this routine is the Squelch "threshold" adjustment.
- Press the [3] key while pressing the [FUNC] key, then press [BS] key until the beep is heard; this saves the new Squelch setting.
- Press the [CLR] key to return to normal operation.
- Turn off the RF Signal Generator and set the SQL knob so that the background noise is just silenced.
- Turn on the RF Signal Generator and increase the RF Signal Generator output level so that the VR-500 Squelch is just opened; confirm that the RF Signal Generator output level is $-15 \text{ dB}\mu \pm 4 \text{ dB}$.
- Set the SQL knob fully clockwise, then increase the RF Signal Generator output level so that the VR-500 Squelch is just opened; confirm that the RF Signal Generator output level is $0 \text{ dB}\mu \pm 4 \text{ dB}$.

WFM Squelch

- Preset the VR-500 using the procedure described previously.
- Set the VR-500 to 100.050 MHz, WFM mode.
- Connect the RF Signal Generator to the Antenna jack.
- Press the [8] key while pressing the [FUNC] key to activate the S-meter adjustment process ("Squelch Set" will appear).
- Inject a 100.050 MHz, $20 \text{ dB}\mu$ (1 kHz tone @ $\pm 3.5 \text{ kHz}$

Alignment

- deviation) signal from the RF Signal Generator. Press the [2] key while pressing the [FUNC] key, and then press the [B.S] key; this routine is the Squelch "Tight" adjustment.
- Reduce the RF Signal Generator output level to $-3 \text{ dB}\mu$. Press the [1] key while pressing the [FUNC] key, and then press the [B.S] key; this routine is the Squelch "Threshold" adjustment.
 - Press the [3] key while pressing the [FUNC] key, then press the [BS] key until the beep is heard; this saves the new Squelch setting.
 - Press the [CLR] key to return to normal operation.
 - Turn off the RF Signal Generator and set the **SQL** knob so that the background noise is just silenced.
 - Turn on the RF Signal Generator and increase the RF Signal Generator output level so that the VR-500 Squelch is just opened; confirm that the RF Signal Generator output level is $20 \text{ dB}\mu \pm 4 \text{ dB}$.
 - Set the **SQL** knob fully clockwise, then increase the RF Signal Generator output level so that the VR-500 Squelch is just opened; confirm that the RF Signal Generator output level is $-3 \text{ dB}\mu \pm 4 \text{ dB}$.

AM Squelch

- Preset the VR-500 per the procedure described previously.
- Set the VR-500 to 1.050 MHz, AM mode.
- Connect the RF Signal Generator to the Antenna jack.
- Press the [8] key while pressing the [FUNC] key to activate the S-meter adjustment process ("Squelch Set" will appear).
- Inject a 1.050 MHz, 0 dB μ (1 kHz tone @ 30% modulation) signal from the RF Signal Generator. Press the [2] key while pressing the [FUNC] key, and then press the [B.S] key; this routine is the Squelch "Tight" adjustment.
- Reduce the RF Signal Generator output level to $-15 \text{ dB}\mu$. Press the [1] key while pressing the [FUNC] key, and then press the [B.S] key; this routine is the Squelch "Threshold" adjustment.
- Press the [3] key while pressing the [FUNC] key, then press [BS] key until the beep is heard; this saves the new Squelch setting.
- Press the [CLR] key to return to normal operation.
- Turn off the RF Signal Generator and set the **SQL** knob so that the background noise is just silenced.
- Turn on the RF Signal Generator and increase the RF Signal Generator output level so that the VR-500 Squelch is just opened; confirm that the RF Signal Generator output level is $0 \text{ dB}\mu \pm 4 \text{ dB}$.

- Set the **SQL** knob fully clockwise, then increase the RF Signal Generator output level so that the VR-500 Squelch is just opened; confirm that the RF Signal Generator output level is $-15 \text{ dB}\mu \pm 4 \text{ dB}$.

LSB Squelch

- Preset the VR-500 per the procedure described previously.
- Set the VR-500 to 10.050 MHz, LSB mode.
- Connect the RF Signal Generator to the Antenna jack.
- Press the [8] key while pressing the [FUNC] key to activate the S-meter adjustment process ("Squelch Set" will appear).
- Inject a 10.050 MHz, $-1 \text{ dB}\mu$ signal from the RF Signal Generator. Press the [2] key while pressing the [FUNC] key, and then press the [B.S] key; this routine is the Squelch "Tight" adjustment.
- Reduce the RF Signal Generator output level to $-14 \text{ dB}\mu$. Press the [1] key while pressing the [FUNC] key, and then press the [B.S] key; this routine is the Squelch "Threshold" adjustment.
- Press the [3] key while pressing the [FUNC] key, then press [BS] key until the beep is heard; this saves the new Squelch setting.
- Press the [CLR] key to return to normal operation.
- Turn off the RF Signal Generator and set the **SQL** knob so that the background noise is just silenced.
- Turn on the RF Signal Generator and increase the RF Signal Generator output level so that the VR-500 Squelch is just opened; confirm that the RF Signal Generator output level is $-1 \text{ dB}\mu \pm 4 \text{ dB}$.
- Set the **SQL** knob fully clockwise, then increase the RF Signal Generator output level so that the VR-500 Squelch is just opened; confirm that the RF Signal Generator output level is $-14 \text{ dB}\mu \pm 4 \text{ dB}$.

AF Output

- Connect the RF Signal Generator to the Antenna jack, and connect the DC volt meter and 8Ω dummy load to the **SP** jack.
- Connect the 13.8 VDC power source to the **EXT DC** jack.
- Set the VR-500 to 100.050 MHz NFM mode, and rotate the **VOL** knob fully clockwise.
- Inject a $60 \text{ dB}\mu$ from the RF Signal Generator; confirm that the DC voltmeter reading is more than 1.10V (150 mW with 8Ω load).
- Disconnect the 13.8 VDC power source from the **EXT DC** jack, then connect the 3.0 VDC power source to the Battery terminal; confirm that the DC voltmeter

Alignment

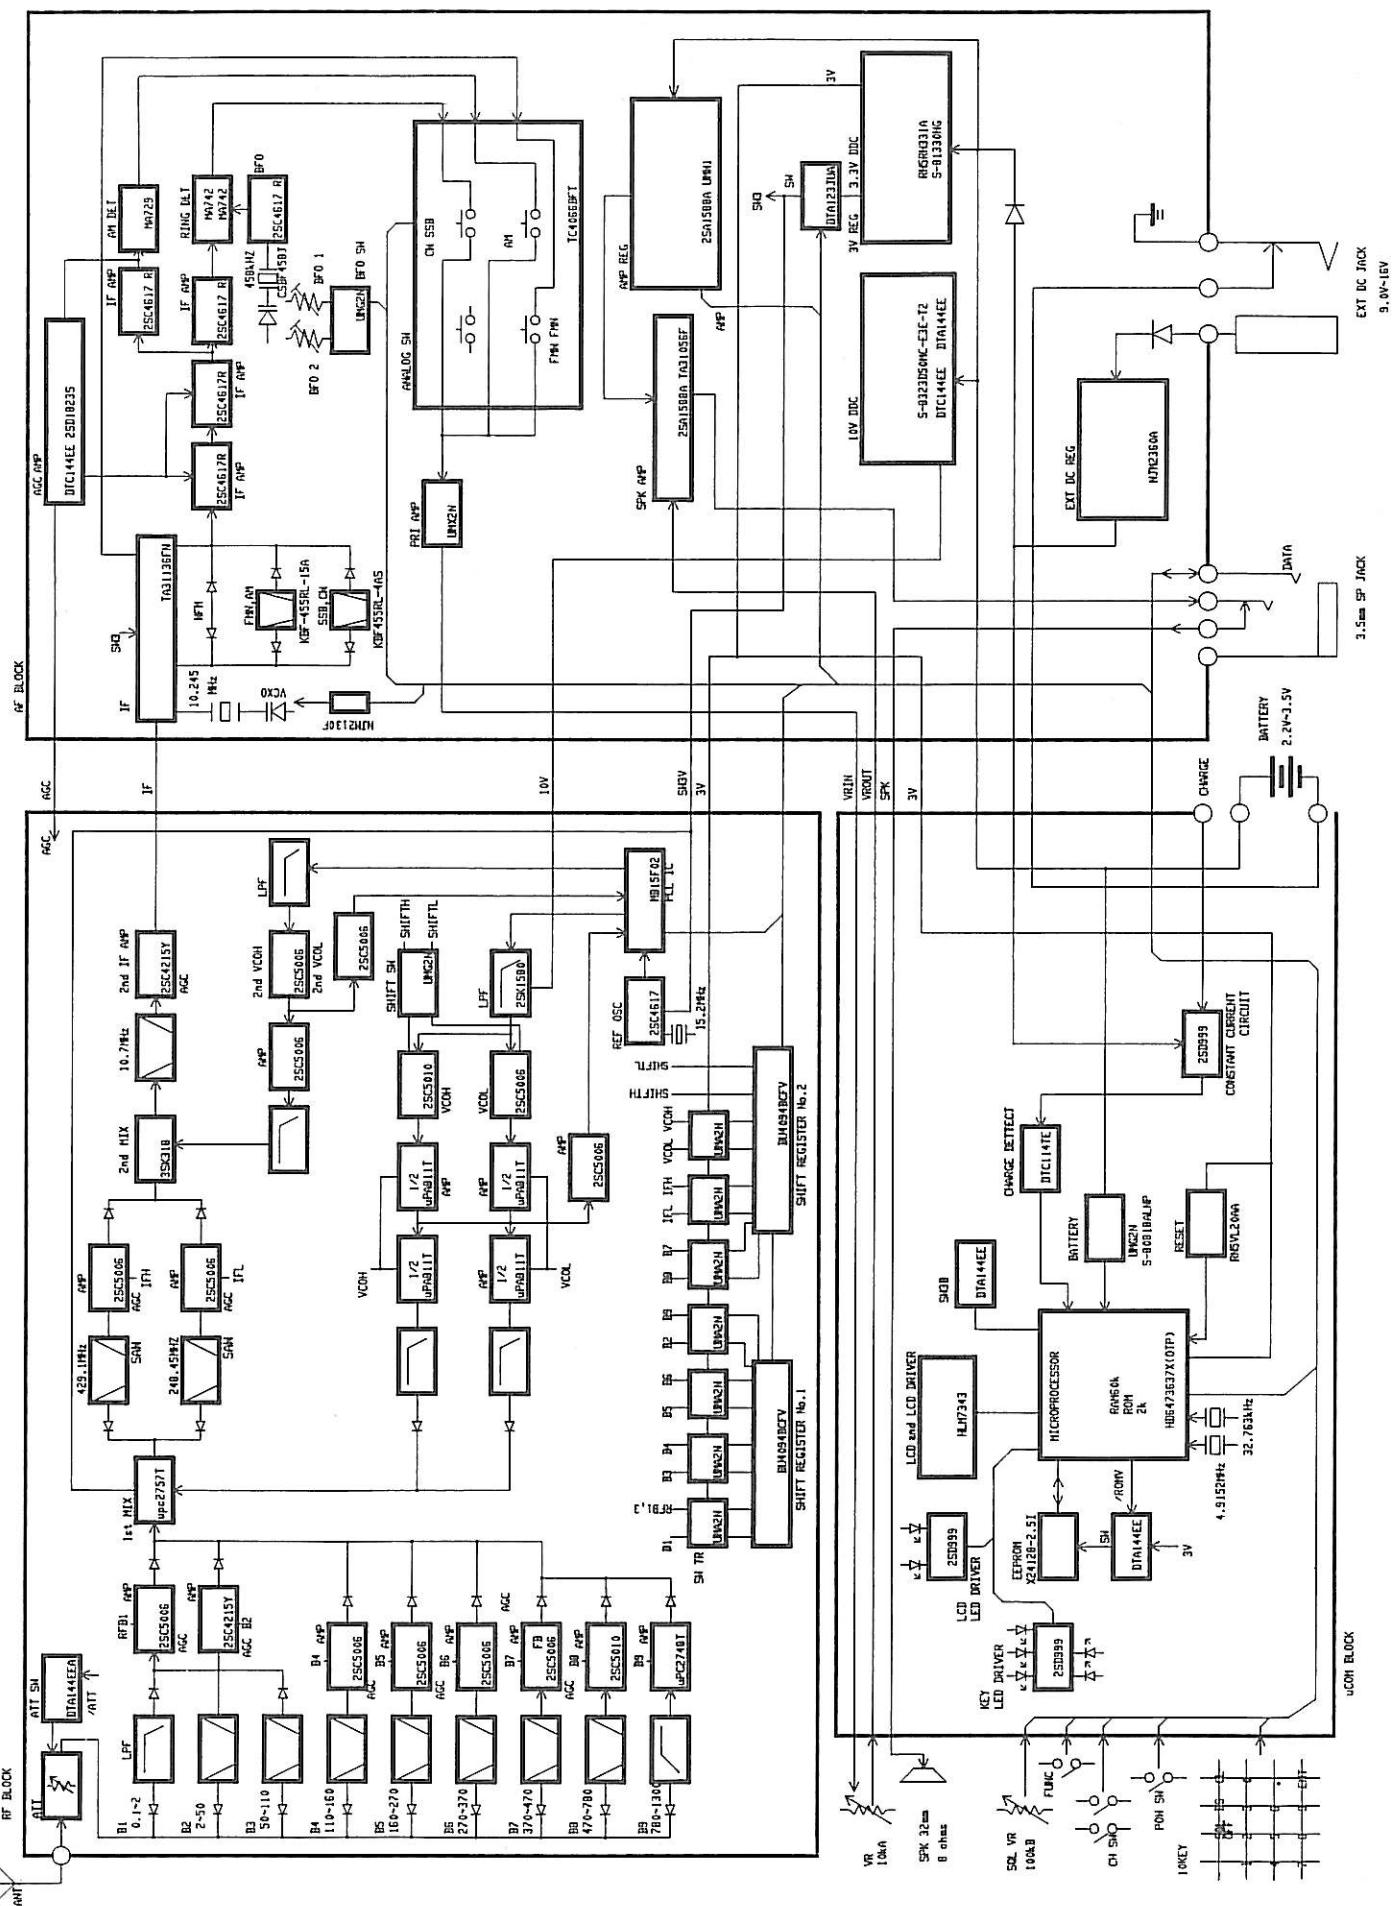

reading is more than 0.85 V (90 mW with $8\ \Omega$ load).

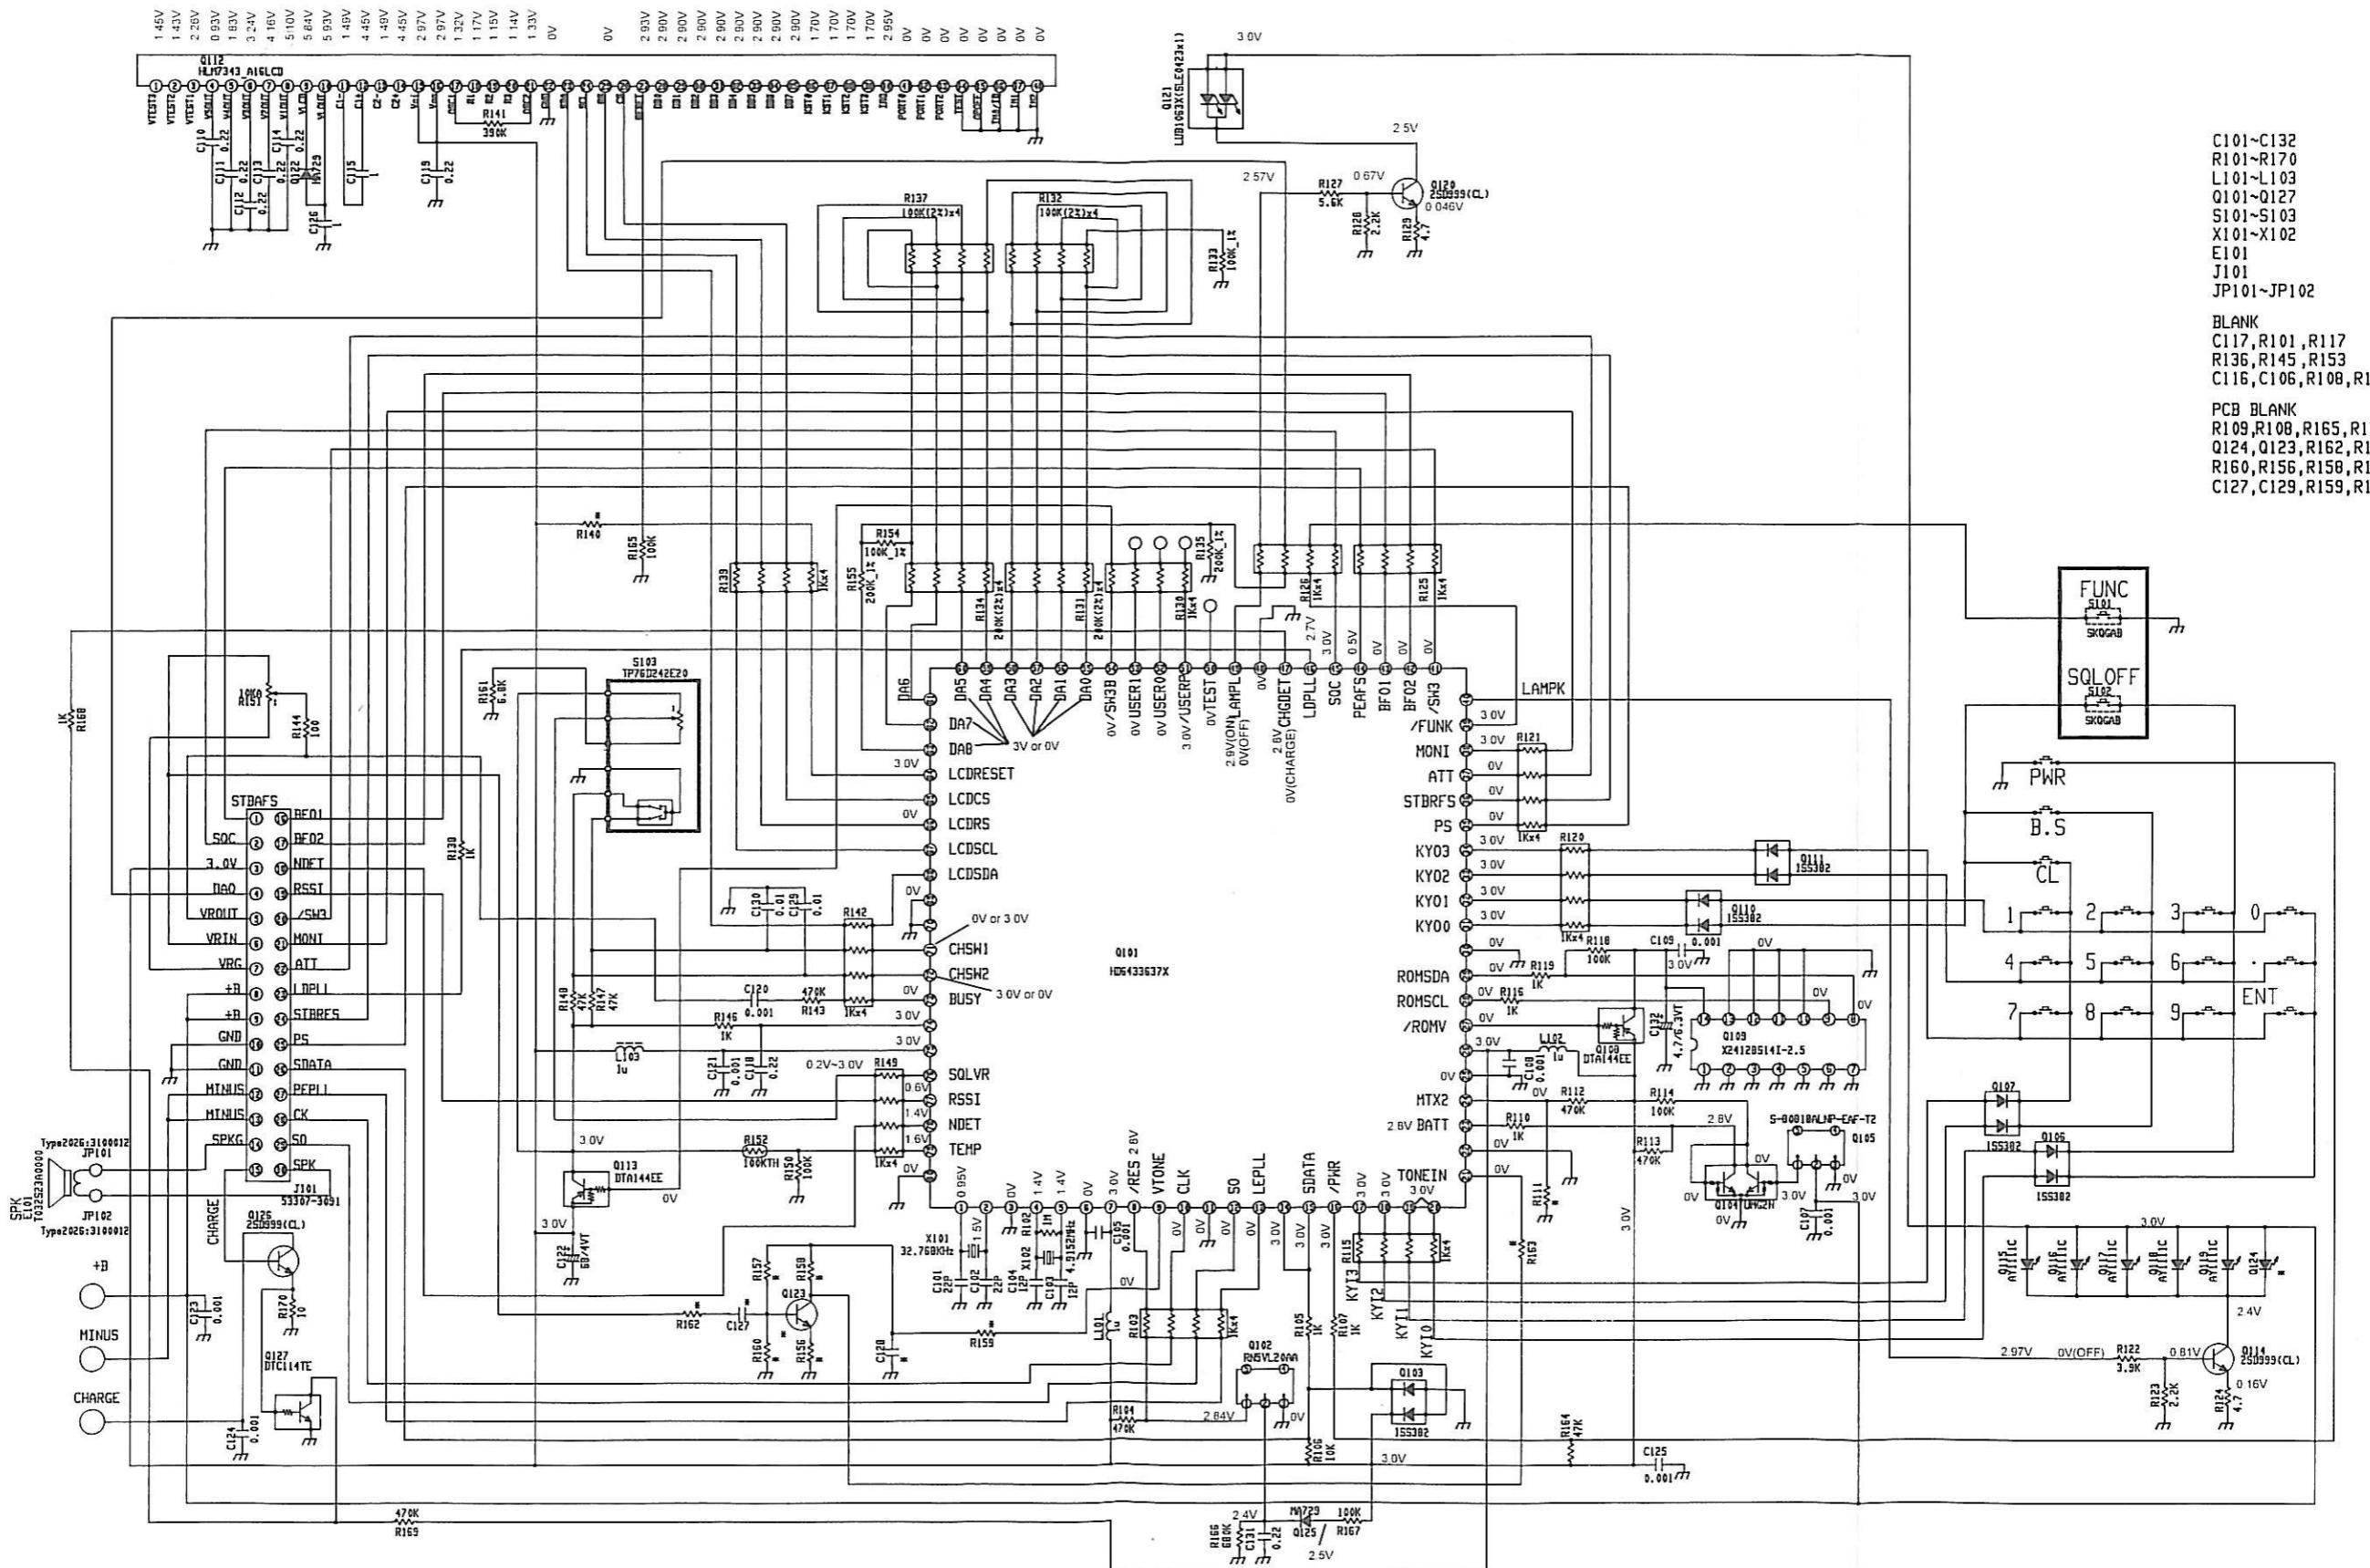

- Repeat the above steps in the WFM, AM, LSB, USB, and CW modes, and confirm that the AF output level is more than 150 mW @ 13.8 VDC and 90 mW @ 3.0 VDC.

ATT

- Set the VR-500 to 100.050 MHz, NFM mode.
- Connect the RF Signal Generator to the Antenna jack.
- Inject a 100.050 MHz, NFM signal from the RF Signal Generator; confirm that the 12 dB SINAD difference between the ATT “ON” and “OFF” conditions is 15 ~ 25 dB.
