Uniform Limited Warranty Statement

Electro-Voice® products are guaranteed against malfunction due to defects in material or workmanship for a specified period, as noted in the product-line statement(s) below, or in the individual product data sheet or owner's manual, beginning with the date of original purchase. If such malfunction occurs during the specified period, the product will be repaired or replaced (at our option) without charge. The product will be returned to the customer prepaid.

Exclusions and Limitations: The Limited Warranty does not apply to: (a) exterior finish or appearance; (b) certain specific items described in the individual product-line statement(s) below, or in the individual product data sheet or owner's manual; (c) malfunction resulting from use or operation of the product other than as specified in the product data sheet or owner's manual; (d) malfunction resulting from misuse or abuse of the product; or (e) malfunction occurring at any time after repairs have been made to the product by anyone other than Mark IV Audio Service or any of its authorized service representatives.

Obtaining Warranty Service: To obtain warranty service, a customer must deliver the product, prepaid, to Mark IV Audio Service or any of its authorized service representatives together with proof of purchase of the product in the form of a bill of sale or receipted invoice. A list of authorized service representatives is available from Mark IV Audio Service at 600 Cecil Street, Buchanan, MI 49107 (800-234-6831 or FAX 616-695-4743).

Incidental and Consequential Damages Excluded: Product repair or replacement and return to the customer are the only remedies provided to the customer. Electro-Voice® shall not be liable for any incidental or consequential damage including, without limitation, injury to persons or property or loss of use. Some states do not allow the exclusion or limitation of incidental or consequential damages so the above limitation or exclusion may not apply to you.

Other Rights: This warranty gives you specific legal rights, and you may also have other rights which vary from state to state.

Electro-Voice® Electronics are guaranteed against malfunction due to defects in materials or workmanship for a period of three (3) years from the date of original purchase. Additional details are included in the Uniform Limited Warranty statement.

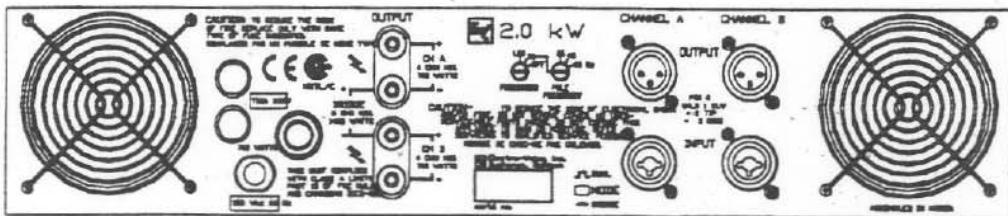

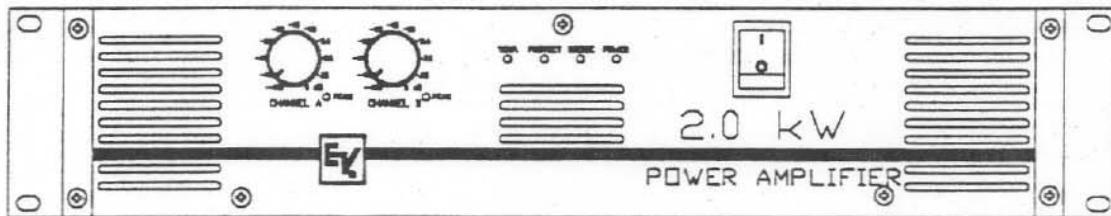

PRODUCT DESCRIPTION

The Electro-Voice® 1.0 kW, 1.5 KW and 2.0 KW amplifiers are designed to meet the requirements of the Music Instrument and the Concert Sound markets. These dual channel amplifiers are light weight while delivering high power to 4 or 8 Ω loads. Both channels can be bridged to provide even greater power to an 8 Ω load. The enhanced performance of these two rack high amplifiers is made possible by combining a Class-H rail technology with dual switchmode power supplies. The high efficiency of both of these technologies combine to provide a cooler running and lighter weight amplifier.

These amplifiers offer an audio signal processor that can be switched ON or OFF. In the ON position the processor provides two different modes of equalization filters. The factory set position is LPN (Low-pass notch), a second-order shelving equalizer with a pole frequency of 50 Hz. This position dramatically and safely enhances the bass performance of compact vented sound reinforcement speaker systems. The second position of the processor is B6. A more conservative equalization scheme, it offers three second-order underdamped high-pass filters with corner frequencies of 60Hz, 43Hz and 26Hz for low-frequency enhancement of sound reinforcement speaker systems.

Detented volume control knobs along with status LEDs are located on the front panel while input and output connectors are located on the rear panel. The input connectors are the combo XLR/PHONE type with parralled output XLRs for ease of dazy-chaining the input signal to other equipment. The output is available on touch-proof binding post. Cooling air is moved from front to rear through two extruded wind tunnels by continuously variable speed fans.

These amplifiers are in full compliance with the safety requirements of UL, CSA and IEC and are in compliance with the emissions requirements of the FCC and VDE.

UNPACKING

This shipping carton is specially designed to protect the amplifier while transporting under normal conditions. It is still possible for damage to occur. Therefore, carefully inspect the outside carton for signs of abuse. If for any reason the amplifier should be returned, use the shipping carton that it came in. Electro-Voice® cannot warranty against damage that occurs as a result of improper packaging.

PRECAUTIONS

Do not replace the fuses with a higher amp rating than what is specified. There are various circuits inside the amplifier that detect fault conditions and place the amplifier in PROTECT (indicated on the front panel by the red LED). A blown ac panel fuse indicates a more severe problem such as a power supply or amplifier failure. An oversized fuse installed under these conditions can lead to a possible fire hazard.

Should an abnormal operating condition occur that would cause the amplifier to over heat (such as a restriction of the cooling air flow or a prolonged over load) the amplifier will shut down. The front panel LEDs for TEMP and PROTECT will be brightly lit. Remove the fault condition and allow the amplifier temperature to return to normal. The amplifier will automatically restart when its internal temperature returns to a safe level.

SPECIFICATIONS

OUTPUT POWER: (Watts)

(Ref. 1K Hz, 1% THD)

INPUT CONNECTIONS

The electronically balanced input connection for each channel is made to a combo connector. The combo connector for each channel is paralleled with a XLR female connector which provides an auxiliary output for routing the input signal to multiple amplifiers. For single-ended unbalanced signal sources, the negative terminal (Ring of the 1/4" phone jack and pin3 of the XLR) should be connected to ground (Sleeve of the 1/4" phone jack and pin 1 of the XLR). The Tip of the 1/4" phone jack connector corresponds to the positive terminal (pin 2 of the XLR). See figure 1.

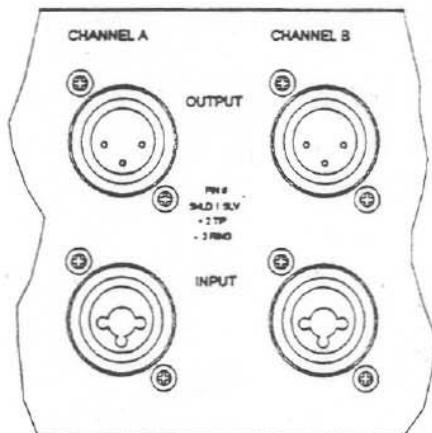

Figure 1A

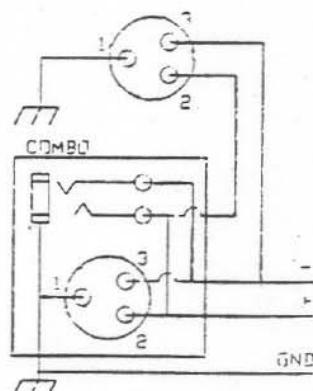

Figure 1B

OUTPUT CONNECTORS

The output terminals for each channel are tough-proof binding post connectors that accept either banana plugs or up to 7 AWG (4mm) wire. The *Red* post is the high (+) output and the *Black* post is the low (-) output. These connectors are used for both stereo or dual output and mono bridged output. The configuration of the output terminals is controlled by the MODE switch located on the rear of the amplifier.

OPERATION

MOUNTING - The amplifier is designed for standard 19 inch rack mounting. In addition, the amplifiers are equipped with non-skid rubber feet for secure table top or stacked operation. When rack mounting one or more amplifiers or when mounting in combination with other equipment, be sure to allow adequate front and rear ventilation to avoid possible heat related damage to the amplifier or other rack mounted items.

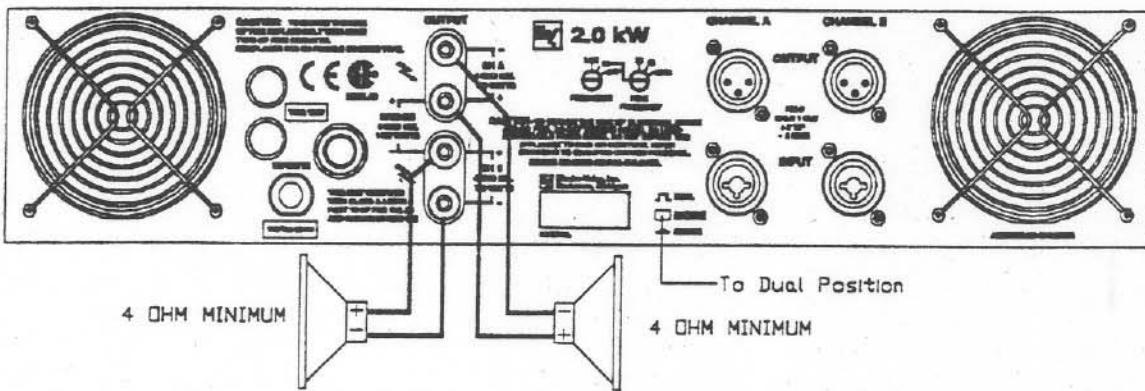

Figure 2

DUAL MODE - In the dual mode of operation, each channel may be operated independently into a minimum load impedance of 4Ω (see figure 2). After installation and hookup, verify that the MODE switch is in the "DUAL" position and that the level controls, located on the front panel, are in the fully counterclockwise (full attenuation) position. Apply power to the amplifier and slowly rotate the level controls clockwise until the desired output power is obtained. If either the "PEAK A" or the "PEAK B" LED is illuminated, reduce the input signal level by rotating the corresponding level control counterclockwise until the LED is extinguished.

WARNING: Never attempt to connect the outputs of the two channels in parallel.

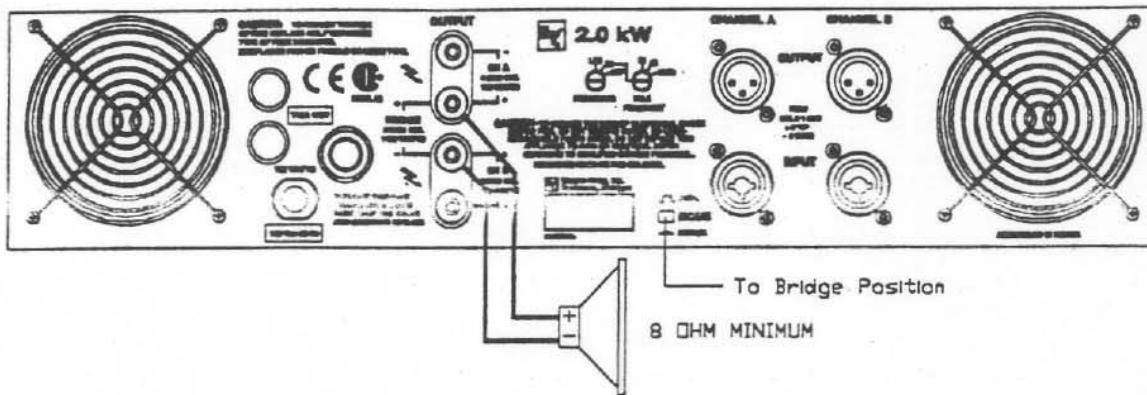

Figure 3

BRIDGE MODE - In BRIDGE mode the output load of $8\ \Omega$ or higher is connected across the two *Red* binding posts. Channel A's *Red* binding post is the (+) terminal and channel B's *Red* binding post is the (-) terminal (see figure 3). The input signal is connected to channel A. The channel B input connector is internally disconnected from the channel B amplifier and the channel B amplifier is connected to the channel A input signal after it has been shifted in phase by 180° .

After installation and hookup, verify that the MODE switch is in the "BRIDGE" position and that the level controls (located on the front panel) are in their fully counterclockwise position (full attenuation). Apply power to the amplifier and verify that the "BRIDGE" LED is illuminated. If the "BRIDGE" LED is not illuminated, the MODE switch is in the wrong position. Reset the MODE switch to the "BRIDGE" position.

Slowly rotate the level controls clockwise until the desired output power is obtained. If either the "PEAK A" or the "PEAK B" LED is illuminated, reduce the input signal level by rotating the corresponding level control counterclockwise until the LED is extinguished.

WARNING: *The bridged output mode provides a true balanced-to-ground output. Do not use any test equipment to test or evaluate this amplifier which does not have floating grounds.*

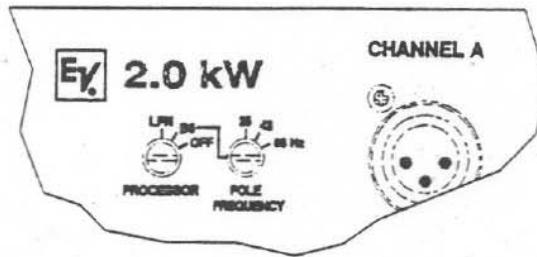

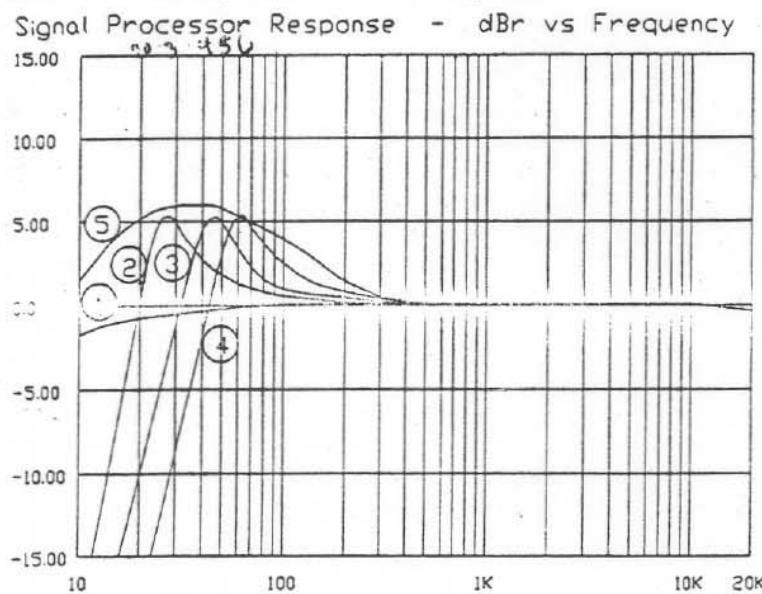

Figure 4

PROCESSOR - This switch, located on the rear panel, can be used to select three different processing modes: LPN, B6 and OFF.

Electro-Voice
Operation Manual for the
1.0KW, 1.5KW & 2.0KW amplifiers

7

- Curve 1 PROCESSOR OFF
Curve 2 B6/26 Hz position
Curve 3 B6/43 Hz position
Curve 4 B6/60 Hz position
Curve 5 LPN position

Figure 5

POSITION LPN - The LPN (low-pass-notch) is the factory preset mode, and is a second-order shelving equalizer with a pole frequency of 50 Hz. It dramatically enhances the bass performance of the typical compact, high-efficiency vented speaker system used in portable sound reinforcement. The shape of the response curve (see figure 5) is designed to complement the requirements of these speaker systems and is difficult if not impossible to achieve with conventional, outboard graphic equalizers.

CAUTION - Care must be exercised when using the LPN position so as not to over power the speaker with low frequency signals.

POSITION B6 - In position "B6", an undamped second-order high-pass filter is inserted in the signal path for both low-frequency equalization/enhancement and infrasonic speaker protection. The underdamping produces a maximum 6 dB of bass enhancement at the so-called peak-boost frequency. Below the boost frequency, output is reduced at a rate of 12 dB per octave. This provides—when the frequency of peak-boost is properly matched to the speaker system—a high degree of infrasonic (very-low-frequency) speaker protection. (For detailed comment on infrasonic speaker protection, see Moderate Bass Enhancement of EV Portable Sound Reinforcement Speaker section, below). The B6 position offers three different peak-boost frequencies: 26 Hz, 43 Hz and 60 Hz.

There are two basic situations where the B6 position is appropriate:

1. Moderate bass enhancement of EV portable sound reinforcement speaker systems.
 2. Thiele-Small B_6 alignment of EV fixed-installation low-frequency and subwoofer speaker systems.
- Each application is discussed in more detail below.

Moderate Bass Enhancement of EV Portable Sound Reinforcement Speaker Systems

EV sound reinforcement speaker systems are, in general, designed to provide uniform low-frequency response down to just above the frequency where response is specified 3 dB down. The B6 positions, properly chosen, will both enhance this inherent performance and supply infrasonic protection of the speaker/enclosure combination. In an optimally designed vented speaker system, the output near and for an octave or so above the system's 3-dB-down point is supplied substantially by air moving back and forth in the vent, driven to full acoustic output by a relative small motion of the speaker cone itself. The

Electro•Voice

Operation Manual for the
1.0KW, 1.5KW & 2.0KW amplifiers

8

frequency of maximum vent output is called the "tuning frequency" of the box, where the mass of air in the vent resonates with the "spring" of air within the box.

Strong bass input can be safely applied above the box tuning frequency. Below the box tuning frequency, system output decreases rapidly and cone excursion increases rapidly. Strong bass input in this region can cause distortion, rob amplifier power and even damage the low-frequency speaker. The bass roll-off below the peak-boost frequency of the B6 filters provides protection against such infrasonic (very-low-frequency) signals that could compromise overall system performance. Potentially problematic infrasonic signals include a dropped microphone and synthesizer-produced high-level low bass that the speaker system is not designed to handle.

The 43 and 60 Hz peak-boost frequencies are designed to enhance Electro-Voice portable sound reinforcement speakers. The 43 Hz boost frequency is intended for boxes tuned from 37 to 50 Hz. The 60 Hz boost frequency is for boxes tuned from 55 to 75 Hz. The fundamental idea is to avoid overstressing the speaker by having the peak-boost frequency no more than 15% below the box tuning frequency. For convenience, current Electro-Voice models are shown in Table I. Contact Electro-Voice for information on systems that are not listed.

Table I

| Model | Recommended B6 Peak-Boost Frequency | Box Tuning Frequency (for reference only) |
|-----------|-------------------------------------------|-------------------------------------------------|
| MTS-1 | 60 Hz | 55 Hz |
| S-122 | 60 Hz | 62 Hz |
| S-152 | 43 Hz | 42 Hz |
| S-181 | 43 Hz | 41 Hz |
| S-1202ER | 60 Hz | 70 Hz |
| S-1503ER | 43 Hz | 44 Hz |
| S-1803ER | 43 Hz | 37 Hz |
| SH-1502ER | 60 Hz | 55 Hz |
| SH-1512ER | 43 Hz | 50 Hz |
| SH-1810ER | 43 Hz | 39 Hz |
| Sb120 | 60 Hz | 55 Hz |
| Sx200 | 60 Hz | 65 Hz |
| T22 | N/A ¹ | 75 Hz |
| T52 | 60 Hz | 55 Hz |
| T53 | 60 Hz | 55 Hz |
| T18 | 43 Hz | 39 Hz |

1. B6 enhancement not recommended for T22. The highest boost frequency of 60 Hz is too low for high-level operation (more than 15% below the 75 Hz box tuning frequency).

"Step-Down" Equalization (Thiele-Small B₆ alignment) of Electro-Voice TL Series Fixed Installation Sound Reinforcement and Music Playback Speaker Systems.

"Step-Down" is a good way to extend system low-frequency response by increasing amplifier power at certain frequencies instead of enclosure size. In step-down, the enclosure is tuned to a lower-than-normal frequency. This increases system output at the new tuning frequency and reduces output slightly in the region of original tuning. The smoothly falling response which results can be equalized to provide a new system 3 dB-down point that is about 0.7 that of the original. To achieve a similar response extension without equalization would require an enclosure at least twice the size.

Electro-Voice
Operation Manual for the
1.0KW, 1.5KW & 2.0KW amplifiers

9

The required equalization is a second-order undamped high-pass filter, which provides a 5 dB maximum boost at the appropriate frequency and a 12 dB-per-octave roll-off below that frequency, offering a high degree of infrasonic speaker protection. (For detailed comment on infrasonic speaker protection, see the Moderate Bass Enhancement of EV Portable Sound Reinforcement Speaker Systems section, above).

Most Electro-Voice TL series permanent-installation low-frequency systems are designed for step-down operation. The B6 peak-boost frequencies are appropriate for many TL models, as detailed in Table II. The boost frequencies differ slightly from those specifically noted in the individual TL system engineering data sheets, but the differences are of minor significance. The data sheets provide step-down instructions (usually a matter of covering one of the two enclosure vents with the supplied cover).

For the interested reader, Pro Sound Facts No. 7, available from Electro-Voice, gives more detailed comments on step-down operation. Contact Electro-Voice for information on systems that are not listed.

Table II

| Model | Recommended B6 Peak-Boost Frequency | Box Tuning Frequency (for reference only) |
|---------|-------------------------------------------|-------------------------------------------------|
| TL12-1 | 43 Hz | 43 Hz |
| TL12-1E | 43 Hz | 39 Hz |
| TL15-1 | 26 Hz | 28 Hz |
| TL15-2 | 26 Hz | 28 Hz |
| TL18-1 | 26 Hz | 28 Hz |
| TL440 | 26 Hz | 25 Hz |
| TL550D | 26 Hz | 25 Hz |
| TI880D | 26 Hz | 25 Hz |
| TL3512 | 26 Hz | 25 Hz |

POSITION OFF - In the OFF position, the low-frequency equalizations are switched off. This position must be selected if a signal processing unit like the Electro-Voice Dx34 is used upstream of the power amplifier. Otherwise equalizer functions are "double-used" in the signal path.

OUTPUT CABLE SELECTION

Speaker wire size plays an important part in quality sound systems. Small wire sizes can waste power and reduce the damping factor at the speaker terminals. This can add coloration and muddiness to the sound. To help offset this problem Tables III and IV have been assembled to enable the user to calculate the power losses in the speaker cable.

CALCULATING POWER LOSSES

To calculate the power loss in the speaker cable, multiply the power loss per foot of the 2-wire cable using the appropriate table below by the length of the cable in feet. For example, suppose an installer uses 160 feet of 12 gauge 2-wire cable with an 8 Ω speaker system connected to a 1.0 KW amplifier. The total power loss in the cable is:

$$\text{Total power Loss} = 0.1053 \text{ Watts / Ft.} \times 160 \text{ Feet} = 16.9 \text{ Watts}$$

Does this mean that whenever the amplifier produces 250 watts of output power, 233.1 Watts (250 Watts minus 16.9 Watts) will be delivered to the $8\ \Omega$ load? NO! The actual load impedance is now $8\ \Omega$ plus the resistance of the cable ($0.00324\ \Omega/\text{Ft} \times 160\ \text{Ft} + 8\ \Omega = 8.52\ \Omega$). Because of the change in the load impedance, the actual total power produced by the amplifier is 234.7 Watts. The power delivered to the load is approximately 234.7 Watts minus 16.9 Watts or 217.8 Watts.

TABLE III
1.0 KW Power losses per foot in 2-wire speaker

DAMPING FACTOR

The higher the damping factor of an amplifier, the greater the ability of the amplifier to control unwanted speaker cone movements. When a signal drives a woofer, current flowing through the voice coil creates a magnetic field. This field interacts with the permanent magnetic field in the gap and forces the combination cone and voice coil assembly to move outward. When the signal is removed, the assembly moves inward but its momentum causes it to overshoot its resting point. This overshoot will dampen itself out eventually but the unwanted movements can add considerable distortion to the sound. In the process of moving inward through the magnetic field, the voice coil assembly generates a current of opposite polarity to the original signal. This current induces a voltage or "back EMF" which travels through the speaker wire to the amplifier's output. The lower the amplifier source impedance, the faster the overshoot of the coil will dampen out. The source impedance of an amplifier can be calculated by

dividing the rated output impedance, typically $8\ \Omega$, by the damping factor. The source impedance of the 1.0 KW, 1.5 KW and the 2.0 KW amplifiers is $0.04\ \Omega$.

Cable Selection for Specified Damping Factor at the Load.

The damping factor rating of the amplifier is typically never realized at the load because of the resistance of the cable. The damping factor at the load should be 30 for general paging systems and 50 for high-fidelity music systems. Economics usually dictate however that these numbers be cut in half. The resulting damping factors at the load should be based on experience and customer

satisfaction. Once a minimum damping factor is determined for a particular type of installation, the following equation can be used to calculate the maximum length of two-wire cable which can be used to achieve the minimum damping factor specified at the load:

$$\text{Max Length} = \frac{\frac{Z_L}{DF} - Z_o}{DCR}$$

ZL = load impedance

Z_o = Amplifier source impedance

DF = minimum permissible damping factor

DCR = dc resistance per foot of the 2-wire cable (Table IV)

Suppose ZL equals $8\ \Omega$, Z_o = $0.04\ \Omega$ and the minimum damping factor at the load is to be 25. In addition, 18 GA cable is preferred. Then the maximum length of cable which can be used to achieve a damping factor of 25 at the load is:

$$\text{Max Length} = ((8/25)-0.04)/0.01302 = 21.5 \text{ feet}$$

SPEAKER PROTECTION

Sometimes it may be desirable to use in-line fuses to protect loudspeaker systems (Figure 6). It is difficult however to determine the proper fuse value with the correct time lag and overload characteristic to match the limitations of a speaker system. Fuse values are shown for the given power and load in Table VII. The values are calculated for fast-blow fuses which carry 135% of their current rating for an hour but will blow within 1 second at 300%. Other fuse values may be calculated for different power levels from the following equation:

$$\text{Fuse Value} = \frac{\sqrt{P_{\text{out}} \cdot Z_L}}{Z_L \cdot 1.35}$$

P_{out} = rated power of amplifier

Z_L = load impedance

TABLE VII Speaker Protection Fuse Current Rating

| Power (Watts) | 4Ω | 8Ω | 16Ω |
|---------------|------|------|------|
| 100 | 3.7 | 2.62 | 1.85 |
| 150 | 4.54 | 3.21 | 2.27 |
| 200 | 5.24 | 3.7 | 2.62 |
| 300 | 6.42 | 4.54 | 3.21 |
| 400 | 7.41 | 5.24 | 3.7 |
| 600 | 9.07 | 6.42 | 4.54 |

Compression drivers are much more susceptible to damage from low frequencies than large cone loudspeakers. Even though an electronic crossover may be employed, problems may arise in the cables between the crossover and the power amplifier, or from misadjustment of the crossover. Either of these situations could apply low frequency signals or hum to the driver and cause damage. To prevent a potential problem Altec Lansing recommends using a capacitor between the amplifier and the compression driver to suppress low frequencies and possible dc. Refer to the example in Figure 7.

EV Product

In choosing a value, one must be careful not to interfere with the crossover frequency. As a general rule, select a capacitor whose break frequency with respect to the load is 3dB down at approximately 1/2 of the high pass corner frequency. Mylar capacitors with at least a 100 Volt ac rating are recommended. Table VIII shows the recommended capacitor values for use with 8 and 16 Ω drivers at common crossover frequencies.

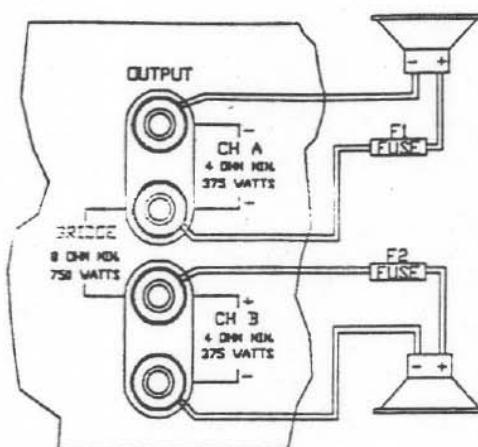

Figure 6

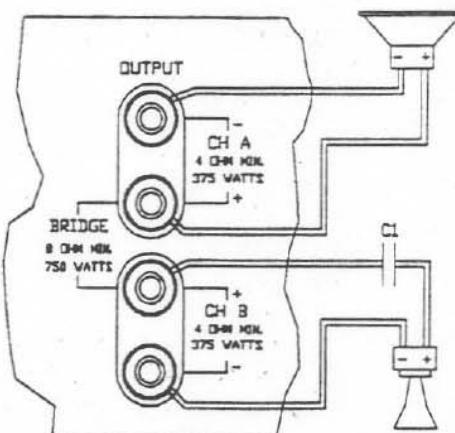

Figure 7

Electro-Voice
Operation Manual for the
1.0KW, 1.5KW & 2.0KW amplifiers
