Selftest - Program D200

- 1.) Cancel all presets (Bass, General, Organ, Upper)
- 2.) Place rhythm pattern selector tab in the position for Slow Rock (Upper)
- 3.) Depress Slow Rock 12/8 button
- 4.) At this time no other tab or button should be depressed.
- 5.) Set metronome counter to 198
- 6.) Depress any upper preset button for approximately 10 seconds.
- 7.) To proceed on to the next test the "+" metronom switch should be depressed momentarily.

Note: If there is a fault the letter "E" will appear with a number "xx" in the following spaces.

Test A: Testing Percussion

The LCD display indicates "Rhythm"
The 27 (16) rhythm instruments will play one after the other. Adjust volume with the footswell and the rhythm volume control.

Test B: Filter test

The LCD display indicates "Channel"
You will hear about all 8 channels the same tone one after another. Because the filters are different, you will hear different tones.

It is possible to adjust the sound intensity with the footswell and the corresponding volume controls. Not all channels have volume control. (ex.organ)

Test C: Interrupt test

The LCD display indicates "Interrupt". There are no sounds with this test. The system is checking the 10mS Interrupt and the rhythm interrupt.

Test D: PROM-check

The LCD display indicates "PROM". There are no sounds with this test. The system is checking certain Prom's. At the same time the D/A-Converter on the board "Filter with DAC" is switched on maximum Voltage (5V).

Test E: RAM-check

The LCD display indicates "RAM and MEG". The system is checking 3 RAM IC's and the RAM of the MEG circuit after another.

Test F: MIDI-test

The LCD display indicates "UART". The system is checking the UART-IC on the MIDI Interface.

8.) To return to normal organ mode depress the tempo "—" button.

9.) During any of the tests, the voicing controls lights will be turned on and off in a sequential pattern. This allows for a visual check to assure that all control lights operate.

Indication of faults

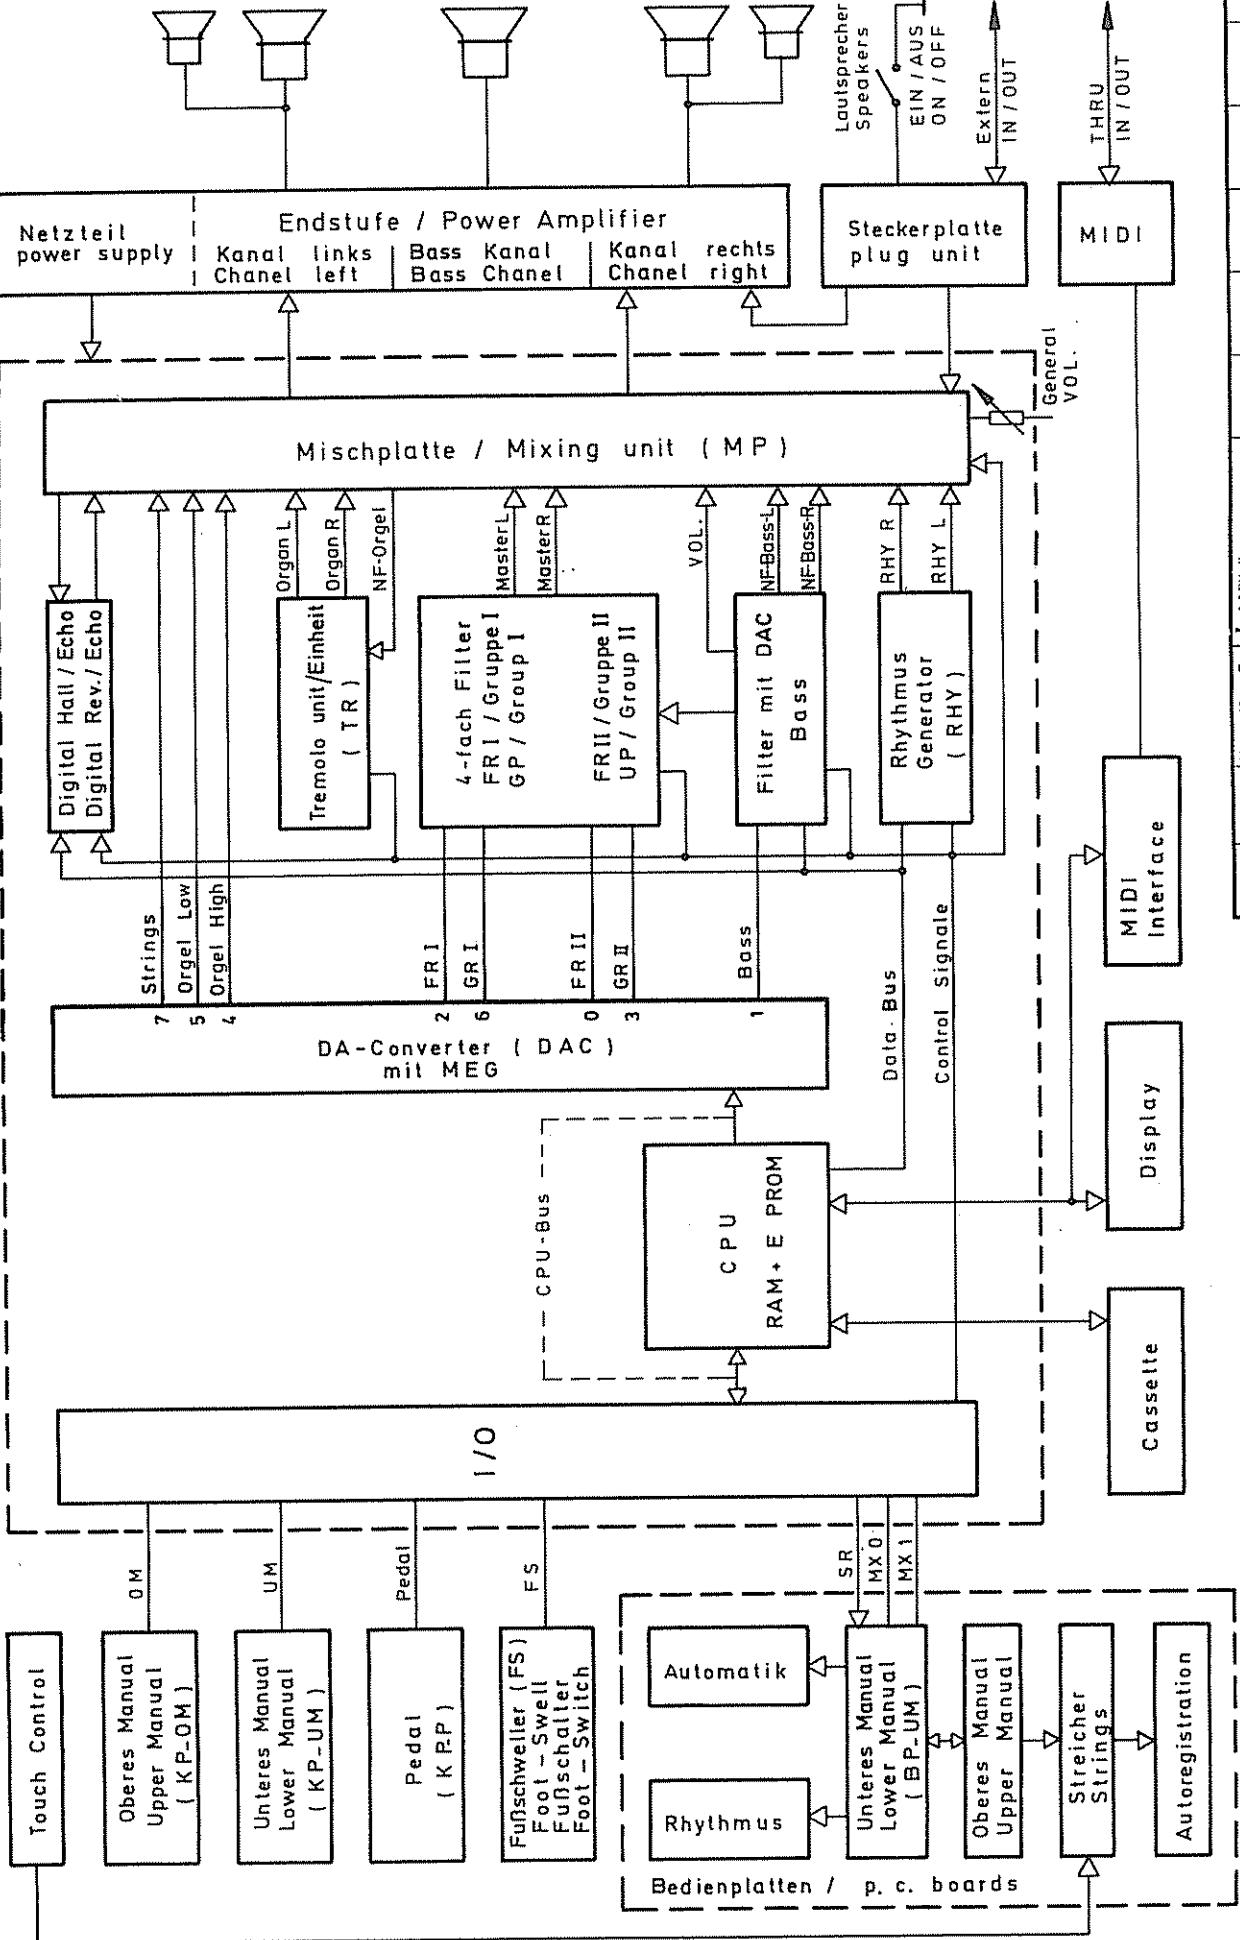

LCD Display	Fault Number	Description of fault	Defect circuit
PROM	0		PROM 1
	1		PROM 2
	2	Fault in the check sum on the CPU - board	PROM 3
	3		Prom 4
	4		PROM 5
	5		PROM 6
RAM	6)		(RAM 1
)		(
	7)		(RAM 2
)	Fault in the CPU-RAM-Memory	(RAM 3
MEG	15	Fault in the MEG-RAM	MEG
INTERRUPT	11	Fault in the 10mS Interrupt	
	10	Fault in the rhythm Interrupt	
UART	30	Fault in the MIDI Interface

I/O - Board

Scanning philosophy:

Two types of scannings are used depending upon the type of contact.

- Tabs-4steps drawbars-keyboards-pedalboard=MATRIX scanning
- Switches with LED = Serial scanning

Matrix scanning:

The matrix scanning uses the 1960 concept of diode-array memory, well known to those familiar with DTL logic.

The micro-processor "sees" a diode array memory, the fuses being replaced by the contacts.

The memory format is 16 words of 16 bits (see matrix organisation).

The word decoding is done like any memory by a decoder (IC-10/11) connected to the address lines. The decoder will select one word from the matrix (Y 0 to Y 15).

The corresponding word data (X₇ to X₀) is read by the CPU. As the CPU is a 8 bit machine, two read operations are necessary: RD_{MO}, and RD_{MI} 1. The signals are generated from IC-B2-74LS138.

As the matrix goes to different parts of the organ several connectors are needed for matrix connexion. Please refer to I/O connectors for X, Y connector layout.

The matrix organisation sheet is very useful to find a hardware fault in the matrix area. As a fault usually occurs on a single X or Y wire, the matrix organisation allows to know very quickly which wire is defect.

For example, if all notes of the upper keyboard upper octave are playing together, this results in a x 3 matrix line shorted to ground or IC A 10 (74C244) defect.

For example, if all E notes are not playing, check if strings 16' and lower manual volume work. If not, this results in a cut on Y4 of a defect IC C 10/11 (74154).

Note: Scanning is difficult to observe with a scope as the scanning scheme is not straight forward: Y₀-Y₁₅.

1 - Switches with LED - Serial scanning

An exclusive scanning scheme is used which combines switch detection and LED display (patent applied for).

The scanning is under microprocessor control using signals SRDAT, SRCLK 1, SREN, provided by addressable latch A3.

The switch status is send to microprocessor by signal SID.

2 - LED display cycle

SREN is low thus enabling the shift registers 374 (see P.C. board upper manual or P.C. lower manual).

The display pattern is shifted using SRCLK 1 to shift SRDAT into the shift registers.

Once the display pattern is shifted, no further shift will occur until switch actuation.

3 - Switch scanning

At regular time intervals, SREN is brought high for a short time.

All the 374 outputs will be tristate, all LED will extinguish.

SID is tested. If zero, this means no switch is ON. If one, SRCLK 1 is clocked, then SREN is brought low.

This sets all 374 outputs to 1.

SEDAT is set to zero and SRCLK 1 is clocked until SID is zero. The count of SRCLK 1 pulses gives the number of the actuated switch. The operation then resumes to normal display.

The switches with LED serial scanning are completely under program control through addressable latch IC A3.

4 - Rhythm interrupt, tempo display

The rhythm interrupt uses a 12 bits counter (B4-B5-B6) which reloads to a value stored on a 12 bit register (A6-A7) when a carry occurs. The value stored on the 12 bit register by the microcomputer sets the rhythm interrupt frequency.

The tempo display is completely under program control.

The program shifts a serial word representing the seven segments pattern by means of SRDAT (data) and SRCLK 2 (clock).

5 - Miscellaneous controls

Circuit C 5 allows for various controls (under program control).

GEON - (General on)	General squelch
TREMOLO ON/OFF	Self explanatory
GRI - Hall	Allows to connect reverb to Group I
FRI - Hall	Allows to connect reverb to general presets
GR II - L/R	Determines output channel for Group II

Strings ON/OFF - Strings squelch

Chorus/Tremolo - Self explanatory

Circuit B1 is used as follows to generate clock pulses under program control to load various data.

WRRYO, WRRYI	- Load rhythm data (refer to rhythm board)
WRDAC	- Load filter data (refer to bass filter board)
WRFI1 to WRFI 5	- Control the various filter
IC B2	- Generates I/O control signals

6 - Scanning of the slider switches for flutes,
sustain, strings, volume, vibrato, portamento,
basspedal.

The conditions of the different slider switches
must converted in digital informations for the
microprocessor.

One of the slider switches will selected with
the address signals ADI - 0-2 and EN 0-4 about
the multiplexer on the p.c.board.

The different voltages are connected with the
signal ANA to the A/D-Converter (A8). This
converter generates digital informations for the
microprocessor.

CPU board

This board comprises

Microcomputer unit (8085)
EPROM max. 88K
Bus and control signals drivers
Clock generator
10 ms real time interrupt
Watch dog timer

Clock generator:

The CPU clock is generated on chip 8085 by means of the X-Tal 6,144Mc.

The clock frequency is divided by 3 (IC-D4) to provide the main system clock H1.

H1 is about 480 ns period with a high time of 320 ns and a low time of 160 ns.

H1 controls the sound generation for periodic sounds and rhythm.

10 MS real time interrupt:

This interrupt is used by the program to generate the various sound envelopes (attacks, sustains) also the vibratos and portamentos.

On half one-shot A-3 is used on the RST 6,5 interrupt input. The one-shot is triggered by program via I/O board (WRET).

Watch dog timer:

This device is used in case of erratic transient or undetected software fault which may cause the program to enter an endless loop or halt condition. Then a trap interrupt will occur which will reinitialize the organ.

IC - C-5 is used to generate the TRAP-Interrupt.

The one-shot is of the retriggerable type, i-e under normal operating conditions, pin 12 will always be at low level, as RDMD will be present.

RDMD is the read matrix switch signal indicating that scanning is in progress (see I/O).

DAC + MEG board

The MEG - IC includes a 32 - voices digital Synthesizer which is under the control of the microprocessor. Each of the 32 Synthesizer voices is able to produce up to 8 octave related signals.

The microprocessor controls the MEG - IC with the multiplexed signals AD₀-AD₇. The signal AWA 0-7 includes time multiplexed waveform addresses and amplitude values. If the WALE signal Logic "1", this means that waveform addresses during logic "0" that amplitude values will transmitted.

The WALE signal loads the address to IC - 17 - 74LS373 and generates with the signals WA8-WA11 the address of a waveform. It is possible to address 16 different waveforms. With the next positive slope of the signal H2 will transmitted the contents of the waveform address, the amplitude values and the output select information to the registers IC-19 and IC-4. These informations get transmitted to the D/A-Converter. The signal LDAC is necessary to start the D/A cycle.

The main clock signal for the MEG-IC is generated with L1 and C121 and an internal clock generator on the chip. The tuning of the organ can be adjusted with L2 (see adjustment procedure).

For the control of the MEG-IC 4 fourther control signals

are necessary:	RD -- "Read Dates"	}	= from the CPU
	WR -- "Write Dates"		
	ALE -- "Address Latch enable")		
	MEG -- "MEG-enable - IC-F4-74LS244		

The function of the D/A-Converter is the same like the function of the D/A-Converter board.

D/A Converter DAC

This board receives sample information from the sound generator board SG and converts them into polyphonic audio signals.

The board is divided in two parts.

- Wave from memory
- D to A conversion

1 - Wave form memory

It comprises 2 k bytes of RAM waveform memory which is loaded by the microcomputer and 2 k bytes of EPROM waveform memory.

Each waveform type is 256 bytes long, the waveform being further splitted into octaves, i.e. 128 samples for octave 1, 64 samples for octave 2, etc. ... until 2 samples for octave 7.

The phase information received by IC 25 is combined with the octave received by IC 13 to elaborate 8 bits of waveform address AW₀ to AW₇.

The contents of waveform memory are waveform amplitude variations (DA₀ to DA₇) which are transmitted to DAC via pipeline register IC 4.

Amplitude and output select are transmitted to DAC via respective pipeline registers IC 26 and IC 27 (resp. IC 14).

2 - D to A Conversion

The DA conversion receives amplitude information AMPL, waveform information DA, output select (channel) information OS and a sampling signal GATE.

For each GATE signal, an output sample is produced with following formula.

$$V_{(OS) t+1} = V_{(OS) t} + V_0 \cdot AMPL \cdot DA$$

$V_{(OS) t+1}$ being the voltage after the GATE signal on the selected output OS.

$V_{(OS) t}$ being the voltage before the GATE signal on the selected output OS.

V_0 being a constant.

To do this, AMPL is converted to analog by IC-15 and the corresponding analog current is fed to analog multiplier IC-14, DA is converted to analog by IC 5 and the corresponding analog currents are fed to analog multiplier IC-14.

IC-14 is a two quadrant analog multiplier followed by an amplifier giving the results V0AMPL DA which is fed to input of analog multiplexer IC 8 (pin 3).

Depending on the OS value, the previous signal is switched to the corresponding channel integrator thus achieving the required function.

Filter with DAC board:

The filter with DAC board is divided in two parts.

- a) D/A-Conversion of digital voltage values (DP 0-7).
- b) integrated bass filter (IC-3-CEM 3391).

1.) D/A-Conversion:

The filter is controlled from the microprozessor with 8 control voltages. Only one D/A-Converter is used for the different values to control the sample and hold circuits which are necessary to control the bass-filter. IC-10 receives the dates from the microprozessor together with the write signal WRDAC. The information will converted in an analog voltage which can vary from 0-5V (IC-2-DAC 0801). The result of this conversion is called "DAC-signal".

The register IC-11-74LS175 receives the channel information (0-7) controlled from the microprozessor and from the signal WRFI-1.

IC-6-CD4051 switches the DAC-signal to the corresponding channel.

C20 - C27 store the D/A voltage for the bass filter. The microprozessor controls cyclic all channels and gives analog values in the memory capacitors. These values are constant for a type of bass instruments, they are updated only upon registration change or upon instruments change in the arrangeur.

D/A-Converter adjustment:

- select test program "P" (see testprogram operation)
- adjust P2 for +5V at pin 6 of IC-7.

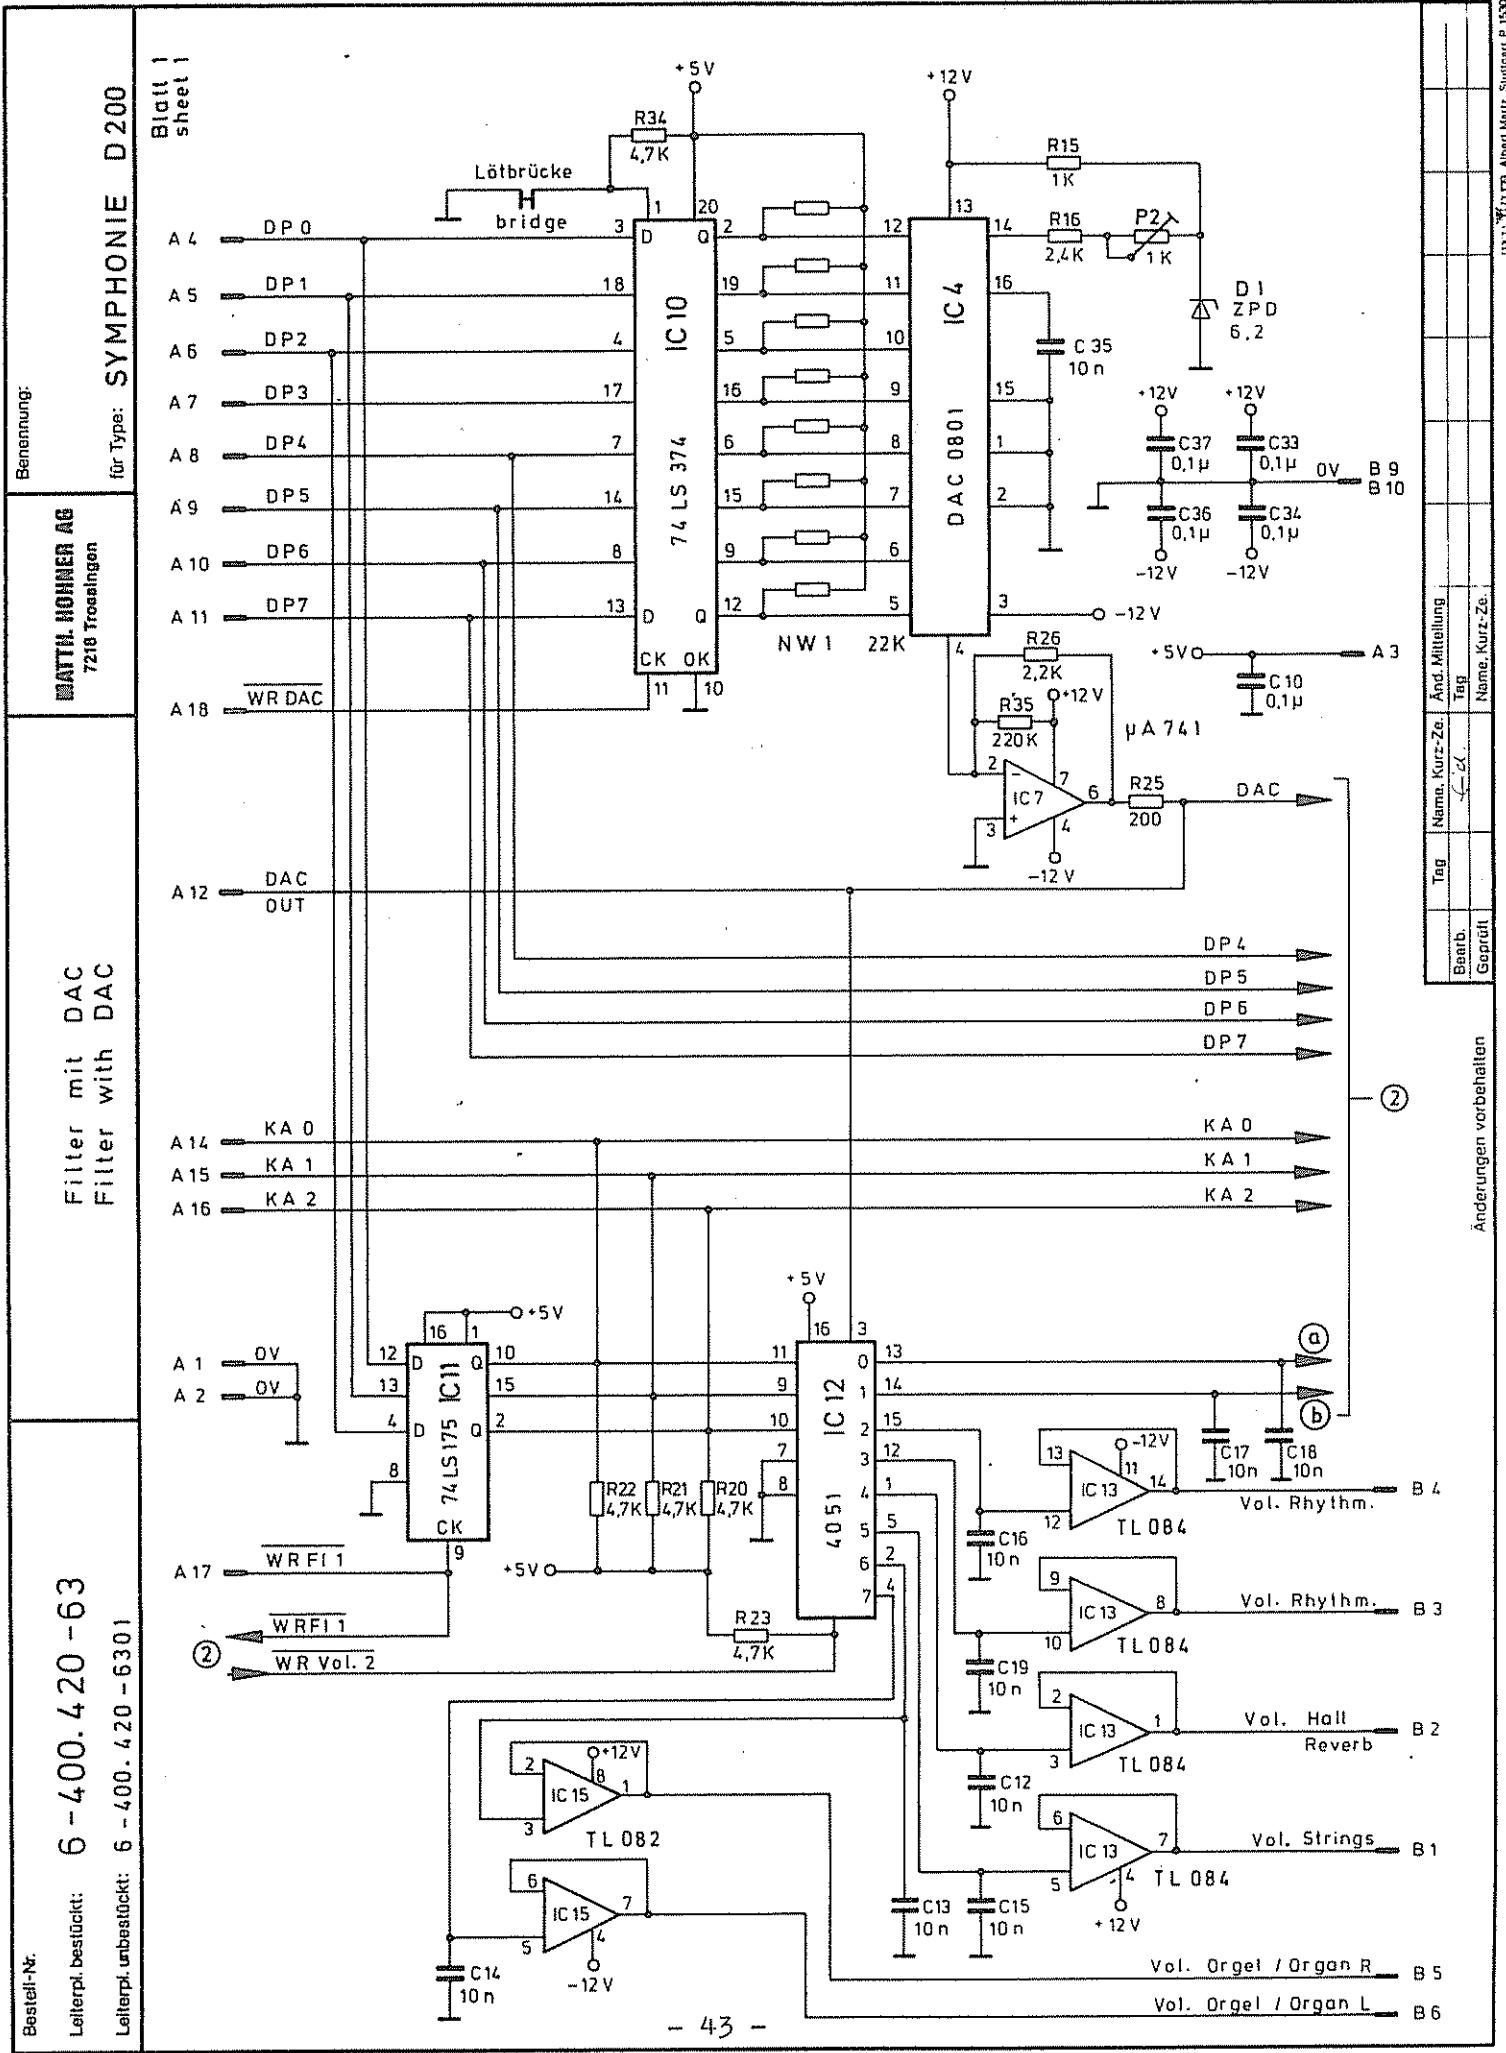

2.) Integrated bass filter:

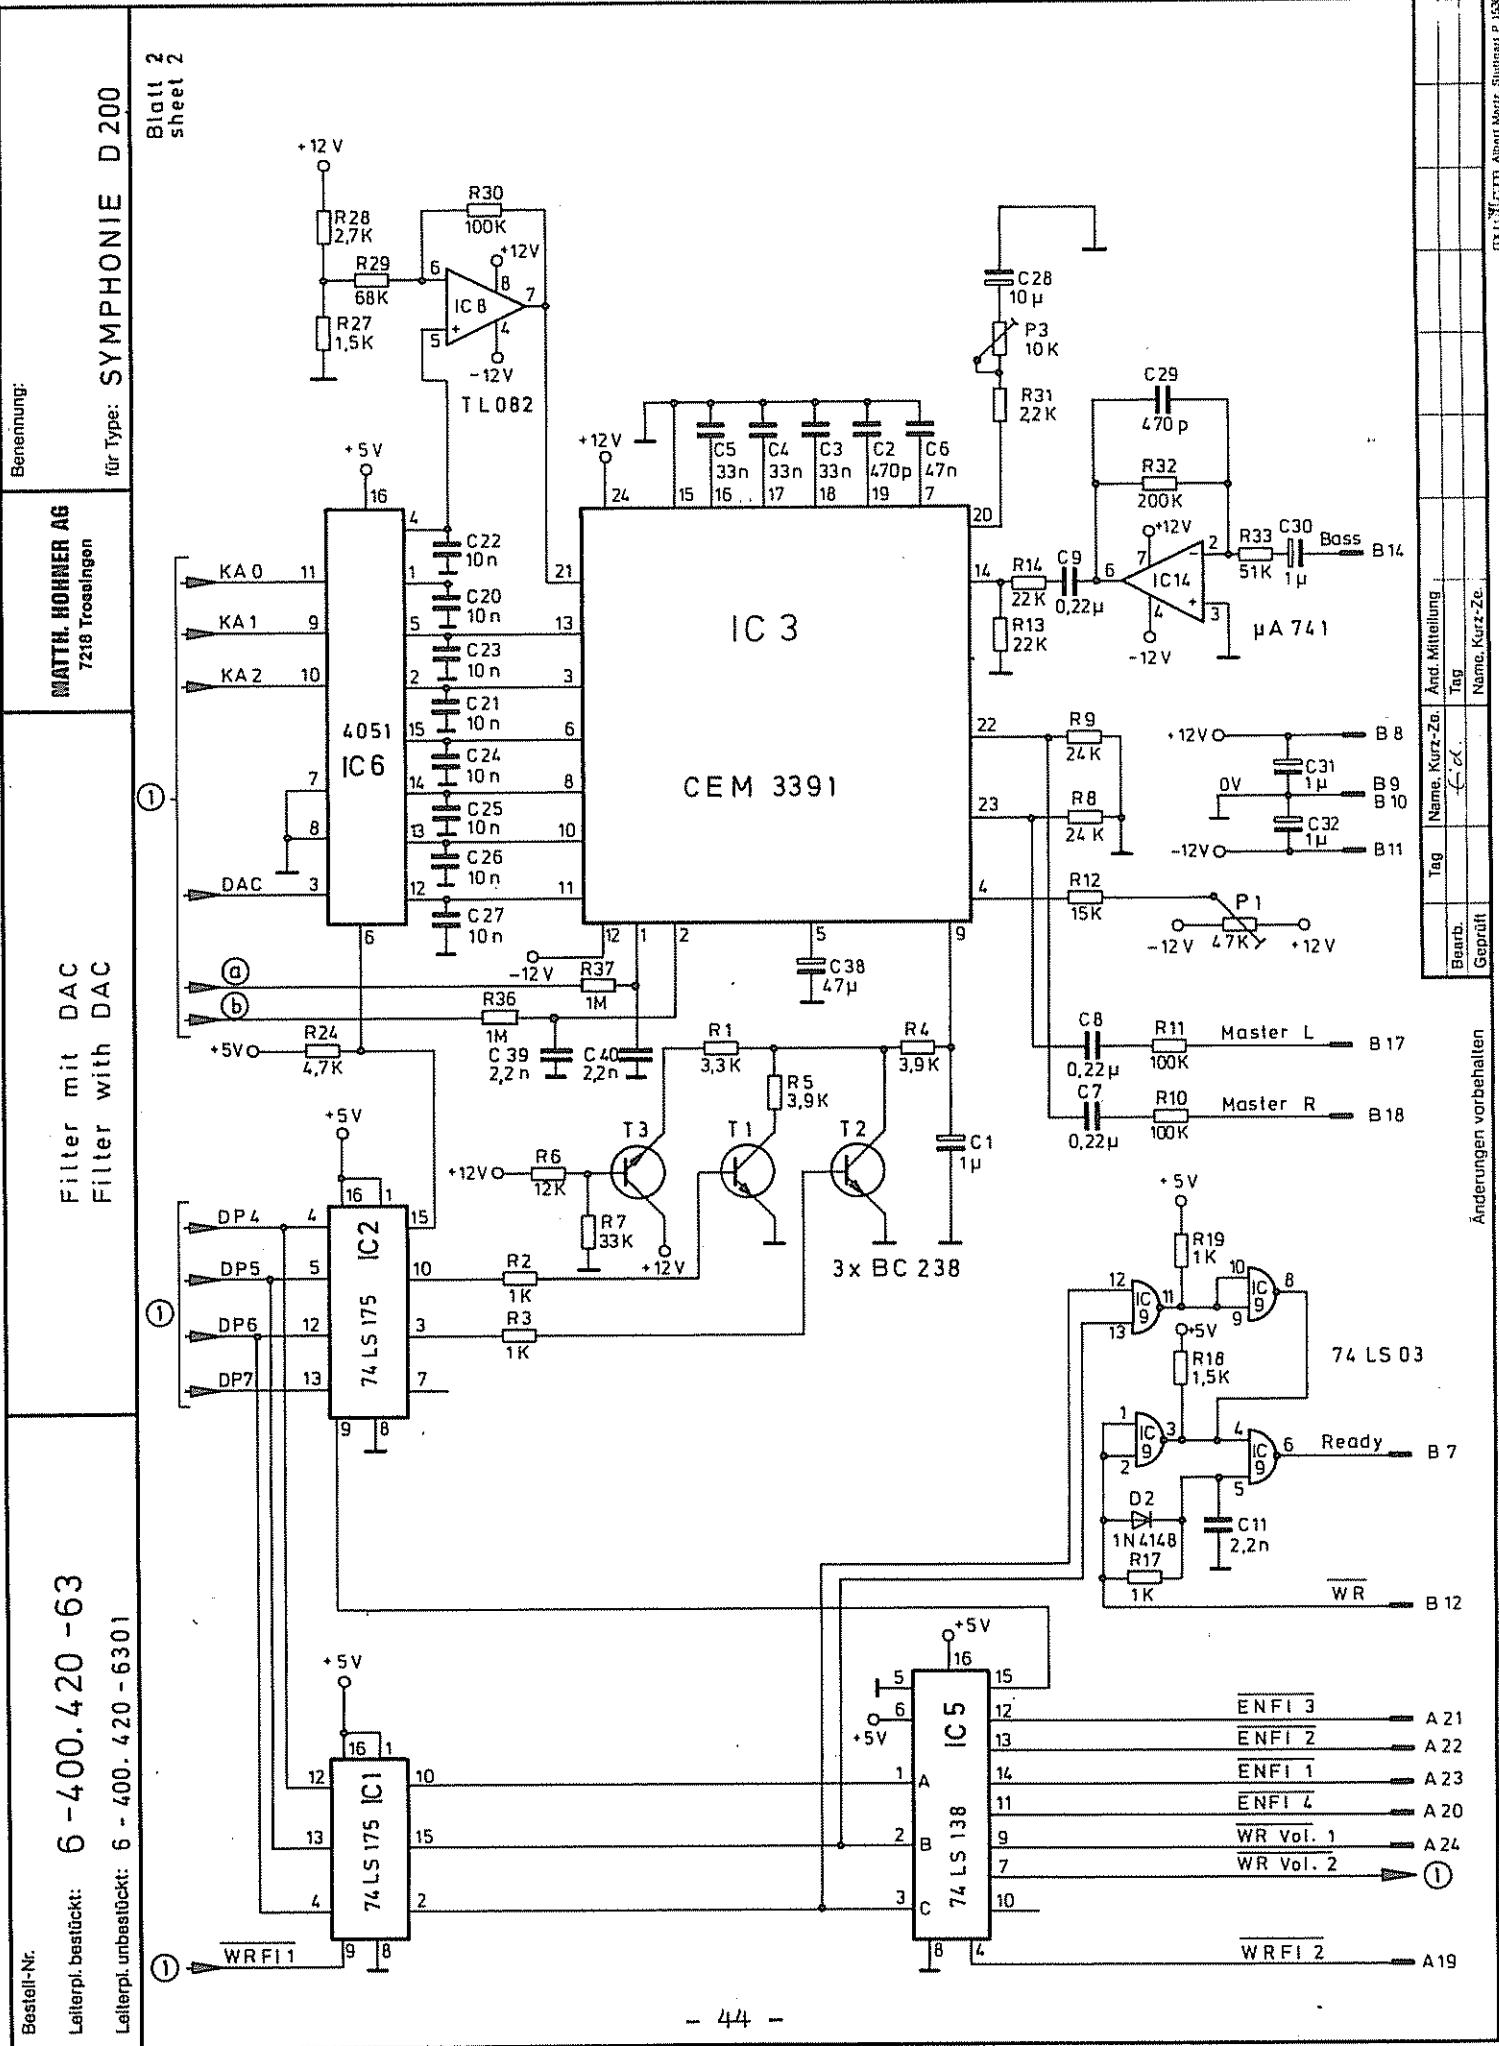

The sound of the bass group is generated with a programmable integrated filter circuit IC-3-CEM 3391. The envelope generator of this circuit is controlled with the single analog voltage values from the memory capacitors C20 - C27. The result are different envelopes dependent from the registration of the bass group.

The VCF center frequency is adjustable with P1. The transistor T2 generates the trigger signal for the filter circuit. The pass band and the envelope of the filter circuit is controlled with control voltages (C20 - C27).

Volume control:

IC-13 and IC-15 generates control voltages which are under programm control. These voltages are used for the VCA's on the mixing unit which are necessary to control the volumes of the other channels.

4-Times filter board:

These board includes the following functions:

- a) Filter for: Group 1, Group 2, FR1, FRII.
- b) Digital control for the envelopes of the filter IC's - CEM3391.
- c) Reverb assignments for the different groups.
- d) Mixing of the different groups on two main channels Left and Right.

The sound of the different groups is generated with four programmable integrated filter circuits CEM3391. This circuit includes one envelope generator which is digital controlled about the inputs pin 3,6,8,10,11. The trigger function for the different filters is realized with an analog signal at pin 9. The pass band is limited with external components. The VCF center frequency and the volume of the filters is adjustable with the trimming potentiometers P1.1-P4.1.

Reverb assignments are done by IC-6-4016.

The reverb for the groups is adjustable with P1.2-P4.2.

Rhythm generator board

This board generates 27 different rhythm instruments sounds on 2 channels - (RYL, RYR) -

The sound generation is fully digital and uses live recorded sounds.

Principle

The sound is generated at $a = 22\text{ K c/s}$ sampling rate with a 6 channel time multiplex scheme. Each channel time is further divided in 16 micro-program steps.

The sounds are stored permanently into 48 k bytes of EPROM memory in straight 8 bits binary coding. This EPROM memory also contains special codes allowing to jump to a given memory address (loops like ROLL) or to stop the sound output at the end of a sound.

The digital to analog conversion uses an 8 bit DA converter (IC-B2) followed by an analog multiplexer and sample and hold circuitry. Another DA-converter is used for the volume control of the respective instruments (IC-B1).

The 6 channels are mixed to give 2 channels whose amplitude is controlled by VCA D6.

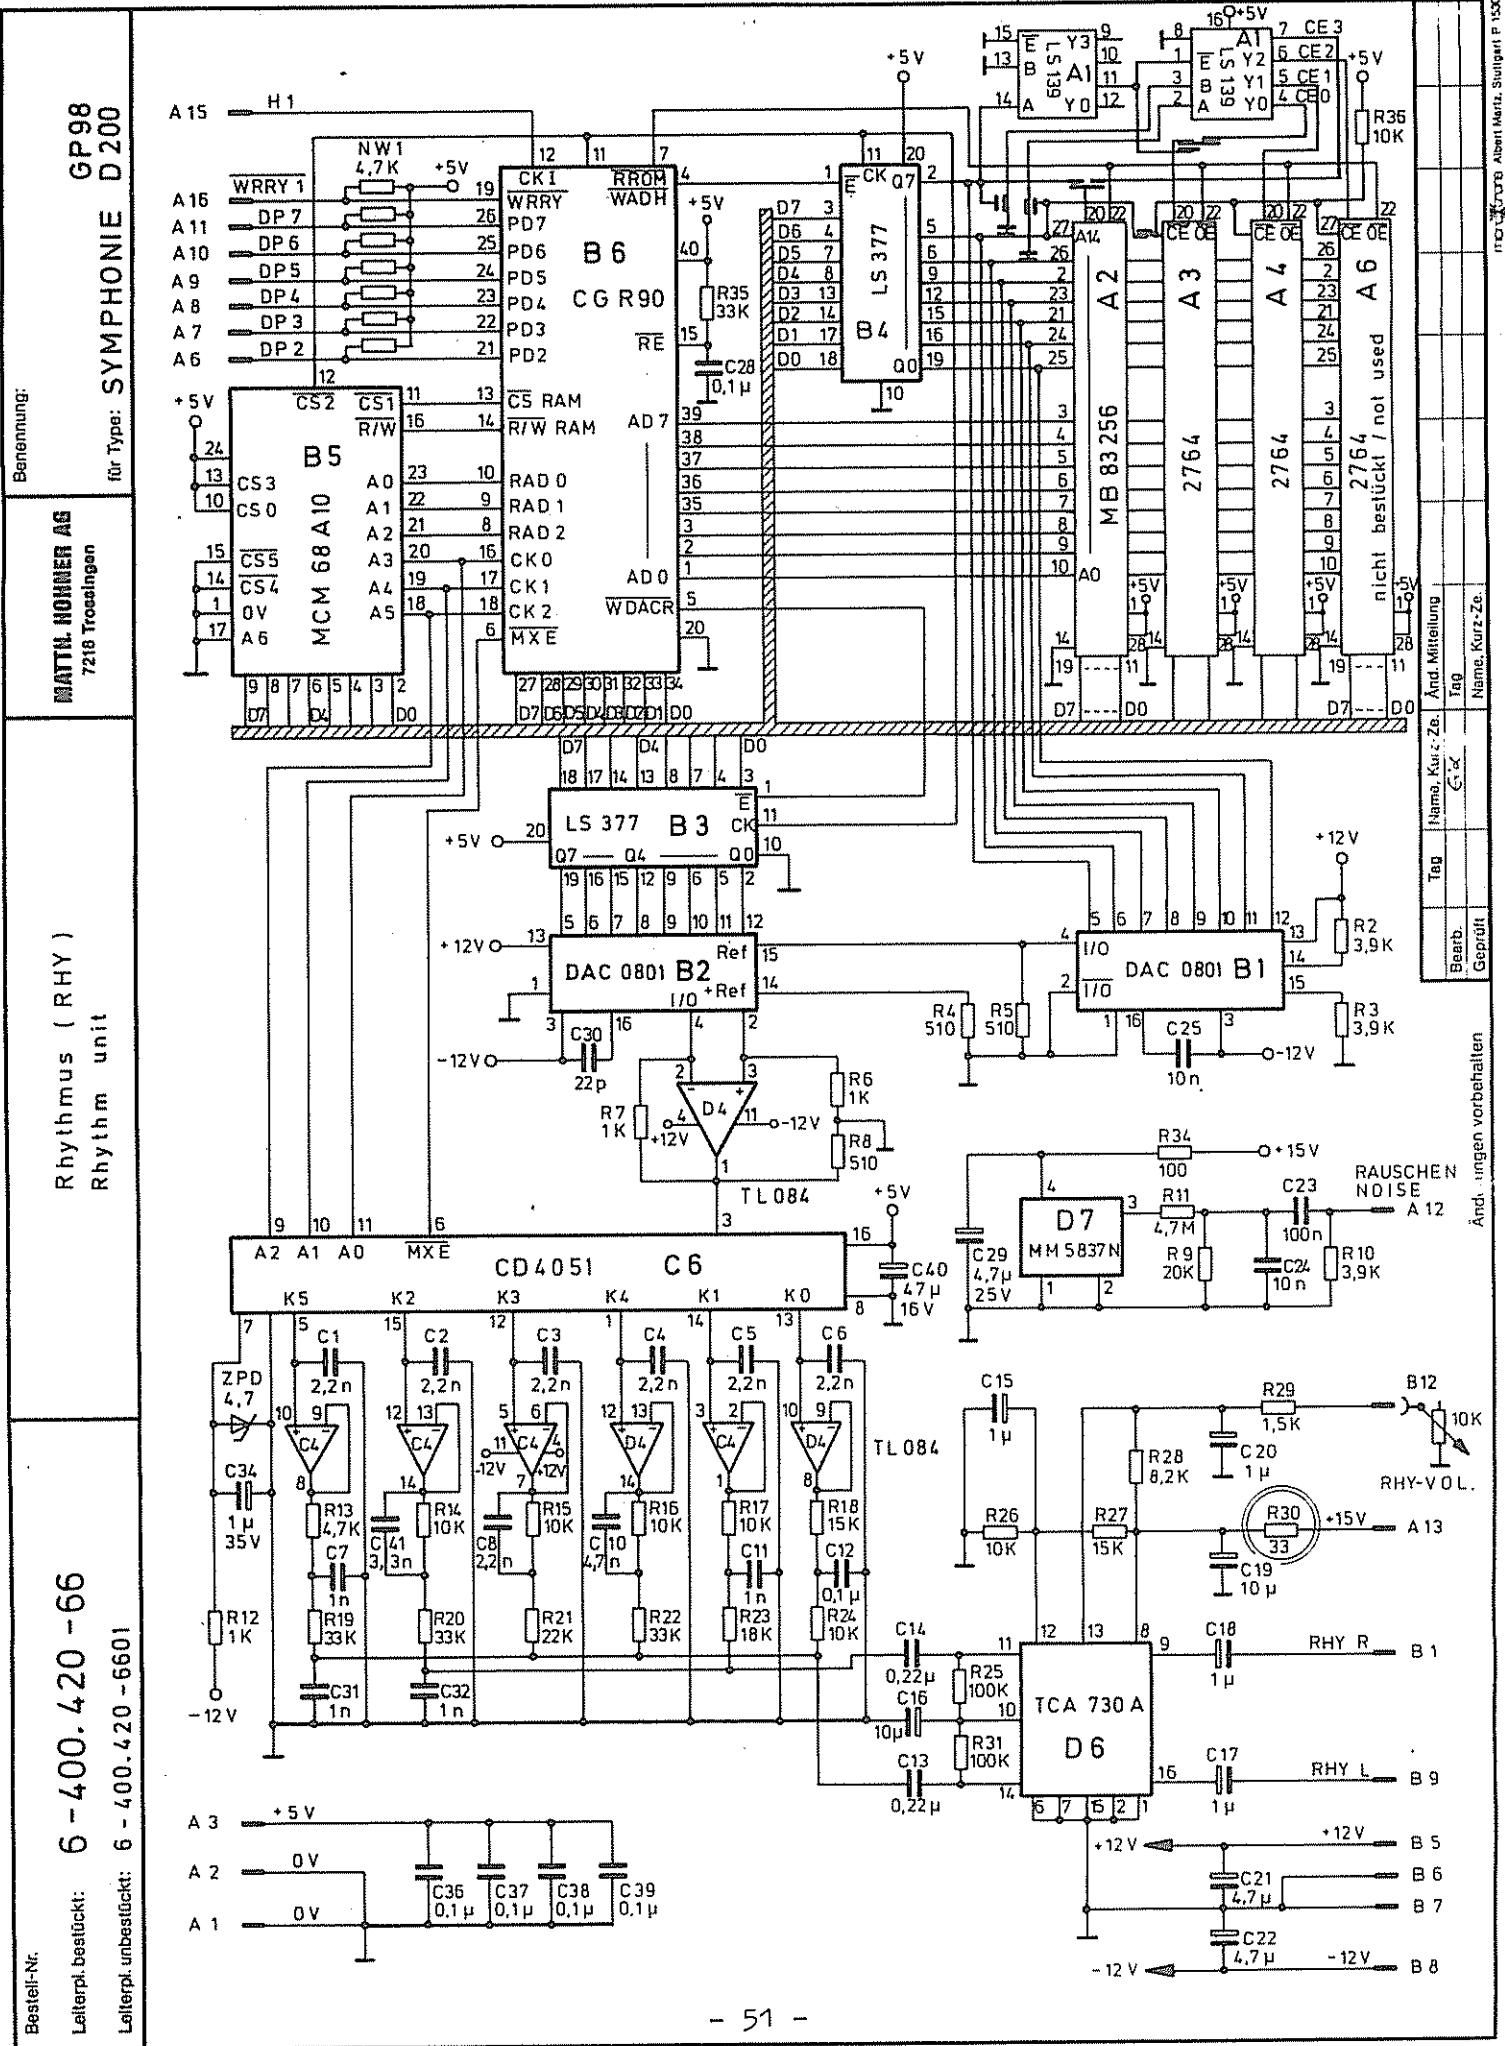

A noise generator D7 (for panflute) is also included.

Adjustments:

None

Test:

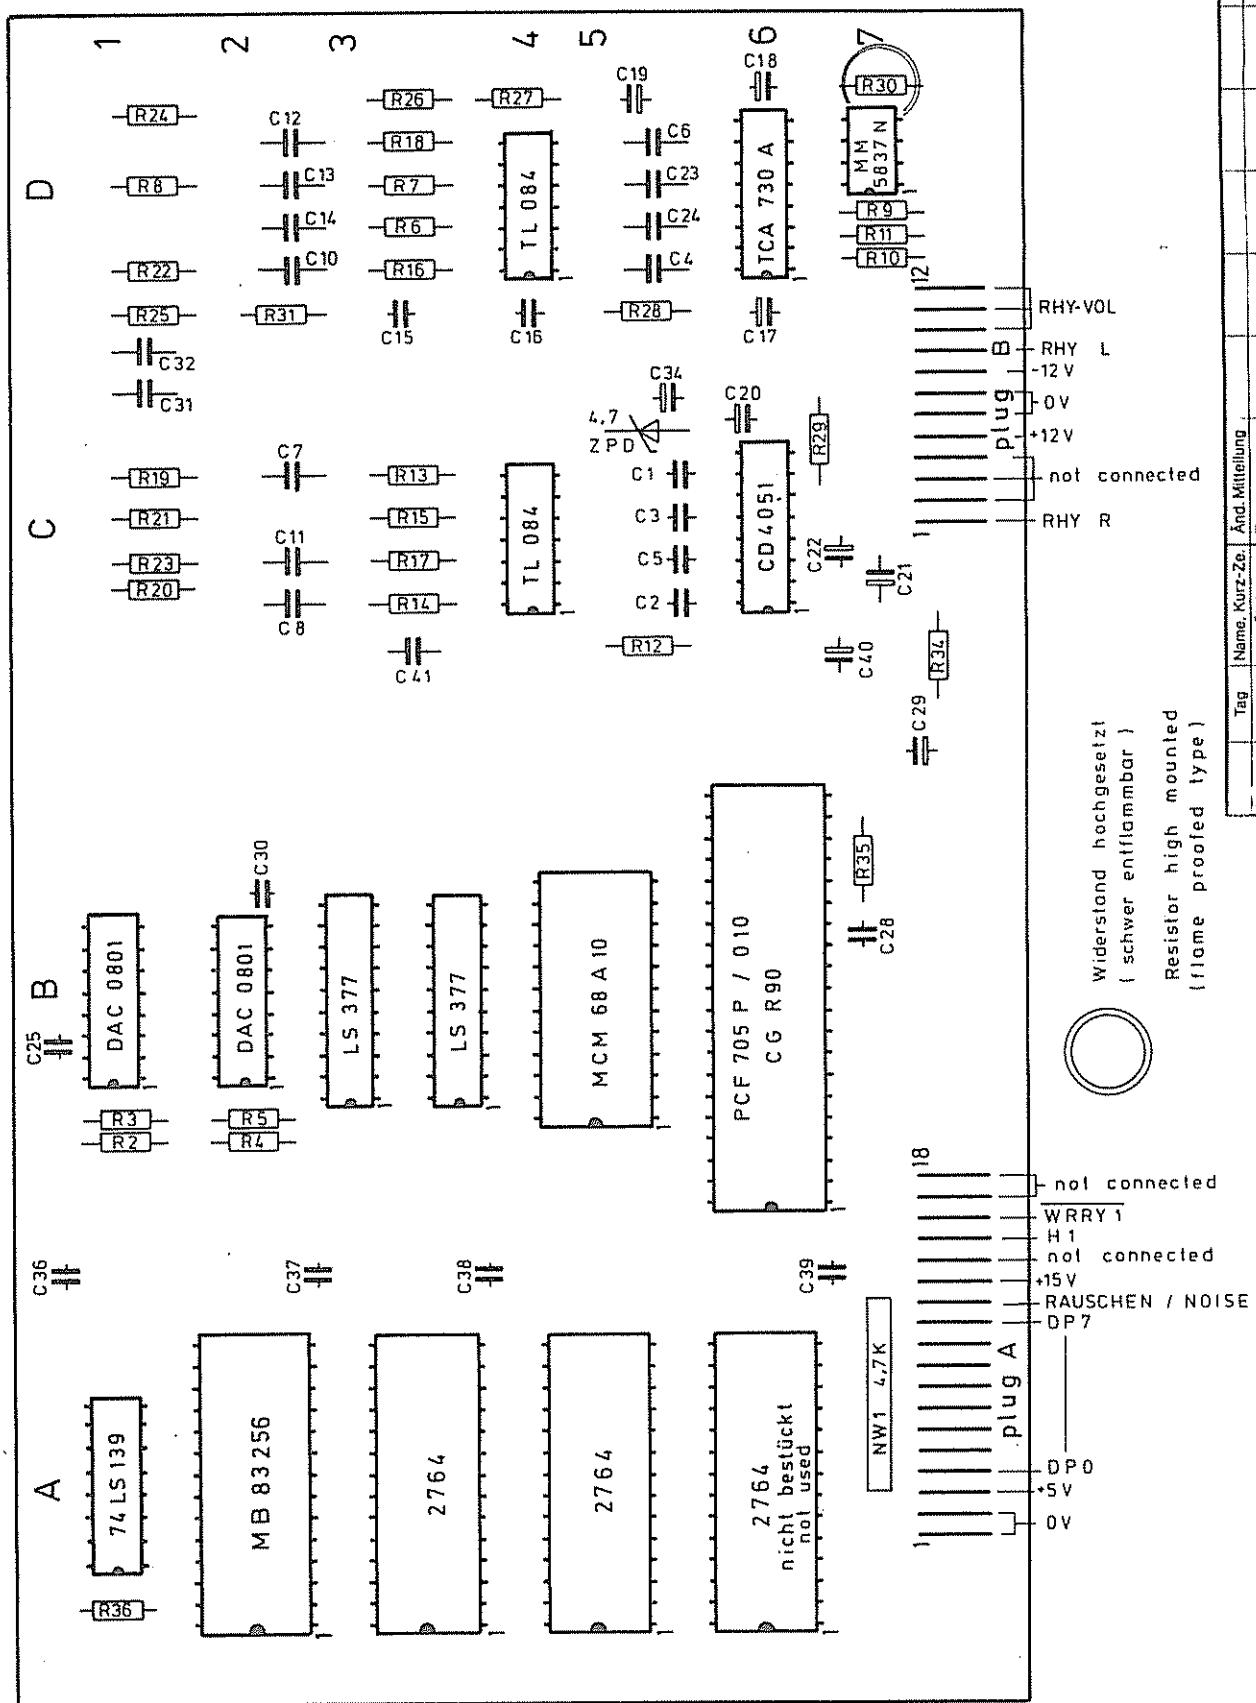

See test program operation.

Bestell-Nr.

Benennung:

GP 98
D 200
für Type: SYMPHONIE

Electronic Reverb:

The NF-signal is fed to the low-pass filter with a cutoff frequency of 8Kc (IC-F7-TL084) and then to the sample and hold amplifier IC-G2-LF398. A comparator IC-G1-LM311 compare the current of the sample and hold amplifier with the output current of the D/A converter PCM53-pin 21. The result is fed about IC-D5-74LS04 to the SAR register D1 and D2.

SAR is the abridgment for Successive Approximation Register. The corresponding dates are fed after the A/D conversion to the D/A converter and to the microprozessor. The microprozessor has a 16-Bit configuration and read the dates if the signal RAD goes to lower values at the circuits C1 and B1. The signal RAD has a reset function for D3 and D4 and starts the A/D conversion.

If the microprozessor reads dates into the register C3 and B3, it is necessary to lock the register B2 and C2-74LS244 with the signal SH. IC-PCM53 is used as a 16-Bit D/A converter.

The signal WDA starts the D/A cycle. With the 16-Bit-databus DA 0-15 the microprozessor transmit the dates to the D/A converter. The result is a analogsignal at pin?1. IC-G3-TL084 is used as a current-voltage-converter and controls the two analog switches IC-E4-4053 in the multiplex mode.

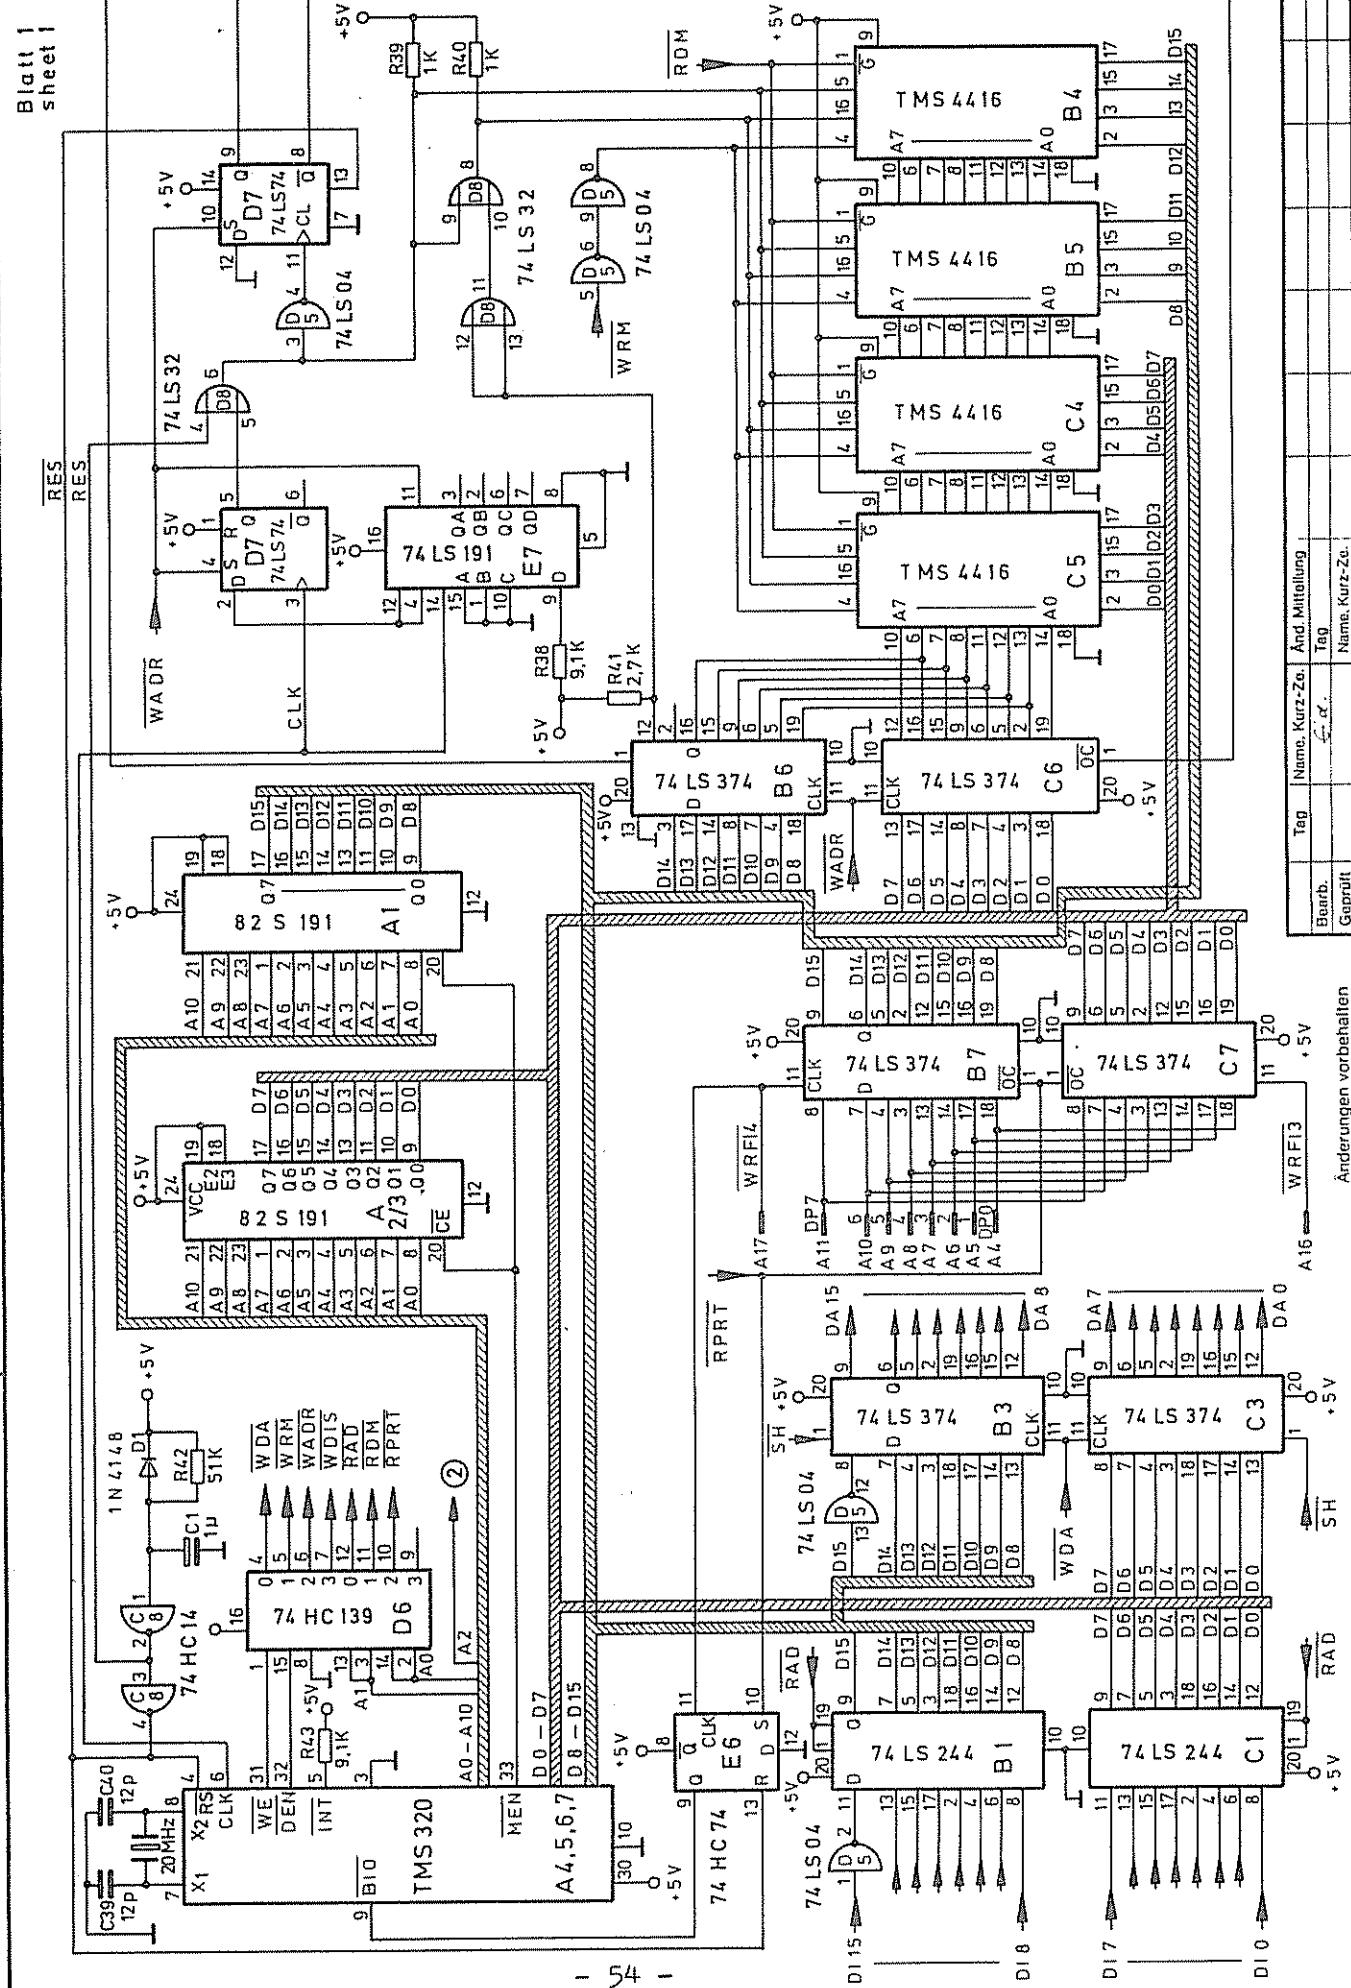

The control signals for the left/right assignments of the output channels are generated with IC-E6-74HC74.

IC-F5 and IC-G3/F3 are used as a low-pass filter and boost the reverb or echo signal on the desired value.

Mixing Unit:

This board includes following functions:

- a) Equalizer for the channel organ left/right.
- b) Treble/Bass control for the master channels left/right.
- c) Loudness circuit
- d) Stereo-wide control
- e) Footswell VCA
- f) Volume control for the channels organ left/right, rhythm left/right, reverb left/right and the strings.
- g) Squelch circuit for the master channels left/right (noisegate).
- h) Mixing of the different channels in two master channels left/right.

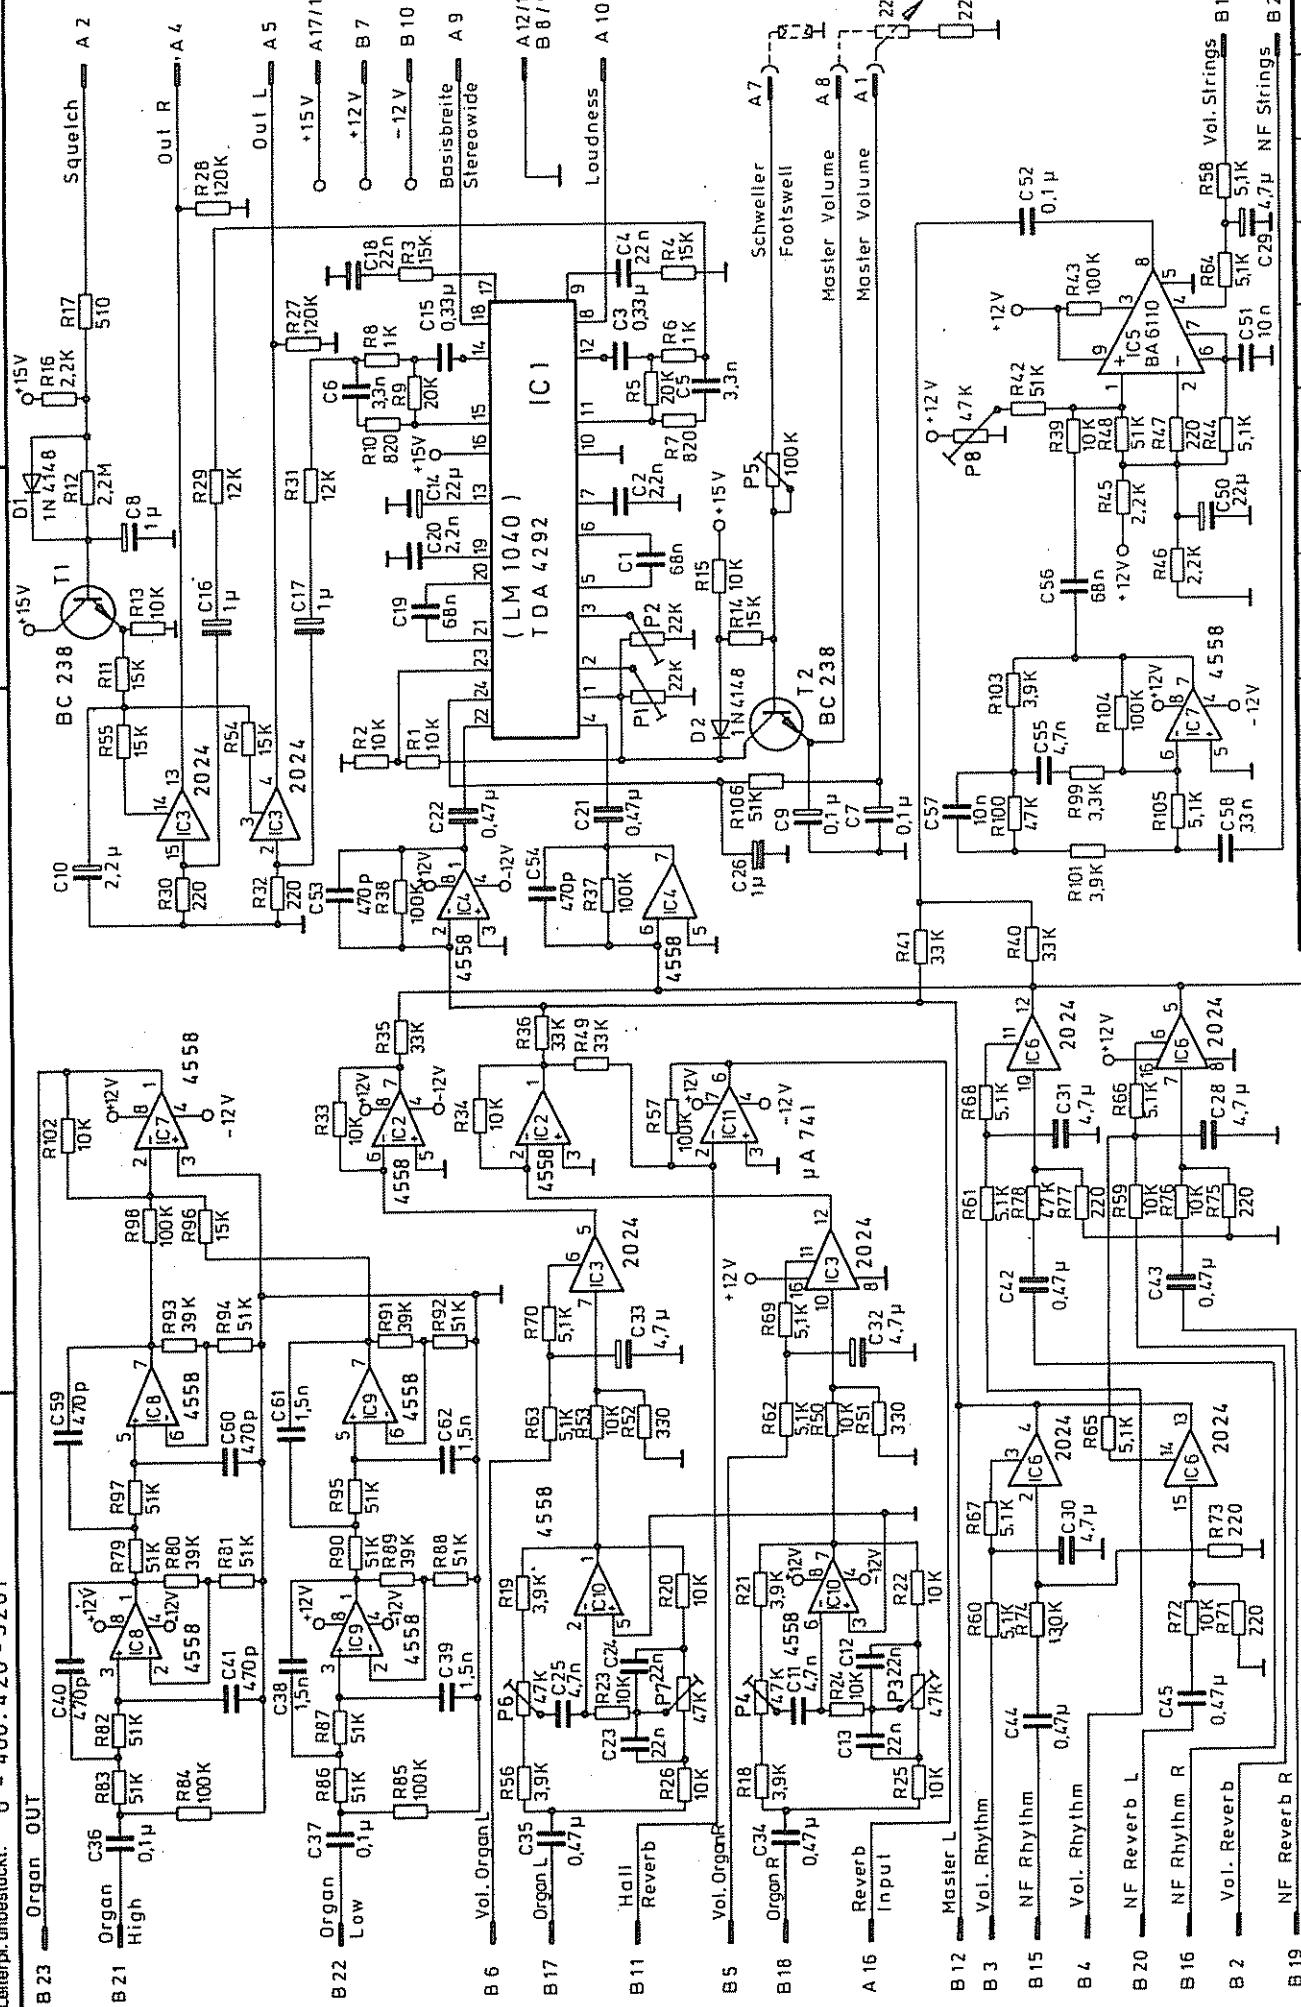

All of the NF-Inputs except the strings are fed in stereo. Each organ channel (L/R) has a separate bass/treble control. VCA's of the type 2024 are used for the volume control of the different channels which are controlled with the control voltages from the filter with DAC board. The stereo output of the 4-times filter board (Master L/R) is fed to the master amplifier IC-4-4558.

IC-1-TDA4292 includes a voltage controlled Bass/Treble equalizer for the outputs of the mixing unit. The squelch signal is generated from T1-BC238 which controls IC-3 (Pin 3,14) to realize the effect of a noisegate. If any note is played the noisegate will be open. The bass and the strings are fed to both master channels.

MIDI (Musical Instrument Digital Interface)

1.) General:

The MIDI sockets enable the connection of the HOHNER D200 to other electronic musical instruments and home computers, equipped with MIDI. It offers a wide variety of applications. The D200 can for example be used to compose and store your own pieces, or as a music box for your next party. The applications reach as far as a programmable rhythm unit and automatic accompaniment for your synthesizer.

2.) MIDI Specifications:

- a) After switching on, the D200 is in the Standard Mode, "MIDI Mode 1" i.e. Omni on, Poly).

This means: The D200 sends all played notes via MIDI channel 1 (CH₁) and plays notes received on channels CH₁ - CH₁₆. If the arrangeur is switched on the timing clock (F8 Hex) is operational. The arrangeur can also be controlled through external clocks provided that the D200 has received the control signal "Start" or "Break" or the MIDI start signal (FA Hex), via the MIDI connection.

In case your instrument or home computer has no start signal for the arrangeur, (only clock), you can make the arrangeur accessible through a trick. Connect sockets MIDI IN and MIDI OUT on the D200 with the MIDI lead. Then press start or break and the D200 switches to external MIDI rhythm. Now disconnect the lead from MIDI OUT and connect it to the MIDI OUT of your home computer. The arrangeur tempo is now in sync with your home computer and is only controllable through the computer.

Please note:

Tempo + and - are no longer operable.

Should you wish to return to internal Arrangeur tempo, the D200 has to receive the "Start" signal via the MIDI IN, or the D200 has to be switched off and on again.

- b) Via MIDI IN, the D200 can be changed to "MIDI Mode 3" (Omni off, Poly). You can then program one of the 16 channels as a melody channel and another one as a rhythm channel. MIDI information on the remaining 14 channels are then ignored. Both channels can be controlled by the home computer at the same time. The transmitted data (MIDI OUT) is the same as in standard mode (MIDI Mode 1).

The correspondence of notes to the rhythm instruments for the rhythm channel are as follows:

The low C on the lower manual has the number 36 - etc.

Note	Key Number	Rhythm Instrument
C	36	Bass Drum
C sharp	37	Rim Shot
D, E	38, 40	Snare Drum
D sharp	39	Hand Clap
F, G	41, 43	Tom 1
F sharp, G sharp	42, 44	Close Hi-Hat
A, B	45, 47	Tom 2
A sharp	46	Open Hi-Hat
C sharp, D sharp	49, 51	Ride Cymbal
F sharp	54	Tambourine
G sharp	56	Cowbell
A sharp	58	Maracas

The switch information is sent every time a switch is operated, and when received has the same effect as if the switch had been used on the instrument.

The system exclusive information is used to store registrations (autoregistration, sound presets), in the computer.

Exception: If the control signal for Start or Break is received, the instrument is switched to external Arrangeur rhythm.

c) Mode Change (System exclusive)

1111 0000

0010 0100 Hohner Identification No.(24 H)

0001 0001 Command No. (11H)

0000 aaaa Melody Channel No.(0 .. FH)
 aaaa ≠ bbbb

0000 bbbb Rhythm Channel No.(0 .. FH)

1111 0111

Change from MIDI Mode 1 (Omni on, Poly) to MIDI Mode 3 (Omni off, Poly).

After receiving this MIDI code, only the notes received on channel aaaa are played. The notes received on channel bbbb are played as rhythm instruments. See table page 29. It is advisable to choose different channels for melody and rhythm.

To revert the D200 to MIDI Mode 1 you have to switch off the instrument.

d) External Arrangeur clock:

1111 1000 -----24 times per quarter note (crotchet)

This information is only decoded if the arrangeur has been switched to external clock through either the Start or Break signal, or the Beat Start signal.

e) External Arrangeur Start

1111 1010 Has the same effect as pressing "Start" if in MIDI Mode 1.
 In MIDI Mode 3 this command is ignored, to avoid conflicts in the rhythm channel.

3. Data

- a) Note off 80 H -----Note off, channel 1
Okkk-----Key number
40 H-----Key release speed

- b) Note on 90 H-----Note on, channel 1
Okkk kkkk-----Key number
40 H-----Key release speed
Okkk kkkk keynumber (36 - 96)
Sending in both modes (MIDI Mode 1 and Mode 3)
on CH 1.

- c) Switch information (See data receive)

- d) Arrangeur clock: F 8 Hex is sent when arrangeur
is switched on.

Please note:

Since the D200 can only play 6 of 12 possible rhythm instruments at the same time, the following combinations are not possible:

1. Hi-Hat open + Hi-Hat closed
2. Ride cymbal + Tambourine
3. Snare drum + Rim Shot
4. Tom 1 + Tom 2
5. Cowbell + Hand Claps

Since these combinations are in practice never or hardly ever used a restriction in musical expression is not noticeable.

3.) Technical Information

Numbers with a suffix H or Hex are Hexadecimal.

4.) Valid Data:

All MIDI codes not listed are invalid and will always be ignored by the D200.

a) Note off:

1000 nnnn

0kkk kkkk

0xxx xxxx

b) Note on:

1001 nnnn

0kkk kkkk

0xxx xxxx

These are ignored in MIDI Mode 3 if nnnn ≠ Rhythm channel.

kkk kkkk = key number

lowest note: C = 36

highest note: C''''=96

x = variable

Channel no. nnnn is ignored in MIDI Mode 1. If MIDI Mode 3 nnnn is the number for the rhythm channel, the rhythm instrument listed in table page 29 is played. A note off command is not necessary.

b) Switch information (System exclusive information)

1111 0000

0010 0000 -----Hohner Identification No.(24H)

0001 0000 -----Command No. (.10 H)

0aaa aaaa -----Switch No.

0bbb bbbb -----Switch position (0 = Off, 1 = On)
1111 0111 -----

Note:

If a data transmission to the UART IC-1-6850 is finished before the NOTE-OFF Information was reading, it is possible that the instrument generates constant notes.

The player can erase this notes if he switch off and on the instrument or if he press the corresponding note.

The UART - IC is an integrated transmitter and receiver for digital informations which is clocked with an external X-Tal oszillator.

The clock frequency is 31,25Kc and is measurable at pin 3 or 4 of the UART. If one information is identified, the IC-1-6850-pin7 sends one interrupt (RXRDY) to the CPU.

Tremolo unit:

This board allows rotating speaker simulation at slow and fast speed with slow to fast and fast to slow smooth transients.

Analog delay lines (BBD) are used to simulate the DOPPLER effect and VCA's to simulate the amplitude variations.

1-Description

IC1 and IC2 are mounted as a low frequency oscillator giving triangle waves (IC2 pin 1). This oscillator is stopped when flute animation is OFF. The tremolo speed can be adjusted by changing the value of R6.

Diodes D 1 to D 4 will provide a "near to sinus" waveform at IC3 (pin 1) and the same with a phase shift of 180° at IC3 (pin 7).

This sinus waveform are used to amplitude modulate the signals on respective channels (IC6, IC7) and to frequency modulate respective oscillators (IC 12, IC 13) which are clock oscillators for the BBD circuits.

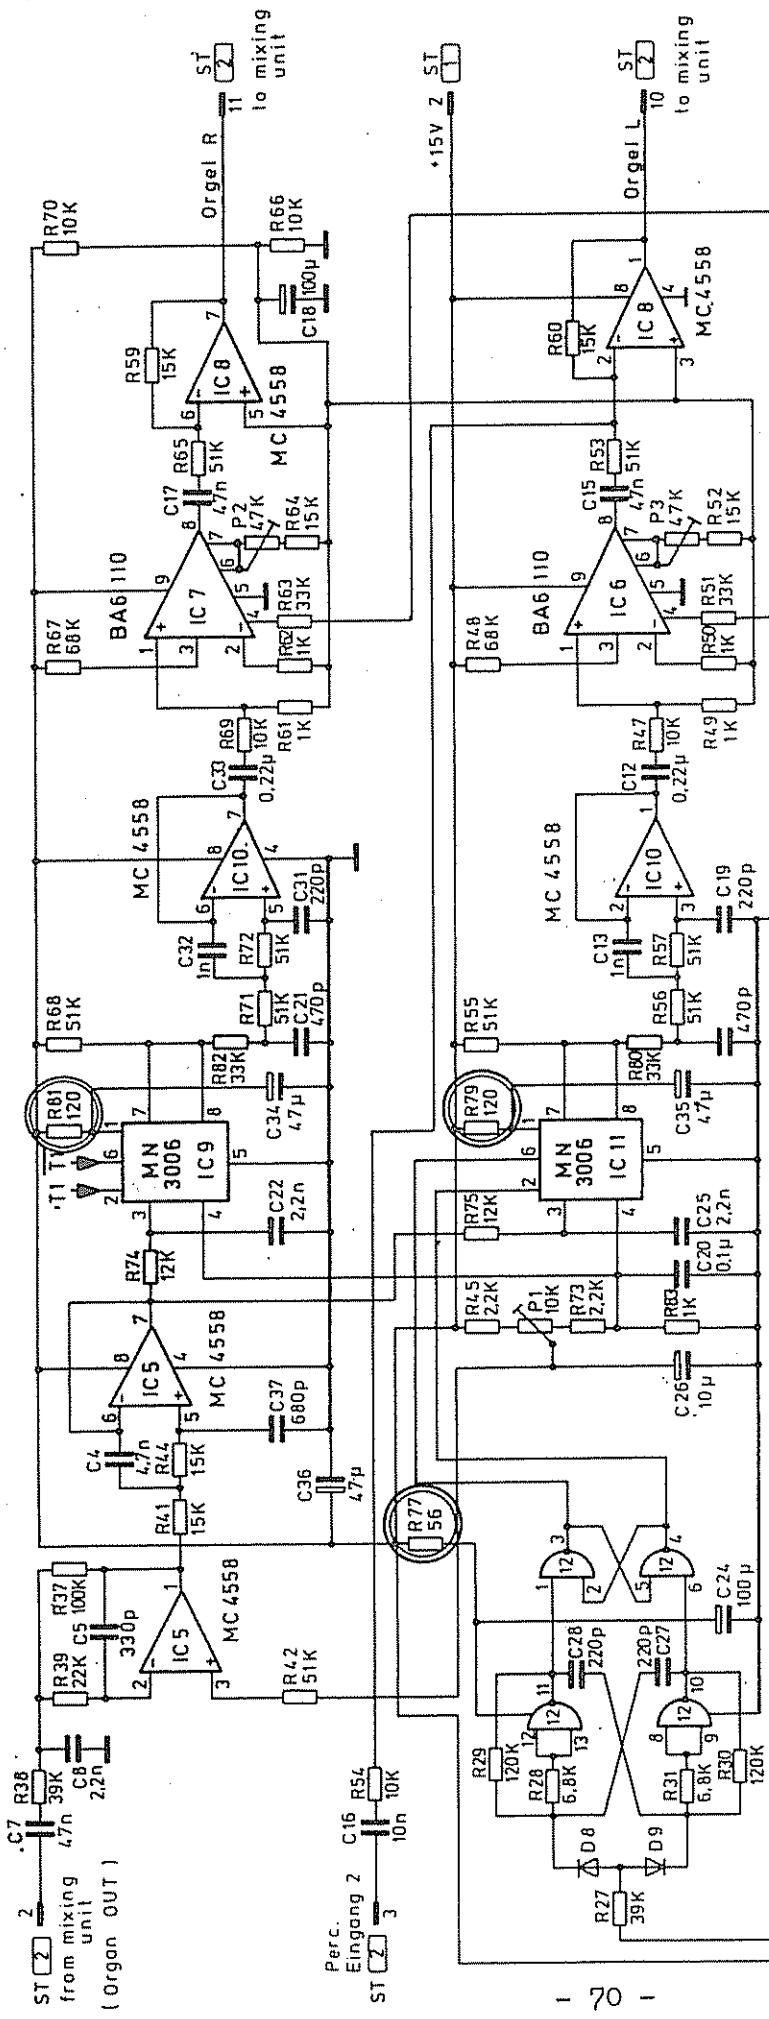

IC5 is a pre-emphasis filter

IC10 is a de -emphasis filter

Power Supply and Power Amplifier board:

Power Supply:

All DC-voltages for the system are generated on this board together with a switch ON delay circuit with the relais 1 and 2. The time delay is realized with the transistors T1 - T7. T3 and T4 control the output of the bass amplifier IC-5. If a DC-voltage at this output is identified, the transistors T1-T4 switch off the relais and protect the bass speaker.

Power Amplifier:

Three seperate amplifiers are used:
two Hybrid power amplifiers STK082 for the main channels left and right and one bass power amplifier STK086. The two channel NF-Signal is fed from the mixing unit to the master amplifier IC-1-4558. One low-pass filter with IC-2-4558 fed the bass signal to the bass amplifier.
IC-4-LM377 is used as a Headphone amplifier.

Adjustment procedure D200

- 1.) CPU-16K:
 - Adjustment of the 10mS Interrupt
 - Test point IC-A3-pin 4
 - Adjustment with P1 of the 10mS repetition rate
 - Checking with the oscilloscope

- 2.) DAC+MEG:
 - Tuning adjustment
 - Play 1 note "A" (middle octave)
 - Adjust L1 for the frequency of 440Hz
 - Checking with pitch controller device

 - Adjustment of P3 and P4 (timing diagram DAC)
 - Adjustment of P13 (DAC-Volume)
 - Checking with a 2-channel oscilloscope
 - Connect scope channel 1 with test point MP3
 - Connect scope channel 2 with test point MP2
 - Registration 2' flute on the upper manual
 - Play the note C in the upper octave
 - Adjust P3, P4 and P13 for the following diagram

- Adjustment of P1 (General Blop)
- Registration piano - FR1
- Play the note C in the middle octave on the upper manual
- The adjustment of P1 is finished if you hear no Blop noise at the end of the decay time.

- Adjustment of P2 (Symmetry)
- Registration trumpet-FR2
- Play the note C in the middle octave on the upper manual
- The adjustment of P2 is finished if you hear no Blop noise at the beginning of the note.

- Adjustment of P5 - P12 (final Blop adjustments)
- P5 - P12 give a final adjustment for the symmetry near zero amplitudes for the individual channels.
- List of registrations and settings used to adjust presets should be inactuated, e.g.
- P5, Hawaiian guitar - FR2
- P6, Bass 8' with sustain
- P7, Piano - FR1
- P8, Swing1, Arrangeur group 2, Keystart, press the note H in the lower manual for a short time.
- P9, Percussion 4' and 2²/3'
- P10, Flutes 16', 8', 4', 2', 1' with Sustain, (Upper manual)
- P11, Barock, Arrangeur group 1, Keystart, press the note H in the lower manual for a short time.
- P12, Strings 2
- The adjustments are finished if you hear no Blop noise at the end of a decay time

Note: It is necessary before you make adjustments on the DA board to switch ON the instrument for a time of 15 - 20 min.

3.) Filter with DAC: - Test program "P" (PROM-check)

- Test point IC-7-pin6
- Adjust P2 for +5V
- Adjustment of P1 (VCF-Center frequency)
- Adjust P1 for 0,95V (measured at the slider of P1)
- Finally it is necessary to check the sound of the bass presets.
- Adjustment of P3 (Bass-Volume)
- Adjust P3 for the desired volume

4.) 4-Times filter board:

- Adjustment of P1.1-P4.1 (VCF-Center frequency)
- All voltages are measured at the sliders of the trimming potentiometers.
- P 1.1 - +1,5V
- P 2.1 - -2,7V
- P 3.1 - -4,4V
- P 4.1 - +0,5V
- Finally it is necessary to check the sound of the different groups (FR1, FR2, GR1, GR2).
- The reverb of the groups is adjustable with P1.2-P4.2

- Adjustment of P1.3-P4.3 (Volume of the groups)
- P1.3, Volume FR2
- P2.3, Volume GR2
- P3.3, Volume FR1
- P4.3, Volume GR1
- Adjust P1.3 - P4.3 for the desired volume.

- 5.) Mixing unit:
- Adjustment of P1 (Treble), P2 (Bass)
 - Adjust P1 for + 4V at IC-1-TDA4292-pin1
 - Adjust P2 for + 4V at IC-1-TDA4292-pin3
 - Adjustment of P3, P4, P6, P7
(Bass-Treble equalizer)
 - With this adjustment it is possible to correct the sound of the organ channel left/right. Each channel has a separate Bass/Treble control.
 - Adjustment of P5 (initial volume for the footswell)
 - Set the footswell in the min.position
 - Set the Master Vol.in the max position
 - Adjust P5 to the desired initial volume
 - Adjustment of P8 (Offset)
 - Registration Strings 2 - upper manual
 - Play 3 notes on the upper manual
 - Adjust P8 that you hear no distortions.

- 6.) Tremolo unit:
- Adjustment of P1
 - Registration all flutes on the upper manual
 - Play 8 notes on the upper manual
 - The adjustment is finished if you hear no distortions.
