GTX47 Specifications

Number of Outputs:	7 (fully configurable)		
Possible System Configurations:	FRONT: 1, 2 or 3-way REAR: 1, 2 or 3-way SUBWOOFER		
Crossover Section Frequencies:	LOW: (SUBWOOFER)		
	Low-Pass 30 - 300Hz		
	FRONT AND REAR MID 1:	High-Pass Filter: 30Hz - 300Hz	
		Low-Pass Filter (x1 mode): 100Hz - 1kHz (x10 mode): 1kHz - 10kHz	
	FRONT AND REAR MID 2:	High-Pass Filter 100 - 1kHz	
		Low-Pass Filter 1k - 10kHz	
	FRONT AND REAR HIGH:	High-Pass Filter (x1 mode): 1kHz - 10kHz (÷20 mode): 50Hz - 500Hz	
Output Level Control Range:	0dB to -20dB		
Overall Frequency Response:	10Hz to 50kHz (+0dB, -1dB)		
Signal-to-Noise Ratio:	100dBA		
Input Sensitivity (for 500mV output, Gain Control CW):	500mV		
Maximum Line Level Input:	4V RMS		
Line Level Input Impedance:	10kΩ MIN		
Output Impedance:	1kΩ MAX		
Speaker Level Input Impedance:	15Ω		
Maximum Speaker Level Input:	7V RMS		
Filter Type:	Subwoofer: Selectable (18dB or 24dB per octave) All others: (12dB per octave Butterworth)		
Size: Main Chassis: (inches. W x L x H).	11-7/8" x 7-1/8" x 1-5/8" (300mm x 180mm x 41mm)		
Size: Remote Unit: (inches. W x L x H).	2.56" x 3.3" x 1.18" (65mm x 84mm x 30mm)		
Weight Main Chassis:	3 lbs. 14 oz. (1.76kg)		
Weight Remote Unit:	8.5 oz. (240g)		
Fuse:	3 Amp ATC		

JBL subscribes to a policy of continuous product improvement. As a result, some design elements and specifications may be changed without notice during the life of the product.

Features

- Variable frequency crossover combined with unique "Virtual Center" image enhancement circuitry.
- Trunk-mount design with dash-mount remote control.
- Separate Front and Rear inputs.
- Configurable to 2, 3 or 4-way operation with independent front and rear channel adjustments.
- Continuously adjustable crossover frequencies independently adjustable for each band.
- Constant-bass (non-fading) Subwoofer output.
- "Phase" switches on each output allow easy polarity reversal to assure optimum band-to-band transitions.
- Stereo/Mono Subwoofer output selection.
- 12 dB per octave crossover slopes on all bands.
- Selectable 18 dB or 24 dB slope Subwoofer filter.
- "Virtual Center" image enhancement circuit stabilizes the center image for the driver and recovers rear channel ambiance.
- Remote control provides adjustment for effects level and bypass modes.
- Small car/large car image optimizer switch.
- Gold-plated connectors eliminate contact oxidation and assure reliable trouble-free connections.

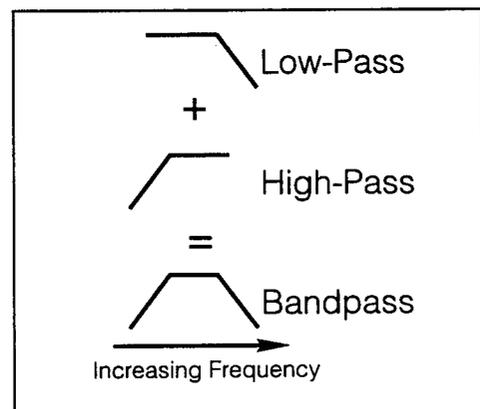

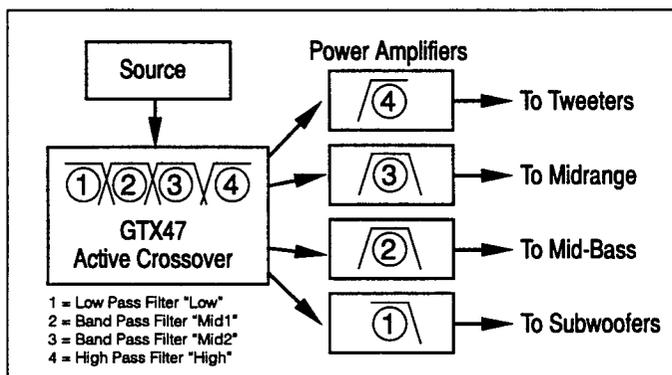

Theory of Operation

Why Crossover Networks are Needed

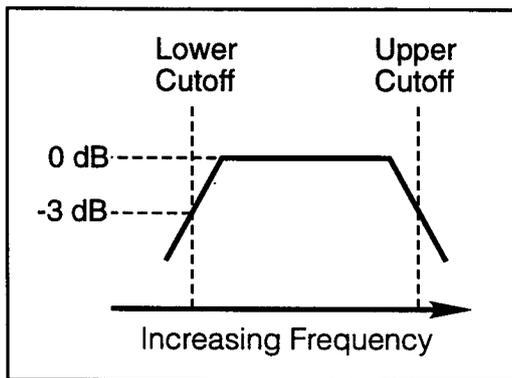

If a single speaker could be made to cover the entire frequency range with smooth response, low distortion, and high output, and be small enough to fit in a car, we would not need crossover networks of any type. Unfortunately, no one has yet developed the "perfect" speaker that has all of these ideal characteristics. As a result, multiple drivers, each specialized for a band a frequencies, are generally used to cover the audible frequency range. The crossover network's job is to divide the full-spectrum music signal into the narrow bands required by each specialized speaker driver. A 2-way speaker separates the frequency spectrum into 2-bands typically handled by a woofer and tweeter which reproduce the lows and highs respectively. 3-way systems add a midrange driver, and 4-way systems commonly add either a Midbass driver or super-tweeter. The GTX47 has the unique flexibility to adapt to any system from 2 to 4-way designs, both front and rear, and with independent adjustment for each band.

Understanding the Terminology

There are three basic types of crossover circuits used in the GTX47: High-Pass, Low-Pass, and Band-Pass. As its name implies, a Low-Pass crossover allows low frequencies to pass through, and blocks higher ones. In the GTX47, a Low-Pass crossover is commonly used for the Subwoofer, and is labeled "LOW". A High-Pass crossover allows high frequencies to pass through and blocks the lows. In the GTX47, two high-pass sections are included, labeled "FRONT HIGH" and "REAR HIGH". By proper use of the frequency controls, these may be used to feed either a front or rear satellite speaker or the tweeters in a 3 or 4-way system. The remaining sections, "FRONT and REAR MIN 1 and MIN 2", are Band-Pass crossovers, where both the highs and lows are blocked, and the band in the middle is allowed to pass through. These are typically used for Midrange or Midbass speakers. The crossover circuits of the GTX47 may be used in a variety of combinations to create 2, 3 or 4-way designs independently for front and rear systems.

The rate at which the crossover attenuates the out-of-band signals is called the slope. In the GTX47, the slope of all of the Band-Pass and High-Pass sections is 12dB per octave. This means that the output of the signal will be attenuated by 12dB for each octave away from the Cutoff Frequency. As in all crossovers, there is still signal which reaches the speaker outside of the frequencies passed by the crossover, but this signal is increasingly attenuated the further away it is from the desired band. The slope of the subwoofer ("LOW") section in the GTX47 may be chosen as 18 or 24 dB per octave. The sharper 24 dB per octave slope is helpful to reduce the amount of Midrange energy produced by the subwoofer, improving system imaging.

The Cutoff Frequency for each band is the point at which the response is 3 dB down from the signal level. On the GTX47, the Cutoff Frequency of each High-Pass and Low Pass is adjustable. Each Band-Pass has adjustments for both the upper and lower Cutoff Frequencies which define the band.

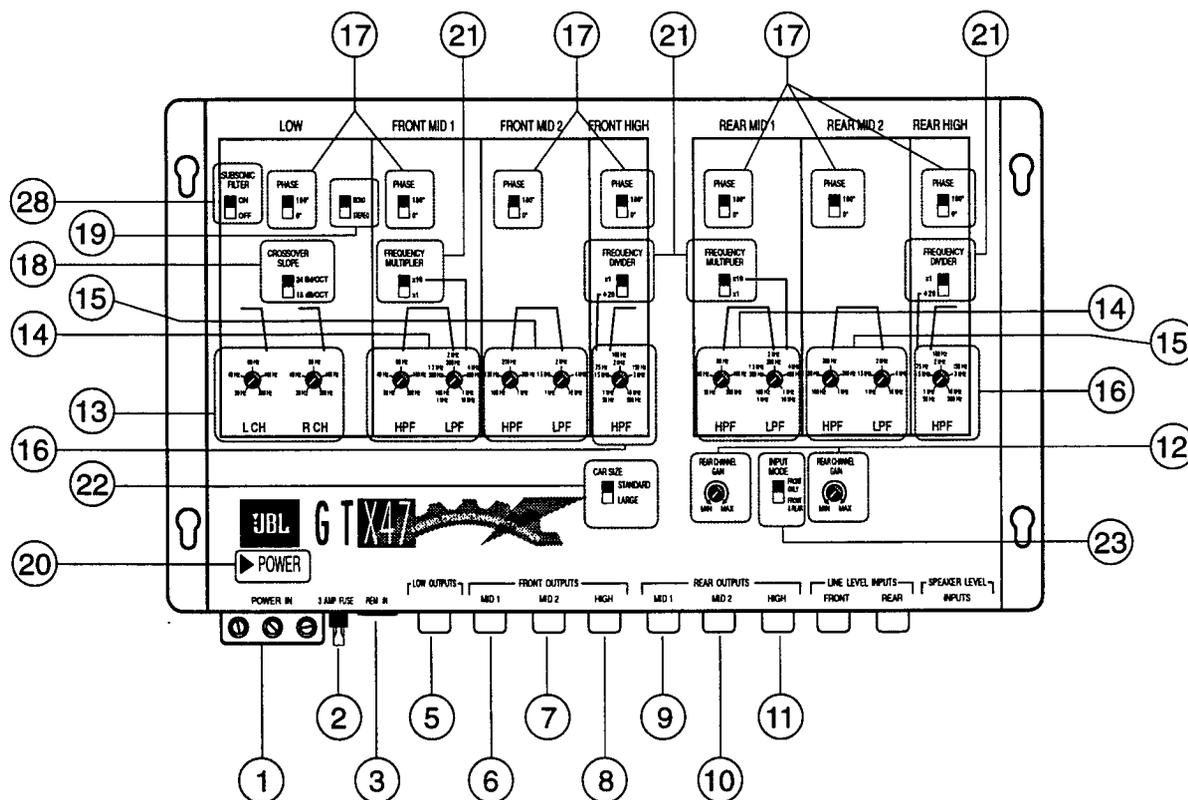

Virtual Center Image Enhancer

Many methods have been tried to recreate the image and spaciousness of a live performance in the confines of a car interior. Multichannel surround sound, DSP, installing a center channel speaker, sophisticated phase and amplitude manipulation, and other approaches can help add to the realism of reproduced sound when applied properly. When misapplied, the results can be disastrous. Until the JBL Virtual Center circuitry was developed, the most successful techniques were expensive as with DSP, or often required difficult installation, as with center channel speakers.

JBL's breakthrough "Virtual Center" circuitry is the result of the understanding of how the human ear responds to timing, frequency, and amplitude cues to determine the apparent direction of a sound source. Virtual Center circuitry manipulates the analog signal in real time to provide each of the driver's ears with the signal they would receive if the driver was seated in the center of the vehicle. This provides a stable centered image to the driver much like that obtained with a dedicated center-channel loudspeaker.

To restore the spaciousness that is generally lost in the small confines of a car interior, the rear channels utilize the differential-mode ambiance recovery system to restore the ambiance information present in all conventional stereo recordings. Unlike DSP, the JBL circuitry does not add synthetic reverb, but recovers real information that is masked in conventional systems. As a result, the overall effect from the Virtual Center circuitry of the GTX47 is incredibly realistic yet simple to adjust and use. Best of all, the "Virtual Center" and ambiance recovery circuits do not require specially encoded recordings and work with virtually all conventional stereo tapes, discs, and broadcasts.

GTX47 Controls, Connectors and Switches

**1. Power Connectors:**

Connect to Battery, Ground and Remote-On signals.

- The Battery terminal should be connected directly to the battery. Do not connect this terminal to the vehicle's electrical system wiring (such as dome-light circuit, etc.). Add a 3-Amp inline fuse (not included) to protect against shorting of the power wire.
- The Ground terminal connection should be made to a clean, bare metal part of the vehicle's chassis (an already installed screw, if possible). Scrape off paint or corrosion from the grounding point.
- The Remote-On terminal should be connected to the remote turn-on wire or power antenna output from the head unit. This will allow the GTX47 to turn on and off simultaneously with the head unit.

2. Fuse:

The fuse protects the units from damage. If the unit's remote-on light does not turn on, check this fuse. If the fuse has blown, replace it with a new one of the same value (do not use larger value fuses). If the fuse blows again, there is a problem with the wiring and/or the unit itself. Your JBL dealer can identify and correct the problem.

3. Remote Control Connector:

Plug the remote control cable into this receptacle.

4. High and Low Level Input Connectors:

When using a head unit with separate front and rear 4-channel preamp-level outputs, connect the front and rear head unit outputs to the front and rear line level inputs respectively. The input selector switch (23) should be in the

"Front & Rear" Position. If using a head unit with just 2-channel preamp output, connect the head-unit to the "Front" line level inputs and switch the input mode switch to "Front Only". If using a head unit which only has speaker level outputs, connect the head unit outputs to the speaker level inputs with the supplied adapter cable. Set the input mode selector to "Front" for a 2-channel head unit and "Front and Rear" for 4-channel units. If you are using a bi-level head unit which has 2-channels of line level and 2-channels of speaker level, both the 2-channels of line level input and 2-channels of speaker level input may be used. In this case, the input mode selector should be set to the "Front & Rear" position.

5. "Low" Output Connectors:

Connect to the subwoofer amplifier input terminals.

6. Front Mid 1 Output Connectors:

Connect to the amplifier used to drive front channel Midrange or Midbass loudspeakers in 3 or 4-way systems.

7. Front Mid 2 Output Connectors:

Connect to the amplifier used to drive Midrange speakers in 3 or 4-way systems.

NOTE: Either Mid 1 or Mid 2 may be used for Midrange driver in 3-way systems depending on the crossover frequency desired.

8. Front High Output Connectors:

Connect to the amplifier used for the front tweeter in 3 or 4-way systems or the front satellite speakers in 2-way systems.

9. Rear Mid 1 Output Connectors:

Connect to the amplifier used to drive rear channel Midrange or Midbass loudspeakers in 3 or 4-way systems.

10. Rear Mid 2 Output Connectors:

Connect to the amplifier used to drive rear Midrange speakers in 3 or 4-way systems.

NOTE: Either Mid 1 or Mid 2 may be used for the Midrange driver in 3-way systems depending on the crossover frequency desired.

11. Rear High Output Connectors:

Connect to the amplifier used for the rear tweeters in 3 or 4-way systems or to the rear satellite speakers in 2-way systems.

12. Front and Rear Channel Gain Controls:

Use these controls to set the input sensitivity level of the GTX47 to the optimal level for connection to the amplifiers.

13. Right and Left Low Output Frequency Adjustment Controls:

Use these controls to set the upper cutoff frequencies for the Low output.

14. Front and Rear Mid 1 Cutoff Frequency Adjustments:

These controls set the upper and lower cutoff frequencies of the Mid 1 band-pass filters. Use the control labeled HPF to set the low frequency limit and the control labeled LPF to set the upper frequency limit.

15. Front and Rear Mid 2 Cutoff Frequency Adjustments:

These controls set the upper and lower cutoff frequencies of the Mid 2 band-pass filters. Use the control labeled HPF to set the low frequency limit and the control labeled LPF to set the upper frequency limit.

16. Front and Rear High Frequency Adjustment Controls:

Use these controls to set the lower cutoff frequency of the Front and Rear High outputs.

17. Phase Switches:

These switches reverse the polarity of the speakers connected to their respective outputs. Start by setting these switches to 0 to keep all of the outputs "in-phase". If an RTA shows a deep dip in response at any of the crossover frequencies, try reversing the polarity of one of the drivers at this crossover. If the dip is reduced or eliminated, leave the phase switch in this position. Check each band and leave the phase switches in the position which gives the smoothest response.

18. "Low" Crossover Slope:

Use this switch to set the "Low" output crossover slope to either 18 or 24dB per octave.

19. Subwoofer Output Stereo/Mono Switch:

Selects Stereo or Mono output for the sub-bass frequencies. The Mono mode allows the use of one subwoofer along with a single channel amplifier. It should also be used when two or more subwoofers are mounted in common enclosure or baffle board. The Stereo mode can provide better separation when independent and isolated enclosures are used for each subwoofer.

20. Remote-On Indicator:

An LED gives visual confirmation of whether or not the unit is in operation. It is also useful for system trouble-shooting.

21. Crossover Frequency Multiplier Switches:

These switches can change the range of crossover frequencies. The alternate multiplied frequency adjustment ranges are listed above the variable controls.

NOTE: The High crossover replaces the frequency multiplier with a frequency divider to be used in 2-way or some 3-way systems.

22. Car Size Optimizer Switch:

Use this switch to optimize the virtual center image position on the built in Imaging Enhancer Processor.

23. Input Mode Switch:

Set this switch to "Front Only" when using the GTX47 with a head unit that has only one set of outputs. This causes the front and rear crossover sections to be driven by the front input signal. Set this switch to Front and Rear when using the GTX47 with a head unit that has two sets of outputs.

24. Remote Bypass/On Indicator:

This indicator is on when the Imaging Processor is engaged and off when the Imaging Enhancer is bypassed.

25. Driver/All Optimizer Indicator:

This indicator is on when the Imaging Enhancer is in "Driver" optimization mode and off when the Imaging Enhancer is in the "All" passenger mode.

26. Front Ambience and On/Bypass Control Switch:

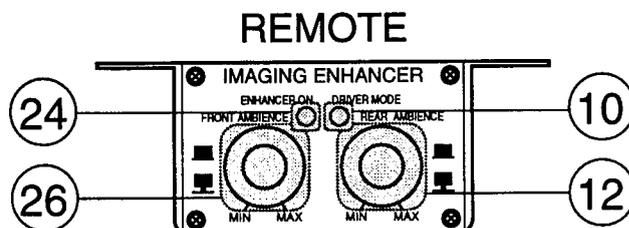

Rotating this control adjusts the amount of ambience and front staging width produced by the Imaging Enhancer. Pulling the knob places the Imaging Enhancer in "Bypass" mode. Pushing in the knob places the Imaging Enhancer in "On" mode.

27. Rear Ambience and Driver/All Optimizer Control:

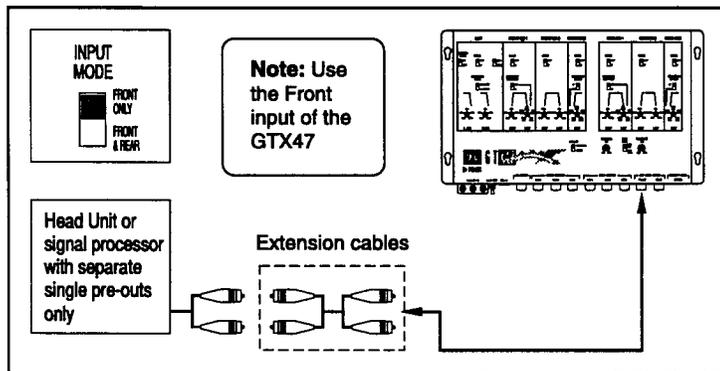

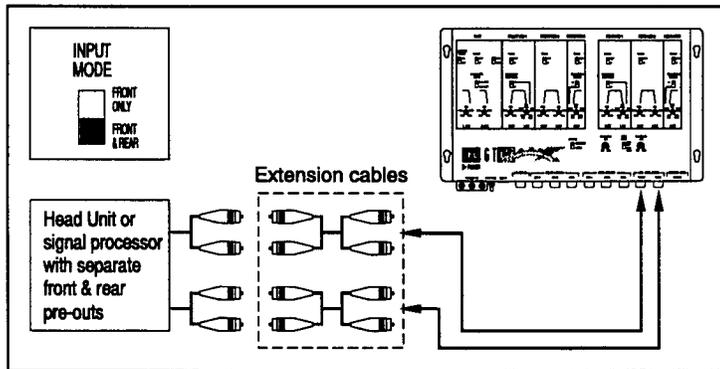

Rotating this knob controls the amount of rear fill ambience and the "room size" of the acoustic environment when used in a system with rear speakers. Pulling the knob out places the Imaging Enhancer in "All" passengers optimization mode. Pushing the knob in places the unit in "Driver" optimization mode. Best results at the driver's position will be achieved with the control in the "Driver" setting.

28. Subsonic Filter Switch:

Engages a 15Hz High Pass subsonic filter.

Wiring Set-up

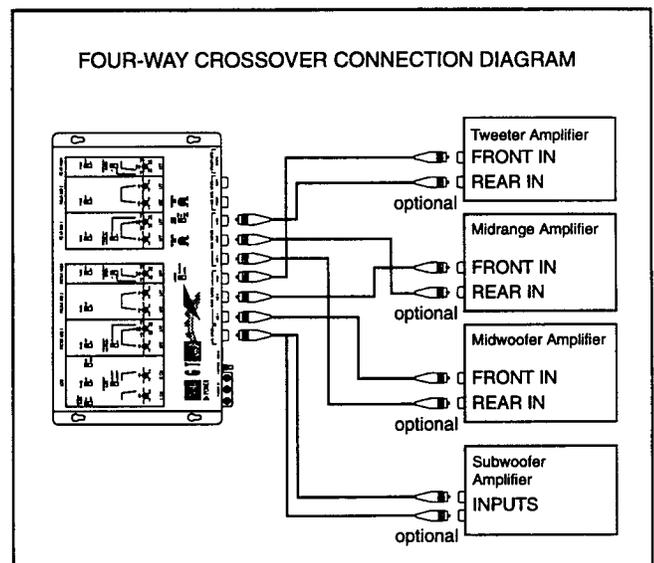

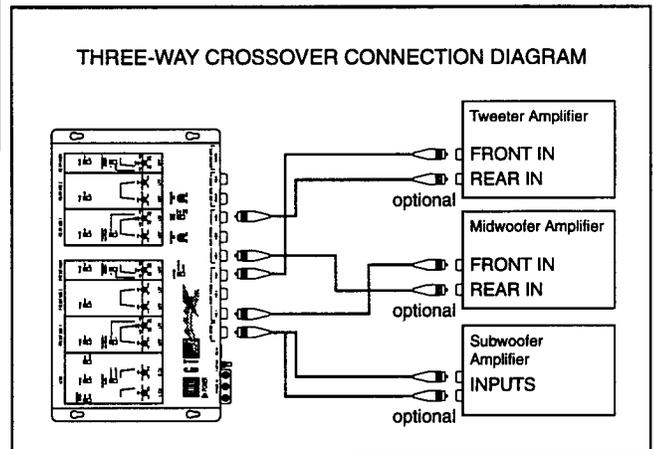

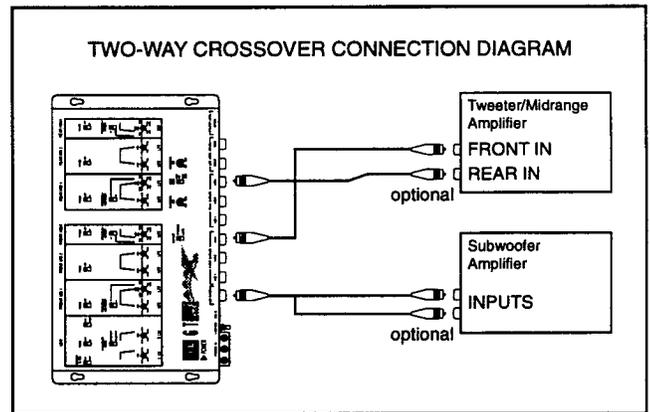

SPEAKER LEVEL INPUT CONNECTIONS

Left Front +	White
Left Front -	White/Black
Right Front +	Gray
Right Front -	Gray/Black
Left Rear +	Green
Left Rear -	Green/Black
Right Rear +	Purple
Right Rear -	Purple/Black

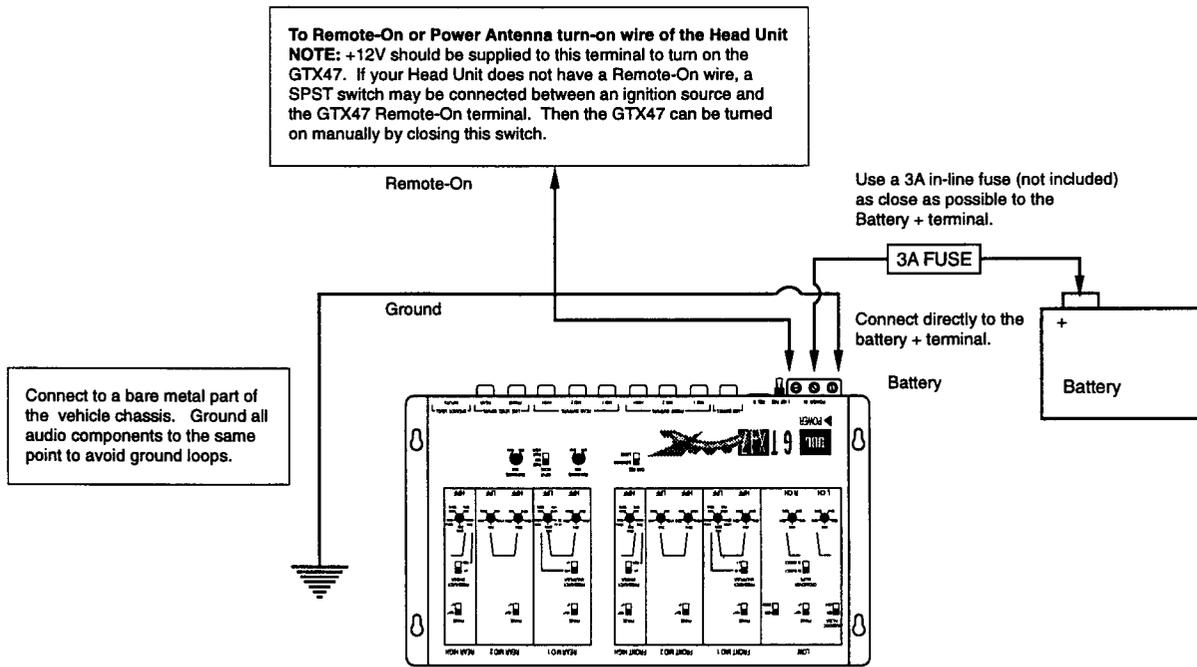

Refer to "Power Connections Diagram and System Configurations Diagrams" for more information.

IMPORTANT NOTE FOR RIGHT HAND DRIVE CARS:

For countries which have right hand drive cars all input and output connections to the GTX47 should be reversed. Connect the left output of your CD/Cassette to the right input of the GTX47 and the right output of the GTX47 to the left inputs of the amplifier. Connect the right outputs of the GTX47 to the left inputs of the amplifier. (see page 7)

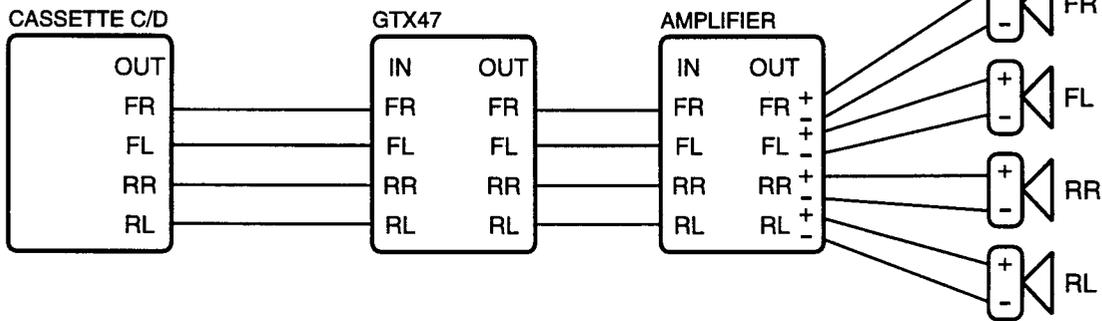

Wiring and Set-Up

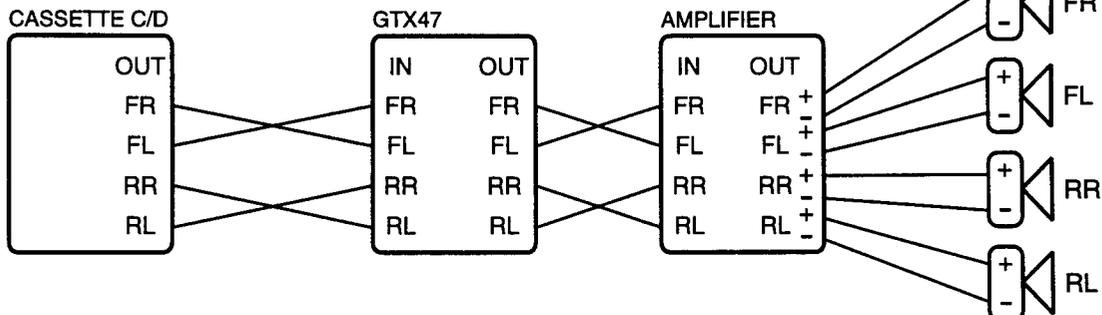

System Configurations

Typical GTX47 system configurations are shown below.

LEFT HAND DRIVE CAR (Connection shown for one speaker type only. Repeat similar connection for other speakers).

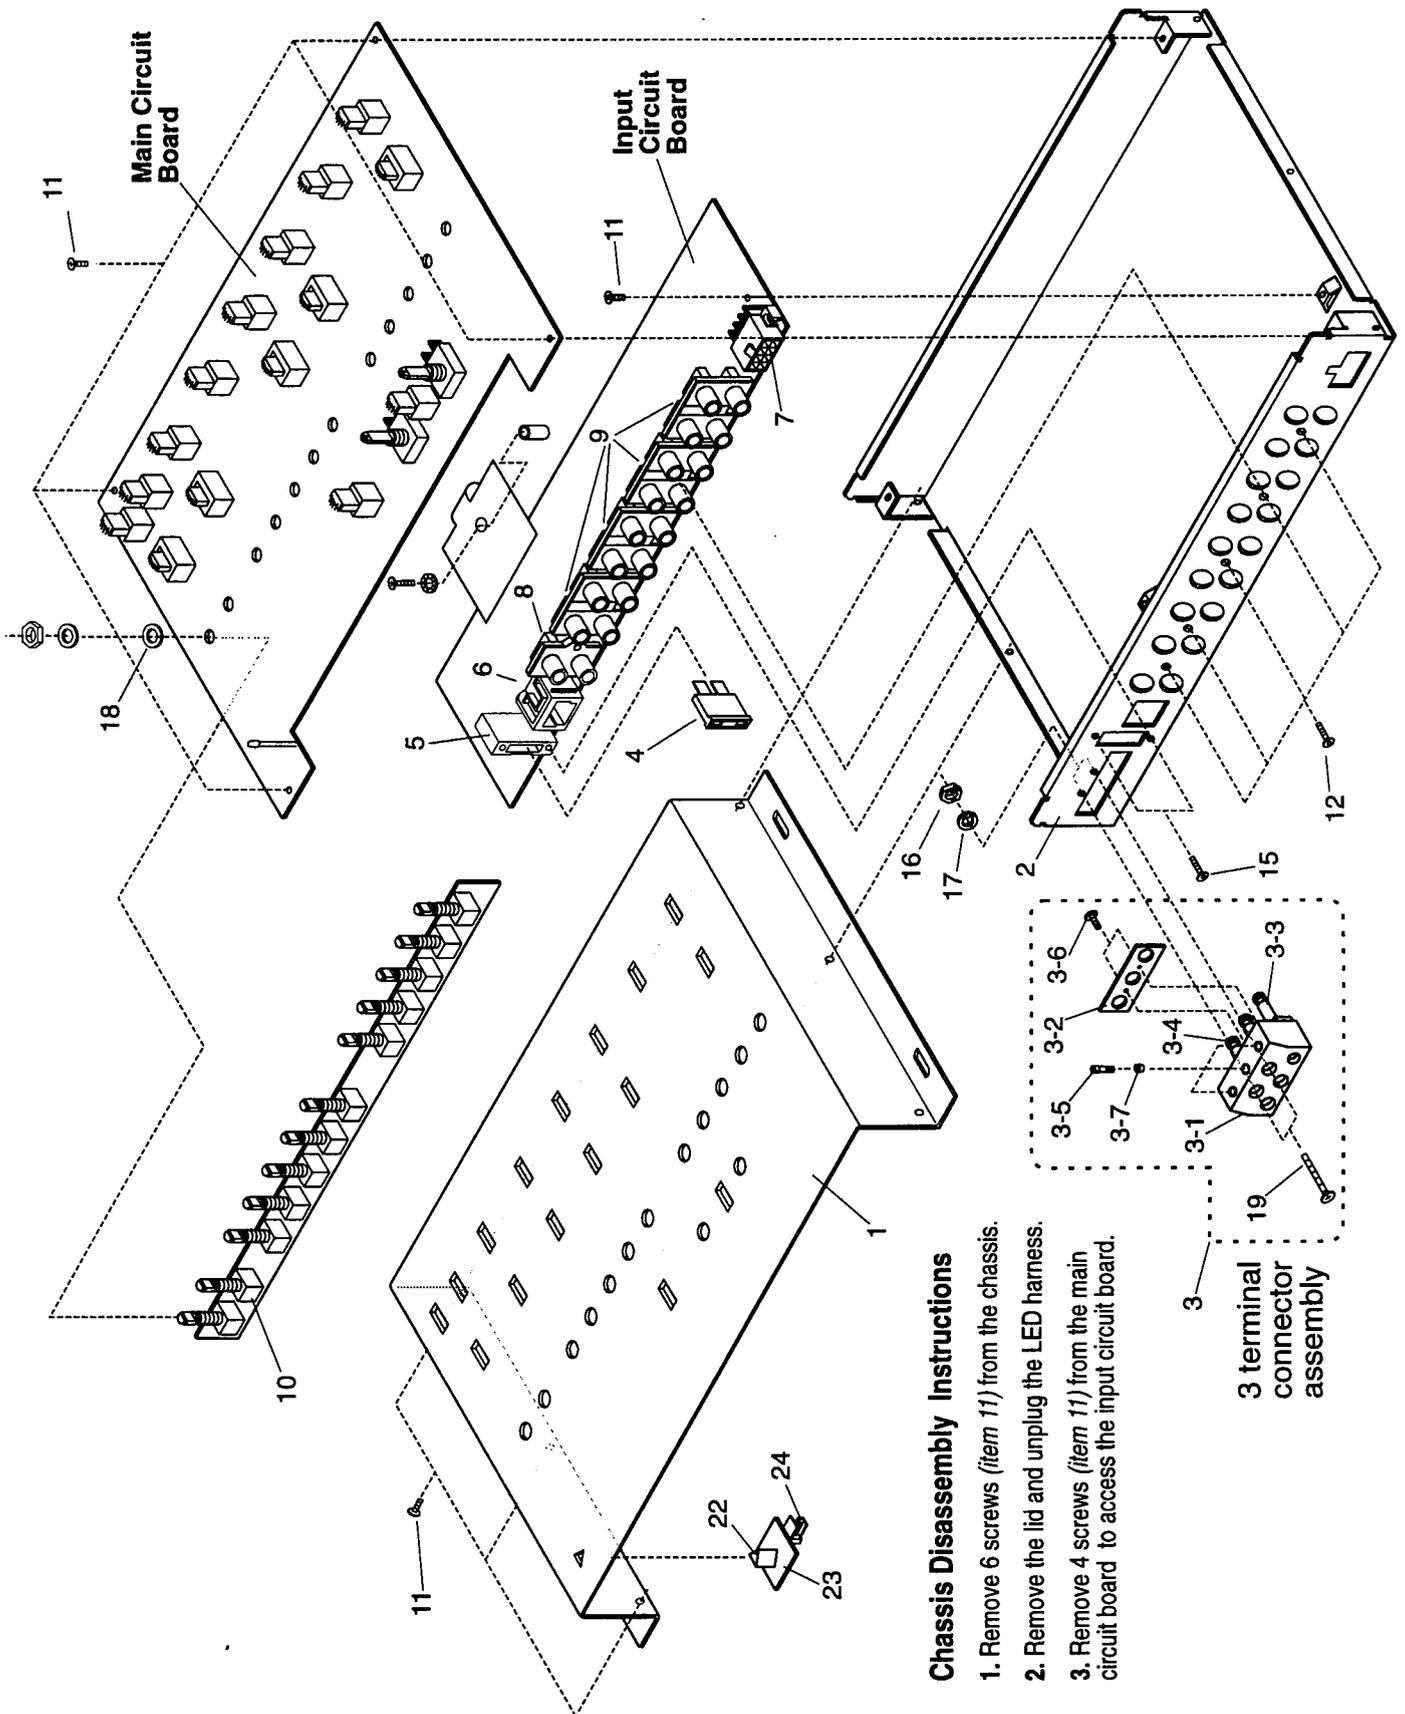

RIGHT HAND DRIVE CAR (Connection shown for one speaker type only. Repeat similar connection for other speakers).

Note: Right hand driver cars must reverse right and left inputs and outputs for proper functioning of the Imaging Enhancer.

Mechanical Exploded View

Chassis Disassembly Instructions

1. Remove 6 screws (item 11) from the chassis.
2. Remove the lid and unplug the LED harness.
3. Remove 4 screws (item 11) from the main circuit board to access the input circuit board.

3 terminal connector assembly
