# S412P

## GENERAL ACOUSTIC & ELECTRICAL SPECIFICATIONS

- Nominal Impedance 8 ohms
- Max Amp Power 250 watts\*
- Frequency Response 32Hz – 20kHz
- Sensitivity 91 dB (1 watt @ 1 meter)
- Crossover Frequency 200Hz, 850Hz, 3500Hz
- Subwoofer Amplifier Output 200 watts

### AURAL SWEEP TEST SPECIFICATIONS:

- A. System Aural Sweep Test 6.0V Input 20 Hz to 20 kHz
- B. L.F. Aural Sweep Test 6.0V Input 20 Hz to 500 Hz
- C. M.B.F. Aural Sweep Test 5.0V Input 100 Hz to 1 kHz
- D. M.F. Aural Sweep Test 4.0V Input 500 Hz to 4 kHz
- E. H.F. Aural Sweep Test 2.83V Input 3 kHz to 20 kHz

### PHYSICAL SPECIFICATIONS

**Enclosure dimensions:** 44 x 16 x 13 3/8" (H x W x D)  
1118 x 406 x 340mm

**Weight** 86lbs./39.1kg Each

\*The maximum recommended amplifier power rating will ensure proper system headroom to allow for occasional peaks. We do not recommend sustained operation at these maximum power levels.

Occasional refinements may be made to existing products without notice but will always meet or exceed original specifications, unless otherwise stated.

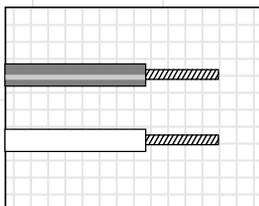

**PRODUCT: JBL S412P**

LINE VOLTAGE	Yes/No	Hi/Lo Line	Nom.	Unit	Notes

# SPEAKER CONNECTIONS

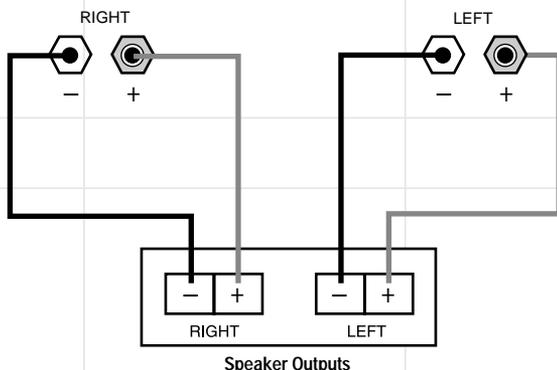

## CONNECTION TIPS

Speakers and electronics terminals have corresponding (+) and (-) terminals. It is important to connect both speakers identically: (+) on the speaker to (+) on the

amplifier and (-) on the speaker to (-) on the amplifier. Wiring "out of phase" results in thin sound, weak bass and a poor stereo image.

## SPEAKER-LEVEL CONNECTIONS

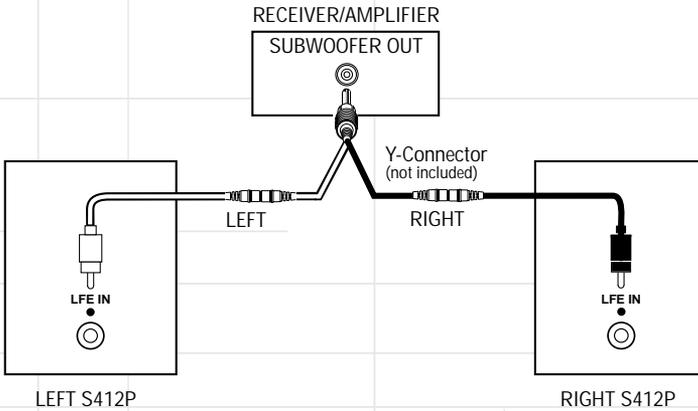

Your S412P speakers should be connected to your receiver in two ways (at speaker level and line level) in order to achieve the best performance, especially when listening to program material recorded in digital 5.1 formats, such as Dolby\*\* Digital and DTS®. Connect the left-front and

right-front speaker terminals on your receiver or amplifier to the 5-way binding posts on the back of each S412P speaker. Remember to maintain the correct polarities ("+" to "+" and "-" to "-"). The S412P uses a red binding post for "+" and black for "-". These connections will provide full-range

sound to all four transducers, and you should ALWAYS make these connections. If your receiver or amplifier does not have a line-level subwoofer output, then you do not need to make any other connections, and you should skip to the section titled "Amplifier Controls."

## LINE-LEVEL CONNECTIONS

Each S412P speaker is also equipped with a line-level Low-Frequency Effects (LFE/Subwoofer) input for superior performance with digital 5.1 surround formats. The .1 LFE channel contains additional low-frequency information not found in the left- and right-front channels. The LFE input works with the full-range speaker-level input to provide the dynamics and

effects that your favorite filmmakers intended. You will need to use a Y-Connector (not included) with one male connector and two female connectors to connect the line-level subwoofer output on your receiver/amplifier to the LFE/Subwoofer inputs on the S412P speakers. Plug the male connector into the subwoofer output on your receiver or amplifier, and connect each of the

two female connectors to extension RCA patch cords. Then plug each patch cord into the LFE/Subwoofer input of the left and right S412P speakers. **Note:** If your receiver has separate left and right line-level subwoofer (or LFE) output jacks, you do not need to use a Y-Connector.

## AMPLIFIER CONTROLS

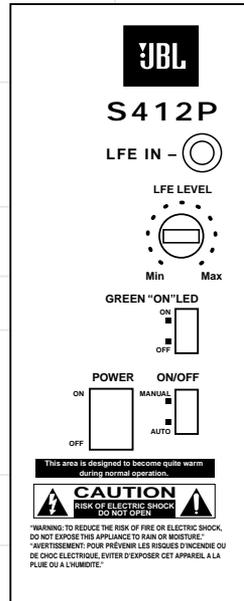

**LFE Level Control:** Allows you to adjust the volume of the low-frequency effects/subwoofer channel to suit your room acoustics or tastes. However, it only affects the LFE signal. If you are not using the LFE input, the LFE level control will not operate.

**Configuring Your Receiver:** You should choose the “Large” or “Wide” option for the left- and right-front speakers so that full low-frequency information will be sent to the S412P speakers. Make sure that you also configure your receiver for “Subwoofer On” or “LFE On.” In this case, the LFE/Subwoofer signal will consist only of the .1 (bass) channel. The LFE signal level can be adjusted by using the LFE level on the S412P amplifier panel. For initial setup, you should set the level controls on both speakers at minimum (full counterclockwise rotation). With 5.1 source material playing, advance the level controls on each speaker slowly until the desired amount of effects channel is present. This is a rather subjective adjustment and should be made using a variety of program materials.

If you choose, you can use the “Small” or “Narrow” setting on your receiver. In this case, all of the information below 80Hz will be fed to the LFE/Subwoofer input on the

S412P. Now the level control operates throughout the entire bass spectrum below 80Hz, not just within the .1 channel portion. This configuration is generally unnecessary but, in certain room-placement conditions, it allows greater bass-level control.

**Power Switches:** The main “Power” switch is simply marked “On” and “Off.” Turn this switch on to commence operation of the powered amplifier after you have plugged the power cord into an AC outlet. The second switch is labeled “On/Off” and has two positions. Placing the switch in the “Auto” position puts the amplifier in Standby mode. In this mode the speaker will be able to automatically sense an incoming signal, which will trigger it to turn fully on. The speaker will also automatically switch itself back into Standby mode after approximately 10 to 15 minutes have passed without its sensing a signal. We recommend that you leave this switch in the “Auto” position for most applications. If you will be away from home or not using your speakers for an extended period of time, you should turn the speakers off by using the main power switch. The Manual position will bypass the auto-sensing feature and leave the amplifier on until turned off with the main switch or returned to

auto sensing by choosing the auto position.

**LED Indicators:** When your speaker is turned on but is not receiving a signal, the LEDs glow red to let you know that your speaker is plugged in. When the speaker is receiving a signal, the LEDs glow green. We have provided a convenient “Green ‘On’ LED” switch on the back panel to allow you to shut off the front LEDs should they interfere with your enjoyment of a movie. This switch has no effect when the LEDs are in red mode.

# TROUBLESHOOTING

## **If there is no sound from any of the speakers:**

- Check that receiver/ amplifier is on and that a source is playing.
- Review proper operation of your receiver/amplifier.

## **If there is no sound coming from one speaker:**

- Check the "Balance" control on your receiver/amplifier.
- Check all wires and connections between receiver/amplifier and speakers.
- Make sure all wires are connected. Make sure none of the speaker wires are frayed, cut or punctured.

## **If the system plays at low volumes but shuts off as volume is increased:**

- Check all wires and connections between receiver/amplifier and speakers.
- Make sure all wires are connected. Make sure none of the speaker wires are frayed, cut or punctured.
- If more than one pair of main speakers is being used, check the minimum impedance requirements of your receiver/amplifier.

## **If there is no (or low) bass output:**

- Make sure the polarities (+ and -) of the left and right "Speaker Inputs" are connected properly.
- Make sure that the speaker is plugged into an active electrical outlet and switched on, and that the green LEDs are displayed.

## **If you used the LFE input and there is no sound from the subwoofer:**

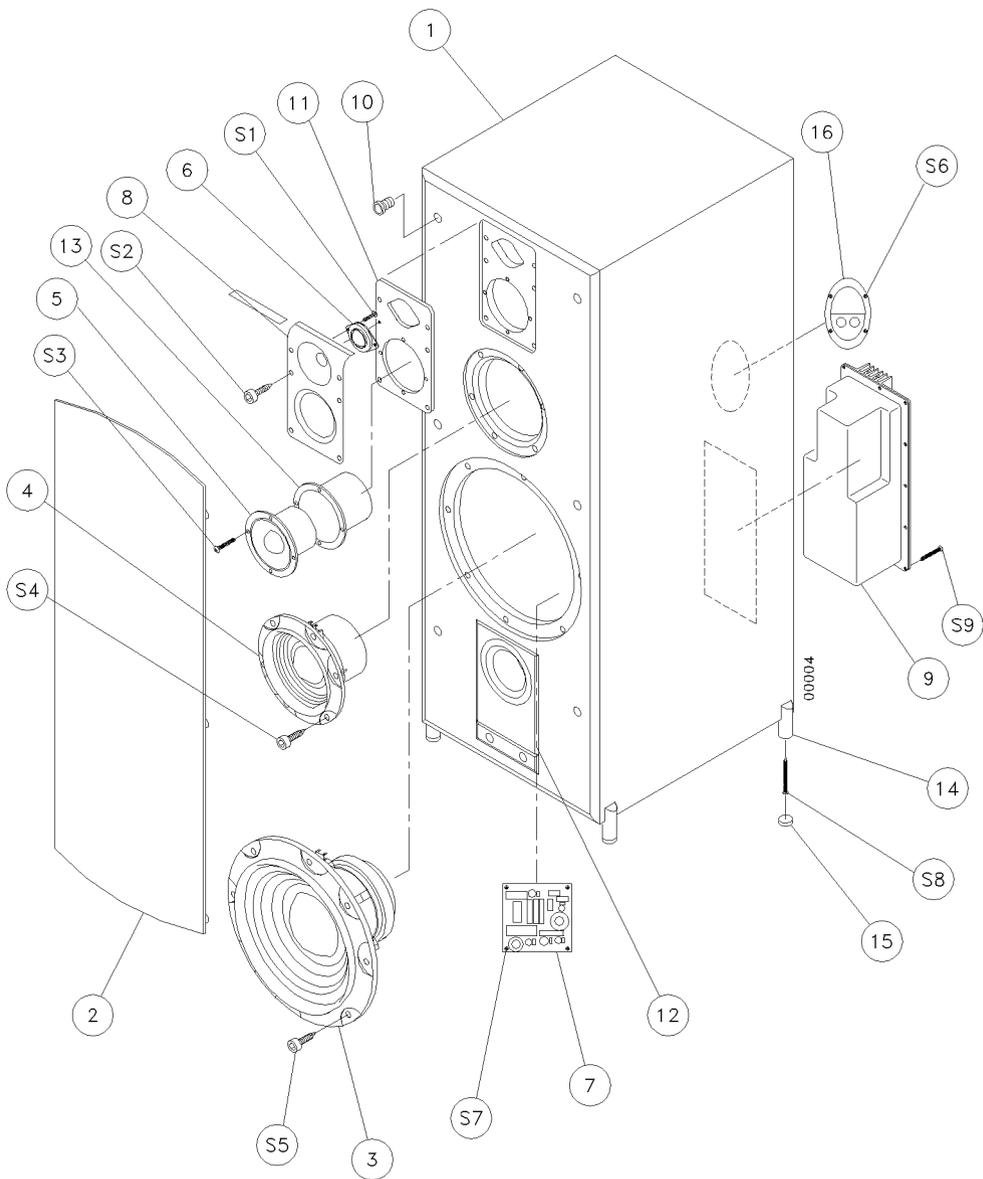

- Check that receiver/ amplifier is on and that a source is playing.
- Make sure that the speaker is plugged into an active electrical outlet.
- Check all wires and connections between receiver/amplifier and speakers.
- Make sure all wires are connected. Review the "Line-Level Connections" section on page 5 of this manual and make sure that a single RCA patch cord is connected to each loudspeaker from the Y-Connector plugged into the receiver/amplifier's subwoofer output. Make sure none of the speaker wires are frayed, cut or punctured.
- Review proper operation of your receiver/amplifier, including making sure that you have configured your receiver so that the subwoofer output is active.

## **If you are using the S412P LFE/Subwoofer input and the bass level decreases (instead of increasing) when you turn the LFE/Subwoofer Level knob clockwise:**

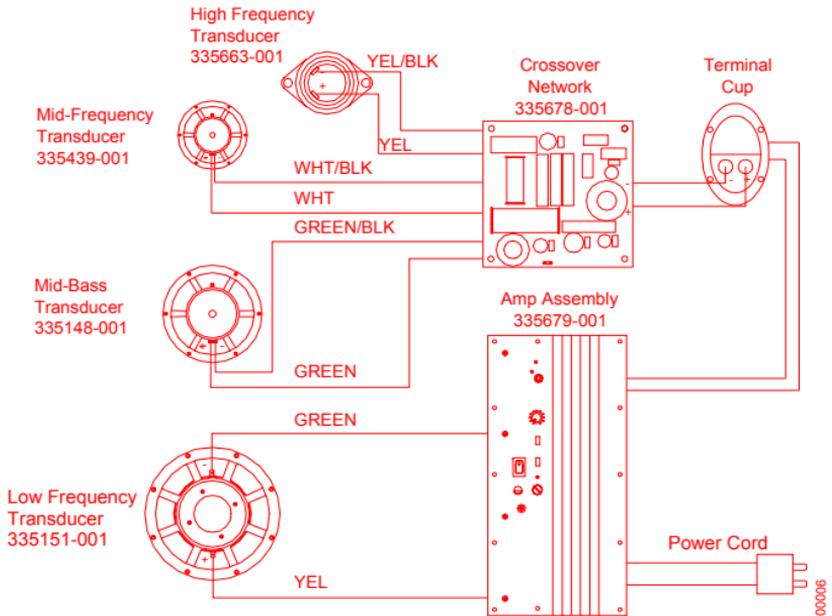

- Recheck to make sure that your receiver or amplifier-speaker outputs are correctly connected to the S412P speaker inputs (gold-plated binding posts), (+) to (+) and (-) to (-). The S412P (+) terminal has a red stripe and is located on the right-hand side, below the letter "L" of the molded JBL logo, when looking directly at the back of the S412P.
- If the wires are connected properly, the confusion may be attributable to the design of your receiver/ amplifier. Your unit may have inverting inputs, which reverse the polarity of the signal between the inputs and outputs of the amplifier. To check if this is the case, reverse the speaker connections for **ALL** S412Ps in your system (and disconnect any other speakers in the system) so that the receiver/amplifier's (+) connector is connected to each S412P's (-) (black stripe) speaker connector. If you do this and the S412Ps function properly (bass increases as you turn your LFE/Subwoofer level-control knobs clockwise), your receiver/amp uses inverting inputs. This is not a problem. Simply connect all of the speakers in your system the same way, with the receiver or amplifier's (+) terminal to the speaker's (-) terminal, and the receiver or amplifier's (-) terminal to the speaker's (+) terminal.
