## 7. ADJUSTMENT PROCEDURE

### 7-1 Power supply check

#### 1. Positive ripple.

Should be no more than 2mVp-p.

Set oscilloscope vertical gain at 10mV/cm and check that power supply ripple is 2mV or less.

#### 2. Negative ripple.

Same as positive, should be no more than 2mVp-p.

### 7-2 Pitch adjustment

#### 1. VCO-1.

Perform adjustment with synthesizer controls at "normal setting" (Scale=8, Waveform=  $\Pi$ , Master Tune, Pitch, and all other knobs at "0"). See figure 1.

a. Play C-3 (high C) on the keyboard and adjust the high ① semi-fixed screw until you obtain the correct tuning as indicated by WT-10A (connected to the SIG OUT jack).

b. Play key C-1 and adjust the low ② semi-fixed screw.

c. Repeat steps a and b as many times as necessary until both are tuned to the correct pitch.

d. Check the tuning of C-1, C-2, and C-3 on the WT-10A meter to make sure pitch deviation is within  $\pm 2$  cents for each.

e. Change the scale to 32', 16', 8', and 4' and check the tuning of all four C keys to make sure that the pitch deviation of each is within  $\pm 10$  cents.

### 7-3 KBD CV adjustment

Use a 4-1/2 digital voltmeter to measure the KBD CV OUT signal.

a. Measure output voltage first when you play key C-3, then when you play key C-2. The output voltage for C-3 should be exactly half that for C-3. Adjust the KBD CV high ③ semi-fixed screw as necessary so that C-2 produces half the voltage of C-3.

b. Measure C-2 and then C-1 in the same way. Adjust the KBD CV low ④ semi-fixed screw as necessary so that C-2 produces exactly half the voltage of C-3.

c. Repeat steps a and b as many times as necessary until the output voltage of each of C-1, C-2, and C-3 is exactly half that of the next.

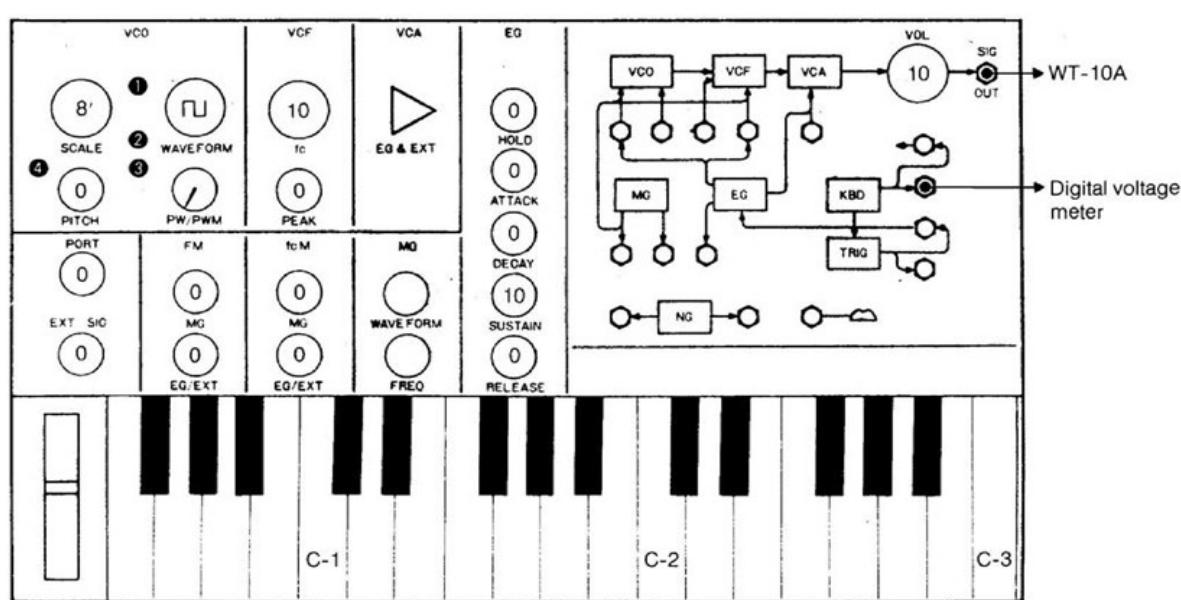

Fig. 1

#### 7-4 VCF Fc adjustment

Connect a frequency counter to the Sig out jack.

##### 1. VC LPF

Refer to the settings shown in figure 2. Set the Fc knob at "5", and the LPF PEAK knob at "10". Then adjust the ① semi-fixed screw as necessary so that the LPF oscillation frequency is 500Hz.
