*****WARNING!!!*****

Dangerous and lethal potentials are present in this product!!

Before proceeding any further, the service center is warned that caution must be used when troubleshooting, repairing and testing the circuits in this unit. High voltage AC line-connected potentials are present in the circuits used in this unit.

All work performed on this unit must be done with an isolation transformer connected between the power circuit's input and the AC line in order to prevent electric shock, especially when connecting test equipment to the circuit. **Extreme caution must be used when working on this product!!!**

HDII Power Amplifier Theory of Operation

Overview

The HDII power amplifier is designed to “model” many of the characteristics of a tube amplifier. So it is significantly different from “typical” solid state amplifiers. The output stage consists of a class H, push-pull MOSFET transconductance power amplifier. A limited amount of negative feedback is used to reduce the output impedance. Both transconductance and the amount of negative feedback are switched to match the output impedance of the amplifier to the load.

Output Stage

The output stage consists of four power MOSFETs configured as voltage controlled current sources. For the MOSFETs connected to the negative rail, operational amplifiers are connected to drive the gates of the MOSFETs such that the voltage at the non-inverting input of the op-amp is equal to the voltage across a current sense resistor connected to the source of the FET. For the “high-side” MOSFETs a similar arrangement is used but in an inverting configuration.

Local Power Supplies

The op-amp that drives the high side power MOSFETs requires a 12V power supply is referenced to the output voltage. To create this “floating” supply Q20, Q34 and Q39 regulate +BIAS_HIGH while the output is below +LOW. During the part of the waveform that the output is above +LOW C25 holds-up +BIAS_HIGH.

For the low side op-amps Q21, Q23, Q33 provide a similar function. Since the output voltage can go all the way to the negative rail, a negative supply is required for U7 to maintain control of the high side MOSFETs. This negative rail is provided by Q35 and D10.

The power amplifier uses a new TLC084 op-amp. This op-amp has very low offset voltages, low noise and can run from a single supply, but it’s maximum supply voltage is 16V total. This is why Q18 and Q19 are used to derive a $\pm 6.8V$ supply from the $\pm 15V$ rails.

The class H step switches Q2 and Q12 have similar gate drive requirements to the main power devices. In these circuits, the gate drive voltage is controlled by the level shifting circuits.

Class H Step Switching

To modulate the power rails going to the output stage, comparator U10 switches the appropriate circuit when the output voltage approaches either rail. A small amount of hysteresis is used to eliminate chattering around the switch point.

Signal Processing

Phase Splitter

To drive the output stage, a voltage analog of the desired current needs to be developed. This is done with U4-A,B,D and associated circuitry.

Mute Circuit

The amplifier is muted by pulling JFET Q31's gate to $-15V$. The main board provides a mute line that mutes the amplifier when it is low and un-mutes in the high ($+5V$) state. The main board will mute the amplifier at startup and when in STUDIO MODE. The amplifier also mutes it when the supply voltage is below the breakdown voltage of D21 – about $18V$.

Output Impedance Switching

Analog switch U1 provides the switching for the 4, 8 and 16 Ohm settings. This is done by simultaneously adjusting the transconductance and the open circuit voltage gain to match the output impedance to the load impedance.

DC Servo

Op-amp U2-C provides DC feedback to reduce the offset voltage at the amplifier output.

Current limiting

D2, D3, D5 and D27 clamp the voltage going into the transconductance stage which limits the output current. The clamping level is reduced when the amp is driven hard or when the thermal limiting circuit detects excessive heatsink temperature.

Error amplifier

Q30 sums the input voltage and the output voltage to create an error signal that drives the transconductance amplifier. Unlike a traditional amplifier the error amplifier has a low gain and as such the output voltage is loosely regulated.

HDII Power Supply Theory of Operation

Overview

Two Switch Mode Power Supplies (SMPS) provide regulated outputs to the main board and power amplifiers.

The main board outputs are provided by a small “housekeeping” power supply that runs independently of the main supply. The three outputs are provided are ± 20 and $+8$. Linear regulators on the main board provide ± 15 and $+5$.

The main power supply provides four outputs to the power amplifiers. To maintain a constant output power capability at 4, 8 and 16 Ohm loads these outputs change to match the load impedance selected on the rear switch. The nominal outputs are ± 30 and ± 45 for 4 Ohms, ± 45 and ± 60 for 8 Ohms and ± 60 and ± 90 for 16 Ohms. Four outputs are used because the amplifier is class H. In class H operation the lower voltage rails are used until the output voltage gets close to the rail voltage. At this point the high rails are switched in to provide additional power to the output. This operation dramatically reduces power dissipation in the amplifier.

Line Filter:

The line filter board is not attached to the power supply but it limits RF energy from being transmitted to the AC power lines. There are no active components on the board so most troubleshooting can be done by doing continuity checks. The black disk is a Negative Temperature Coefficient Resistor (NTC) or inrush limiter. When it is cold, it has a high resistance and limits the input current at turn-on. As current is drawn from the AC line, power is dissipated in the NTC and it heats up. As its temperature increases its resistance decreases and it ceases to limit current draw.

Input rectifier:

The input rectifier performs line frequency AC to DC conversion. There are separate configurations 120VAC and 240VAC. When connector J2 has a jumper installed, the unit is configured for 120VAC operation and should never be connected to 240VAC – unit goes BANG! If the jumper is not installed, the unit is set for 240VAC operation and will not be damaged if connected to 120VAC.

When the unit is configured for 240VAC, the large electrolytic caps, C1 and C2, are connected in series and the circuit operates like a typical full wave rectifier.

When the voltage-doubler jumper is installed, the neutral is connected to the center point of the two caps and the line alternately charges C1 and C2 to the peak line voltage. Since the output is taken across both caps, the input voltage to the high frequency power converter remains the same for both configurations. Note that only two of the four diodes are used in the voltage-doubler mode.

The two 47k 2W power resistors, R1 and R2 ensure that the capacitor voltages are balanced in 240VAC operation.

High Frequency Power Converter

The High Frequency Power Converter is a multi-output, two transistor forward converter with coupled output inductor – quite a mouthful. The interested reader will find a much more detailed description in power supply literature. The Readers Digest version is: Both power transistors are turned on and off

simultaneously at a 130kHz rate. When they are on, the input DC bus is connected across the primary of the transformer and reflected to the secondaries. This places voltage across the coupled output inductor and power is transferred to the output. The output voltage is regulated by increasing or decreasing the time the power transistors are on or Pulse Width Modulation (PWM). Two “catch” diodes are used to return any energy stored in the transformer back to the input capacitors.

Current transformer T2 has a single turn primary and a 100 turn secondary. Using a transformer provides electrical isolation and allows a larger voltage proportional to current signal to be derived without excessive power dissipation.

Gate Drive transformer T3 drives the gates of the primary connected power transistors from the secondary connected PWM chip. Small signal transistors Q13 and Q14 improve power transistor turn-off and reduce gate drive power requirements by not allowing the gates of the power transistors to swing negative. A zener diode is connected in series with the primary of the transformer to eliminate the possibility of saturation of the transformer core. When small signal transistor Q8 is turned off energy stored in the core of T3 cause the voltage to “flyback” but the voltage is limited by zener diode D40.

Control Loop

The control topology used is an average current mode control loop. Again the Readers Digest version. There are two loops used the “inner” loop is comprised of U4-C, U4-D and the secondary of current sense transformer T2. This loop attempts to maintain a constant average current whose magnitude is determined by the voltage loop. The “outer” loop is the voltage loop, which is comprised of U4-A and U4-B. This loop looks at a weighted sum of all four outputs and attempts to regulate this quantity. Currently the weights given to the lower rails is zero, so only the high rails are considered. U4-B scales the output voltage to a single voltage that is regulated by U4-A. U4-A regulates the output voltage by demanding more or less current from the “inner” average current loop. Note that the output voltage switching is done at U4-A by transistors Q9-11.

PWM Control IC

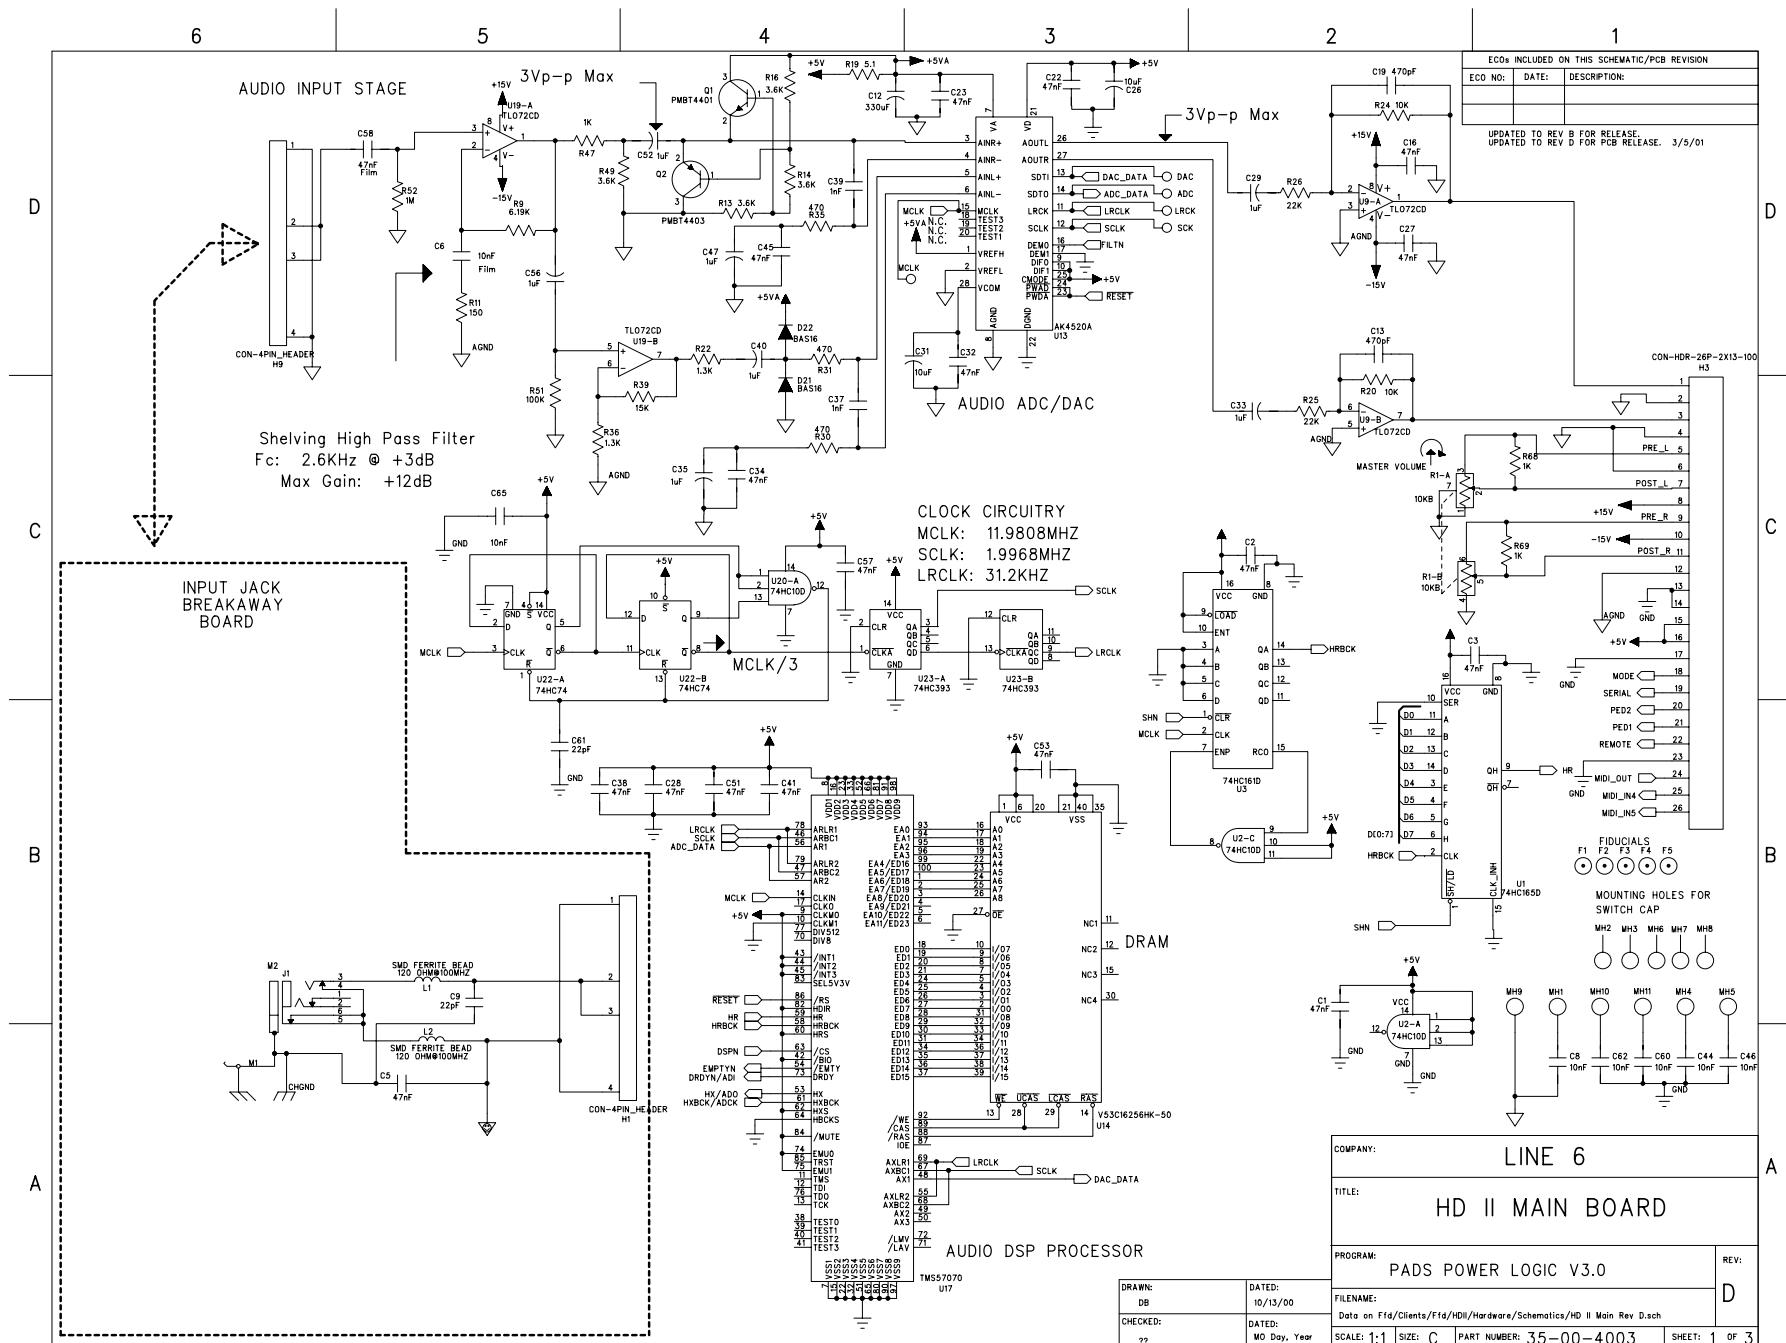

A UC3845 or UC3844 control IC is used to provide the PWM drive signals for the main SMPS. The UC384x family is typically used in peak current mode control but it is very low cost and readily available so we have “tricked” it into doing average current mode control. The timing ramp is scaled and used instead of the current sense signal, but the peak current is “OR’ed” into this pin to provide pulse by pulse current limit. Q6 and associated components provide a “soft-start” for the current loop while C13 provides voltage loops soft start.

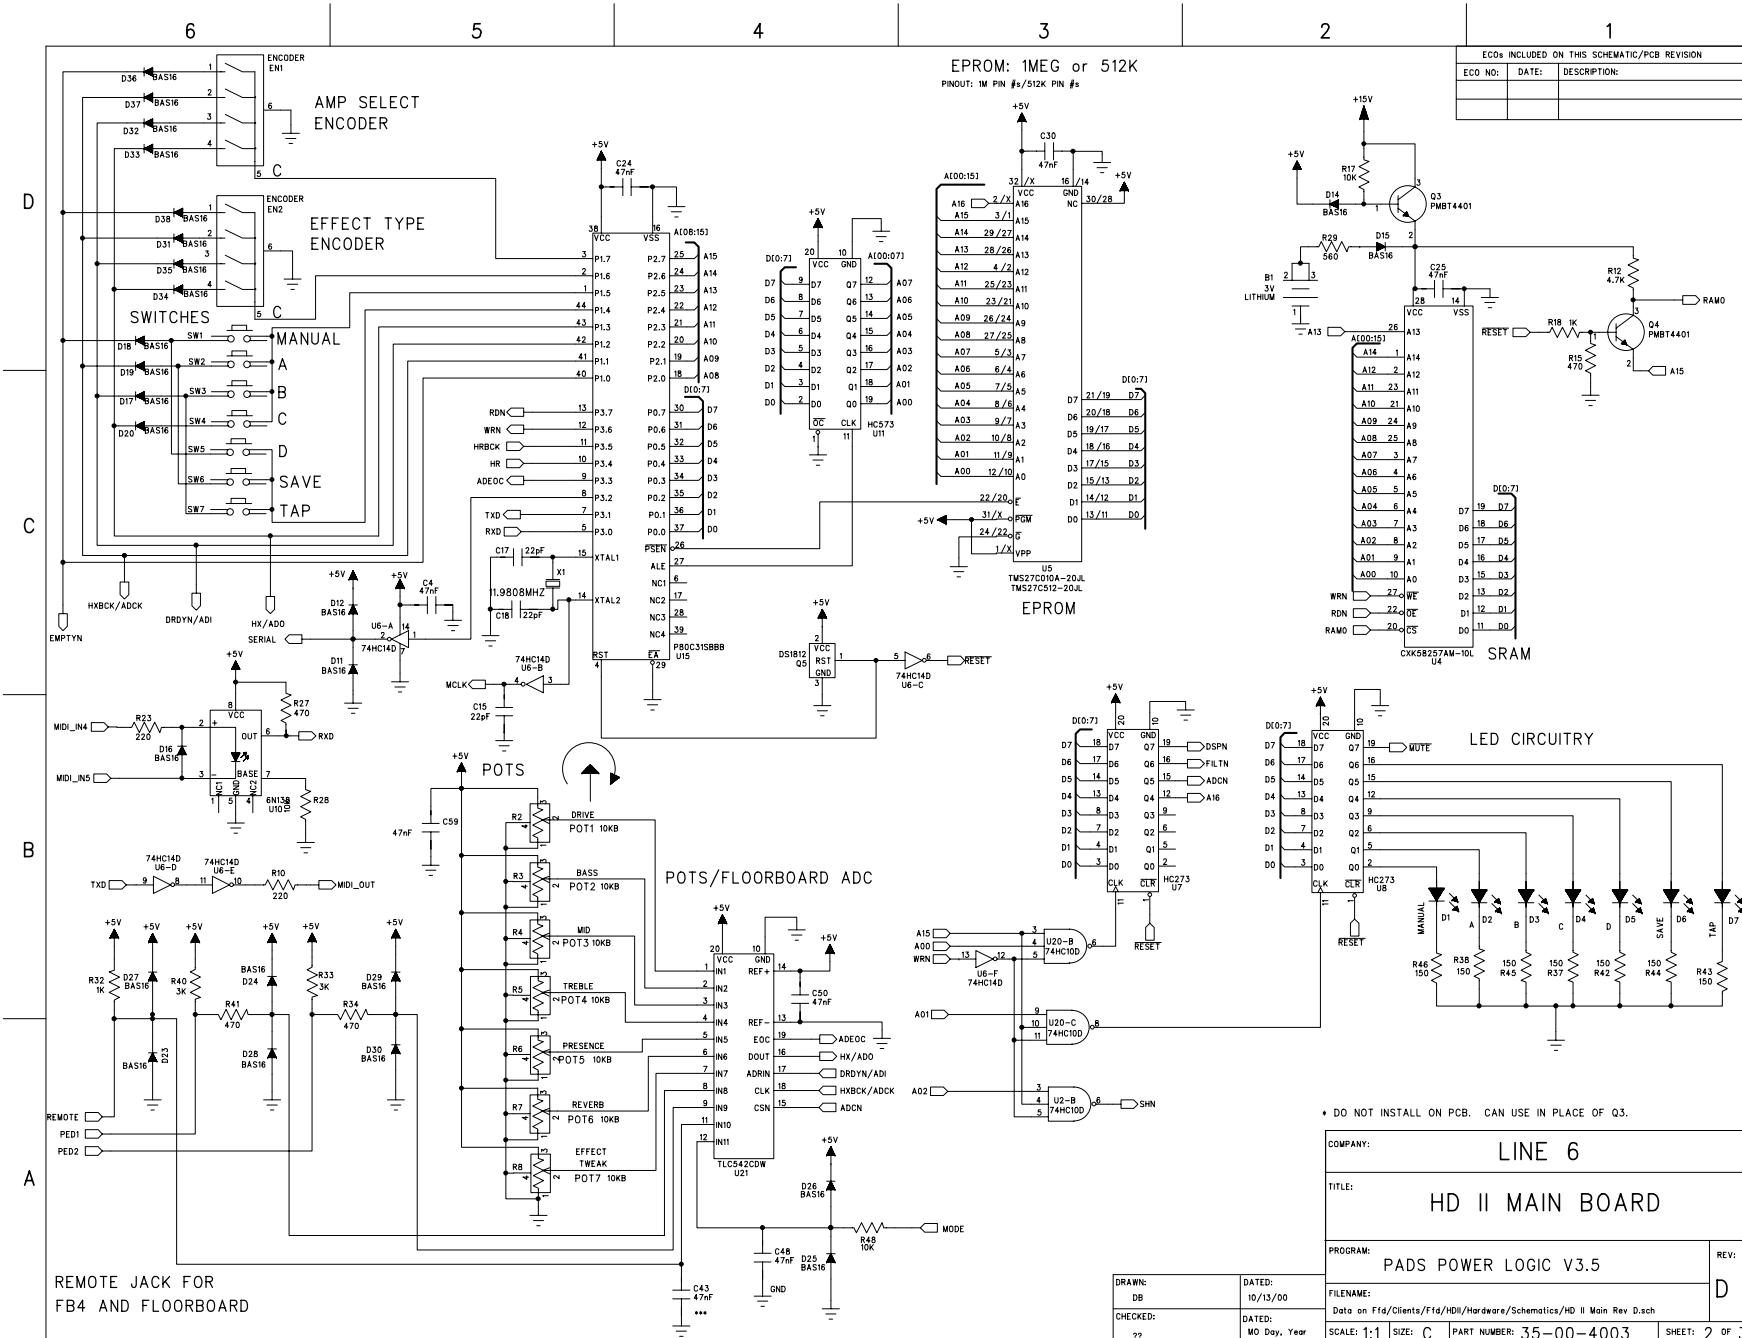

Thermal Shutdown

PTC1 is a Positive Temperature Coefficient resistor whose resistance increases with temperature. These parts have a sharp “knee” in their resistance vs. temperature curve so they can act like a thermal switch. PTC1 is mounted on the output rectifier heatsink, so when the temperature threshold is exceeded Q7 is turned on and the output voltage is reduced.

Housekeeping Supply

Power for the main power supplies control circuitry and the digital and analog circuits in the rest of the system are developed in the housekeeping supply. It is based on the TOP234 integrated PWM IC. This IC contains the power MOSFET and all of the PWM control circuitry to run a power supply. See Mfg. Data sheet for complete explanation.

HD II FINAL TEST PROCEDURE

February 19, 2001

ENTERING TEST MODE:

- 1) Plug a MIDI cable between the MIDI IN and MIDI OUT on the rear of unit.
- 2) Hold down **TAP** button for 3 seconds while turning on **POWER**.
- 3) **SOFTWARE TEST** - Four software tests will run automatically. A LED will turn on for each test that passed. Check that 4 LED's are on.
 - LED **A** - EPROM Test
 - LED **B** - SRAM Test
 - LED **D** - BATTERY backed RAM
 - LED **SAVE** - MIDI
- 4) Advance to next test stage by pressing the **MANUAL** button. **MANUAL** will scroll through three more tests A,B,C. Each LED A,B,C will light up to indicate which test has been selected. Start with Test A. Press the **SAVE** button to start Test A.
 - 4.1). **TEST A** – Test the front panel LED's (D1-D7).
 - 4.1.1). **LED Test** – All front panel LED's (D1-D7) will light up together, then each LED will light up one at a time from left to right. Make sure brightness for all LED's is the same and that each LED turns on/off properly.
 - 4.1.2). When Test A is complete, the B LED will light up to indicate that Test B has been selected. Press **SAVE** to start Test B.
 - 4.2). **TEST B** – Test encoders (**AMP MODELS & EFFECTS**) and 7 buttons.
 - 3.2.1). **BUTTON Test** – Push each button and check that the LED (for that button), toggles on/off.
 - 3.2.2). **ENCODER Test** – Turn each encoder (**AMP MODELS & EFFECTS**) clockwise and the button LED (D1-D7) will light up, one at a time from left to right.
 - 3.2.3). **POTS Test** – Turn each pot from one end to the other. LED's (D1-D7) will light up, one at a time from left to right or vice versa, depending on which direction the pot shaft is turned. The **MASTER VOLUME** pot (R1) cannot be tested.

NOTE: **TEST C** does not need to be performed in the HD II Final Test.

- 5) Turn off power to the HD II head and plug a signal generator and 2 speaker cabinets to the outside left and Right ¼" speaker outputs.
- 6) Set the 2 way switch on the rear to **LIVE** and the other 2 way switch to **SERIES**. Remove the MIDI Cable.

- 7) Turn power on (NOTE: audible click is normal, a loud pop is not) signal should be heard evenly through both cabinets (unplug one cable at a time to tell if the volume is the same), unplug the cables from the outside 2 speaker jacks and plug them into the 2 inside speaker jacks. Again an even signal should be heard from both cabinets.
- 8) On the rear change the switch from **4 OHMS** to **8 OHMS** to **16 OHMS**, a signal should be heard at all 3 settings.
- 9) Plug a stereo $\frac{1}{4}$ " cable into the **SEND** (the signal should still be present), plug the other end into the **RETURN** (the signal should still be present), unplug the end in the SEND jack (the signal should disappear), select **PARALLEL** with the 2 way switch and the signal should return. Unplug the cable.
- 10) Plug the XLR listening cable into each XLR output, a clear signal should be heard from each channel.
- 11) Select **STUDIO** with the 2 way switch, the signal should disappear from the speaker cabinets, and a clear signal should be heard from both XLR outputs. The **MASTER VOLUME** may need to be adjusted.
- 12) Plug the footswitch into the RJ-45 connector on the rear and test that the unit works with the floorboard.
- 13) Turn off the unit.

Flextone II Head Assembly Instruction

January 12, 2001

General Notes:

1. Unless otherwise noted, all dimensions are in inches.
2. Unless otherwise noted, all screws shall be installed with external teeth (star) washers.
3. For clarity, not all component details are shown in the figures.
4. Part identifying notes are in this format: Description (Quantity)
P/N part number
5. Right and Left designations are used as if you were looking at the front panel.

Step 1: Install buttons onto Main PCBA (Printed Circuit Board Assembly):

- a. Align the Button assembly with the holes in the PCBA and snap the buttons onto the PCBA. See Figure 1.
- b. Test the buttons by pushing on each one and listen for a “click”.

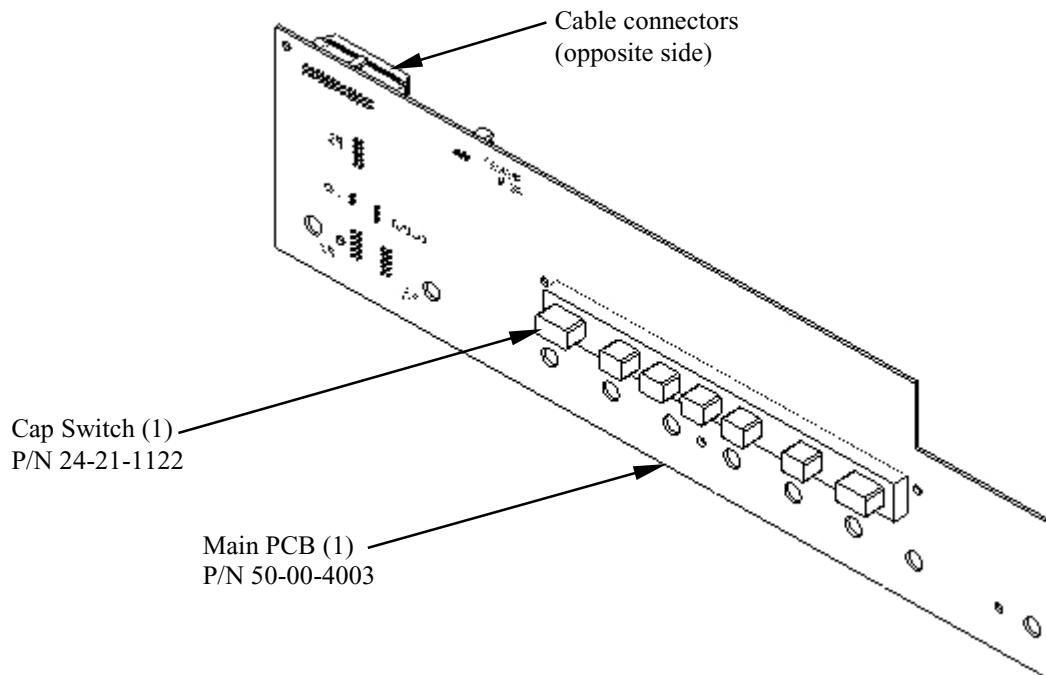

Figure 1

Step 2: Install Main PCBA into Chassis.

- a. Install the Main PCBA into the Chassis using six 6-32UNC x 3/8 screws. See Figures 2 and 3.

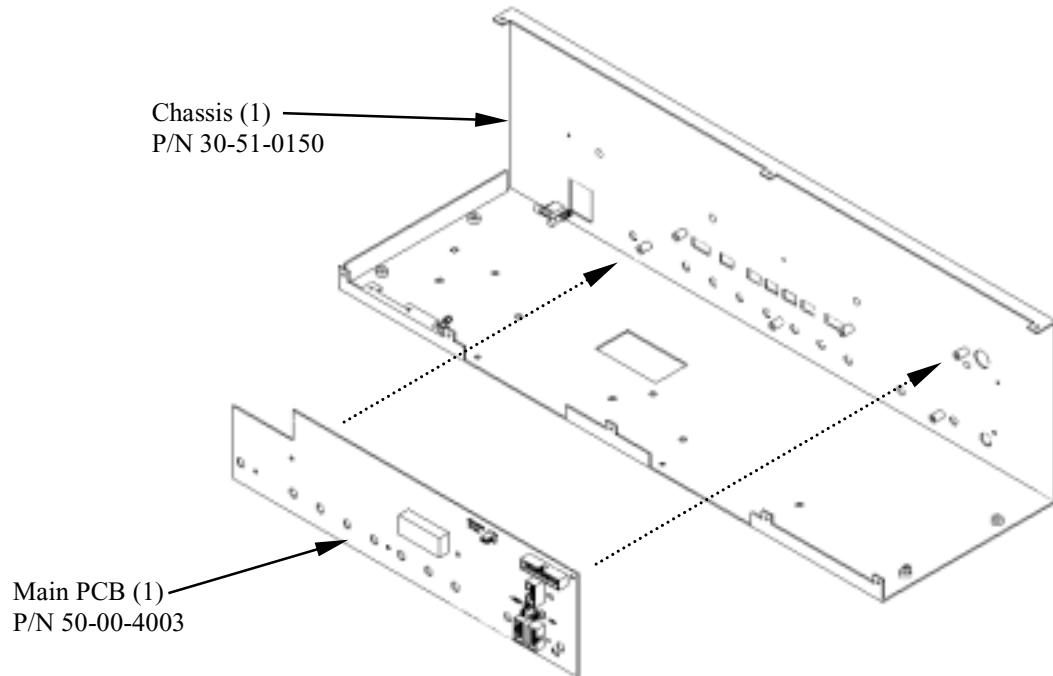

Figure 2

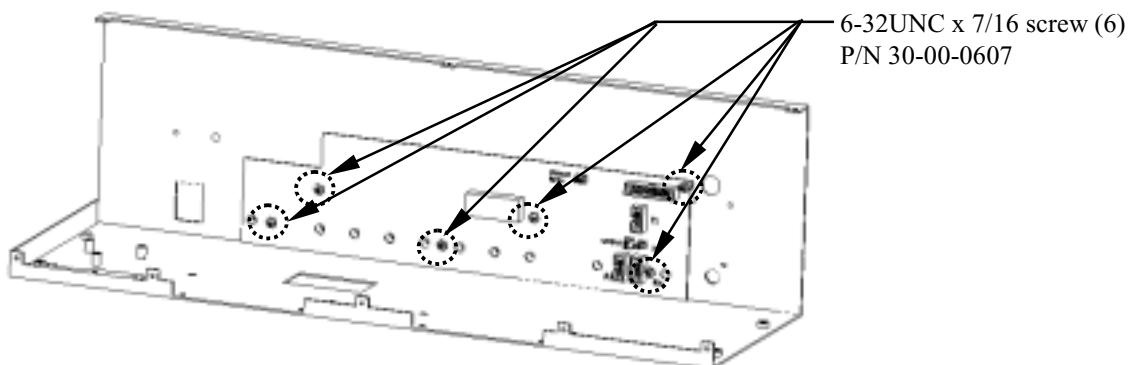

Figure 3

Step 3: Front panel assembly (see figure 4):

- a. Wipe chassis front surface with clean cloth dampened with isopropyl alcohol.
- b. Align and mount Overlay.
- c. Align LED lens and LED PCBA with Chassis mount holes and install using 6-32 UNC x 3/8 screws. Route LED power cable as noted.
- d. Align Knobs with potentiometer and encoder shafts and press on until fully seated.

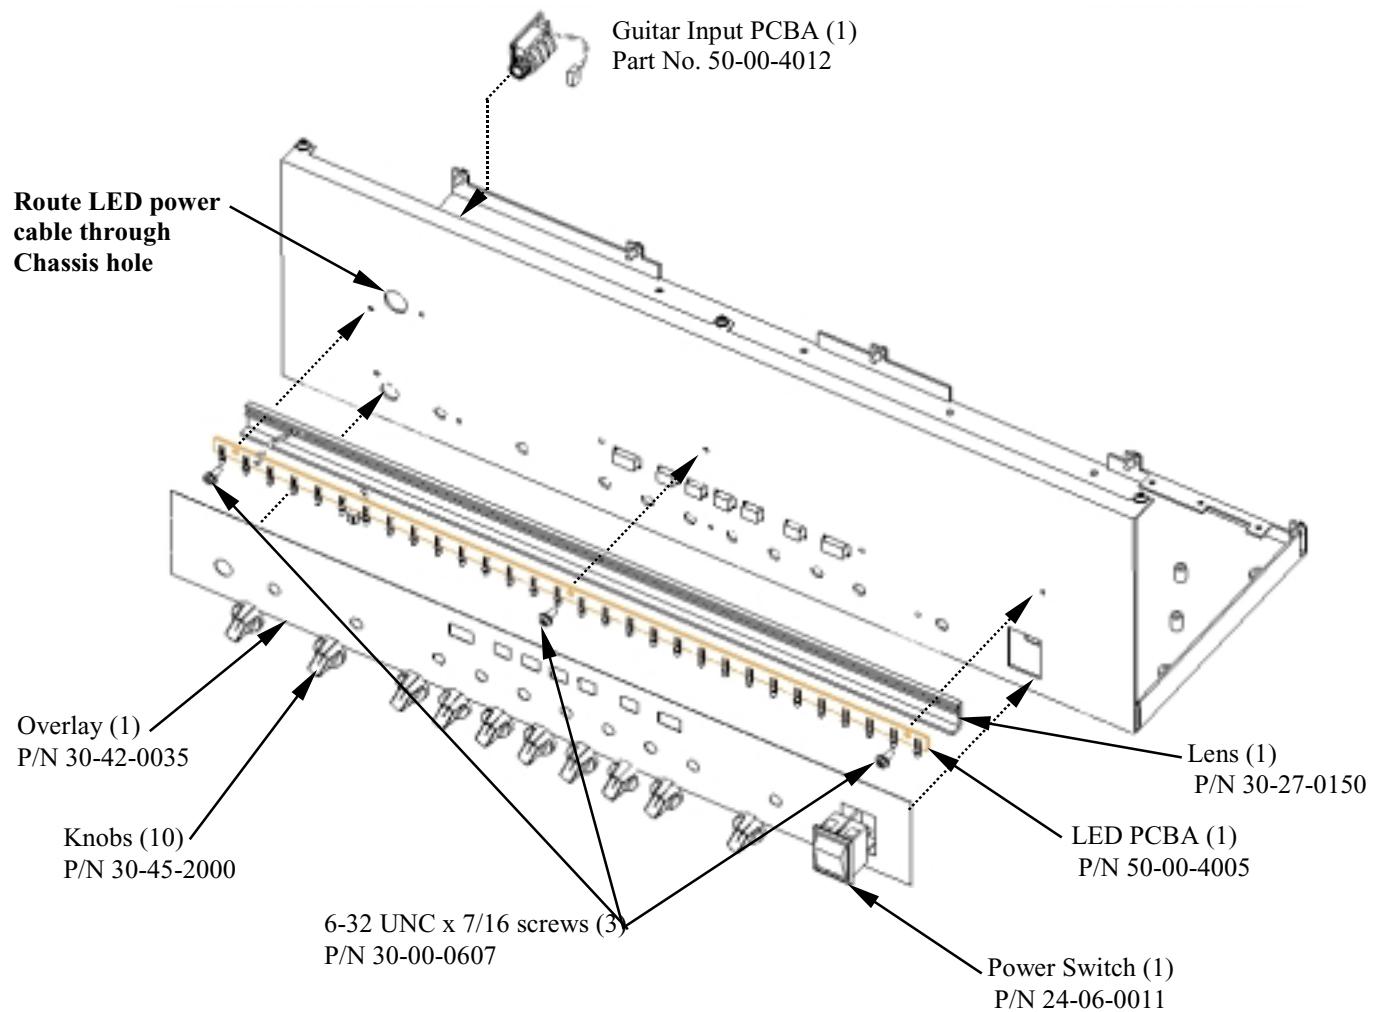

Figure 4 (front view)

Step 3: Front panel assembly (continued).

- e. Install Power Switch. Push firmly until Switch seats flat against front panel Overlay. See figures 4 and 5 for position and correct orientation.

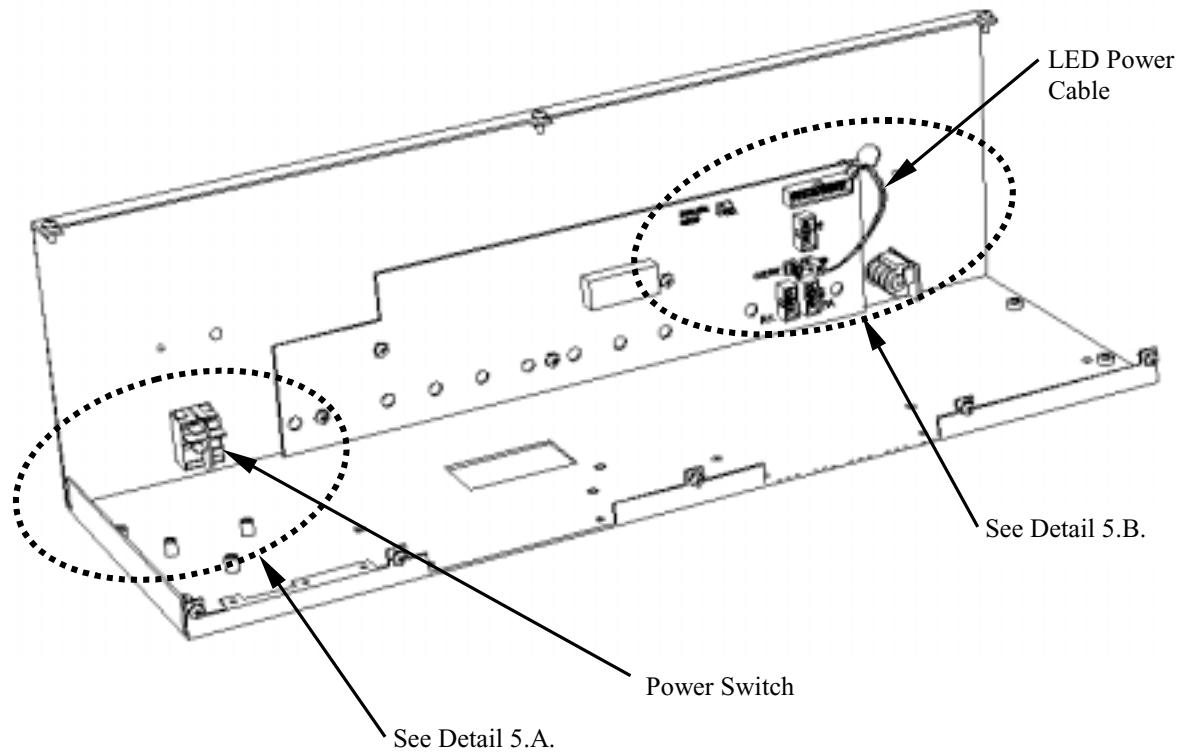

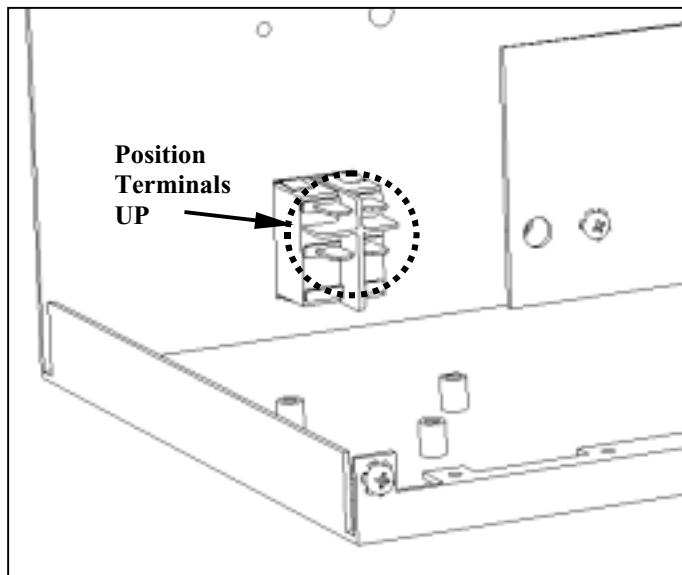

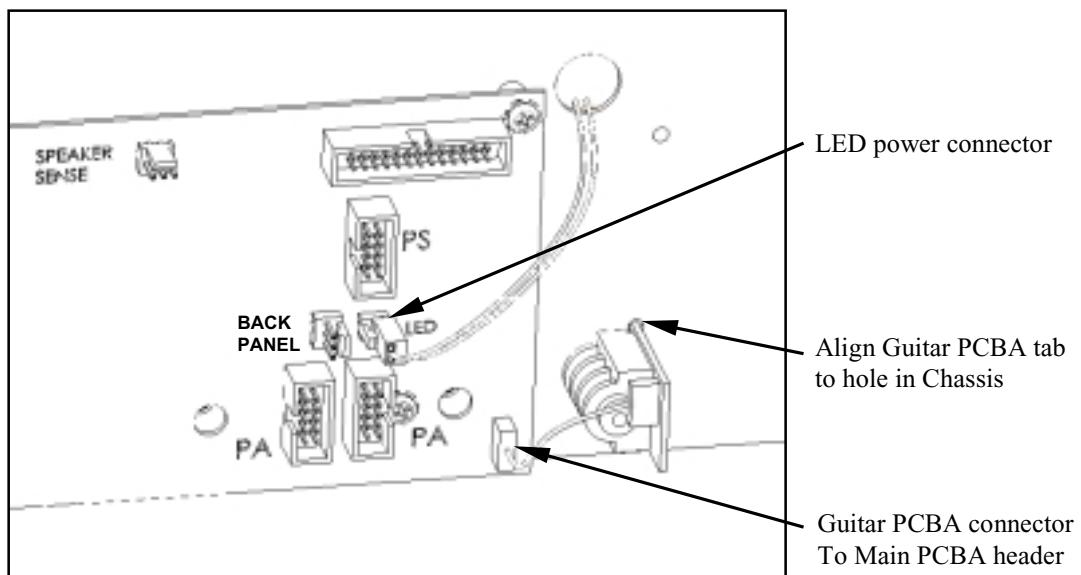

Figure 5 (rear view)

Step 3: Front panel assembly (continued).

Detail 5.A.

- f. Install Guitar input PCBA cable assembly onto Main PCBA header. See Detail 5.B.
- g. Align Guitar input PCBA tab with hole in chassis.
- h. Install LED power cable connector onto main PCBA header.

Detail 5.B.

Step 3: Front panel assembly (continued).

- i. Secure guitar input PCBA using plastic nut. See figure 6.

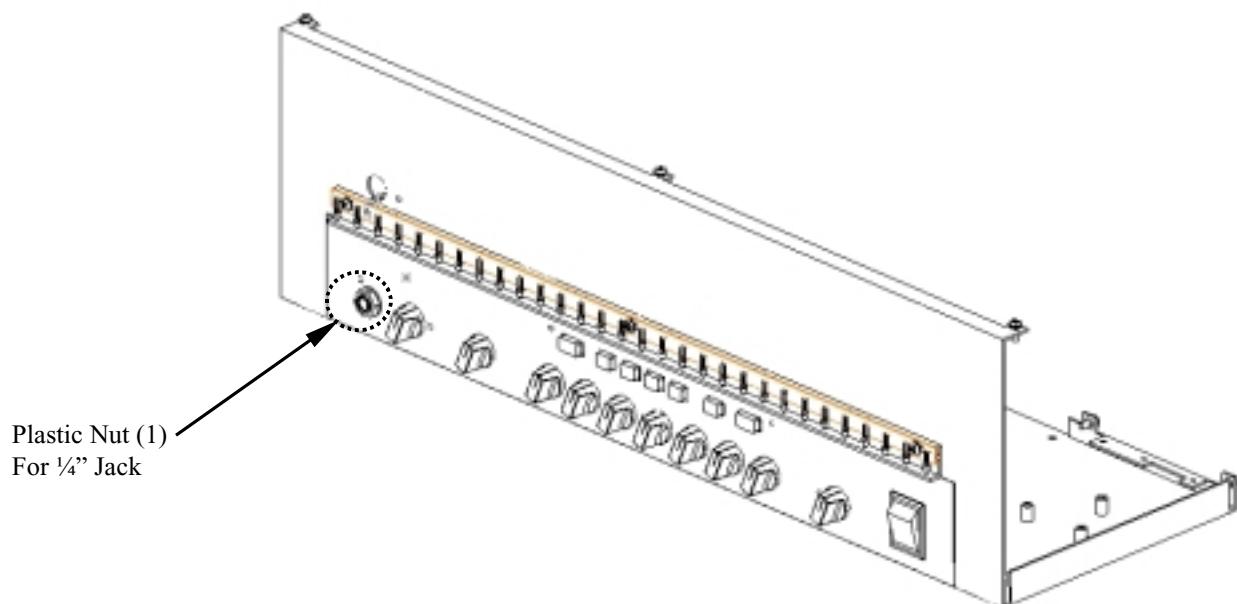

Figure 6

Step 4: Install Power Supply cable assemblies:

- a. With Power Supply oriented as shown in figure 7 (bracket notch on top), install a ribbon cable assembly and a 2-wire cable assembly.

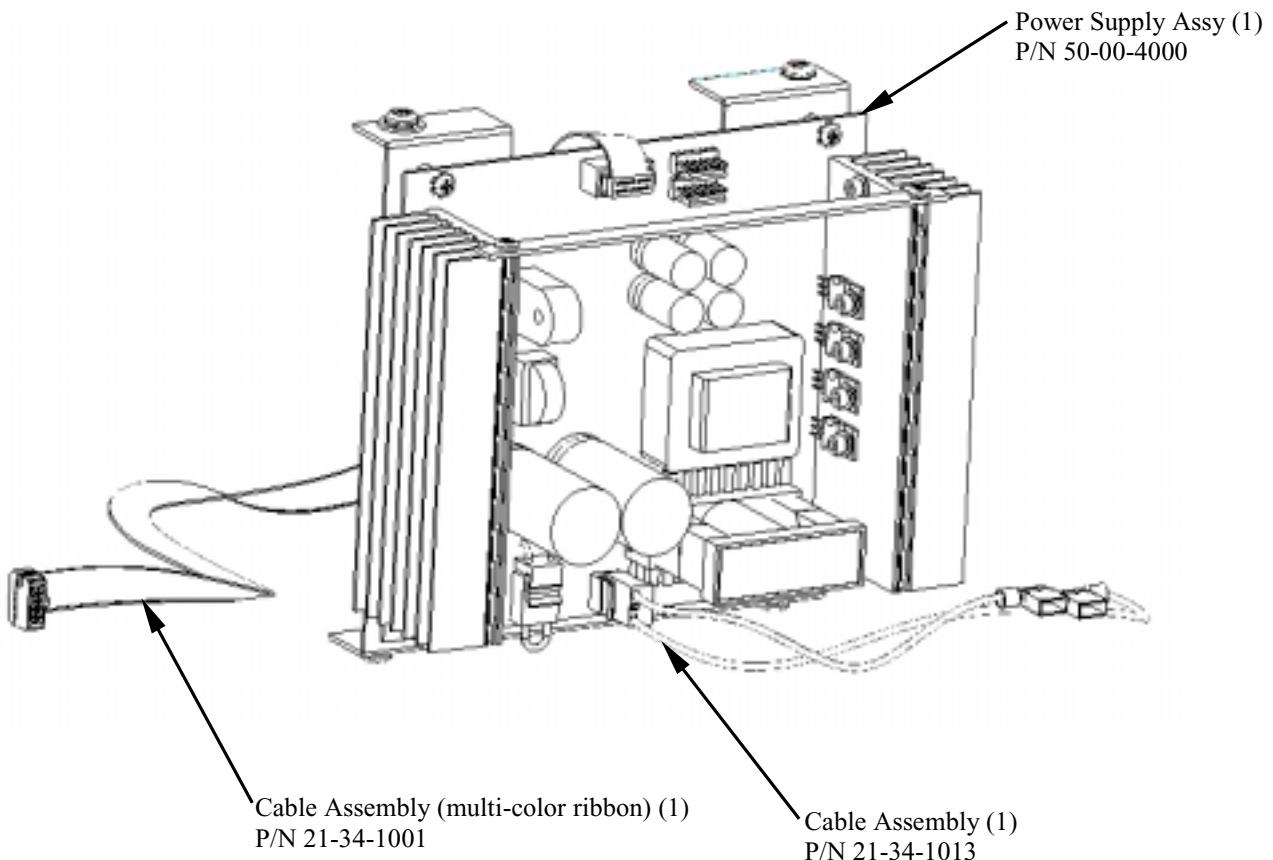

Figure 7

Step 5: Install Power Supply into Chassis:

- a. Install Power Supply onto Chassis. Guide Black and White wires to the side. See figure 8.

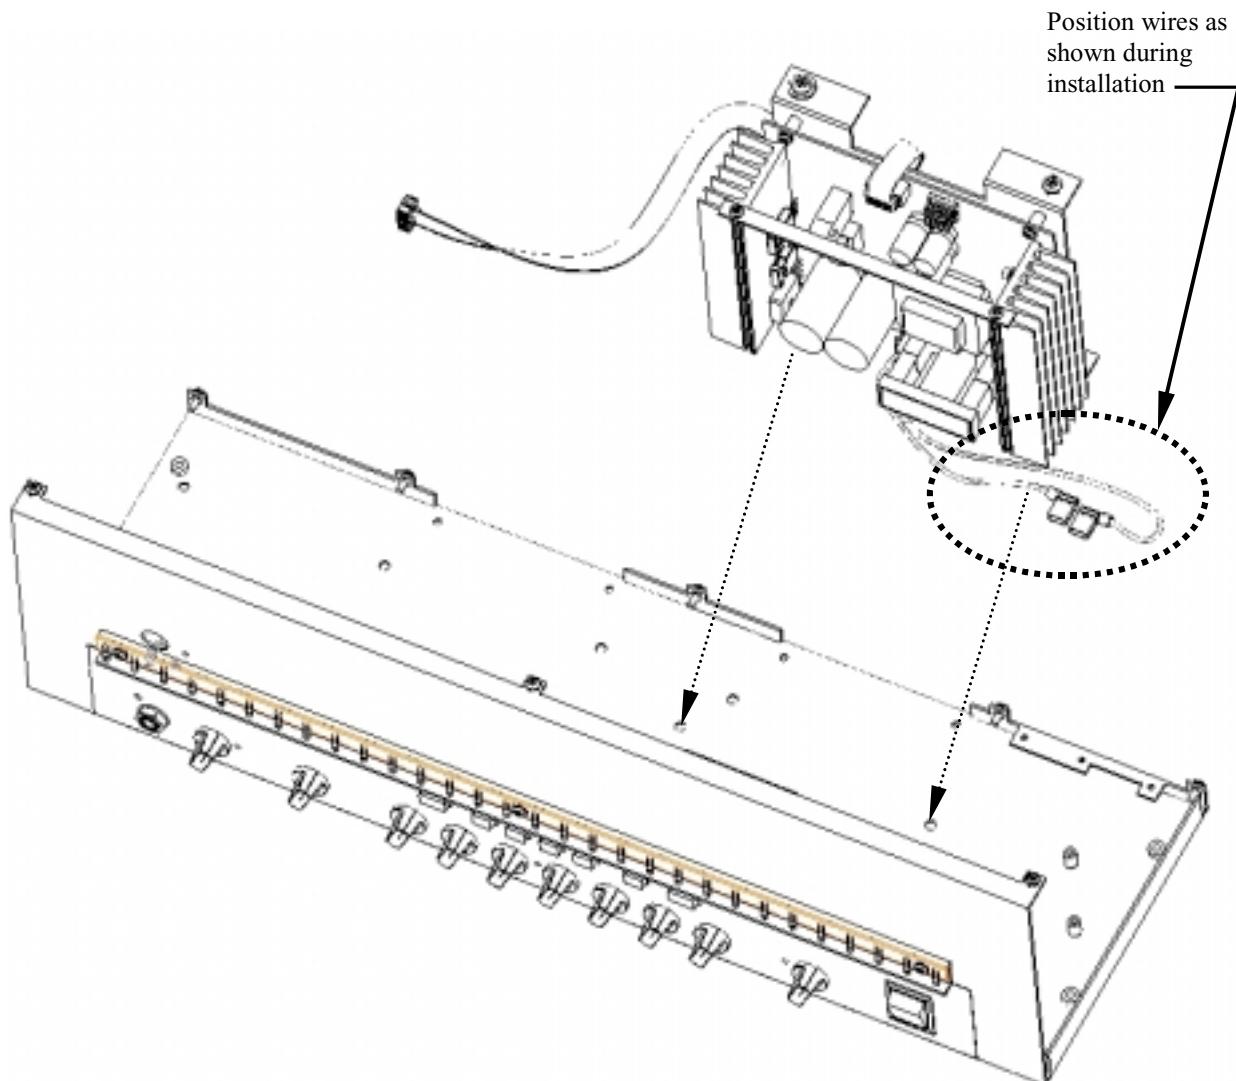

Figure 8

Step 5: Install Power Supply into Chassis (continued):

- a. Install 10-32UNF x 3/8 screws with Star Washers through bottom of Chassis into Power Supply Bracket. See figure 9.
- b. Install ribbon cable assy connector onto Main PCBA header. See detail 9.B.
- c. Install Power Switch wires onto lower terminals. See detail 9.A.

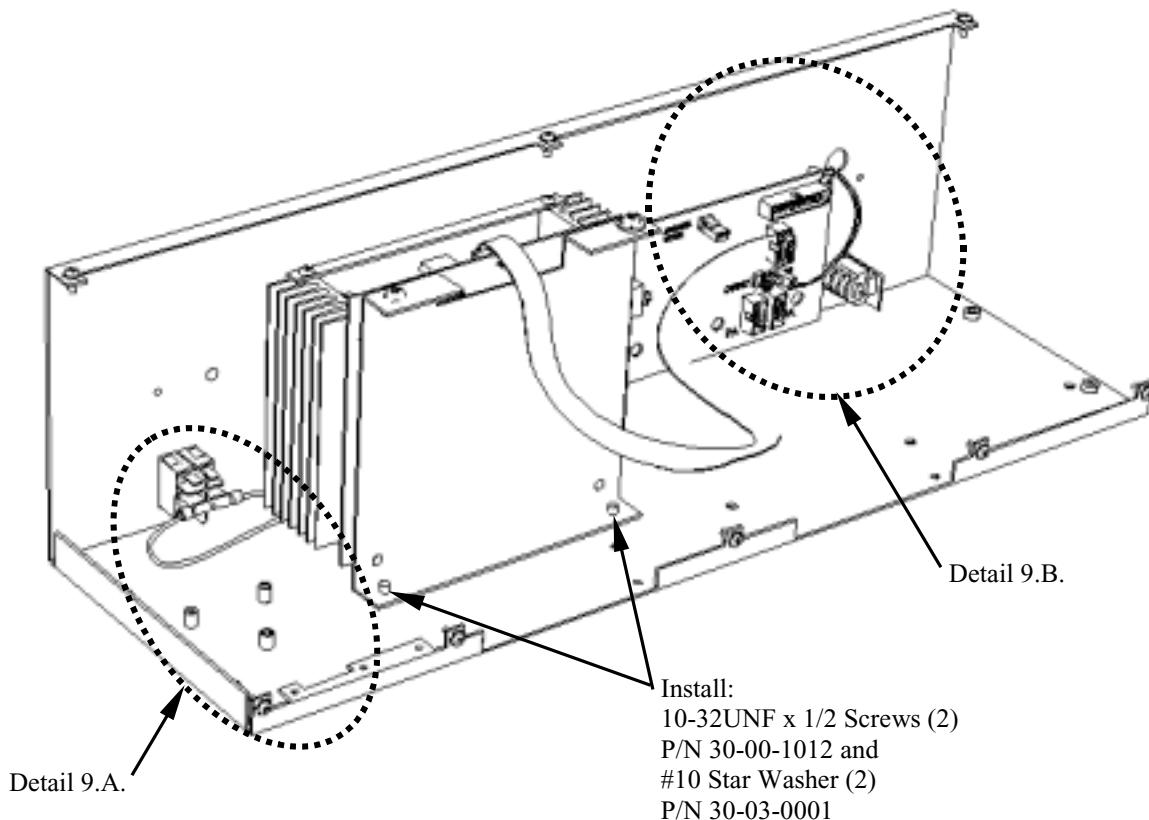

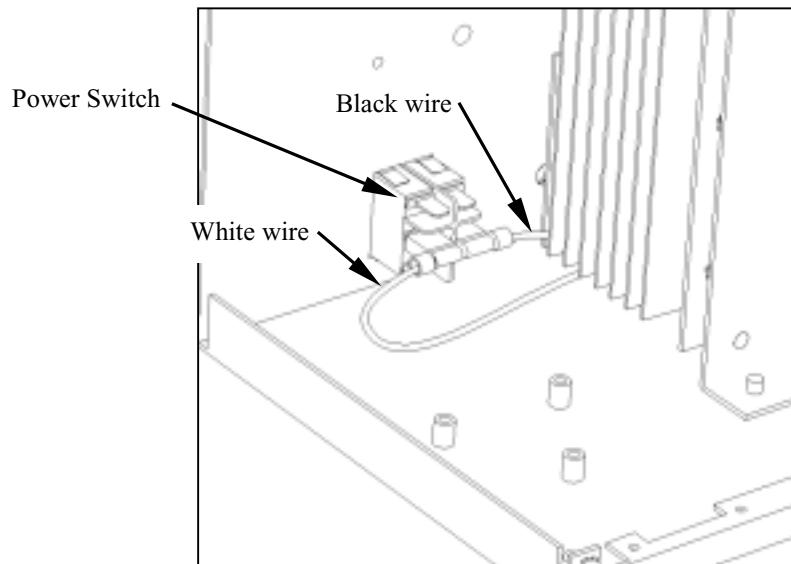

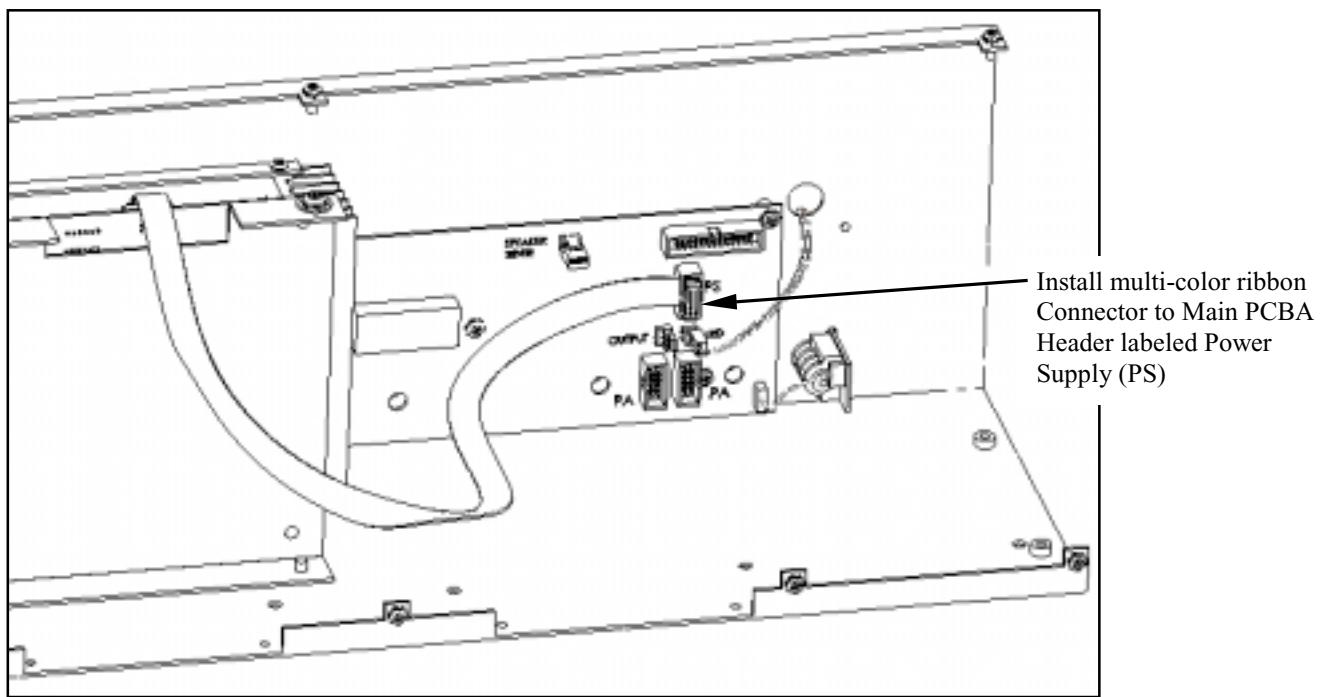

Figure 9

Step 5: Install Power Supply into Chassis (continued):

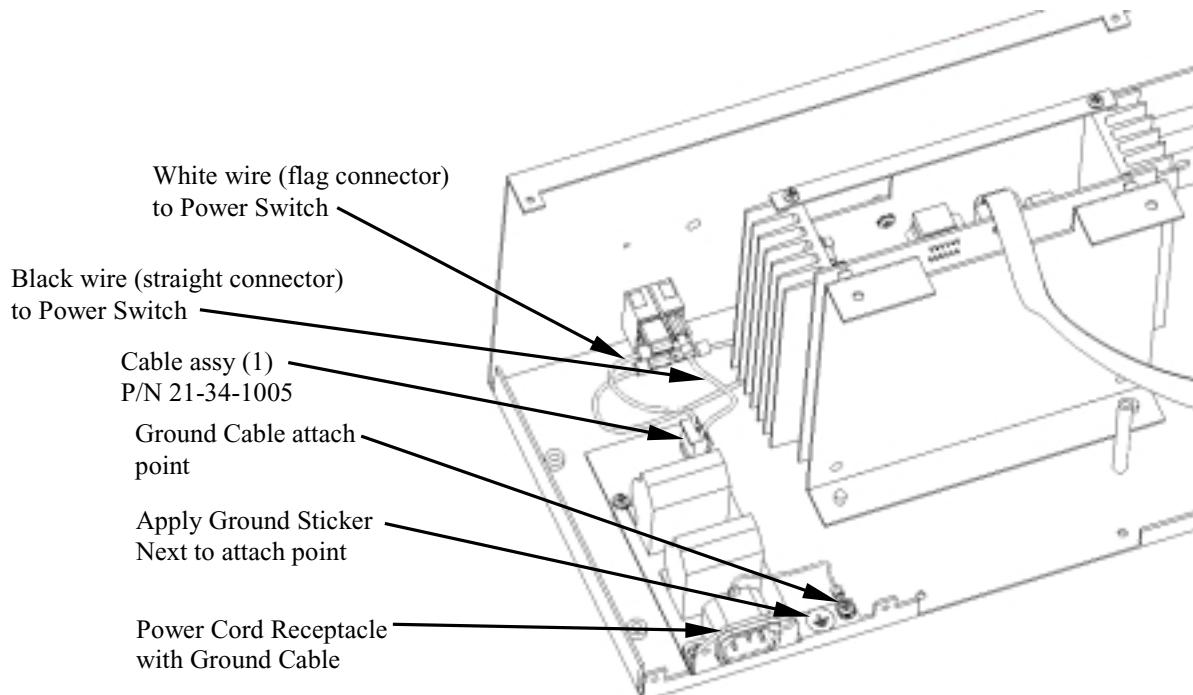

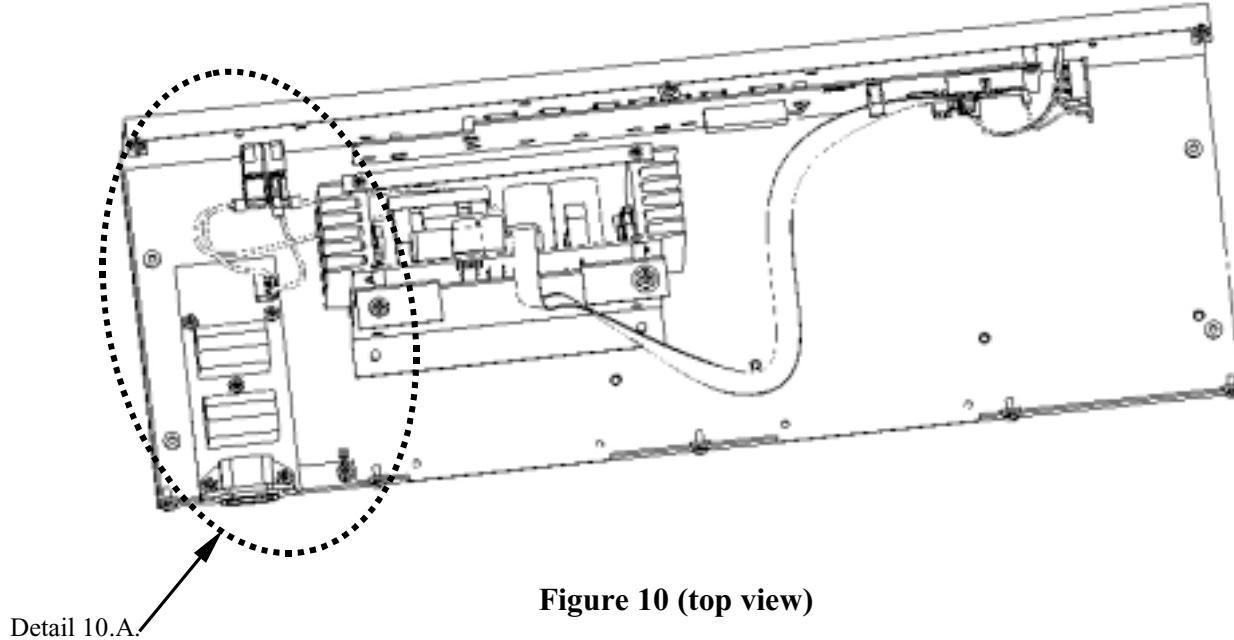

Detail 9.A.

Detail 9.B.

Step 6: Install Line Filter PCBA into Chassis:

- a. Install Line Filter PCBA. See figure 10.
- b. Install Line Filter to Power Switch Cable Assy. See detail 10.A.

Detail 10.A.

Step 7: Install 2" standoffs.

- a. Install four 2" standoffs using 6-32 UNC x 7/16 (P/N 30-00-0607) screws inserted through bottom of Chassis. See figure 11.
- b. Route multi-color ribbon cable around 2" standoff as shown.

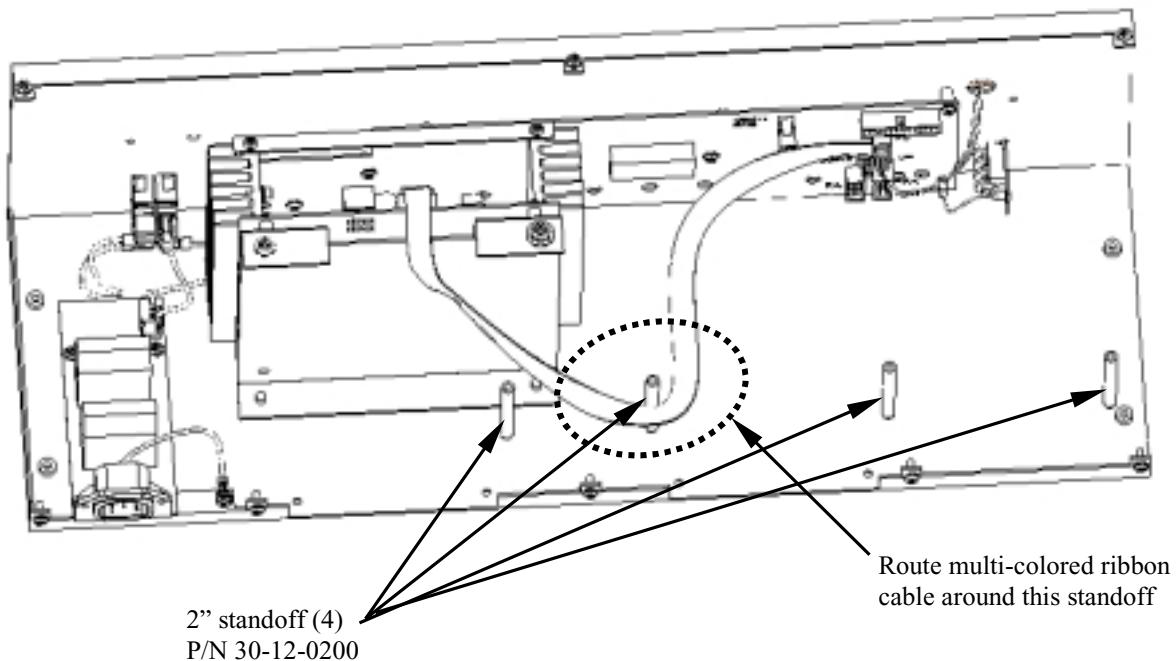

Figure 11

Step 8: Mount Midi-Cab/XLR PCBA and Speaker Output PCBA:

- a. Mount Midi-Cab/XLR PCBA and Speaker Output PCBA onto the 2" standoffs. See figure 12.
- b. Install Output to Main Cable assembly. The Main PCBA header is labeled "Speaker Sense". See figure 12 and 13.

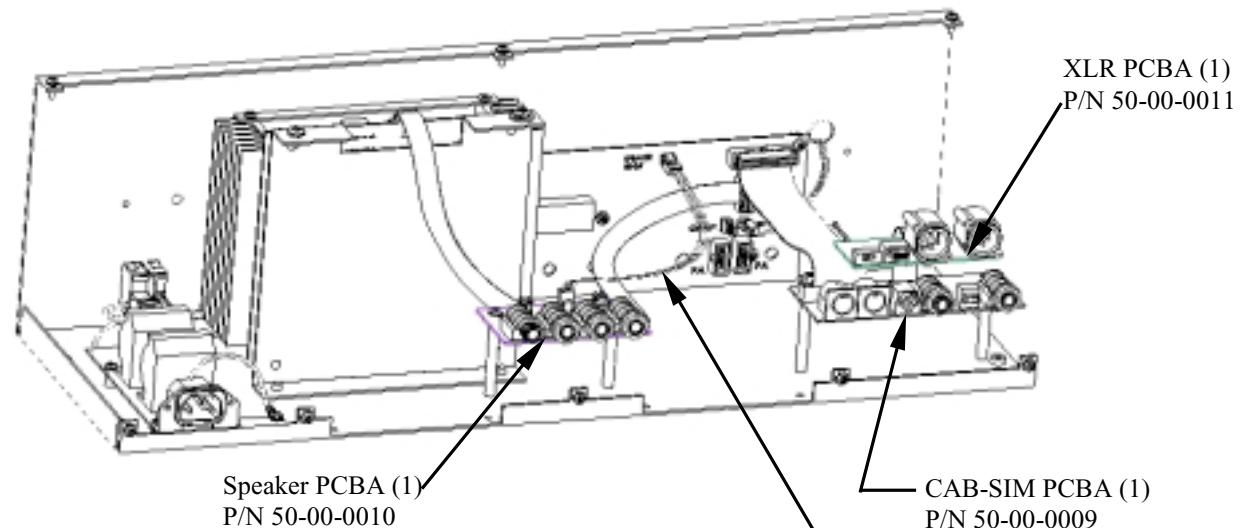

Figure 12 (rear view)

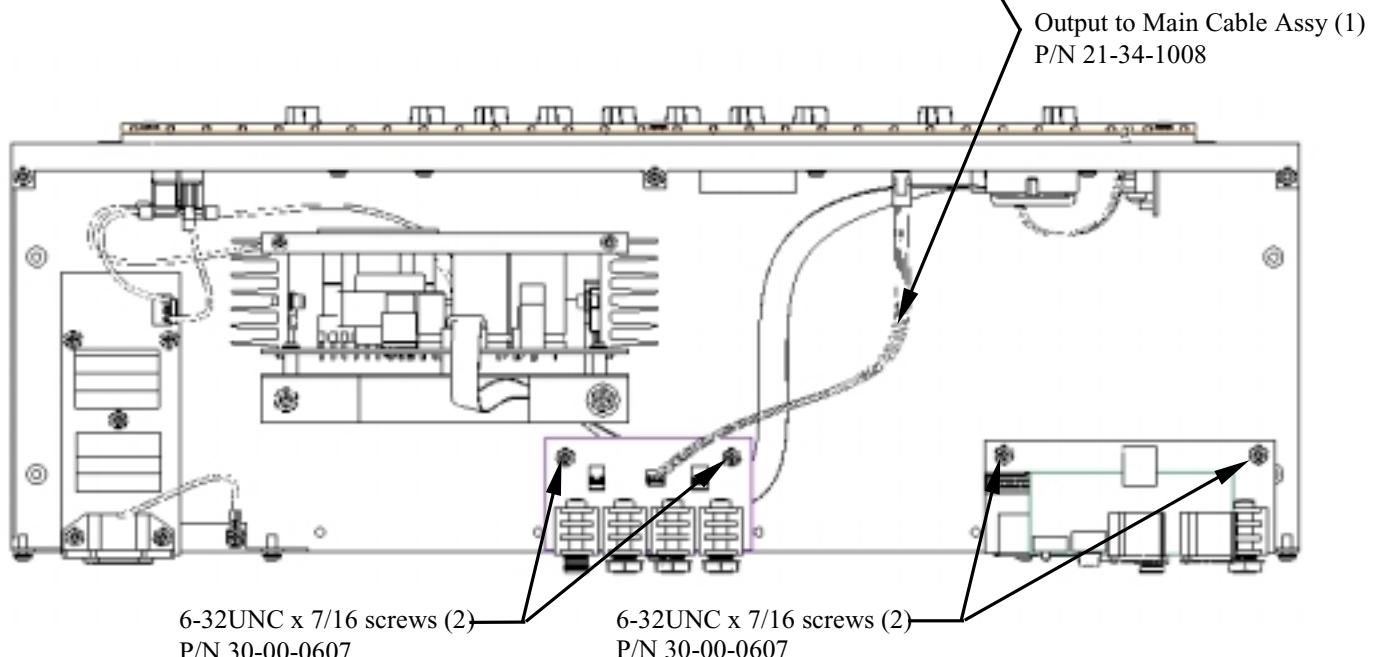

Figure 13 (top view)

Step 8: Mount Midi-Cab/XLR PCBA and Speaker Output PCBA (continued):

- a. The XLR PCBA will remain loose until the Cover is installed. See figure 14.

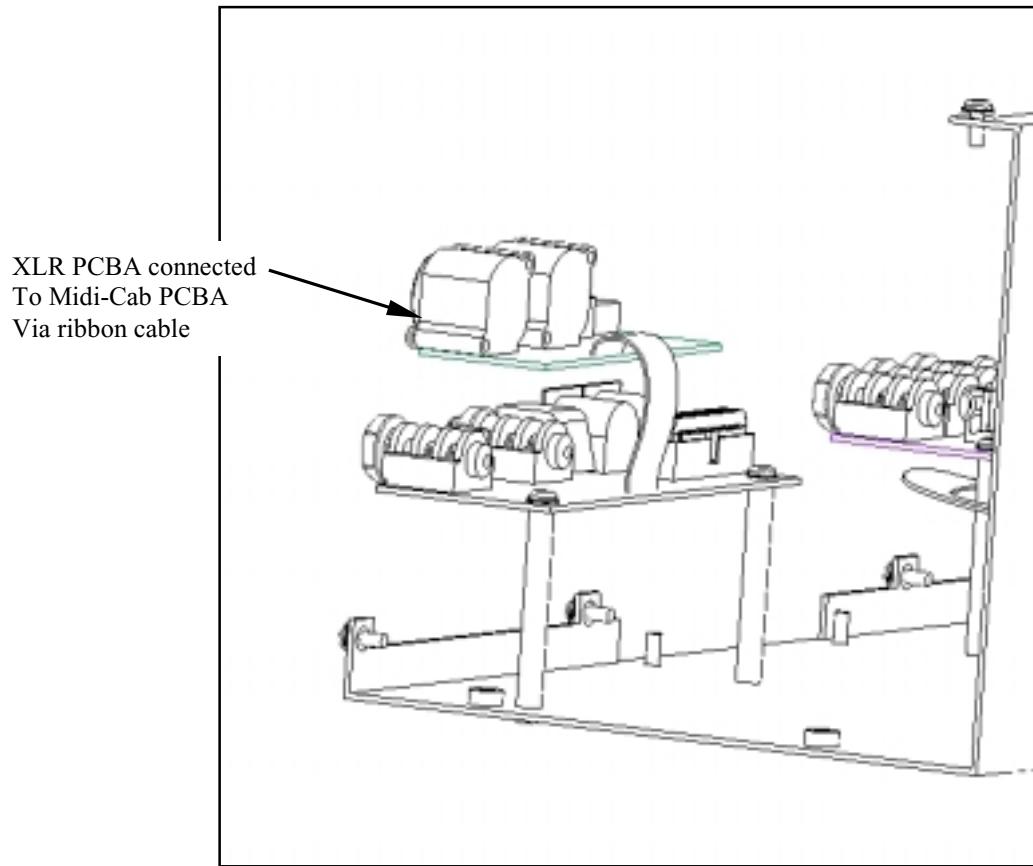

Figure 14

Step 9: Install cables onto Power Amplifiers:

- a. Install cable assemblies onto the Power Amplifiers. See figure 15.
Note: All none Ribbon cable assemblies should be twisted 4 to 5 times.

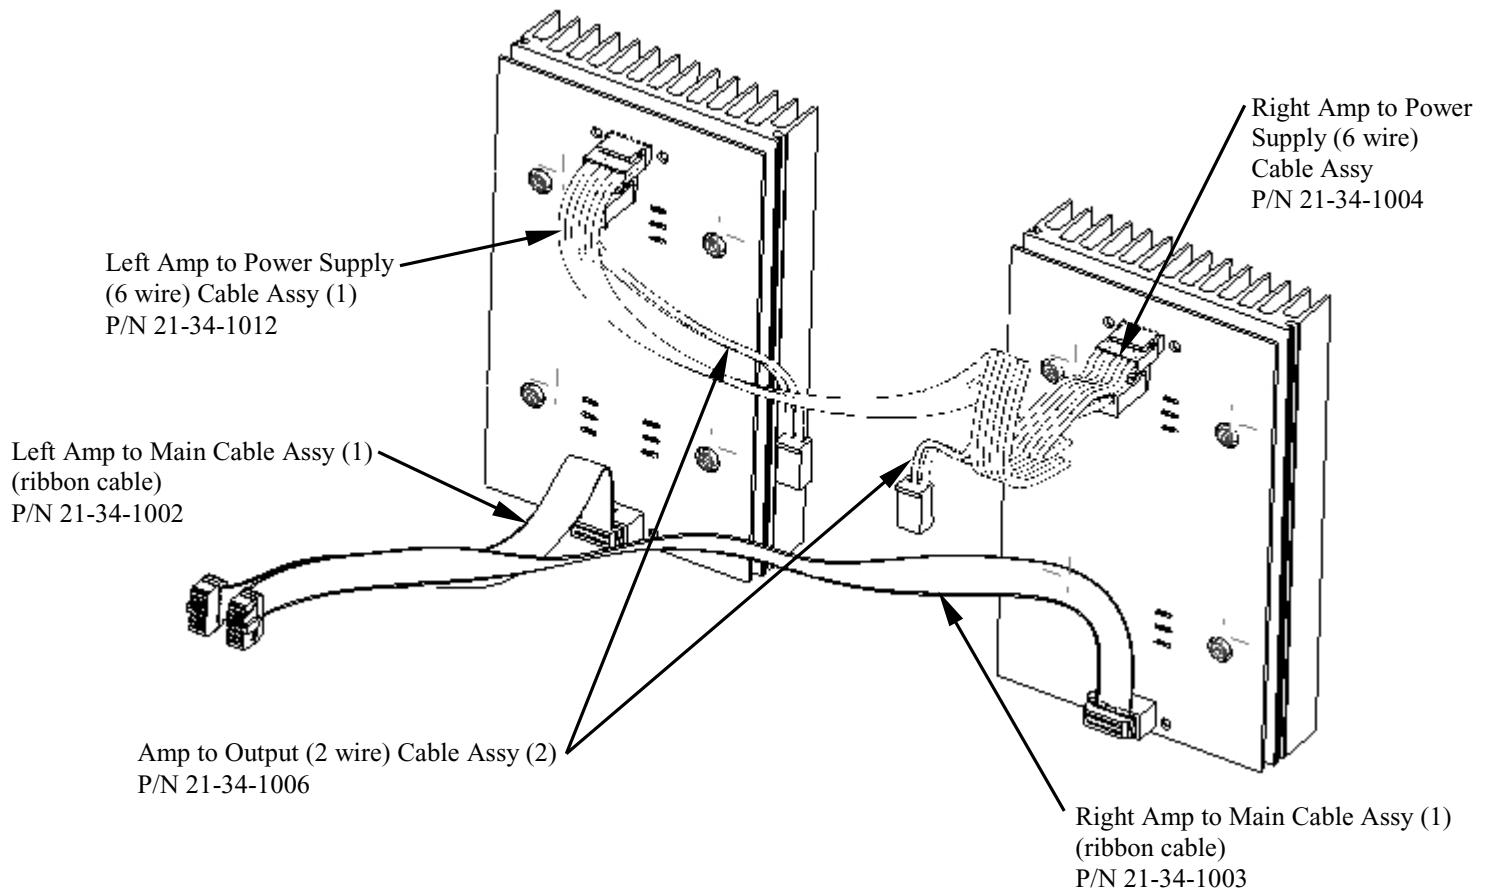

Figure 15

Step 10: Install Power Amplifiers (P/N 50-00-4004) into Chassis:

- a. Mount Power Amplifiers onto the Chassis using 6-32UNC x 3/8 self-tapping screws threaded into the Power Amplifier heat sink channels. See figure 16.

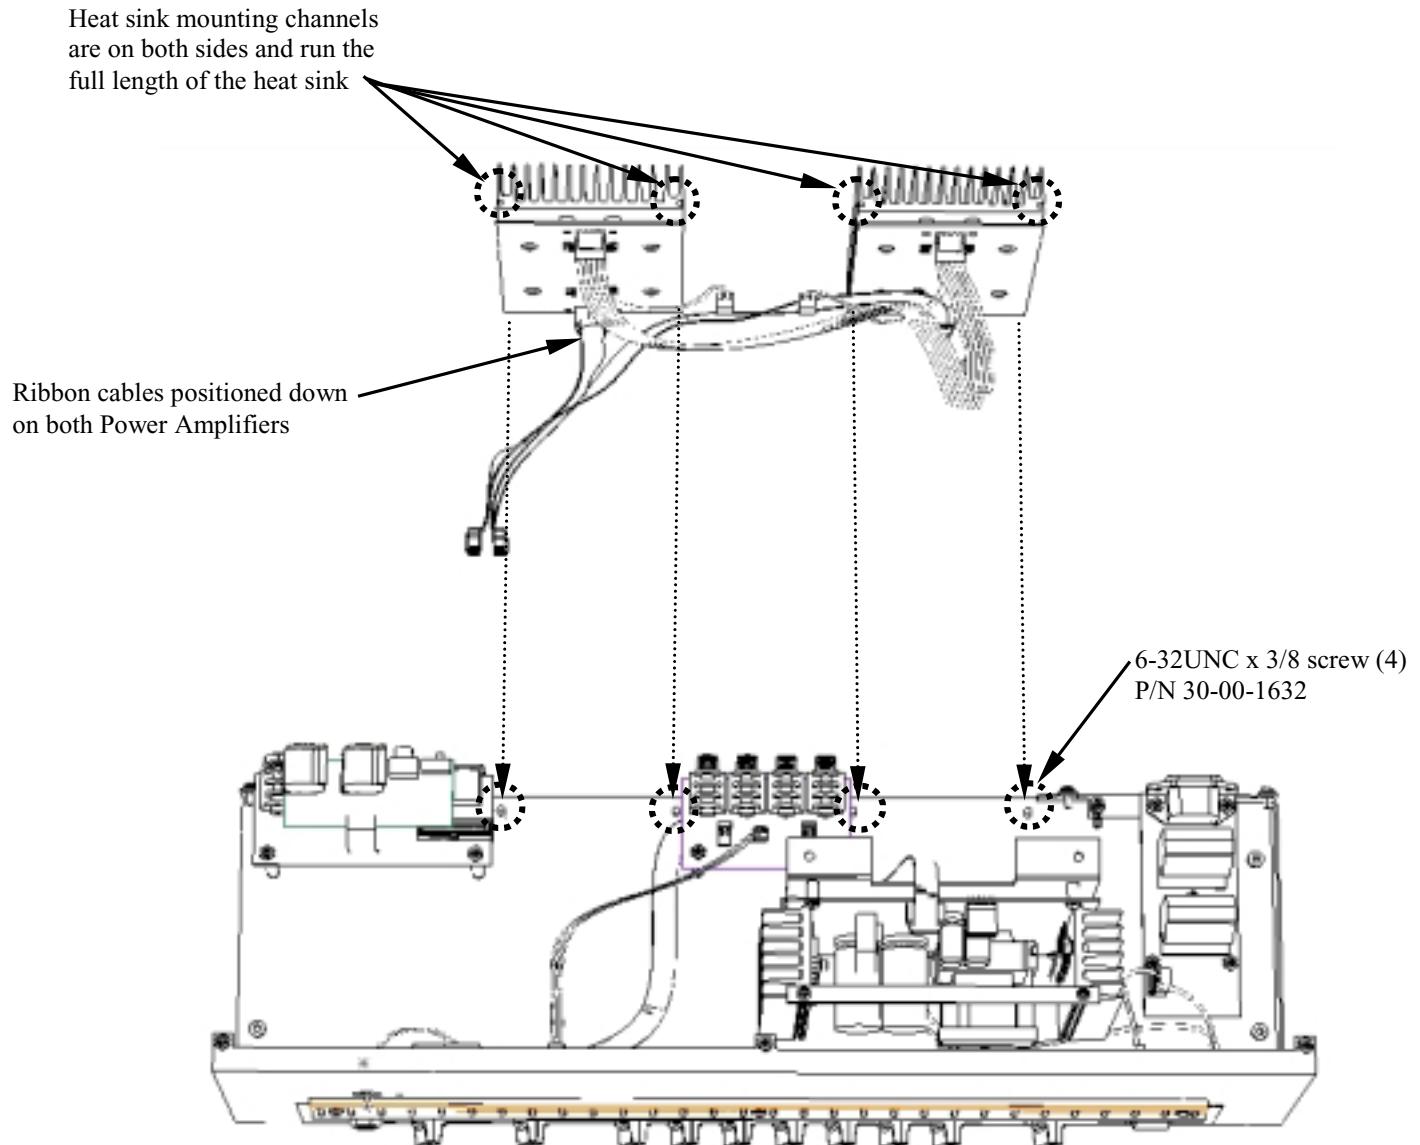

Figure 16

Step 11: Route/connect Power Amplifiers cables:

- a. Route and connect Power Amplifier cables. See figure 17.

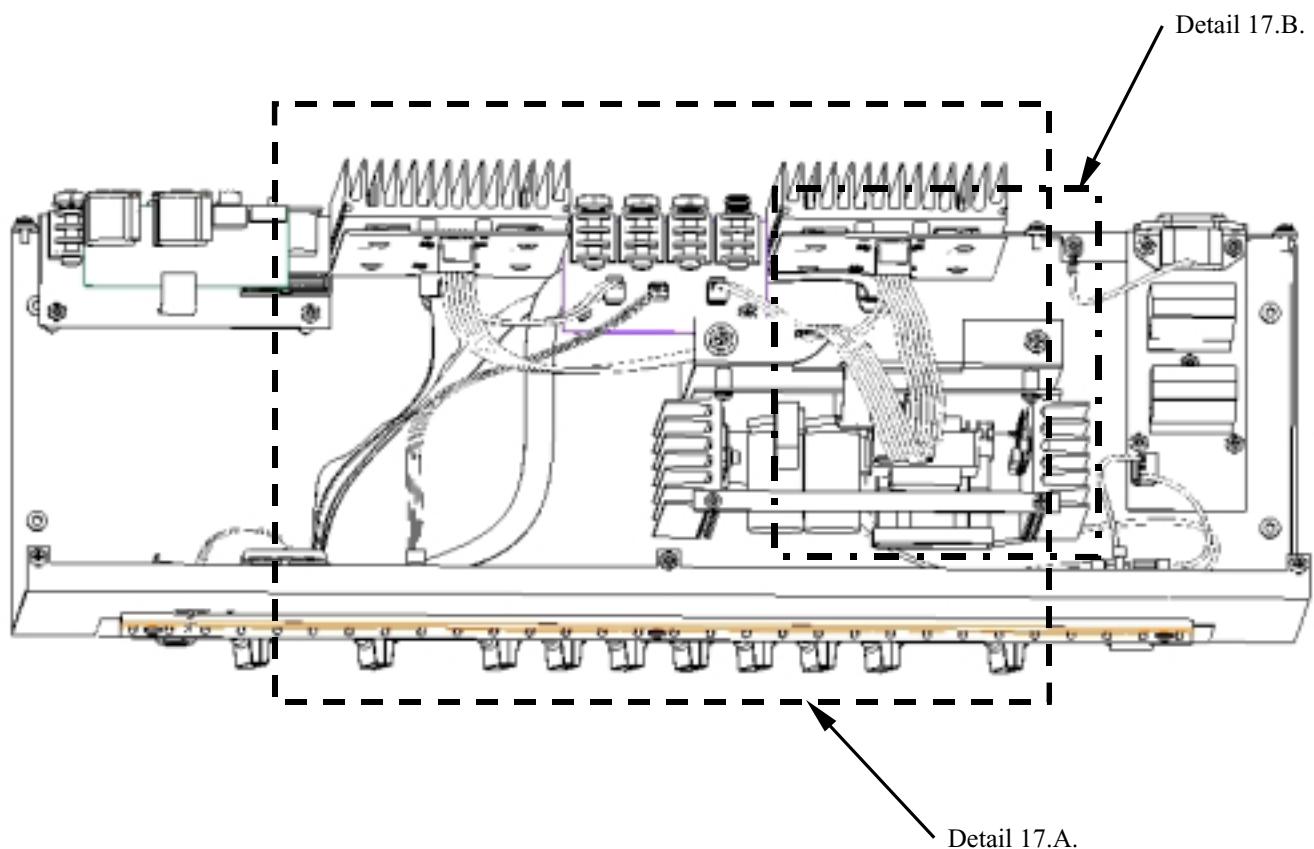

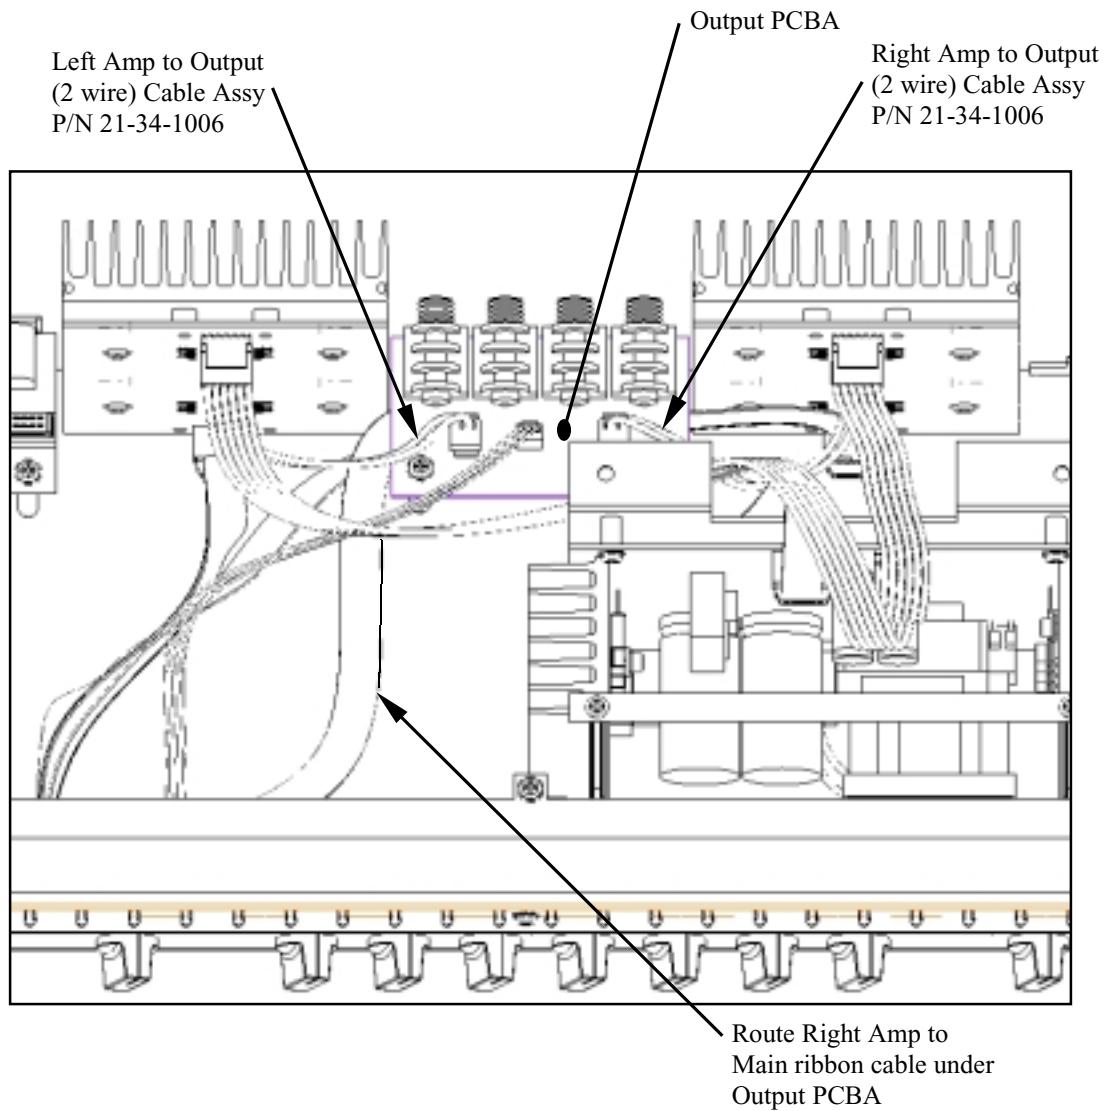

Figure 17

Step 11: Route/connect Power Amplifiers cables (continued):

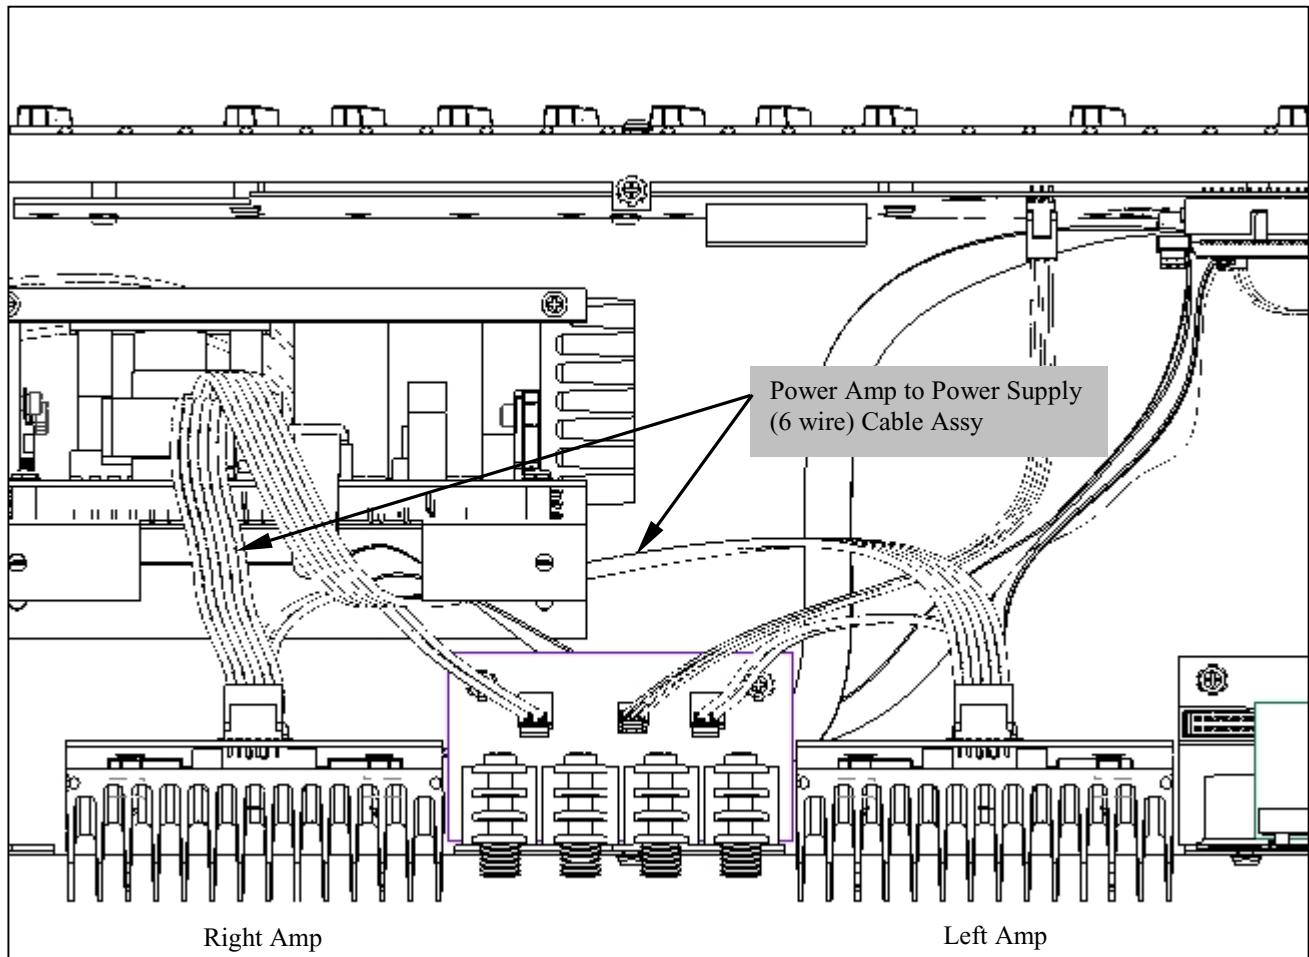

- b. Route ribbon cable from the right Power Amplifier to the Main PCBA under the Output PCBA. See detail 17.A.
- c. Connect Power Amplifier (2 wire) cables to Output PCBA.

Detail 17.A. (top view - looking backward)

Step 11: Install Power Amplifiers (continued):

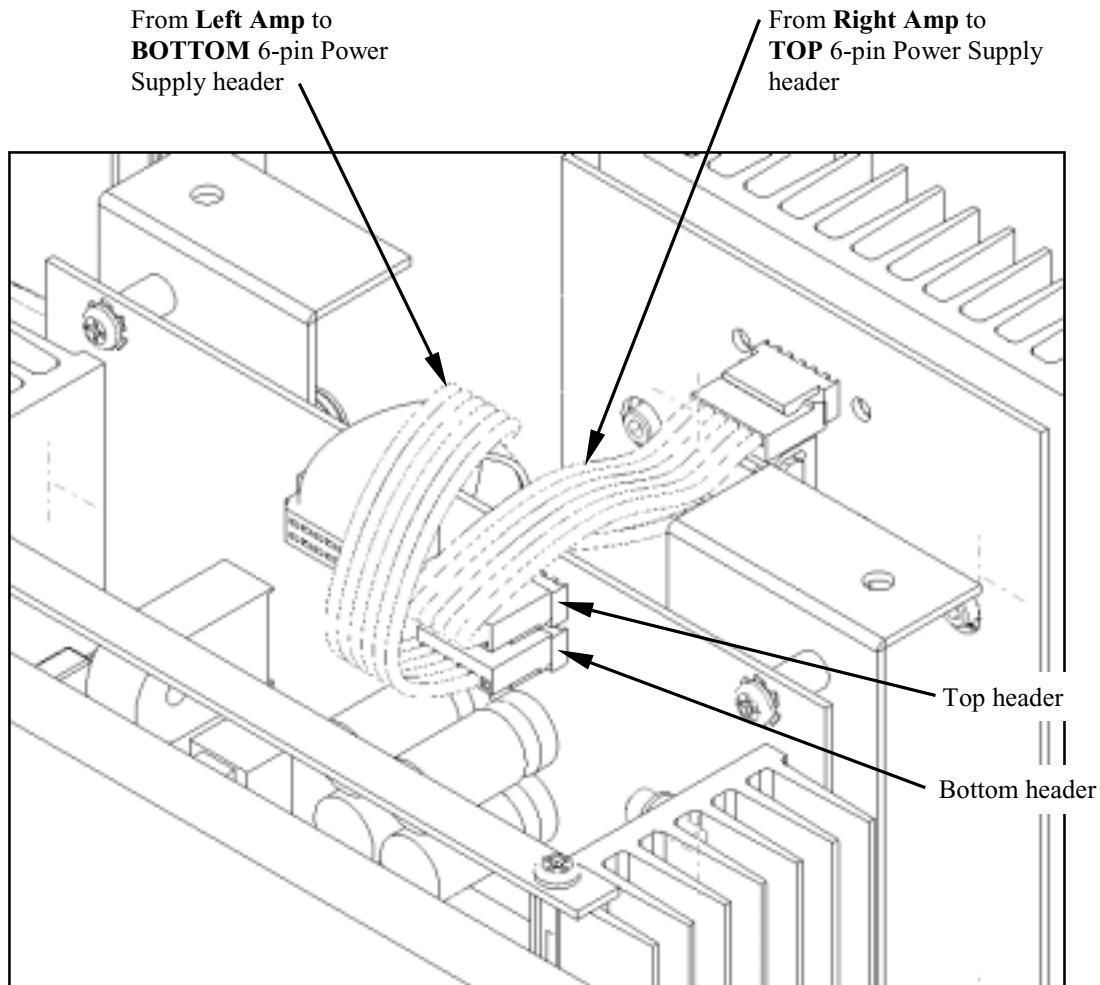

- d. Route Power Amplifier to Power Supply Cables as shown. See detail 17.A.

Detail 17.A. (top view - looking forward)

Step 11: Install Power Amplifiers (continued):

- e. Connect 6 wire cable assemblies to Power Supply. See detail 17.B.

Detail 17.B.

Step 12: Mount Load Switch onto Cover:

- a. Position Load Switch in Cover as shown in figures 18 and 19.
- b. Install mounting screws. See figure 18

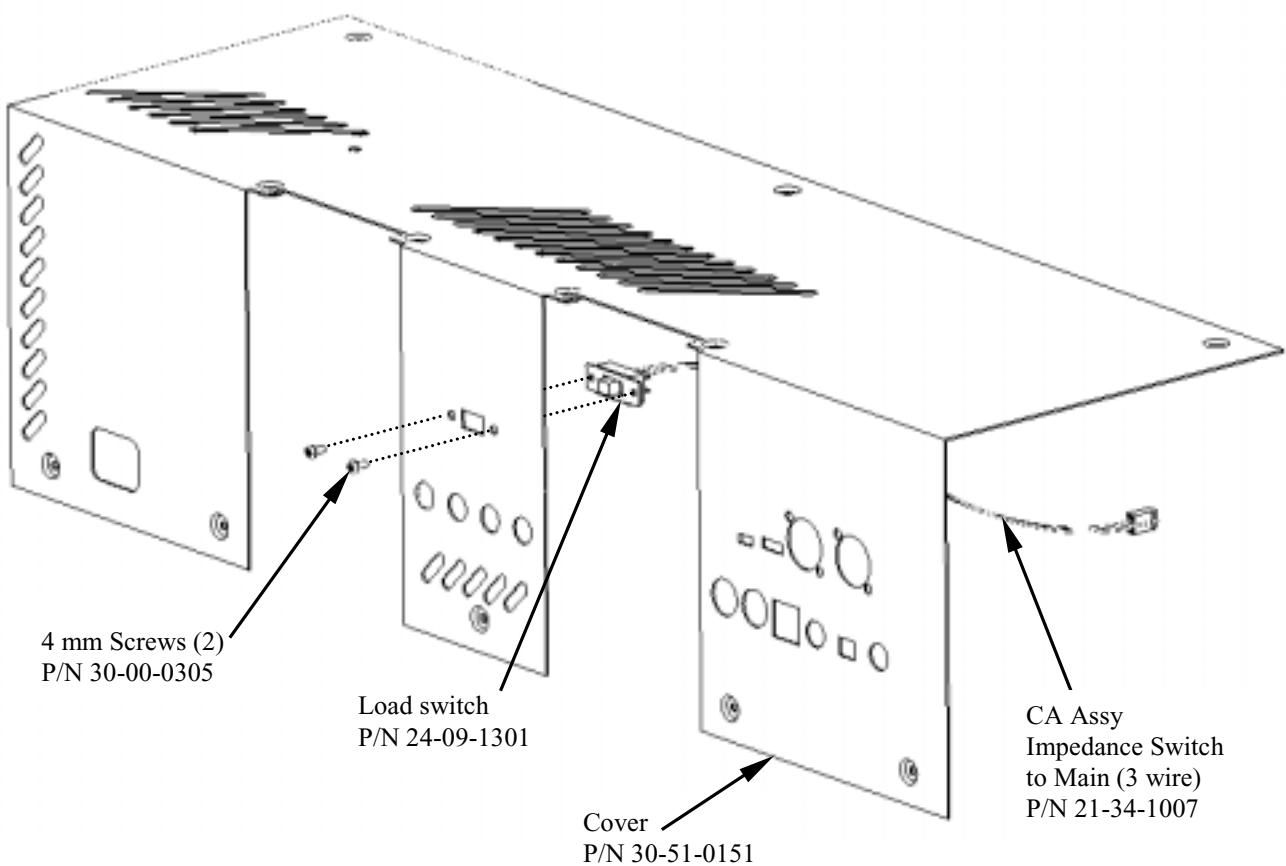

Figure 18

Step 12: Mount Load Switch onto Cover (continued):

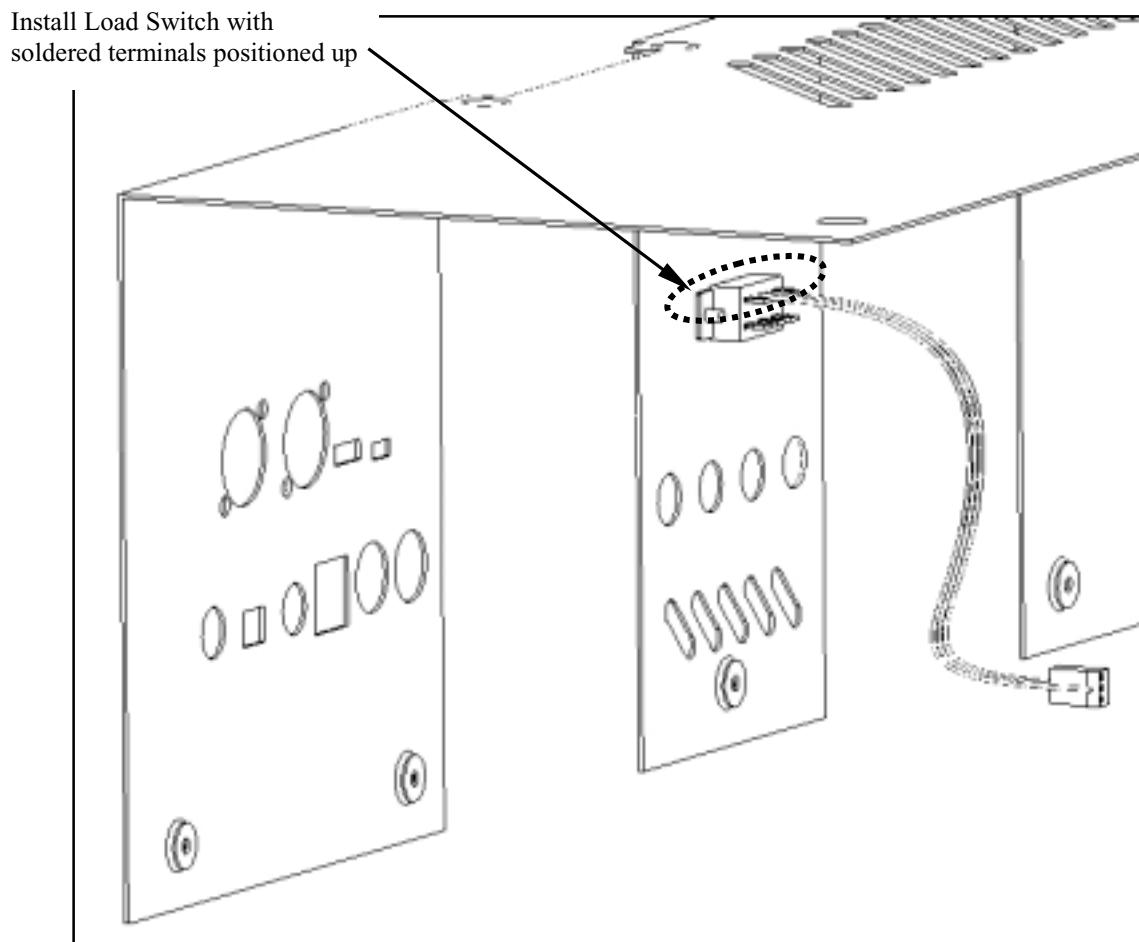

Figure 19 (rear view of Cover)

Step 13: Mount Cover onto Chassis:

- a. Slide Cover into position near the Chassis close enough so that you are able to connect the Load Switch cable connector to the Main PCBA header. See Figure 20.

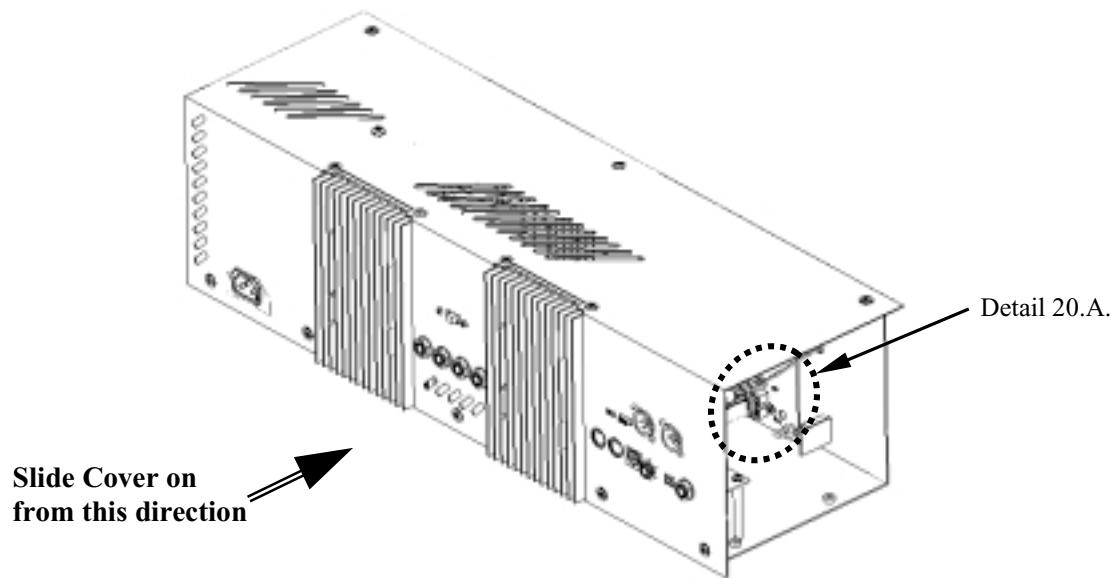

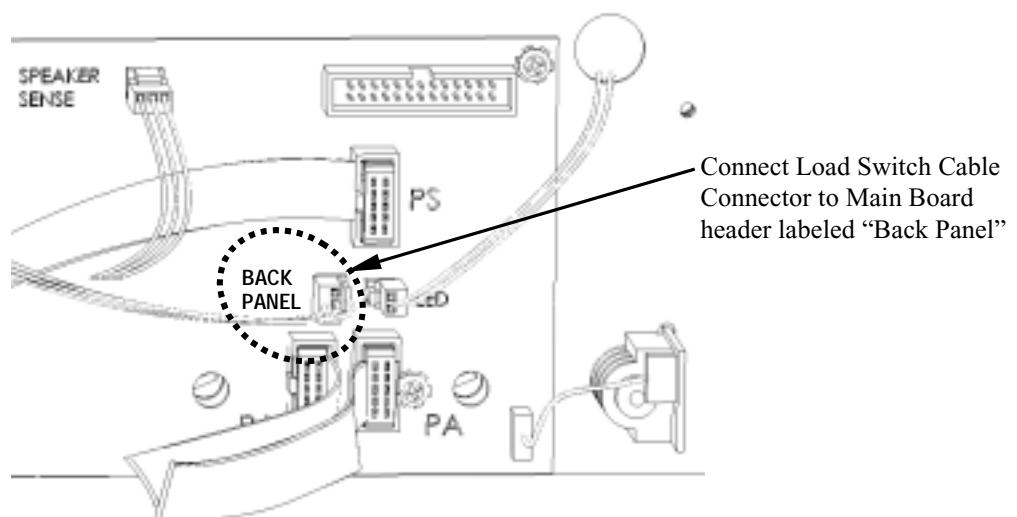

Figure 20

Detail 20.A.

Step 13: Mount Cover onto Chassis (continued):

- b. Install 6-32UNC x 3/8 screws. See figure 21.

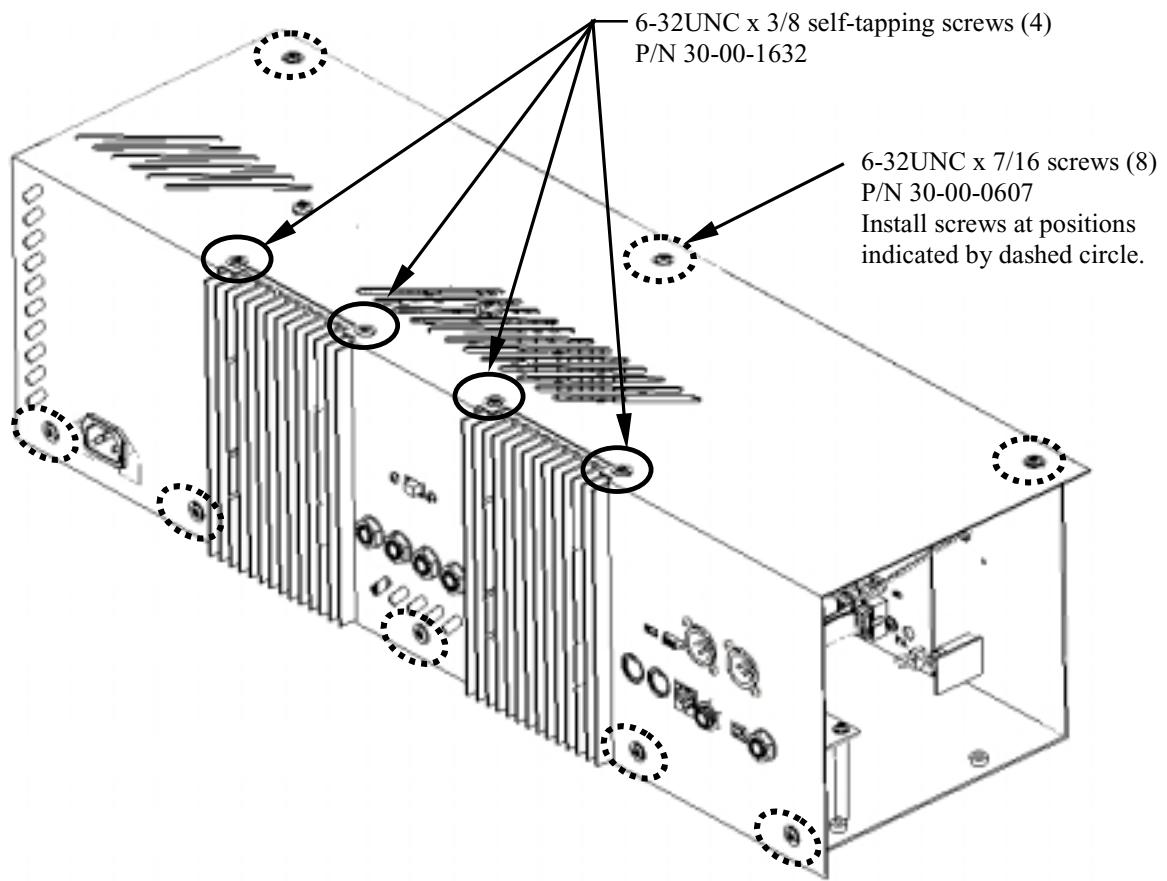

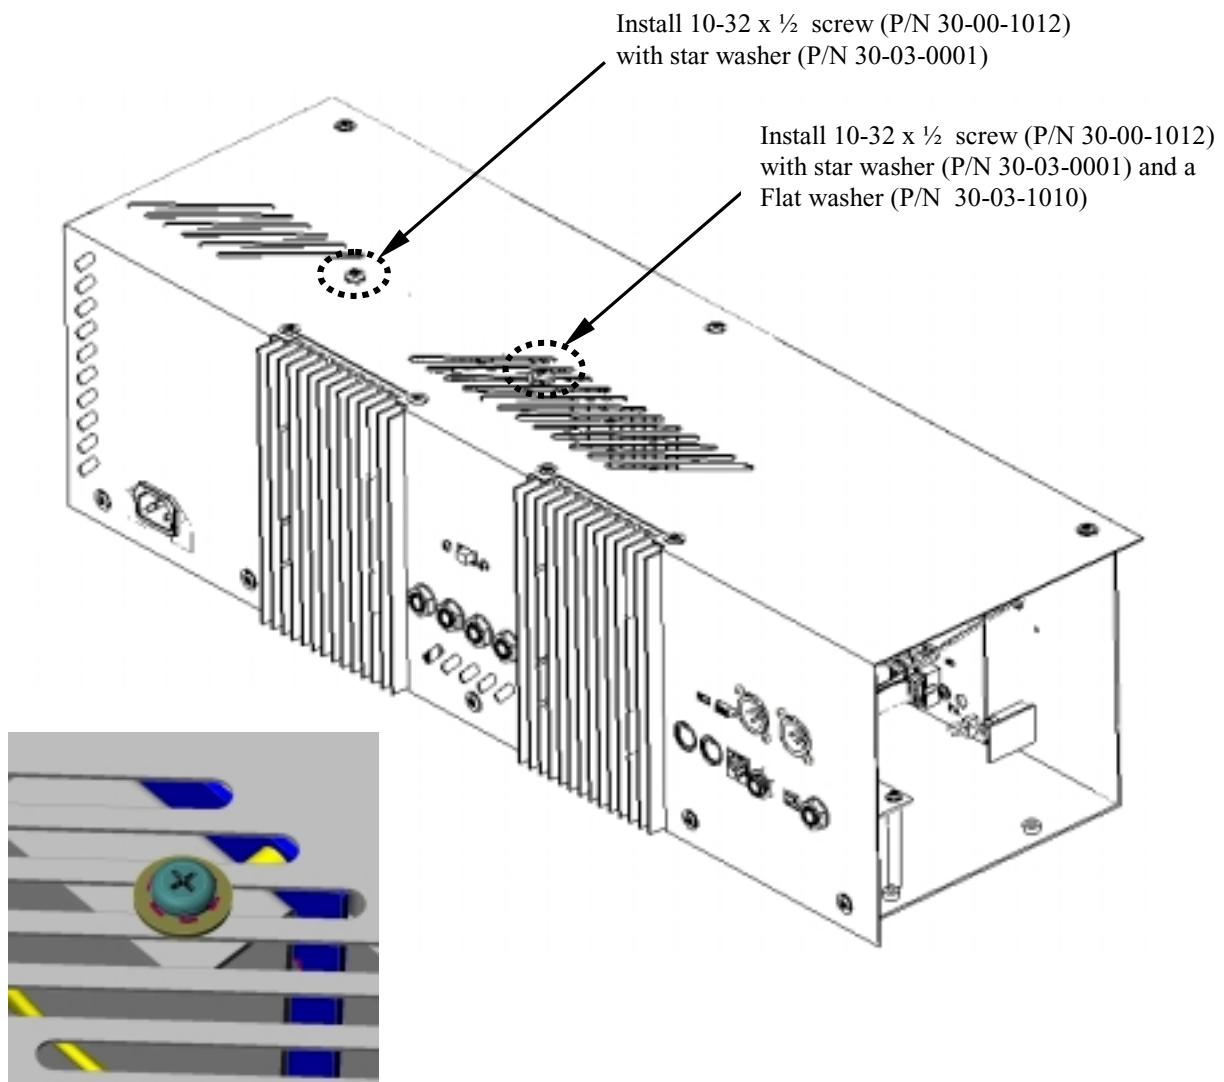

Figure 21

Step 13: Mount Cover onto Chassis (continued):

- c. Complete mounting of the Power Supply Bracket. Install two 10-32 x 3/8 screws. See figure 22.

Screw, star washer and flat washer Detail

Figure 22

Step 13: Mount Cover onto Chassis (continued):

- d. Install plastic nuts onto input/output jacks. See figure 23.
- e. Install four 4- x 1/4 screws into XLR jacks. See figure 23.

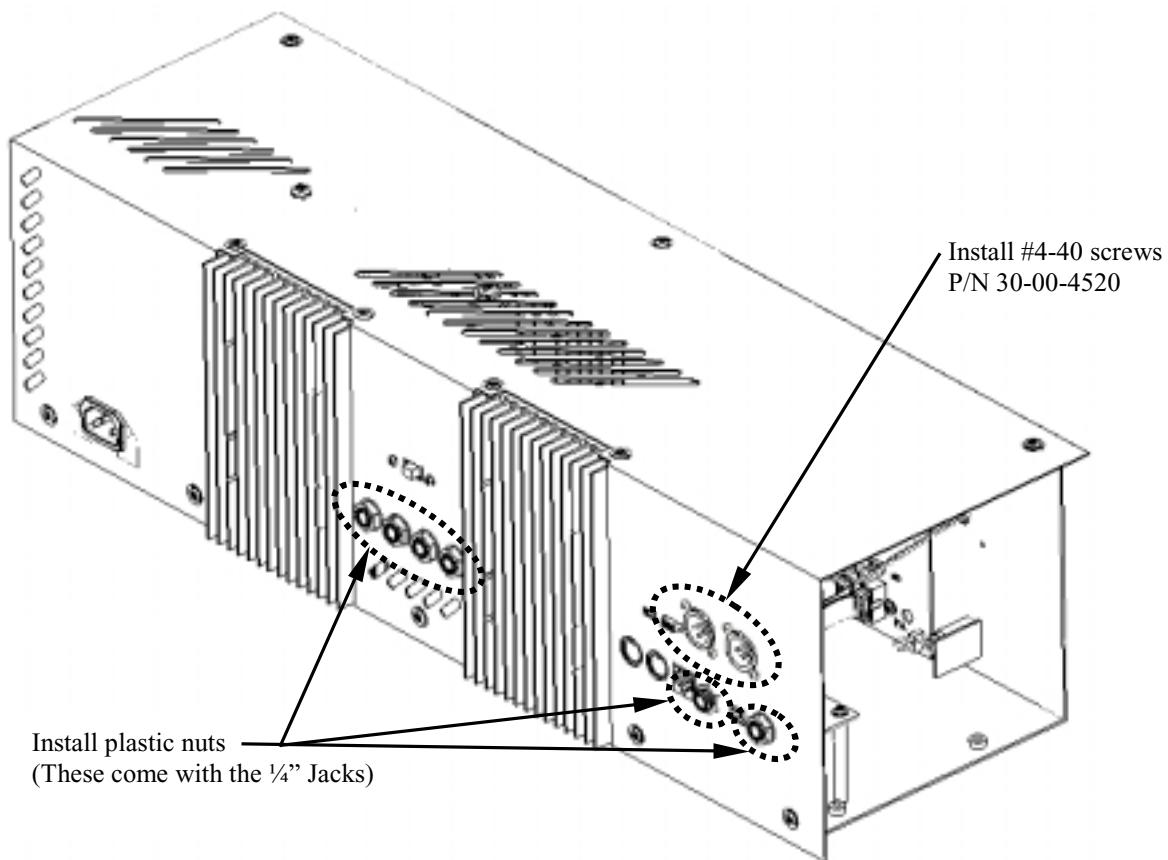

Figure 23

Step 14: Install Midi-Cab PCBA to Main PCBA cable assembly:

- a. Install 26 pin Midi-Cab to Main PCBA ribbon cable assembly. See figure 24.

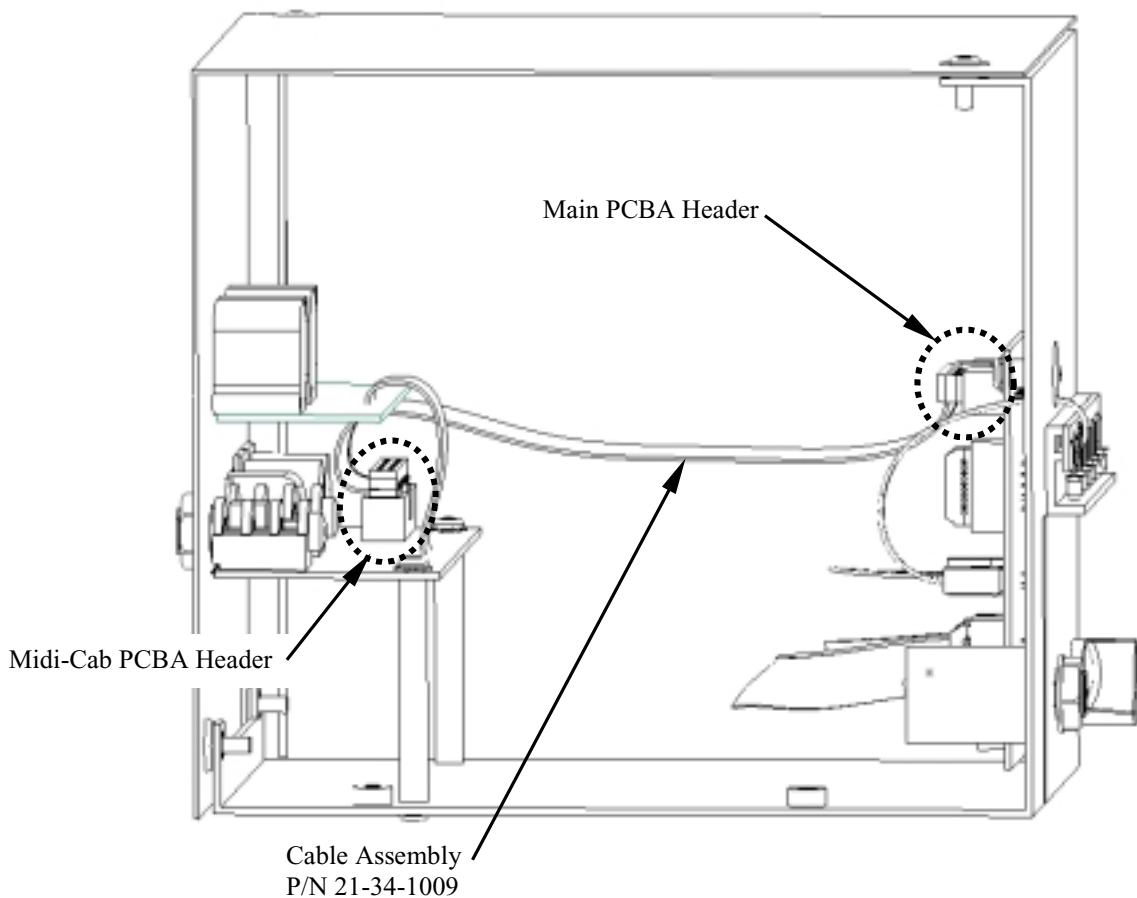

Figure 24 (left side view)

Step 15: Flextone II Head chassis assembly complete:

- a. Proceed to Chassis assembly into Cabinet.

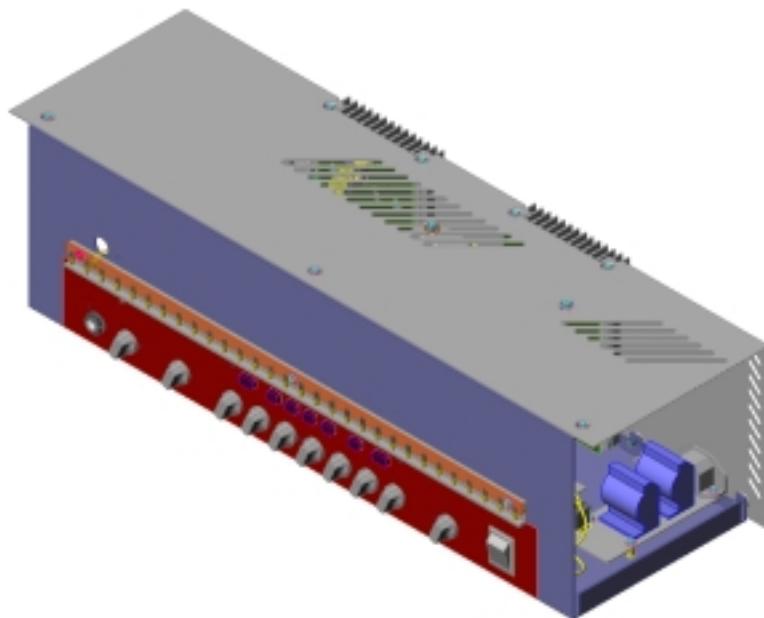

Figure 25 (front view)

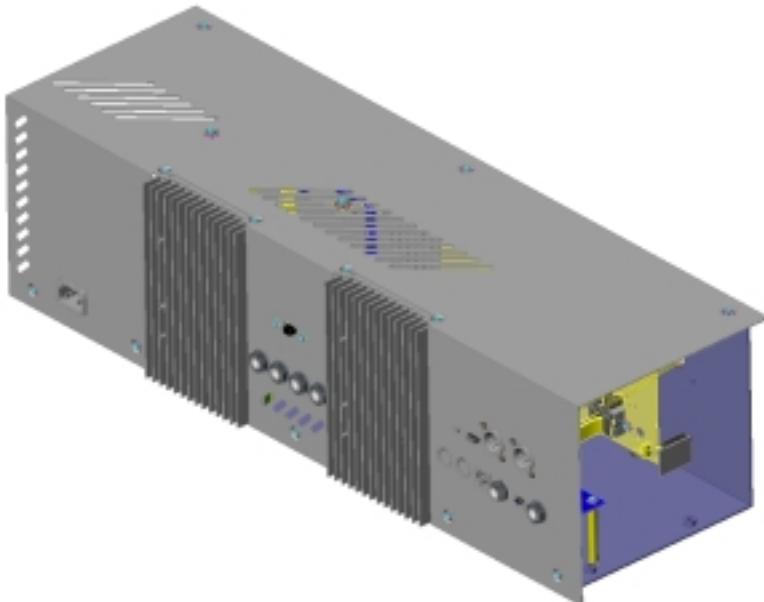

Figure 26 (rear view)

Step 16: Flextone II Head assembly:

- a. From inside the Cabinet, poke the Chassis mounting holes and surface covering so they can be easily located on the outer surface. See figure 27.
- b. Install Chassis assembly into Cabinet. See figure 28.

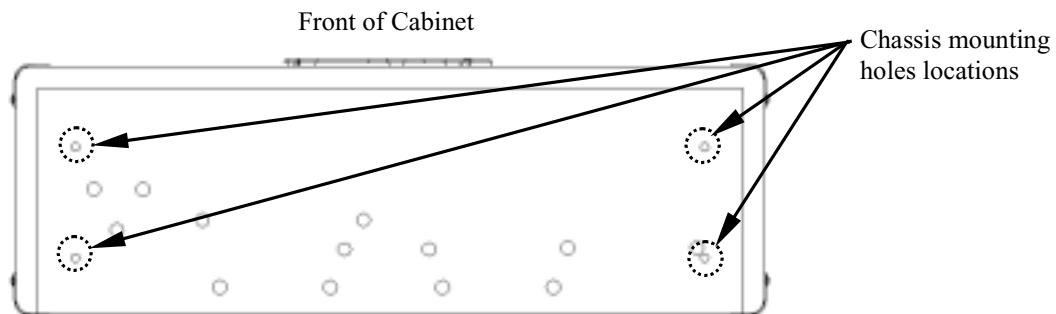

Figure 27 (top view)

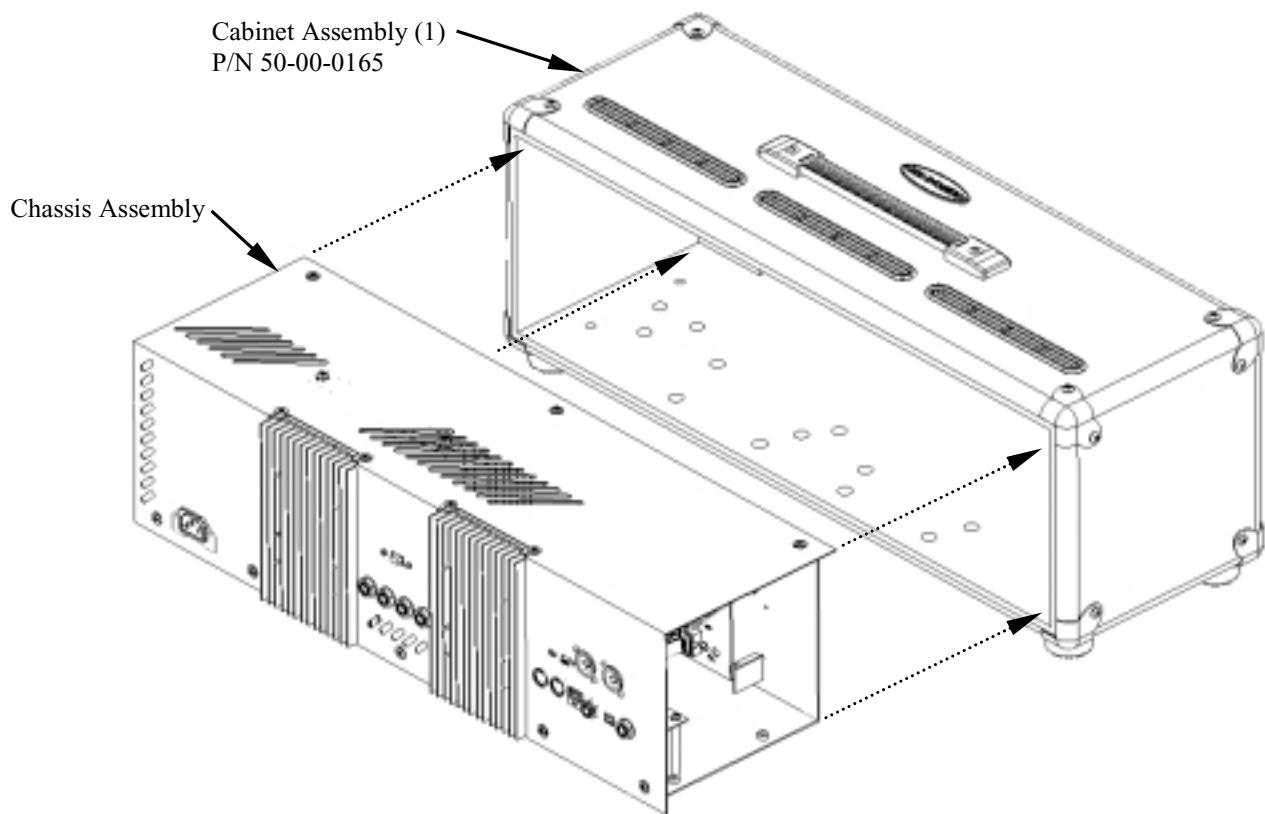

Figure 28

Step 16: Flextone II Head assembly (continued):

- c. Rotate Cabinet (face down) and install Chassis mounting screws through bottom of Cabinet. See figure 29.
- d. The Flextone II Head is now complete – ROCK ON!!.. See figure 30.

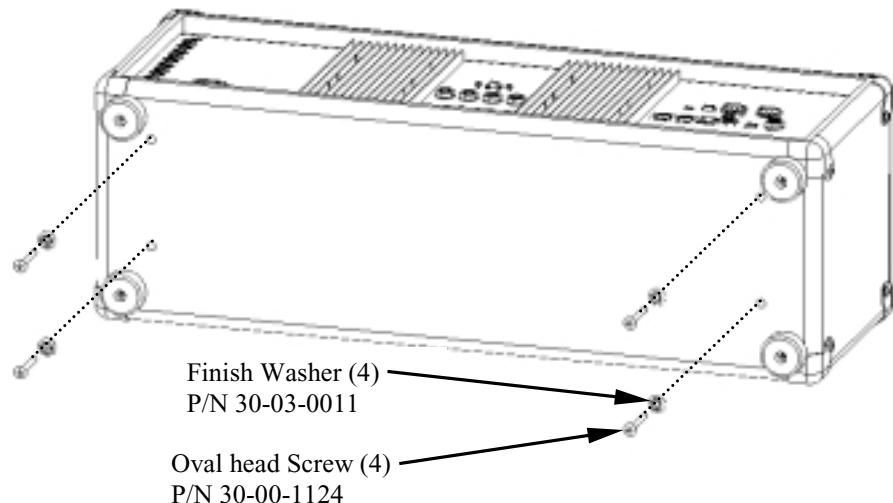

Figure 29

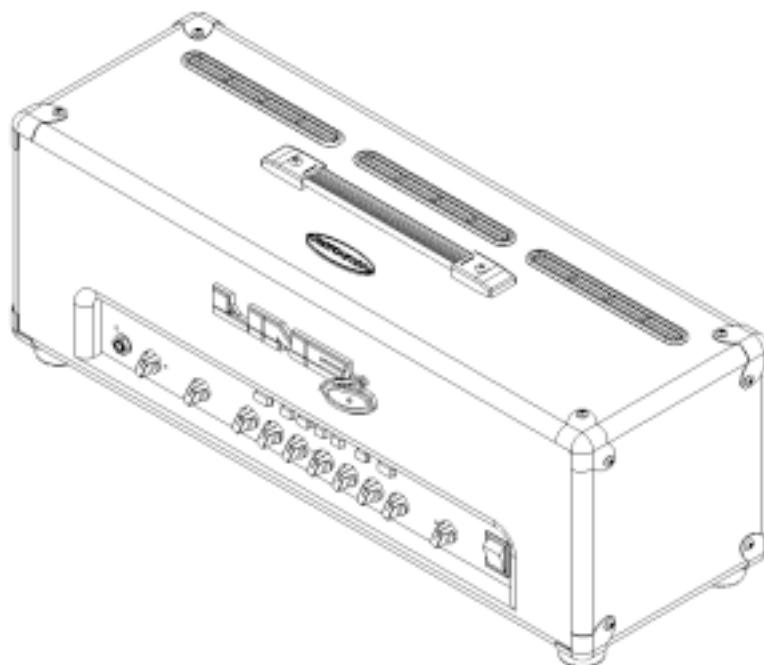

Figure 30

Service Dept.

Procedure for reinitialization of Flextone and Flextone 2 amps (Hard reset)

Power unit up while holding down the A, B, C, and D buttons. Hold for 3 seconds and then release. Factory presets will be re-installed.

Procedure for identifying firmware version of Flextone and Flextone 2 amps

Power unit up while holding down the “C” button. “D” button will flash for major version; “Save” button will flash for minor version.

Example: For Flextone 2.1 software, the “D” button will flash 2 times and then the “Save” button will flash once.
