Operating Manual

OPTIMOD-FM[®]

Six-Band Limiter Processor

Model 8100AXT2

An Accessory for the OPTIMOD-FM Model 8100A1

IMPORTANT NOTE: The name of your OPTIMOD-FM Six-Band Limiter and references to it in this manual may not match. Refer to the unit's rear panel for your Model #. Also, note that current Model #s to other OPTIMOD-FM units do not match references to them in this manual.

MANUAL:		
Part Number: 95057-000-04C	Description 9105A Manual	

CAUTION: TO REDUCE THE RISK OF ELECTRICAL SHOCK, DO NOT REMOVE COVER (OR BACK). NO USER SERVICEABLE PARTS INSIDE. REFER SERVICING TO QUALIFIED SERVICE PERSONNEL.

WARNING: TO REDUCE THE RISK OF FIRE OR ELECTRICAL SHOCK, DO NOT EXPOSE THIS APPLIANCE TO RAIN OR MOISTURE.

This symbol, wherever it appears, alerts you to the presence of uninsulated dangerous voltage inside the enclosure — voltage that may be sufficient to constitute a risk of shock.

This symbol, wherever it appears, alerts you to important operating and maintenance instructions in the accompanying literature. Read the manual.

IMPORTANT SAFETY INSTRUCTIONS

All the safety and operating instructions should be read before the appliance is operated.

Retain Instructions: The safety and operation instructions should be retained for future reference.

Heed Warnings: All warnings on the appliance and in the operating instructions should be adhered to.

Follow Instructions: All operation and user instructions should be followed.

Water and Moisture: The appliance should not be used near water (e.g., near a bathtub, washbowl, kitchen sink, laundry tub, in a wet basement, or near a swimming pool, etc.).

Ventilation: The appliance should be situated so that its location or position does not interfere with its proper ventilation. For example, the appliance should not be situated on a bed, sofa, rug, or similar surface that may block the ventilation openings; or, placed in a built-in installation, such as a bookcase or cabinet that may impede the flow of air through the ventilation openings.

Heat: The appliance should be situated away from heat sources such as radiators, heat registers, stoves, or other appliances (including amplifiers) that produce heat.

Power Sources: The appliance should be connected to a power supply only of the type described in the operating instructions or as marked on the appliance.

Grounding or Polarization: Precautions should be taken so that the grounding or polarization means of an appliance is not defeated.

Power-Cord Protection: Power-supply cords should be routed so that they are not likely to be walked on or pinched by items placed upon or against them, paying particular attention to cords at plugs, convenience receptacles, and the point where they exit from the appliance.

Cleaning: The appliance should be cleaned only as recommended by the manufacturer.

Non-use Periods: The power cord of the appliance should be unplugged from the outlet when left unused for a long period of time.

Object and Liquid Entry: Care should be taken so that objects do not fall and liquids are not spilled into the enclosure through openings.

Damage Requiring Service: The appliance should be serviced by qualified service personnel when:

The power supply cord or the plug has been damaged; or

Objects have fallen, or liquid has been spilled into the appliance; or

The appliance has been exposed to rain; or

The appliance does not appear to operate normally or exhibits a marked change in performance; or

The appliance has been dropped, or the enclosure damaged.

Servicing: The user should not attempt to service the appliance beyond that described in the operating instructions. All other servicing should be referred to gualified service personnel.

The Appliance should be used only with a cart or stand that is recommended by the manufacturer.

Safety Instructions (European)

Notice For U.K. Customers If Your Unit Is Equipped With A Power Cord.

WARNING: THIS APPLIANCE MUST BE EARTHED.

The cores in the mains lead are coloured in accordance with the following code:

GREEN and YELLOW - Earth BLUE - Neutral BROWN - Live As colours of the cores in the mains lead of this appliance may not correspond with the coloured markings identifying the terminals in your plug, proceed as follows:

The core which is coloured green and yellow must be connected to the terminal in the plug marked with the letter E, or with the earth symbol, $(\frac{1}{2})$, or coloured green, or green and yellow.

The core which is coloured blue must be connected to the terminal marked N or coloured black.

The core which is coloured brown must be connected to the terminal marked L or coloured red.

The power cord is terminated in a CEE7/7 plug (Continental Europe). The green/yellow wire is connected directly to the unit's chassis. If you need to change the plug and if you are qualified to do so, refer to the table below.

WARNING: If the ground is defeated, certain fault conditions in the unit or in the system to which it is connected can result in full line voltage between chassis and earth ground. Severe injury or death can then result if the chassis and earth ground are touched simultaneously.

CONDUCTOR		WIRE COLOR		
		Normal	Alt	
L	LIVE	BROWN	BLACK	
Ν	NEUTRAL	BLUE	WHITE	
E	EARTH GND	GREEN-YELLOW	GREEN

Safety Instructions (German)

Gerät nur an der am Leistungsschild vermerkten Spannung und Stromart betreiben.

Sicherungen nur durch solche, gleicher Stromstärke und gleichen Abschaltverhaltens ersetzen. Sicherungen nie überbrücken.

Jedwede Beschädigung des Netzkabels vermeiden. Netzkabel nicht knicken oder quetschen. Beim Abziehen des Netzkabels den Stecker und nicht das Kabel enfassen. Beschädigte Netzkabel sofort auswechseln.

Gerät und Netzkabel keinen übertriebenen mechanischen Beaspruchungen aussetzen.

Um Berührung gefährlicher elektrischer Spannungen zu vermeiden, darf das Gerät nicht geöffnet werden. Im Fall von Betriebsstörungen darf das Gerät nur Von befugten Servicestellen instandgesetzt werden. Im Gerät befinden sich keine, durch den Benutzer reparierbare Teile.

Zur Vermeidung von elektrischen Schlägen und Feuer ist das Gerät vor Nässe zu schützen. Eindringen von Feuchtigkeit und Flüssigkeiten in das Gerät vermeiden.

Bei Betriebsstörungen bzw. nach Eindringen von Flüssigkeiten oder anderen Gegenständen, das Gerät sofort vom Netz trennen und eine qualifizierte Servicestelle kontaktieren.

Safety Instructions (French)

On s'assurera toujours que la tension et la nature du courant utilisé correspondent bien à ceux indiqués sur la plaque de l'appareil.

N'utiliser que des fusibles de même intensité et du même principe de mise hors circuit que les fusibles d'origine. Ne jamais shunter les fusibles.

Eviter tout ce qui risque d'endommager le câble seceur. On ne devra ni le plier, ni l'aplatir. Lorsqu'on débranche l'appareil, tirer la fiche et non le câble. Si un câble est endommagé, le remplacer immédiatement.

Ne jamais exposer l'appareil ou le cable à une contrainte mécanique excessive.

Pour éviter tout contact averc une tension électrique dangereuse, on n'oouvrira jamais l'appareil. En cas de dysfonctionnement, l'appareil ne peut être réparé que dans un atelier autorisé. Aucun élément de cet appareil ne peut être réparé par l'utilisateur.

Pour éviter les risques de décharge électrique et d'incendie, protéger l'appareil de l'humidité. Eviter toute pénétration d'humidité ou fr liquide dans l'appareil.

En cas de dysfonctionnement ou si un liquide ou tout autre objet a pénétré dans l'appareil couper aussitôt l'appareil de son alimentation et s'adresser à un point de service aprésvente autorisé.

Safety Instructions (Spanish)

Hacer funcionar el aparato solo con la tensión y clase de corriente señaladas en la placa indicadora de caracteristicas.

Reemplazar los fusibles sólo por otros de la misma intensidad de corriente y sistema de desconexión. No poner nunca los fusibles en puente.

Proteger el cable de alimentación contra toda clase de daños. No doblar o apretar el cable. Al desenchufar, asir el enchufe y no el cable. Sustituir inmediatamente cables dañados.

No sometar el aparato y el cable de alimentación a esfuerzo mecànico excesivo.

Para evitar el contacto con tensiones eléctricas peligrosas, el aparato no debe abrirse. En caso de producirse fallos de funcionamiento, debe ser reparado sòlo por talleres de servicio autorizados. En el aparato no se encuentra ninguna pieza que pudiera ser reparada por el usuario.

Para evitar descargas eléctricas e incendios, el aparato debe protégerse contra la humedad, impidiendo que penetren ésta o liquidos en el mismo.

En caso de producirse fallos de funcionamiento como consecuencia de la penetración de líquidos u otros objetos en el aparato, hay que desconectarlo inmediatamente de la red y ponerse en contacto con un taller de servicio autorizado.

Safety Instructions (Italian)

Far funzionare l'apparecchio solo con la tensione e il tipo di corrente indicati sulla targa riportante i dati sulle prestazioni.

Sostituire i dispositivi di protezione (valvole, fusibili ecc.) solo con dispositivi aventi lo stesso amperaggio e lo stesso comportamento di interruzione. Non cavallottare mai i dispositivi di protezione.

Evitare qualsiasi danno al cavo di collegamento alla rete. Non piegare o schiacciare il cavo. Per staccare il cavo, tirare la presa e mai il cavo. Sostituire subito i cavi danneggiati.

Non esporre l'apparecchio e il cavo ad esagerate sollecitazioni meccaniche.

Per evitare il contatto con le tensioni elettriche pericolose, l'apparecchio non deve venir aperto. In caso di anomalie di funzionamento l'apparecchio deve venir riparato solo da centri di servizio autorizzati. Nell'apparecchio non si trovano parti che possano essere riparate dall'utente.

Per evitare scosse elettriche o incendi, l'apparecchio va protetto dall'umidità. Evitare che umidità o liquidi entrino nell'apparecchio.

In caso di anomalie di funzionamento rispettivamente dopo la penetrazione di liquidi o oggetti nell'apparecchio, staccare immediatamente l'apparecchio dalla rete e contattare un centro di servizio qualificato.

PLEASE READ THIS FIRST!

Manual

The Operating Manual contains instructions to verify the proper operation of this unit and initialization of certain options. You will find these operations are most conveniently performed on the bench before you install the unit in the rack.

Please review the Manual, especially the installation section, before unpacking the unit.

Trial Period Precautions

If your unit has been provided on a trial basis:

You should observe the following precautions to avoid reconditioning charges in case you later wish to return the unit to your dealer.

- 1) Note the packing technique and save all packing materials. It is not wise to ship in other than the factory carton. (Replacements cost \$35.00).
- 2) Avoid scratching the paint or plating. Set the unit on soft, clean surfaces.
- 3) Do not cut the grounding pin from the line cord.
- 4) Use care and proper tools in removing and tightening screws to avoid burring the heads.
- 5) Use the nylon-washered rack screws supplied, if possible, to avoid damaging the panel. Support the unit when tightening the screws so that the threads do not scrape the paint inside the slotted holes.

Packing

When you pack the unit for shipping:

Tighten all screws on any barrier strip(s) so the screws do not fall out from vibration. Wrap the unit in its original plastic bag to avoid abrading the paint. Seal the inner and outer cartons with tape.

If you are returning the unit permanently (for credit), be sure to enclose:

- The Manual(s)
 - The Registration/Warranty Card
- The Line Cord
- All Miscellaneous Hardware (including the Rack Screws and Keys)
- The Extender Card
- The Monitor Rolloff Filter(s) (OPTIMOD-AM only)
- The COAX Connecting Cable (OPTIMOD-FM and OPTIMOD-TV only)

Your dealer may charge you for any missing items.

If you are returning a unit for repair, do not enclose any of the above items.

Further advice on proper packing and shipping is included in the Manual (see Table of Contents).

Trouble

If you have problems with installation or operation:

- 1) Check everything you have done so far against the instructions in the Manual. The information contained therein is based on our years of experience with Optimod and broadcast stations.
- 2) Check the other sections of the Manual (consult the Table of Contents and Index) to see if there might be some suggestions regarding your problem.
- 3) After reading the section on Factory Assistance, you may call Orban Customer Service for advice during normal California business hours. The number is in the Manual.

1525 Alvarado Street, San Leandro, California 94577 USA Phone: (1) 510/351-3500 FAX: (1) 510/351-1001

Note: We have redesigned the 8100AXT2 meter display, upgrading the analog meters to LED bargraph meters. To do this upgrade, we have added a meter display board. Otherwise, all information provided in the 8100AXT2 manual is valid for your 8100AXT2 unit.

This document provides a Circuit Description, Parts List, Schematic and Assembly Drawing for the new 8100AXT2 meter display board.

IMPORTANT: If you are using an 8100AXT2 (featuring upgraded LED meters) with an Orban Model 8100A OPTIMOD-FM that does not have a 3/4A (or .315A "T"-type) fuse installed, you need to replace the old fuse in the 8100A to accommodate the extra current draw of the new 8100XT2 chassis.

Included with the 8100AXT2 is a packet containing:

1	3/4A Slo-Blo fuse
1	.315A Slo-Blo "T"-type fuse
1	Fuse Rating Sticker

To ensure proper operation, complete the following steps:

- Replace the original 8100A fuse with the correct fuse for your model: 3/4A Slo-Blo or .315A Slo-Blo "T"-type. (Refer to the 8100A1 Operating Manual for instructions on removing the front panel and locating the fuse.)
- 2. Place the Fuse Rating Sticker over the old Fuse Rating Indicator (located behind the 8100A front panel).

P/N 95343-000-01 300 - CB - 9/93 Orban, a division of AKG Acoustics, Inc. 1525 Alvarado Street, San Leandro, California 94577 Phone (1) 510/351-3500 Fax (1) 510/351-1001

Circuit Description of 8100AXT2 Bargraph

LED Bargraph GAIN REDUCTION Meters

The GAIN REDUCTION meters each consist of ten comparators with open collector outputs. The ten LEDs in the bargraph are connected in series, and a current source forces a constant current into the LED string. As the input voltage to the comparators decreases, they progressively shunt to the -15V rail the current that would ordinarily flow through the LEDs, turning off all LEDs closer to the -15V rail. The comparators are biased with equal voltage increments, producing a meter whose scale is linear. Because the gain control voltage is linear in dB, this produces a dB-linear meter scale.

A 250Hz "dither" signal is injected into the reference voltage string, modulating the turnon threshold of each comparator and causing the LEDs to appear to smoothly fade on and off instead of switching abruptly.

Component-Level Description:

All six meters are identical. We will describe Meter 1 (the 150Hz Band).

Current source Q1, R1, R11, R22, CR7 applies a constant current to the seriesconnected diodes in LED assembly CR1. A string of ten comparators IC1-D to IC3-B receives the dB-linear gain reduction voltage. Voltage divider string R10, R12–R21 biases the comparators with DC reference voltages from 0.09 to 0.9VDC in 0.09V steps. Each 0.9V step corresponds to 2dB additional gain reduction. When the gain reduction is less than 2dB, the gain reduction voltage is less than 0.09V and the outputs of all comparators are active negative, shunting current from the series-connected LED string. As the gain reduction increases, the output of each comparator in turn becomes open collector and current is permitted to flow in the LED string until it encounters a comparator whose output is still active negative, at which point the active comparator shunts the current away from the rest of the LEDs.

A 250Hz triangle-wave "dither" signal is injected into the reference voltage string through R10. This AC signal modulates the turn-on threshold of each comparator, causing the LEDs to appear to smoothly fade on and off instead of switching abruptly.

IC16 is the 250Hz dither oscillator. IC16-A is an integrator charged from the output of IC16-B, which acts as a comparator. Positive feedback from the output of IC16-A through R8 causes the output of IC16-B to abruptly change state each time the output of IC16-A reaches approximately ± 0.046 V. The output of IC16-B is thus a square wave, and IC16-A integrates this square wave to form the desired triangle wave.

Section 1 General Information

In this section:

1. How to Use This Manual	(Table of Contents)	this	page
 Registration, Warranty, Feedback Index The XT2 Six-Band Limiter Simplified Description of the 8100A Interface with OPTIMOD-FM 	/1 + XT2 System	page	1-2 1-3 1-4 1-5 1-6

1. HOW TO USE THIS MANUAL

This manual has six sections:

Section 1: General Information Section 2: Installation Section 3: Operating Instructions Section 4: Maintenance and Calibration Section 5: Troubleshooting Section 6: Technical Data

Each section has a Table of Contents. In addition, a comprehensive **INDEX** (on page 1-3) covers the entire manual.

This **GENERAL INFORMATION** section provides an overview of the product and its application. For complete installation instructions, see the INSTALLATION section.

Performance verification procedures are in the MAINTENANCE AND CALIBRATION section. See the TROUBLESHOOTING section for information on technical support, factory service, and shipping.

The **TECHNICAL DATA** section contains specifications, circuit descriptions, parts lists, and schematics. Throughout the circuit descriptions, keywords are highlighted to help you quickly locate the information you need.

2. REGISTRATION, WARRANTY, FEEDBACK

Registration Card

There are two good reasons for returning the Registration Card shipped with this product:

- 1) It enables us to inform you of new applications, performance improvements, and service aids which may be developed, and
- 2) It helps us respond promptly to claims under warranty without having to request a copy of your bill of sale or other proof of purchase.

Please fill in the Registration Card and send it to us today. If it is lost (or you have purchased this unit used), please photocopy the duplicate below, fill it in, and send it to Orban at the address on the inside of the front cover.

Warranty

The warranty, which can be enjoyed only by the first end-user of record, is stated on the Warranty Certificate on a separate sheet packed with this manual. Save it for future reference. Details on obtaining factory service are provided in Section 5.

User Feedback Form

We are very interested in your comments about this product. Your suggestions for improvements to either the product or the manual will be carefully reviewed. In the back of this manual, a postpaid User Feedback Form is provided for your convenience. If it is missing, please write us at the address on the inside of the front cover. Thank you.

4. THE XT2 SIX-BAND LIMITER

The Orban Model 8100A/XT2 Six-Band Limiter Accessory Chassis was designed for those stations that need a "louder" or more processed sound than that provided by an OPTIMOD-FM used alone and in the recommended manner. The XT2 provides the means to fine-tune your on-air sound through precise control of bass and treble sound texture, program density, and program dynamics.

The XT2 is designed to give you:

- Increased loudness for a given level of audible processing side-effects (compared to an unmodified 8100A/1).
- Improved consistency from source to source, due to the "automatic equalization" effect of the six-band limiter.
- Increased presence and intelligibility on smaller radios and in autos.
- Control of bass and high-frequency equalization.

The XT2 is particularly well-suited for highly competitive pop music formats, such as AOR, CHR, AC, and Urban Contemporary. Oldie and Beautiful formats can also benefit from the improved consistency that the XT2's "automatic equalization" can provide. Because it has been specifically "tuned" to the OPTIMOD-FM, it produces less processing side-effects than do complex processing systems that use OPTIMOD-FM cascaded with other processors. (The XT2 cannot be used with other audio processors or as a stand alone unit.)

In general, the 8100A/1 + XT2 System will be only slightly louder than an 8100A/1 alone, operated with very fast release times and large amounts of clipping. This is because the loudness capabilities of an audio processor system are primarily determined by the design of the peak-limiting system, and the XT2's peak-limiting system is very similar to the highly sophisticated, patented system used in the 8100A/1.

Any loudness increase produced by the XT2 results from two characteristics: 1) the XT2 can automatically re-equalize dull program material, increasing energy in the frequency range to which the ear is most sensitive, and 2) XT2 processing reduces voice level by comparison to music. Since the clipping level in a processor system must often be set to avoid audible voice distortion, the XT2 permits the processor to be adjusted to produce higher loudness on music before voice distortion becomes objectionable.

Because of the XT2's "automatic equalization" of program material, there is some material (notably "heavy metal" with extreme amounts of 3kHz energy) which will actually be *quieter* through the XT2 than through the 8100A/1 alone because the amount of 3kHz energy (to which the ear is maximally sensitive) will be reduced by the XT2.

The primary advantages of the 8100A/1 + XT2 System are improved consistency, increased brightness on naturally dull program material, and reduction of audible processing side effects — all while retaining or slightly exceeding the high loudness capabilities of an aggressively operated 8100A/1.

5. SIMPLIFIED DESCRIPTION OF THE 8100A/1 + XT2 SYSTEM

The 8100A/1 and the XT2 combine to form an integral system. Functionally, the XT2 adds bass equalization, six-band limiting, high-frequency equalization, and multiband distortion-cancelling clipping to the 8100A/1.

In the 8100A/1 + XT2 System, the 8100A/1's dual-band compressor is used to maintain constant levels into the XT2's six-band limiter. This prevents *excessive* six-band limiting (which can result in unpleasant increases in density), while ensuring that desirable amounts of limiting occur consistently. The 8100A/1's RELEASE TIME control adjusts the speed of the dual-band compressor's response. Settings toward SLOW cause the compressor to ride gain like a "slow hand on the pot", not affecting short-term density or texture. Settings toward FAST result in a more consistently loud sound with increased density.

The dual-band compressor is also used as a dynamic bass equalizer to control the "warmth" of the sound. The 8100A/1's BASS COUPLING control adjusts this broadband bass equalization. In addition, the XT2 gives the signal a bass boost to compensate for the increased brightness often added by the six-band limiter. The boost frequency has been chosen to create very "punchy" bass, particularly on speakers with reasonably extended bass response. BASS EQ controls adjust the amount of bass "punch" the XT2 adds to each channel.

The XT2 divides the signal into six bands by a set of filters. Separate PRESENCE and BRIL-LIANCE controls adjust the drive levels into the two highest bands, enabling use of the XT2 as a dynamic high-frequency equalizer.

The use of six bands of limiting permits significant correction of midrange frequency balances and production of a more consistent, intelligible, and pleasing sound. Individual limiters for each of the six bands make the XT2 capable of far more *fast* gain control without audible side effects than would be possible with the dual-band compression used in the 8100A/1.

Loudness is increased by reducing the peak-to-average ratio of the audio, so the average level can be increased within the modulation limits permitted. The peak-to-average ratio of the six-band limiter's output is reduced by distortion-cancelling clipping and filtering. This also allows the signal to be applied to a final safety clipper (in the 8100A/1) without the need for further broadband gain control, which could introduce pumping and modulation effects.

The output of the safety clipper is returned to the 8100A/1's stereo generator, which produces the stereo baseband signal.

(If maximum loudness combined with improved spectral protection of the SCA region of the baseband is desired, the safety clippers in the 8100A/1 can be replaced with the optional FM Filter Card, available as Accessory Kit ACC-22.)

For a more detailed description of XT2 circuitry, see Section 6. For more information about 8100A/1 circuitry, see the 8100A/1 Operating Manual.

6. INTERFACE WITH OPTIMOD-FM

The XT2 interfaces with the Model 8100A/1 OPTIMOD-FM through a cable which connects to the 8100A/1's Accessory Port #2. The XT2 receives its power from the host 8100A/1, and should always be mounted immediately beneath the host. To reconfigure the 8100A/1 for operation with the XT2, it is only necessary to move plug-in jumpers on certain circuit boards (see Section 2). Reconverting an 8100A/1 to operate without the XT2 is as simple as repositioning those jumpers (see Section 4).

The earlier Model 8100A can be easily converted to accept the XT2 by installation of Retrofit Kit RET-27, available from dealers or from the factory. This kit includes a prewired 25-pin connector, a replacement Card #5, and other parts. RET-27 installation instructions are included in Section 2. Instructions for reconverting an 8100A for use without the XT2 are given in Section 4 (some soldering is required).

The 8100A/ST Studio Accessory Chassis (used to implement the "split" studio/transmitter configuration) is fully compatible with the XT2.

Section 2 Installation

CAUTION

The installation and servicing instructions in this manual are for use by qualified personnel only. To avoid electric shock, do not perform any servicing other than that contained in the Operating Instructions unless you are qualified to do so. Refer all servicing to qualified service personnel.

1. WHAT TO DO

READ THIS FIRST!

If you are installing an **8100A/ST Studio Chassis**, read XT2 WITH THE STUDIO CHASSIS ACCESSORY at the end of this section *before* installing either unit.

The XT2 itself merely needs to be mounted in a rack and connected to the host OPTIMOD-FM Audio Processor. However, certain jumpers on the host OPTIMOD-FM's circuit boards must be repositioned to configure the unit for operation with the XT2. In addition, older OPTIMOD-FM Audio Processors may require simple reworking of some of their circuit boards and/or installation of an accessory port.

If your OPTIMOD-FM is Model 8100A/1 with a serial number of 699000 or above, you need only follow the INSTALLATION INSTRUCTIONS.

(The model and serial number of your OPTIMOD-FM are shown on a rear-panel label.)

If your OPTIMOD-FM is Model 8100A/1 with a serial number below 699000, you must first perform steps 1 and 2 of the RETROFIT INSTRUCTIONS.

If your OPTIMOD-FM is Model 8100A (serial number below 638000), you must follow all of the RETROFIT INSTRUCTIONS before installing the XT2.

2. INSTALLATION INSTRUCTIONS

Read "WHAT TO DO" on the preceding page before continuing.

Allow about an hour for installation.

(Installation must be done with the OPTIMOD-FM off-the-air.)

The XT2 should not be installed until the OPTIMOD-FM Audio Processor has been installed and thoroughly tested on the air.

1) Unpack and inspect.

If you ever re-ship the XT2 (e.g., for servicing), it is best to ship it in the original packing materials since these have been carefully designed to protect the unit. Make a mental note of the method of packing and save all packing materials.

Packed with the 8100A/XT2 are:

- 1) Two 1.8-ohm resistors (for step 2 of RETROFIT INSTRUCTIONS)
- 2) Four 10-32 x 3/4" screws (for rack mounting)
- 3) Two keys for front-panel door
- 4) Final Factory Qualification Test Results for this unit
- 5) This Operating Manual

Perform a general inspection of the contents of the package to check for obvious damage. DAMAGE CLAIMS must be made by *you* against the carrier *immediately upon discovery*. Save packing and other evidence of damage for the carrier's inspector.

IMPORTANT: Before continuing, you *must follow the RETROFIT INSTRUCTIONS* in this section if the serial number of your OPTIMOD-FM is below 699000 (see WHAT TO DO on the preceding page). When the retrofit is complete, return to this step.

2) Reposition jumpers on OPTIMOD-FM Cards #5, #6, #8, and #9.

a) Open the OPTIMOD-FM's front panel, remove subpanel.

Jumpers may be reset from the front of the chassis while the unit is in the rack, once the front panel has been opened and the subpanel removed.

Remove the three hex-socket screws at the top of the front panel with a 5/64" hex wrench (provided with unit). Tilt the hinged front panel downward to reveal the interior. Set the AC POWER switch to OFF. Loosen the four DZUS fasteners on the subpanel by turning each one-quarter turn counterclockwise with a long 3/16" or 1/4" flat-blade screwdriver. Taking care not to stress the flat cables beneath it, tilt the top of the subpanel outward and to the left to clear the upper chassis lip and the door support rail at the right.

CAUTION -

To avoid trauma to circuit card components, be sure the AC POWER switch (located behind OPTIMOD-FM's front panel) is set to OFF before removing or inserting any of the printed circuit cards.

b) Remove Card #5. Move each of jumpers A, B, and C to the "6–BAND LIMITER ACCESSORY CHASSIS" position (see Fig. 2-1). Reinstall Card #5.

Fig. 2-1: Jumper Positions, OPTIMOD-FM Card #5

(For Card #5, part numbers 30741-000-03 and above only — if your card looks different, see Appendix J of your OPTIMOD- FM Operating Manual for jumper locations.)

c) Remove Card #6. Move the two links at jumper C to jumper B (see Fig. 2-2). DO NOT MOVE jumper A. Reinstall Card #6.

Fig. 2-2: Jumper Positions, OPTIMOD-FM Card #6

(For Card #6, part numbers 30461-000-03 and above only — if your card looks different, see Appendix J of your OPTIMOD-FM Operating Manual for jumper locations.)

d) Remove Cards #8 and #9. On each of Cards #8 and #9, move the link at jumper B to the "ACCESSORY CHASSIS" position (see Fig. 2-3). DO NOT MOVE jumper A on either card. Reinstall the cards.

Fig. 2-3: Jumper Positions, OPTIMOD-FM Cards #8 and #9

(For Cards #8/#9, part numbers 30481-000-04 or above only — if your cards look different, see Appendix J of your OPTIMOD-FM Operating Manual for jumper locations.)

e) Reinstall the OPTIMOD-FM's subpanel and close the front panel.

Taking care not to stress the flat cables beneath it, tilt the top of the subpanel inward and to the left to clear the upper chassis lip and the door support rail at the right. The DZUS fasteners turn only 1/4-turn. Don't force them, lest they be damaged in a way that is very time consuming to repair. The subpanel should always be replaced since it is an integral part of the chassis RFI protection.

Set the internal AC POWER switch to ON. Raise the front panel and fasten the three screws that secure it in place. If the unit was removed from the rack, remount it. Ground the unit and connect AC power.

- 3) Mount and connect XT2.
 - a) Mount the XT2 in a rack immediately below the OPTIMOD-FM.
 - The XT2's connecting cable will not reach the connector on the OPTIMOD-FM unless the XT2 is mounted directly below the OPTIMOD-FM.
 - b) Plug the flat cable from the XT2 into the OPTIMOD-FM's ACCESSORY PORT #2 and attach the connector with the retaining screws.

Both power and signals for the XT2 are supplied through this cable.

4) Complete the Registration Card and return it to Orban (please).

5) Set 8100A + XT2 System controls.

The OPTIMOD-FM and XT2 work together in a system. The controls on one unit affect the performance of the other. See Section 3 for recommended control settings and for information on customizing your audio processing.

If you are using an 8100A/ST Studio Chassis, set *its* controls to the settings recommended for the 8100A in Section 3.

3. RETROFIT INSTRUCTIONS

IMPORTANT: Skip these instructions if the serial number of your OPTIMOD-FM is 699000 or above.

If your OPTIMOD-FM is Model 8100A/1 with a serial number below 699000 but not below 638000, follow steps 1 and 2 only.

If your OPTIMOD-FM is Model 8100A (serial number below 638000), follow steps 1 through 6.

Materials: Retrofit Kit RET-27 (available from the factory) contains the parts needed in steps 3 through 6. The resistors specified in step 2 are supplied with the XT2.

These retrofit modifications are simple and require only common circuit board repair skills, appropriate tools, and a careful, systematic approach. However, to save time and avert errors, we suggest that you read through each step in these instructions with board in hand before beginning work.

The drawings in Appendix J of your OPTIMOD-FM Operating Manual show component locations. (If you have the older 8100A unit, see Section 6 of the this manual for Card #5 drawings.) Advice for reworking printed-circuit cards is given in Appendix F of the OPTIMOD-FM manual.

1) Open the OPTIMOD-FM's front panel, remove subpanel.

Remove the three hex-socket screws at the top of the front panel with a 5/64" hex wrench (provided with unit). Tilt the hinged front panel downward to reveal the interior. Set the AC POWER switch to OFF. Loosen the four DZUS fasteners on the subpanel by turning each one-quarter turn counterclockwise with a long 3/16" or 1/4" flat-blade screwdriver. Taking care not to stress the flat cables beneath it, tilt the top of the subpanel outward and to the left to clear the upper chassis lip and the door support rail at the right.

2) Check, add resistors on OPTIMOD-FM Card #PS.

Allow about 45 minutes for this step.

a) Check the values of resistors R103 and R104 on the OPTIMOD-FM Card #PS, the power supply regulator card. If the values of R103 and R104 are already 0.62 ohms (blue-red-gold-gold), or if "piggyback" resistors of 1.8 ohms (brown-gray-gold) have been added in parallel to existing 0.91-ohm resistors, skip to step d.

Card #PS is mounted on the inside of the rear panel. These large resistors can be seen by opening the front panel, removing the subpanel, then looking in the rear interior of the unit to the left of Card #3. A flashlight will be necessary.

b) Remove the OPTIMOD-FM from the rack, place it on a bench, and carefully open the rear panel.

Set the unit on a pad with the rear panel facing you and about 6" (15cm) back from the edge of the bench. Make certain the power cord is unplugged. Remove the screws which attach the top and bottom covers to the rear panel (eight screws on each cover). There is no need to remove the other cover screws. Remove the nine screws circled in black on the rear panel. Very carefully and slowly pull the rear panel out about 3/4" (2cm), then tilt the top edge down until the rear panel is horizontal.

CAUTION -

Watch for snags in the internal wiring and for any stress on the ceramic capacitors on the divider wall or input filter box. These capacitors are very fragile and difficult to replace.

c) Connect a 1.8-ohm resistor in parallel with R103. Connect another 1.8-ohm resistor in parallel with R104.

Two 1.8-ohm (brown-gray-gold-silver or brown-gray-gold-gold), 1-watt wirewound resistors are supplied with the XT2. Bend each lead at right angles (about 1/8" from the resistor bodies), then "piggyback" the new resistors onto the old on the component side of the board. To avoid heat damage, solder the leads together as far away from the resistor bodies as practical. We suggest you mark these changes on the power supply schematic. The net value of each resistor pair is now approximately 0.62 ohms.

d) If your OPTIMOD-FM is a Model 8100A (with a serial number below 638000), skip to step 3.

If you have a Model 8100A/1 (serial number 638000 or above), close the rear panel (but not the front panel) if open, remount the unit in the rack, skip the rest of the RETROFIT INSTRUCTIONS, and follow the INSTALLATION INSTRUCTIONS on page 2-3.

When replacing the rear panel, make sure that no wires are pinched under the flanges.

3) Install accessory port in OPTIMOD-FM (Only in Model 8100A, S/N below 638000).

Allow about one hour for this step.

a) If a connector is installed in Accessory Port #1, remove the metal plate covering Accessory Port #2 and discard the plate and its fasteners.

If no connector is installed, remove the metal plate covering both Accessory Ports. Save the fasteners, and discard the plate. Install the metal plate from the Retrofit Kit over Accessory Port #1, using the fasteners from the discarded plate.

b) Install the connector in the rear-panel hole marked "ACCESSORY PORT 2" with the hardware provided (see Fig. 2-4). Note the orientation of the connector. Dress the wires as shown, adjusting the cable ties as needed. Connect each wire to the mother board as indicated in the table in Fig. 2-4.

With only moderate force, use a #6 (3/16") hex nutdriver (a 5mm nutdriver will also work) to tighten the small screws.

The wire lengths have been chosen to provide enough slack to enable other service operations on the rear panel to be performed. It would be unwise to shorten the wires. The routing shown should be followed to avoid possible crosstalk.

It is safe to tack-solder to the motherboard with the circuit cards in place except in very high RF fields, in which case all cards should be removed. In any case, we recommend using a soldering iron with a grounded tip to minimize possibility of circuit damage. Avoid using excessive amounts of heat or flux at the motherboard, since the connectors could be damaged by tempering of the contacts through excessive heat or by creeping flux.

Because some of the motherboard traces are close together, inspect your work very carefully to be sure that you have not created solder bridges between traces or pads.

c) Re-attach the rear panel by reversing the disassembly procedure.

When replacing the rear panel, make sure that no wires are pinched under the flanges.

4) Check, replace OPTIMOD-FM Card #5.

Allow about 5 minutes for this step.

In this and the following two steps, you will be instructed to set cards aside rather than reinstalling them. This is to save you from removing them again to set jumpers as directed in the INSTALLATION INSTRUCTIONS.

CAUTION

Be sure OPTIMOD-FM's internal AC POWER switch is set to OFF before removing or inserting any of the printed circuit cards. Fig. 2-4: Accessory Port #2 Installation

1

Installation

5-2

a) Remove Card #5 and check the part number etched on the solder side.

If the part number is 30741-000-03, the card you have is the correct one for use with the XT2. Set the card aside (do not reinstall it yet) and skip to step 5. You may return the Card #5 included with the Retrofit Kit to the factory for credit.

To do this, contact Orban Customer Service at one of the numbers at the front of this manual to get a Return Authorization number. We will need to know the serial number of your OPTIMOD-FM and the six-digit serial number stamped on the card itself. Only the Card #5 included with the Retrofit Kit (not the one that was already in your unit) will be accepted for credit. The duplicate Card #5 must be returned to us within 60 days of the date of its shipment to you.

Upon receipt of your duplicate Card #5, we will mail a refund to the organization represented as the owner on the Registration Card. If the Registration card is not on file, other proof of ownership will be required.

If the part number is 30451-000-nn (where -nn is any number) or 30741-000-02 or -01, use the Card #5 provided in the Retrofit Kit (which will have an etched number of 30741-000-03 or higher) instead of the old card. Do not install the new card yet — set it aside, taking care not to confuse it with the old card.

The old card is not returnable, but can serve as an emergency spare (although you may hear more processing artifacts with it).

5) Check, rework the OPTIMOD-FM Card #6.

Allow about one hour for this step.

The rework in this step enables the XT2 to defeat the OPTIMOD-FM's high-frequency limiters and soft clippers, and it redirects the output of Card #6 to the accessory port installed in step 3.

a) Remove Card #6 check the part number etched on the solder side.

If the part number is 30461-000-05 or above, the card you have is the correct one for use with the XT2. Set it aside and skip to step 6.

If the part number is 30461-000-04 or below, continue to step b.

- b) Remove all the solder from both sides of the foil pad connected to the center terminal of toggle switch S602 with a vacuum desoldering tool. Use fairly strong diagonal cutters to *gently* clip the center leg of S602, leaving a stub on the switch long enough to later solder two wires to (1/8" will do). Remove and discard the portion of the leg formerly soldered to the card. Gentle wiggling with chain-nose pliers may help release it.
- c) Solder the banded (cathode) end of a glass 1N4148 diode to the pad where the center leg of S602 was attached.
- d) On the solder side of the card, cut the trace between pin F and CR603. Remove about 1/8" of the trace to avoid a possible short. Using the long wire from the kit, connect the non-banded (anode) end of CR603 to the center terminal of S602. Also connect the free end of the 1N4148 diode installed in step c to this terminal. Carefully solder both diodes to the terminal. Avoid excess heating and excess solder or flux (which could creep into the switch).

If the part number is 30461-000-04, move the jumpers according to Figure 2-2 and skip to step 6.

If the part number is 30461-000-03 or below, continue to step e.

e) Locate and mark pins J and S on the edge connector. On the *component side* of the card, cut both of these traces as close as convenient to the pads near the card edge with a sharp razor knife. Remove about 1/8" of each trace to avoid possible shorts.

Note that not all letters are used, and that pin J is therefore the 8th pin from the top and that pin S is the 15th from the top.

f) Working on the solder side of the card, solder the two short jumpers supplied in the Retrofit Kit to the pads indicated in Fig. 2-5.

Because these pads are so small, there is a risk of shorts. After soldering, it would be wise to remove all flux with a cotton swab moistened with flux remover (Energine[®] Fireproof Spot Remover works well) and to examine the area for solder slivers.

g) Reset the two jumper links (located on the component side of the board, opposite the switch) so that they each contact only one pin.

This "storage" position retains the links so that they can be used to restore the card to its normal configuration should this be necessary in the future.

h) Carefully recheck all work done in step 5, then set the card aside.

Fig. 2-5: Card #6 Rework

6) Check, rework OPTIMOD-FM Cards #8 and #9.

Allow about 30 minutes for this step.

The rework in this step disconnects the input of each distortion-cancelling low-pass filter from other circuitry. These inputs will now be driven from the XT2.

2-11

a) Remove Cards #8 and #9 and check the part number etched on their solder sides (both cards should have the same part number).

If the part number is 30481-000-04 or above, the cards you have are the correct ones for use with the XT2. Set the cards aside and skip to step d.

If the part number is 30481-000-03 or below, continue to step b. Rework both cards.

b) Using a vacuum desoldering tool, desolder and lift those leads of R804 and R805 which are closest to the card's upper edge. Do not desolder the opposite ends. After the leads have been freed by bending the resistors upward, clear the holes of solder for possible future use.

The two resistors should be positioned so that the free leads cannot accidentally come in contact with other circuits or with each other. A small piece of tape over the holes may be helpful.

- c) Carefully recheck all work done in step 6, then set the cards aside.
- d) Follow the INSTALLATION INSTRUCTIONS on page 2-3.

4. XT2 WITH THE STUDIO CHASSIS ACCESSORY

If you are using the 8100A/ST Studio Chassis, we recommend that the Studio Chassis and the OPTIMOD-FM levels be matched to each other before the OPTIMOD-FM is configured for use with the XT2. See the 8100A/ST Operating Manual for complete instructions.

Leave the covers off the Studio Chassis following level-matching to facilitate your replacing Card #5. If you have an "old" Card #5 (part number 30741-000-01 or -02 or any part number beginning 30451), use it during the alignment between the Studio Chassis and the 8100A/1. If you only have a "new" Card #5 (part number 30741-000-03), set its jumpers as shown in Fig. 2-6 and use it during the alignment.

Please note that accurate level alignment between the OPTIMOD-FM and the Studio Chassis is much less critical when the XT2 is in use, because a stage of gain reduction has been placed between the input of the OPTIMOD-FM and its clippers to protect the clippers from being overdriven in the event of gain errors. But if the above suggestions are followed, the STL will be correctly aligned for the OPTIMOD-FM with Studio Chassis even if the XT2 is removed from the system.

Installation 2-13

Note also that when Card #5 is strapped for XT2 operation, it no longer produces a "standard level" of +3.6dBm at the Studio Chassis output, nor does it cause the OPTIMOD-FM's VU meter to read "OVU" in the L or R COMPR OUT positions. Instead, its output is reduced approximately 5dB, causing the "standard level" test to produce -1.4dBm and the VU meter to read "-5VU". This is because Card #5's limiting threshold is reduced to compensate for the increased attack time (which increases overshoots on program material) and so maintain approximately the same program peak levels and STL peak modulation.

Fig. 2-6: Jumper Positions for Studio Chassis Alignment, Card #5 (Part number 30741-000-03 or above.)

Section 3 Operating Instructions

In this section:

Fig. 3-1: XT2 Controls and Meters Fig. 3-2: 8100A/1 Controls	page	3-2 3-3	
1. Recommended Settings for the Best Sound		3-4	
Fig. 3-3: Recommended Control Settings		3-5	
2. Customizing the Settings		3-6	
 Some audio processing concepts. Compression, density, and loudness. Clipping, loudness, and distortion. High-frequency equalization: presence, brilliance, and loudness. Bass equalization. More on distortion. 		3-6 3-6 3-7 3-7 3-8 3-8	
-			

All XT2 controls are located behind the access door on the front panel of the XT2. This access door may be locked with the supplied key. There are no user adjustments on the circuit cards.

XT2 Controls and Meters

H-F EQualization controls boost high-frequency response by up to 6dB:

BRILLIANCE control increases the gain (prior to limiting) of the 6.2kHz-to-15kHz band. Produces an audibly attractive effect with increased "air" and "transparency" (similar to that of a "psychoacoustic exciter").

PRESENCE control increases the gain (prior to limiting) of the 3.7kHz band. The 3.7kHz band limiter will resist such gain increase to prevent introducing excess stridency into material with excessive presence energy.

BASS EQualization controls adjust the amount of bass boost. Separate controls for left and right channels (all other controls affect both channels) provide a peaking boost to achieve solid, punchy bass from most consumer radios without exciting the midbass dashboard resonances in cars. Range is 0dB to +10dB; center frequency is 65Hz; "Q" is 1.4 (approximately 1 octave).

CLIPPING control adjusts signal level going into the multiband clippers and therefore determines the amount of peak limiting done by clipping. Range is -4dB to +2dB. This control governs the trade-off between loudness and distortion.

COMPressor switch disables the limiters and clippers when set to PRoof (used for testing).

DENSITY control adjusts signal level going into the six-band limiter, and therefore controls density of output audio by determining the amount of gain reduction in the six-band limiter. The resulting sound texture can be open and transparent, solid and dense, or somewhere in between. Range is 20dB.

6-BAND LIMITER G/R meters show the amount of gain reduction for each of the six limiter bands. Note that the gain reduction in the 6.2kHz band is controlled by, and is always identical to, the gain reduction in the 3.7kHz band.

Fig. 3-1: XT2 Controls and Meters

8100A/1 Controls

INPUT ATTENUATORS (L and R) adjust the signal level going into the 8100A/1 + XT2 System and therefore determine the range of gain riding provided by the AGC/compressor.

CLIPPING control effect is identical to the XT2's DENSITY control. Leave the CLIPPING control on the 8100A/1 set to "0", and use the DENSITY control on the XT2 instead.

H-F LIMITING control has no effect when the unit is used in an 8100A/1 + XT2 System. Leave this control set to "5".

RELEASE TIME control adjusts how fast the gain of the "master" compressor increases when the program material gets soft. Settings toward SLOW cause the compressor to act as a slow "hand on the pot". Settings toward FAST will result in increased program density. Changing the RELEASE TIME control setting has less effect upon audio texture when the 8100A/1 is operated with the XT2 than when it is operated without the XT2.

BASS COUPLING control determines the range of dynamic low-frequency (below 200Hz) shelving equalization. Settings toward INDEPENDENT provide substantially more dynamic equalization than do settings toward WIDEBAND.

GATE THRESHOLD control determines the input level that the system considers "noise". Audio below this level causes the dual-band AGC/compressor to gate, effectively freezing gain to prevent noise breathing.

Fig. 3-2: 8100A/1 Controls Used in Adjusting the 8100A/1 + XT2 System

1. RECOMMENDED SETTINGS FOR THE BEST SOUND

The 8100A/1 + XT2 System is very flexible, enabling you to fine-tune your air sound for your target audience and desired market position.

Figure 3-3 details four sets of recommended settings. Each set produces a different sound texture, and each incorporates a different set of trade-offs between openness, loudness, brightness, and distortion.

Start with one of these sets of recommended settings. Spend some time listening critically to your on-air sound. Listen to a wide range of program material typical of your format, and listen on several types of radios (not just on your studio monitors). Then, if you wish, customize your sound using the information in "Customizing the Settings", which follows.

The four sounds produced by the recommended settings are:

OPEN An "unprocessed" sound with a nice sense of dynamic range. With these settings, the XT2 provides gentle "automatic equalization" to keep the frequency balance consistent from record to record (especially those recorded in different eras). And for "background music" formats, these settings ensure that your sound doesn't lose its highs and lows.

Formats: Beautiful Music, Light Pop.

TALK Processing for this sound keeps the levels of announcers and guests consistent, pulls low-grade phone calls out of the mud, and keeps a proper balance between voice and commercials. Voice is the most difficult audio to process, but these settings result in a most favorable trade-off between consistency, presence, and distortion.

Format: Talk.

SMOOTH The sound texture for the station that values a clean, easy-to-listen-to sound with a tasteful amount of punch, presence, and brightness added when appropriate. This is an "unprocessed" sound that sounds just right on music and voice when listened to on small table radios, car radios, portables, or home hi-fi systems.

Formats: Album-Oriented Rock, Adult Contemporary, Modern Country, Oldies, Talk.

COMPETITIVE This is the major market "competitive" sound, emphasizing loudness as well as clean audio. The sound from cut to cut and announcer to announcer is remarkably consistent as the "texture" of music is noticeably altered to a standard. Bass has an ever-present punch, there's always a sense of presence, and highs are in perfect balance to the mids, no matter what was on the original recording.

With these settings, your sound is getting farther away from the balance and texture of the original recording. We think that this is as far as processing can go without causing noticeable listener fatigue.

Formats: Adult Contemporary, Contemporary Hit Radio, Oldies, Modern Country, Urban.

Fig. 3-3: Recommended Control Settings

_
2. CUSTOMIZING THE SETTINGS

The controls in the 8100A/1 + XT2 System give you the flexibility to customize your station sound. But as with any audio processing system, proper adjustment of these controls requires proper balancing of the trade-offs between loudness, density, brightness, and audible distortion. The following provides the information you need to adjust the 8100A/1 + XT2 System controls to suit your format, taste, and competitive situation.

1) Some audio processing concepts.

Loudness is increased by reducing the peak-to-average ratio of the audio. If peaks are reduced, the average level can be increased within the modulation limits permitted. The effectiveness with which this can be accomplished without introducing objectionable side effects (like clipping distortion) is the single best measure of audio processing effectiveness. Compression reduces dynamic range in a manner similar to "riding the gain"; limiting and clipping reduce the short-term peak-to-average ratio of the audio.

Compression reduces the difference in level between the soft and loud sounds to make more efficient use of permitted peak level limits, resulting in a subjective increase in the loudness of soft sounds. It *cannot* make loud sounds seem louder.

Six-band limiting increases audio density. Increasing density can make loud sounds seem louder, but can also result in an unattractive "busier", "flatter", or "denser" sound. It is very important to be aware of the many negative subjective side effects of excessive density when setting controls which affect the density of the processed sound.

Clipping sharp peaks does not produce any audible side effects when done moderately. Excessive clipping, however, will be perceived as audible distortion.

The 8100A/1 + XT2 System is designed to allow you to make maximum use of compression, limiting, and clipping, while minimizing the associated processing artifacts. It is important, however, to remember that *there is a fundamental trade-off between loudness, brightness, density, and distortion.*

2) Compression, density, and loudness.

The compression which takes place in OPTIMOD-FM makes audio levels more consistent without significantly altering texture. The XT2's six-band limiting audibly changes the density of the sound and dynamically re-equalizes it as necessary (booming bass is tightened; weak, thin bass is brought up; highs are always present and consistent in level).

The various combinations of *compression* and *density* offer great flexibility:

Light compression + light limiting yields a wide sense of dynamics, with a small amount of automatic re-equalization.

Moderate compression + light limiting produces an open, natural quality with automatic re-equalization and increased consistency of frequency balance.

Light compression + moderate limiting gives a more "dense" sound.

Moderate compression + moderate limiting results in a "wall of sound" effect which may cause listener fatigue.

Adjust OPTIMOD-FM to produce the desired amount of compression, and then fine-tune the limiting and clipping with the XT2's controls.

The RELEASE TIME control on OPTIMOD-FM affects the amount of compression (reduction in dynamic range) by the dual-band compressor in OPTIMOD-FM. Lower (faster) settings result in a more consistently loud output, while higher (slower) settings allow a wider variation in dynamic range. To avoid objectionable pumping, do not set this control below "4".

The DENSITY control on the XT2 affects the relative amount of six-band limiting. Adjust it to your taste and format requirements. Used lightly, the limiter produces an open, re-equalized sound.

The DENSITY setting is *critical to sound quality* — listen carefully as you adjust the controls. There is a point beyond which increasing density will no longer yield more loudness, and will simply degrade the punch and definition of the sound.

We recommend no more than 5dB gain reduction as shown on the meters for the 700Hz and 1.6kHz bands. More than 5dB will often create a "wall of sound" effect that many find fatiguing.

3) Clipping, loudness, and distortion.

The CLIPPING control on the XT2 determines the primary loudness/distortion trade-off. The CLIPPING control adjusts the threshold of limiting for all limiters simultaneously. This means that as the CLIPPING control is turned down, the average level of the audio going into the clippers is decreased as a result of the amount of six-band limiting's being *increased*.

For a given setting of the CLIPPING control, perceived clipping distortion will increase as the DENSITY control is advanced, and the CLIPPING control may have to be turned down to compensate.

When using moderate amounts of limiting, we recommend that the CLIPPING control on the XT2 be set to "0". Conversely, if you are operating with light amounts of limiting (2–3dB in midrange), it is often possible to turn up the CLIPPING control without suffering from excessive distortion.

If the OPTIMOD-FM's VU meter (set to L or R FILTER OUT) consistently indicates peaks higher than about -2VU (-1VU if the optional ACC-22 FM Filter Card has been installed), some audible distortion is likely, and we recommend operating in this manner only if your competitive situation absolutely demands it.

4) High-frequency equalization: presence, brilliance, and loudness.

Controls are provided on the XT2 to increase the presence and brilliance of program material. It is important to understand how these controls interact with other 8100A/1 + XT2 System controls.

The PRESENCE control boosts the 2-6kHz region. Turning up the PRESENCE control can increase loudness substantially.

The audible effect of the PRESENCE control is closely associated with the amount of gain reduction in the 3.7kHz band. With low levels of gain reduction, the effect is an actual boost in the level of energy in the presence region. As gain reduction in the 3.7kHz band is

increased (by turning the DENSITY control up or the CLIPPING control down), the PRESENCE control will have progressively less audible effect. The limiter for the 3.7kHz band will tend to reduce the effect of the PRESENCE boost (in an attempt to keep the gain constant) to prevent excessive stridency in program material which already has a great deal of presence energy. So with large amounts of gain reduction, the density of presence region energy will be increased more than will the level of energy in that region.

Nevertheless, if less than 5dB gain reduction is used in the 3.7kHz and 6.2kHz bands, the PRESENCE control will have a significant audible effect almost all of the time. Use the PRESENCE control with caution. Excessive presence boost tends to be audibly strident and fatiguing. And the sound quality, although loud, can be very irritating. A maximum of 3–4dB boost is suggested, although 6dB can be achieved.

The BRILLIANCE control boosts the region centered at 10kHz. In general, a brilliance boost is audibly attractive — similar to the effect produced by a "psychoacoustic exciter".

Unlike the PRESENCE control, the BRILLIANCE control will have an audible effect at all times. Interestingly (because the 3.7kHz band limiter controls the gain reduction in the 6.2kHz band also), turning up the PRESENCE control may *decrease* energy in the 6.2kHz band, since you will be increasing the gain reduction in *both* the 3.7kHz and 6.2kHz bands. You may wish to compensate for this effect by turning up the BRILLIANCE control.

Excessive brilliance boost can also increase the noticeability of tape hiss and distortion in program material that is less than perfectly clean. We suggest no more than 4dB boost as a practical maximum, unless source material is primarily from compact disc.

5) Bass equalization.

The 8100A/1 + XT2 System's three bass equalization controls give you separate control of "warmth" and "punch". Because the XT2 often increases the brightness of program material, some bass boost is usually desirable to keep the sound spectrally well-balanced.

Adjustment of bass equalization must be determined by individual taste and by the requirements of your format. Be sure to listen on a wide variety of radios — it's possible to create a very muddy sound in certain cars by over-equalizing the bass. Be careful!

The OPTIMOD-FM's BASS COUPLING control influences the amount of "warmth" added to bass-shy material by using the dual-compressor as a dynamic low-frequency (below 200Hz) shelving equalizer. Setting the BASS COUPLING control toward INDEPENDENT will increase the average amount of bass boost, while setting it toward WIDEBAND will result in less bass boost.

The XT2's BASS EQ controls provide a peaking boost (at 65Hz) to achieve a solid, punchy bass from most decent consumer radios. We recommend a +2 to +3dB boost for most formats.

6) More on distortion.

As indicated above, a major potential cause of distortion is excess clipping. Another cause is poor-quality source material, including the effects of the station's playback machines, electronics, and STL. If the source material is even slightly distorted, that distortion can be greatly exaggerated by the XT2 — particularly if a large amount of gain reduction is used. If objectionable distortion is heard when the OPTIMOD-FM's VU meter (set to L or

Operating Instructions 3-9

R FILTER OUT) is indicating -2VU or less (-1VU or less if the optional ACC-22 FM Filter Card has been installed), source quality is the most likely cause. See Appendix K of the OPTIMOD-FM Operating Manual for a discussion of how to improve source quality.

Section 4 Maintenance and Calibration

In this section:

1. In-System Performance Verification	page	4-2
2. Field Audit of Performance		4-2
Fig. 4-1: Pink Noise Generator		4-3
Table 4-1: OPERATE Mode THD and Output Level		4-6
Table 4-2: Expected XT2 G/R with Pink Noise		4-7
Fig. 4-2: Distortion Cancellation — Band 5		4-8
Fig. 4-3: Distortion Cancellation — Band 6		4-9
3. Field Alignment Procedure		4-9
Table 4-3: VCA DISTORTION, THUMP Test Points and Trimmers		4-11
Table 4-4: VCA GAIN and BALANCE Trimmers		4-14
4. Removing the XT2 from Operation		4-14

No routine maintenance of this product is required.

See Section 6 for locations of test points.

To access circuit cards, remove all screws holding the appropriate cover in place, then lift that cover off. Remove the *top cover* for access to Card #A1 (Crossovers and Bass Equalizer) or Card #A2 (Limiter Control Circuitry). Remove the *bottom cover* for access to Card #A3 (VCAs). When replacing the covers, be sure to replace all screws and secure them tightly to maintain RFI suppression.

If you look at the top of the chassis with the meters are on the lower left-hand side, Card #A1 is to the right and Card #A2 is to the left. Card #A3 is located on the bottom side of the horizontal metal plate which divides the two sections of the chassis. All three cards are mounted on standoffs with #6-32 screws. If you wish to access the bottom of the card for troubleshooting, remove the screws and tilt the cards backwards, being careful not to accidentally short-circuit the metallic traces on the cards to the chassis. To completely remove a card from the chassis, you must also unplug all ribbon cables connected to that card (note the orientation of the plugs for later reconnection).

CAUTION

The installation and servicing instructions in this manual are for use by qualified personnel only. To avoid electric shock, do not perform any servicing other than that contained in the Operating Instructions unless you are qualified to do so. Refer all servicing to qualified service personnel.

1. IN-SYSTEM PERFORMANCE VERIFICATION

The FCC (USA) has eliminated requirements for periodic Proof-of-Performance measurements. However, those performance standards still specified in the FCC Rules must still be met. Many stations will still wish to make periodic equipment performance measurements. The text below provides the general information which is needed to perform measurements verifying the performance of a transmission system including the XT2. Instructions for bench-top verification of XT2 performance outside of the transmission system are given in Section 4.2, "Field Audit of Performance".

Doing an in-system performance verification with the XT2 in use is very similar to doing one with a "stock" 8100A/1. It would be wise, for future reference, to annotate the beginning of Part 6 of your 8100A/1 Operating Manual with the words: "For performance verification with the 8100A/XT2 Six-Band Limiter Accessory or the 8100A/ST Studio Accessory Chassis installed, please see additional information in the manuals provided with those units."

- 1) Set the XT2's COMP switch to PR.
- 2) Note the positions of the XT2's controls.
- 3) Turn all of the XT2's controls, *except* CLIPPING, fully counterclockwise.

This makes the frequency response of the XT2 flat and optimizes system signal-to-noise ratio.

4) Follow the instructions in Part 6 of the 8100A/1 Operating Manual.

If you have followed the instructions in steps 1 through 3 here, the XT2 will act as a flat amplifier in the signal path of the 8100A/1, and performance verification can be performed exactly as specified in Part 6 of the 8100A/1 Operating Manual.

In PROOF mode, all active elements remain in the signal path. While measured performance will not be as good as that of an 8100A/1 alone (because of the extra crossovers and VCAs introduced in the signal path by the XT2), performance will still be excellent: noise will typically be -70dB below 100% modulation, and THD will be less than 0.1%. Sufficient headroom has been provided to modulate above 100% at all frequencies.

5) When you are finished, return the XT2's COMP switch to OP, and return the controls changed in step 3 (above) to their original settings.

2. FIELD AUDIT OF PERFORMANCE

These are instructions for checking the performance of a total 8100A/1 + XT2 System. Because the XT2 circuitry is embedded within the 8100A/1 circuitry, it is not practical to test it independently of the 8100A/1 in the field.

(If the 8100A/ST Studio Accessory Chassis is in use and you are certain that the fault is not within the 8100A/ST, it is possible to test only the 8100A/1 + XT2 combination by applying test signals to the input of the 8100A/1. Bear in mind that no broadband compression will be produced since this function resides in the 8100A/ST.)

This procedure is a starting point for detecting and diagnosing a problem that you have pinpointed to the 8100A/1 + XT2 System. It is also useful in maintenance, and can be used

to check routine equipment performance. By its nature, it is limited in scope to discovering *static* problems. A dynamic problem in the AGC circuitry (caused by the failure of a timing module on Card #A2, for example) would not tend to be discovered in the course of these tests. For this reason, measurements must always be complemented by listening. If you are well-acquainted with the "sound" of OPTIMOD-FM as adjusted to your tastes, then faults that develop will ordinarily be readily detectable by ear.

Perform procedures in order without skipping steps.

Equipment required:

- Audio oscillator

An ultra-low-distortion type like the Sound Technology 1710B is preferred. However, a Heathkit or similar oscillator can be used to obtain approximate results, provided that the residual distortion has been verified to be below 0.1%.

- Noise and distortion test set

Again, a high-performance type like the Sound Technology 1710B is preferred, but not required.

- General-purpose oscilloscope

DC-coupled, dual-trace, with at least 5MHz bandwidth.

- Pink noise generator

A suitable circuit is shown in Fig. 4-1.

It is often more convenient to make measurements on the bench, away from high-RF fields which might otherwise affect results. For example, it is very difficult in a high-RF field to accurately measure the very low THD produced at most frequencies by a properly-operating 8100A/1 + XT2 System. However, in an emergency situation (is there any other kind?!), it is usually possible to do measurements that reveal the grosser faults even under high-RF conditions.

The audio processing can be measured independently of the stereo generator by connecting the measuring instruments to the 8100A/1's rear-panel AUDIO TEST JACKS. The following procedure assumes that all test excitations are applied to the 8100A/1's rear-panel audio INPUT terminals, and that all responses are measured at the 8100A/1's AUDIO TEST JACKS.

TEST PROCEDURE:

1) Set controls as shown below.

BUT FIRST, record the normal settings of the controls so that they can be reset after the measurements have been completed.

8100A/1:	INPUT ATTENUATOR (L and R)	0
	COMPRESSOR	PROOF
	LIMITER	PROOF
	CLIPPING	0
	H-F LIMITING	5
	RELEASE TIME	10
	BASS COUPLING	10
	GATE THRESHOLD	0
XT2:	DENSITY	0
	COMPressor	PR
	CLIPPING	0
	BASS EQ (L and R)	0
	PRESENCE	0
	BRILLIANCE	0

2) Perform a "skeleton proof" on both the left and right channels.

- a) Connect a low-distortion audio oscillator to the 8100A/1's (L or R) INPUT.
- b) Set the oscillator frequency to 15kHz.
- c) Adjust the oscillator output level to produce 3.3V RMS (an internal level corresponding to 100% modulation) at the appropriate (L or R) AUDIO TEST JACK.

This is most easily done by adjusting the oscillator output level until the 8100A/1's VU meter reads "+3" when R or L FILTER OUT is selected (select the channel you are testing).

 d) Connect the input of the N&D test set to the appropriate AUDIO TEST JACK through a de-emphasis network, such as the one shown in Appendix D of the 8100A/1 Operating Manual).

Use the de-emphasis network as shown if your test set has an input impedance of 1 megohm or greater (for 75μ s de-emphasis). If your country's standard is 50μ s, substitute a 4.99K ±1% resistor (if unavailable, use a 5.1K ±5% resistor) resistor for the 7.50K resistor.

If your test set is one of the many with a 100K input impedance, the 7.50K resistor should be changed to an 8.06K, $\pm 1\%$ resistor (for 75 μ s); use a 5.23K, $\pm 1\%$ resistor for 50 μ s.

e) Measure the frequency response by plotting on a standard pre-emphasis graph the increase in oscillator output (over the reference level set in step c) required to produce 3.3V RMS at the appropriate AUDIO TEST JACK (or to make the VU meter read "+3") at 50, 100, 400, 1000, 5000, 10,000, and 15,000Hz.

Measure the THD at 100% modulation at the same time that you measure frequency response.

Doing both tests on each frequency before moving on to the next should be more convenient since the frequency response test requires you to readjust the oscillator output level at each frequency to produce 100% modulation at the 8100A/1's output.

If you are using the the N&D test set's AC voltmeter in the frequency response test, remember that you must connect the de-emphasis network to the N&D meter input for the *THD measurements only*; the de-emphasis network *must not* be used for the frequency response measurements.

The results of these tests will be valid only if the XT2 controls have set as specified in step 1 (above).

Frequency response should be within ± 1.0 dB of the standard pre-emphasis. To obtain more reliable results, it is advisable to measure the frequency response at several points between these frequencies.

The de-emphasized **THD** should not exceed 0.15% at any frequency. In many cases, results will be determined entirely by the quality of oscillator and distortion analyzer available, and/or by the presence of RF fields which might affect the instruments.

Frequency response errors which develop in the field are usually caused by incorrect quiescent VCA gains. The system first breaks the audio into two bands with a crossover at 200Hz (this occurs in the 8100A/1). Following pre-emphasis in the 8100A/1, the signal is divided into six bands in the XT2. Frequency response errors are most likely to be introduced at this point.

The Block Diagram in Section 6 provides a "road map" through the system. By tracing the signal through the entire system from input to output and measuring the frequency response as you proceed, it is possible to discover which stage introduces the error. (A sweep generator greatly speeds the measurement process.) If the error is not due to a misaligned VCA, then crossover filter failure must be suspected. If the error *is* due to a misaligned VCA, be aware that there may be drift in the VCA or its associated exponential converter that must be repaired to achieve stable frequency response.

A more complete frequency response evaluation can be performed by sweeping the system with a test set like the Tektronix 5L4N Spectrum Analyzer/Tracking Generator. If the station has such equipment, see paragraph 6.c of Appendix E in the 8100A/1 Operating Manual.

f) Short both of the 8100A/1's inputs, and measure the noise at the output of the 8100A/1 through the de-emphasis network. Noise should not exceed -53dBm (corresponding to -70dB below 100% modulation).

Note that hum or buzz due to test equipment grounding problems and/or high RF fields may result in falsely high readings. If the output of the N&D set is monitored with a scope, problems like this should be immediately apparent.

3) Measure OPERATE mode performance.

These measurements evaluate certain static characteristics of OPTIMOD-FM in its normal OPERATE mode. Typical measurements given herein are provided for service guidance only, and are not guaranteed.

As with the PROOF mode measurements in step 2, these measurements should be repeated for both left and right channels.

- a) Reconnect the audio oscillator to the 8100A/1 (L or R) INPUT.
- b) Set the 8100A/1's COMPRESSOR and LIMITER switches to OPERATE and the XT2's COMP switch to OP.
- c) Verify that the other operating controls are set as specified in step 1.
- d) Set the oscillator frequency to 1kHz.
- e) Adjust the oscillator output level to produce 10dB gain reduction as read on the 8100A/1's MASTER G/R meter.
- f) Adjust the XT2's DENSITY control to produce 10dB gain reduction as indicated on the XT2s 700Hz G/R meter.
- g) Measure the output level and THD for each frequency indicated in Table 4-1, and compare your results with the typical readings given in the table. Output level should be within $\pm 2dB$ ($\pm 26\%$) of values provided.

THD can vary substantially, but should not exceed 0.5% at any frequency. THD is highly dependent on the setting of the XT2's CLIPPING control, because this control can move the sine-wave level above or below the thresholds of the band clippers.

Frequency (Hz)	THD (%)	Output (V RMS)
50	0.25	0.78
100	0.25	1.05
400	0.08	0.91
1000	0.08	0.93
2500	0.08	1.15
5000	0.08	1.52
7500	0.20	2.05
10000	0.10	2.35
15000	0.15	2.40

Table 4-1: OPERATE Mode THD and Output Level

-7

- h) Connect a pink noise generator to the 8100A/1's (L or R) INPUT.
- i) Adjust the pink noise generator's output level until the 8100A/1's TOTAL MASTER G/R meter reads "-10". DO NOT change any settings on the XT2.
- j) Verify that the readings of the XT2's G/R meters match the expected readings given in Table 4-2.

A reading outside of tolerance can indicate a problem with the control circuitry of a given band-limiter. Because of the non-periodic nature of pink noise, certain failures in the control circuitry dynamic response may also be indicated in these tests. Such failures ordinarily require return of the XT2 to the factory for diagnosis and repair.

Band	Hz	G/R (dB)
1	150	5
2	400	5
3	700	5
4	1600	8
5	3700	10
6	6200	10

Table 4-2: Expected XT2 BAND LIMITER G/R Meter Readings with Pink Noise Excitation (Tolerance = ±3dB)

k) Disconnect the pink noise generator from the 8100A/1.

4) Verify distortion-cancellation performance.

If the system has passed the tests above, the XT2 may be considered to be correctly interfaced to the 8100A/1 in all respects but one: those tests do not indicate whether the output of the XT2's distortion-cancelling sidechain is correctly connected to the input of the 8100A/1's distortion-cancelling filter.

The following tests verify that the distortion-cancellation system is operating correctly. If, after installation of the XT2, you hear consistent "thickening" and distortion of sibilance (i.e., if "esses" sound more like "effs"), these tests should be performed. Otherwise, they may be considered optional because they are somewhat inconvenient, as they require that the covers of the XT2 be removed to access internal test points, and that a sweep generator or frequency response test set like the Tektronix 5L4N be available.

In these tests, correct operation of the distortion-cancelling sidechain is indicated by sharp selectivity in the band 5 and 6 traces. All test points are located on Card #A1.

a) Connect the output of the 5L4N tracking generator (or the sweep generator) to the cathode of CR8 to test the left channel of band 5.

See assembly drawing in Section 6 for location of component.

- b) Connect the input of the 5L4N (or an oscilloscope) to the 8100A/1's left AUDIO TEST JACK.
- c) Verify that the trace resembles that in Fig. 4-2.
- d) Connect the output of the 5L4N tracking generator (or the sweep generator) to the cathode of CR10 to test the left channel of band 6.
- e) Verify that the trace resembles that in Fig. 4-3.
- f) Connect the input of the 5L4N (or an oscilloscope) to the 8100A/1's right AUDIO TEST JACK.
- g) Test the right channels of band 5 (at the cathode of CR18) and band 6 (at the cathode of CR20).
- h) Reassemble the XT2 (see page 4-1).

Fig. 4-2: Distortion Cancellation — Band 5

Fig 4-3: Distortion Cancellation — Band 6

(The photos in Figs. 4-2 & 4-3 were taken from the 5L4N with a 20–20kHz log sweep and 10dB/division vertical sensitivity.)

3. FIELD ALIGNMENT

The following describes how to align and calibrate the XT2 in the field. It is included primarily for purposes of reference. Routine alignment is neither necessary nor desirable, due to the high stability of the circuitry.

Before commencing alignment, remove both the XT2 and 8100A/1 from their normal rackmounted location and place them on the test bench *away from RF fields*. Jumper the chassis and circuit grounds together on the rear-panel barrier strip. Note the normal positions of the set-up controls and of the jumpers on the cards to aid reinstallation.

To minimize probability of RFI, the connecting cable between the XT2 and the 8100A/1 is very short — too short to allow operating the XT2 upside-down on top of the 8100A/1, which is a more convenient arrangement for troubleshooting. But sufficient slack to do this can be obtained by removing four screws (two on the cable clamp inside the XT2 and two below the cable on the outside of the rear panel) and then pulling the cable into the chassis and routing it back out over the rear panel. To facilitate reinstallation, note how the cable is installed before you remove it.

Perform procedures in order without skipping steps.

ALIGNMENT PROCEDURE:

[These adjustments are done on Card #A3. See page 4-1 for card location and access instructions; see schematics and assembly drawings in Section 6 for locations of components.]

In the following procedure, the second-harmonic distortion and control-voltage feedthrough of each VCA is nulled. Then VCA gains are set. The entire 8100A/1 + XT2 System is swept, and the gains of the band VCAs are adjusted to achieve the flattest frequency response from each channel.

Each of the VCAs employed in bands 1 through 5 is designed to have +26dB minimum (i.e., with the DENSITY control set to "0") nominal gain. The left and right channel band 6 VCAs have +31dB minimum nominal gain to permit the them to take up to 30dB of gain reduction. Further loss is incorporated into certain VCAs by adding resistors in series with the VCAs' inputs.

1) Null VCA distortion.

a) Set controls as shown on the following page.

BUT FIRST, record the normal settings of the controls so that they can be reset after the measurements have been completed.

8100A/1:	INPUT ATTENUATOR (L and R) COMPRESSOR LIMITER CLIPPING H-F LIMITING	0 PROOF PROOF 0 5
	RELEASE TIME BASS COUPLING GATE THRESHOLD	10 10 0
XT2:	DENSITY COMPressor CLIPPING BASS EQ (L and R) PRESENCE BRILLIANCE	0 PRoof 0 0 0 0

b) Connect the output of the oscillator in series with a 10.0K $\pm 1\%$ resistor to a short jumper lead with a miniature alligator clip or E-Z Hook test lead at its other end.

If you cannot find a $\pm 1\%$ resistor, you can use a 10K, $\pm 5\%$ carbon film resistor, although this will slightly (but not fatally) compromise the accuracy of the gain trim adjustments in step 3.

c) Set the oscillator output to 1kHz at +5dBu.

0dBu = 0.775V RMS. The dBm/600-ohm scale commonly found on test instruments can be read as dBu for this application.

d) Connect the test clip to the "input resistor" for the left channel of band 1.

Table 4-3 identifies the "input resistor" for each band and channel. Connect the test clip to the resistor lead that is physically nearest to the rear of the XT2 chassis. The clip may also be connected to pin 6 of the corresponding opamp.

Band	Hz	Channel	Input Resistor	VCA Opamp	Output Capacitor	DISTORTION NULL Trim	THUMP NULL Trim
1	150	left	R1	IC1	C2	R3-b	R3-a
	2.	right	R19	IC2	C5	R3-d	R3-c
2	400	left	R29	IC3	C7	R31-b	R31-a
		right	R47	IC4	C10	R31-d	R31-c
з	700	left	R57	IC5	C12	R59-b	R59-a
		right	R75	IC6	C15	R59-d	R59-c
4	1.6K	left	R89	IC7	C24	R91-b	R91-a
		right	R107	IC8	C27	R91-d	R91-c
5	3.7K	left	R117	IC9	C30	R119-b	R119-a
		right	R135	IC10	C34	R119-d	R119-c
6	6.2K	left	R145	IC11	C37	R147-b	R147-a
		right	R163	IC12	C41	R147-d	R147-c

Table 4-3: VCA DISTORTION and THUMP Test Points and Trimmers

e) Connect the N&D meter to the output of the band 1 left channel VCA.

The output of the VCA is available at pin 1 of the VCA opamp or (perhaps more conveniently) at the "output capacitor" lead that is nearest the "Orban" name on the left side of the board. See Table 4-3.

- f) Verify that the VCA's output level is approximately +10dBu.
- g) Adjust the DISTORTION NULL trimmer for the left channel of band 1.
- h) Repeat steps d through g for each channel of each band.

When measuring the band 6 VCAs, use a 0dBu oscillator level (instead of +5dBu) to compensate for the 5dB extra gain in these VCAs.

2) Null VCA thump.

NOTE: Before thump can be nulled, distortion must be nulled. The corresponding THUMP NULL trimmer must be nulled if the any DISTORTION NULL trimmer is readjusted.

- a) Verify that the oscillator is set to 1kHz, and that the oscillator, 10K resistor, and test clip are connected together as described in step 1b.
- b) Set the oscillator output level to -20dBu.
- c) Connect the test clip to the R88 lead nearest the rear of XT2 chassis.

This modulates the VCA bias current for bands 1, 2, and 3 at a 1kHz rate.

d) Connect the N&D meter to the output of the band 1 left channel VCA.

The output of the VCA is available at pin 1 of the VCA opamp or (perhaps more conveniently) at the "output capacitor" lead that is nearest the "Orban" name on the left side of the board. See Table 4-3.

e) Adjust the THUMP NULL trimmer for the left channel of band 1 until the 1kHz level observed on the N&D meter is minimized.

Connecting a 75µs de-emphasis network between the VCA output and the N&D meter will facilitate this procedure by reducing noise that would otherwise mask 1kHz the feedthrough being nulled.

- f) Repeat steps d and e for the right channel of band 1 and for each channel of bands 2 and 3.
- g) Disconnect the test clip from R88 and connect to the R175 lead nearest the rear of the XT2 chassis.

This modulates the VCA bias current for bands 4, 5, and 6 at a 1kHz rate.

h) Repeat steps d and e for each channel of bands 4, 5, and 6.

3) Calibrate VCA gain.

- a) Verify that the oscillator is set to 1kHz, and that the oscillator, 10K resistor, and test clip are connected together as described in step 1b.
- b) Set the oscillator output level to +5dBu.

c) Connect the test clip to the "input resistor" for the left channel of band 1.

See Table 4-3. Connect the test clip to the resistor lead that is physically nearest to the rear of the XT2 chassis. The clip may also be connected to pin 6 of the corresponding opamp.

d) Connect the N&D meter to the output of the band 1 left channel VCA.

The output of the VCA is available at pin 1 of the VCA opamp or (perhaps more conveniently) at the "output capacitor" lead that is nearest the "Orban" name on the left side of the board. See Table 4-3.

- e) Adjust GAIN trimmer R17 until the N&D meter indicates a VCA output level of +10.6dBu.
- f) Repeat steps c through e for the right channel of band 1, adjusting BALANCE trimmer R28 to achieve a +10.6dBu output level.

You have now set a *reference gain* for band 1. The settings of R17 and R28 MUST NOT BE CHANGED in the following steps!

- g) Disconnect the test clip.
- h) Connect the output of the sweep generator (or 5L4N tracking generator) to the L INPUT of the 8100A/1.
- i) Set the sweep generator's controls for a logarithmic sweep from 30 to 15,000Hz (or set the 5L4N to its 20–20kHz log sweep mode at 2dB/division).
- j) Set the 8100A/1's VU meter selector to L FILTER OUT.
- k) Adjust the 8100A/1's LEFT INPUT ATTENUATOR control and/or the sweep generator's (or 5L4N tracking generator's) output level until the maximum reading on the 8100A/1's VU meter is approximately "0VU".

This assures that clipping will not occur in any circuitry. The maximum will occur as the swept frequency passes through 15kHz (the highest part of the pre-emphasis curve).

 Connect the vertical input of the scope (or the input of the 5L4N) to the 8100A/1's L AUDIO TEST JACK through a de-emphasis network, such as the one shown in Appendix D of the 8100A/1 Operating Manual.

Use the de-emphasis network as shown if your test set has an input impedance of 1 megohm or greater for 75 μ s de-emphasis. If your country's standard is 50 μ s, substitute a 4.99K ±1% resistor (if unavailable, use a 5.1K ±5% resistor) for the 7.50K resistor.

If your test set is one of the many with a 100K input impedance, the 7.50K resistor should be changed to an 8.06K, $\pm 1\%$ resistor for 75 μ s; use a 5.23K, $\pm 1\%$ resistor for 50 μ s.

- m) Connect the horizontal input of the scope to the sweep ramp of the sweep generator (if used).
- n) Adjust the VCA GAIN trimmers for bands 2 through 6 to achieve a maximally flat response during the 30–15,000Hz sweeps (20–20kHz if you are using 5L4N).

See Table 4-4. A response better than ± 1 dB throughout the range of 30–15,000Hz should be achievable. DO NOT ADJUST band 1 GAIN trimmer R17, as it is the reference gain against which the other bands are measured. (You are observing the swept response of the *entire* left channel of the 8100A/1 + XT2 System.)

- o) Move the output of the sweep generator (or 5L4N tracking generator) to the 8100A/1's R INPUT.
- p) Connect the vertical input of the scope (or the input of the 5L4N) to the 8100A/1's R AUDIO TEST JACK through the de-emphasis network.
- q) Adjust the VCA BALANCE controls for bands 2 through 6 to achieve a maximally flat response, during the 30–15,000Hz sweeps (20–20kHz if you are using 5L4N).

See Table 4-4. A response better than ±1dB should be achievable. DO NOT ADJUST band 1 BALANCE trimmer R28.

Band	GAIN Trimmer	BALANCE Trimmer
1	R17	R28
2	R45	R56
3	R73	R84
4	R105	R116
5	R133	R144
6	R161	R172

Table 4-4: VCA GAIN and BALANCE Trimmers

4) Reinstall the chassis.

Return all set-up controls to their original positions (as recorded in step 1a).

4. REMOVING THE XT2 FROM OPERATION

If the XT2 will be removed from the system for servicing or any other reason, its host 8100A/1 can be easily restored to "stock" condition. These are concise instructions for such restoration.

There are alternate procedures for Cards #6, #8, and #9, depending on whether the card is a converted "8100A-type" card or if it is a newer "8100A/1-type" card. Make notes on which procedure you are following to facilitate reinstallation of the XT2, if desired.

[Refer to the assembly drawing for Card #5 in this manual, and to the assembly drawings for Cards #6, #8, and #9 in the 8100A/1 (or 8100A) Operating Manual for card and component locations.]

1) Remove power from the 8100A/1.

4-15

- 2) Remove Card #5 from the 8100A/1 (follow the circuit card access instructions given in Appendix C of the 8100A/1 Operating Manual).
- 3) Place the links on jumpers A, B, and C in the "NORMAL" positions (see the Card #5 assembly drawing in Section 6 of this manual).
- 4) Examine Card #5 to see if resistors R552 and R533 are installed. If so, the card should be restored to "stock" condition for use without the XT2.

The presence of these two resistors indicates the "Gated Mode Noise Reduction Modification" described in Section 5.3 has been performed. Follow the procedure given there in reverse order to restore the card.

- 5) Remove Card #6 from the 8100A/1.
- 6) If there is a diode soldered between the center terminal of the LIMITER switch (S602) and the PC board foil, you will see two jumper links stored on only *one* pin each. Place each jumper link on *both* of its associated pins, as shown in the Card #6 assembly drawing in the 8100A/1 Operating Manual.

This will be seen only in units with serial numbers below 638000.

If the switch is soldered to the board normally, remove the two links from jumper B, and place them on jumper C in the "NORMAL" position.

Note that the links' "NORMAL" orientation on the jumper C pins is turned 90° from their "NORMAL" position on the jumper B pins.

- 7) Remove Cards #8 and #9 from the 8100A/1.
- 8) If only one lead each of resistors R804 and R805 are soldered to the cards with the other lead left "hanging", bend these resistors down and resolder them to their foil pads. This will be seen only in units with serial numbers below 638000.

If both leads of these resistors are soldered to the board, move the link on jumper B to the "NORMAL" position.

9) Replace all cards in their slots, and reassemble the 8100A/1.

The 8100A/1 is now ready to be put back on the air without the XT2.

Section 5 Troubleshooting

In this section:

 Troubleshooting Technique Symptoms and Possible Causes 	page 5-2 5-2
3. Gated Noise Reduction Modification	5-5
 Technical Support Factory Service Shipping Instructions 	5-6 5-7 5-7

[See also troubleshooting information in Appendix F of the 8100A/1 Operating Manual.]

When installed, the XT2 becomes an integral part of the 8100A/1's circuitry: the XT2 cannot be used by itself. When troubleshooting, it is therefore important to remember that the XT2 and 8100A/1 are operating together *as a system*. Almost all comments in Appendix F of the 8100A/1 Operating Manual apply to diagnosis of trouble in the 8100A/1 + XT2 System — if you remember that the XT2 is simply an added stage between the 8100A/1's high-frequency limiter (on Card #6) and its peak-limiting system (on Cards #8 and #9). The comments on the first page of Appendix F are particularly applicable.

CAUTION

The installation and servicing instructions in this manual are for use by qualified personnel only. To avoid electric shock, do not perform any servicing other than that contained in the Operating Instructions unless you are qualified to do so. Refer all servicing to qualified service personnel.

1. TROUBLESHOOTING TECHNIQUE

In addition to the information on "VU Meter Technique" in Appendix F of the 8100A/1 Operating Manual, note that:

In a system containing the XT2, the L and R FILTER OUT settings of the 8100A/1's VU meter monitor the signal after it has passed through the XT2. Therefore, if the signal is normal with the VU meter selector set to L or R COMPR OUT, but abnormal when set to L or R FILTER OUT, the XT2 may be suspected, as may be the 8100A/1's Cards #6, #8, and #9. The card-swap technique described below can be used to further narrow the possibilities.

The following supplements the discussion of "Card Swap Technique" in the 8100A/1 Operating Manual's Appendix F.

If:

- 1) The problem is observable on the 8100A/1's VU meter with the meter selector set to L or R FILTER OUT, but is not seen with the selector set to L or R COMPR OUT position, and
- 2) Swapping the 8100A/1's Cards #8 and #9 or turning the links on jumper B on the 8100A/1's Card #6 1/4-turn does not move the fault from one channel to the other,

then the XT2 is almost certainly faulty.

There are no card-swap techniques for diagnosing problems within the XT2. However, the bad channel can be compared to the good one by conventional signal-tracing techniques. To do this, drive the left and right system inputs with identical (mono) signals and compare corresponding circuit points in the left and right channels, moving circuit by circuit from the XT2's input to its output until a difference is found. This will locate the problem between the "good" and "bad" points.

Problems common to both channels within the XT2 are almost certainly due to faults in the limiter control circuitry on Card #A2.

2. SYMPTOMS AND POSSIBLE CAUSES

Always verify that the problem is not in the source material being fed to the 8100A/1, or in other parts of the system.

If audio problems develop, many engineers immediately blame their processing. However, as is the case with *any* processing, faults in the audio equipment *preceding* OPTIMOD-FM will be magnified by the action of the processing. When aggressive processing is used, program material that is marginally distorted at the OPTIMOD-FM's input is likely to be unlistenable by the time it emerges from the output — particularly when the XT2 is employed! In addition, be sensitive to possible defects in the monitoring equipment. Verify that a problem can be observed on at least two receivers before pushing the panic button.

1) Problems with subjective sound quality.

[Particularly problems that are not clearly identifiable as simple electronics failures.]

Review the "Catalog of Operating Problems and Solutions" at the end of Part 5 of the 8100A/1 Operating Manual. Also review Sections 2 and 3 of this manual to make sure the problem isn't simply an installation or control setting problem.

2) Output frequency balance doesn't sound like input.

It's not supposed to. The thresholds of the six-band limiter have been adjusted to provide dynamic high-frequency boost with most program material. Conversely, very bright program material will suffer loss of highs due to the unavoidable limitations of the FM pre-emphasis curve. In addition, the six-band limiter will tend to act as an "automatic equalizer", dynamically changing the frequency balance of program material to make it more pleasing and consistent on typical small radios and in cars.

Frequency balance is also affected by the BASS COUPLING, PRESENCE, and BRILLIANCE controls.

The available bass boost is limited dynamically to prevent bass from overdriving the safety clippers in order to avoid excessive IM distortion. While OPTIMOD-FM is capable of producing punchy, well-defined bass which sounds correct and is musically balanced, highly exaggerated bass boost cannot be obtained.

3) Sibilance distortion.

Possible causes:

- a) Source material at the 8100A/1's input terminals is distorted.
- b) Failure of the distortion-cancelling sidechain on the 8100A/1's Cards #8 or #9.
- c) Failure of the control circuitry in the XT2's band 5 (3.7kHz). If band 5 is exhibiting no gain reduction, then even a properly-operating distortion-cancelling clipper may generate some audible distortion.

4) Gross distortion.

Possible causes:

(also see Moderate, Subtle, Sibilance Distortion)

- a) Power supply voltage (supplied from the 8100A/1) is low. Check AC power line voltage first.
- b) IC opamp failure. This must be diagnosed by signal tracing.
- c) Failure in clipper-diode bias supplies on the XT2's Card #A1 or the 8100A/1's Card #6. Low bias voltage will cause excessive clipping and will also result in abnormally low modulation. Set the 8100A/1's COMPRESSOR and LIMITER switches to OPERATE and the XT2's COMP switch to OPERATE. Check IC4 and associated circuitry on card #A1 to verify that the output from IC4 is $\pm 1.8V$ ($\pm 10\%$). Check IC613 and associated circuitry on Card #6 to verify that the output from IC613 is approximately $\pm 4.2VDC$.

- d) Gross failure of IC803a, IC804a, or IC804b on the 8100A/1's Card #8 or the corresponding ICs on the 8100A/1's Card #9. This will either misbias the main signal path or add distortion to the main signal without causing the main signal to disappear.
- e) Failure of one or more bands in the six-band limiter causing distortion to be injected into the signal path from the defective band. Because other bands are still operating normally, signal passage will still occur, although with strange frequency response due to the missing band(s). Faults can occur in the pre-compressor crossovers on Card #A1, in the VCAs on Card #A3, and in the post-compressor crossover and multiband clipper on Card #A1.

5) Moderate to subtle distortion.

Possible causes:

- a) Distorted program material and/or distortion problems in studio or STL. For more on audio quality in FM plants, see Appendix K in the 8100A/1 Operating Manual.
- b) For moderate deviations from normal parameters, check points listed under "Gross Distortion" (immediately above).
- c) Misadjustment of the XT2's CLIPPING and/or DENSITY controls.
- d) Failure in Card #A2, causing one or more bands in the XT2 to produce modulation control solely by multiband clipping. This is usually indicated by the affected band's G/R meter reading "0" at all times.
- e) Failure in the distortion-cancelling sidechain on the 8100A/1's Cards #8 and #9. This is typically indicated by a "gritty" high end with severe sibilance splatter.

6) Noise is pumped up during very long pauses in material like classical music or radio drama.

Refer to Section 5.5, "Gated Noise Reduction Modification", for a procedure which changes the nominal gain reduction during gating from 0dB to -10dB.

3. GATED NOISE REDUCTION MODIFICATION

If program material containing sections of low-level audio lasting longer than 10 seconds is broadcast, the 8100A/1 + XT2 System can pump up noise to disturbing levels even if the 8100A/1's GATE THRESHOLD control has been adjusted to place such material below the 8100A/1's gating threshold. Such low-level material might be found in classical music or radio drama, for example.

It should be emphasized that we do not expect program material subject to this problem to be broadcast on stations which choose XT2 processing, since normal 8100A/1 processing is usually far more appropriate for such material. Information on this modification is therefore provided primarily for reference — we believe that few XT2 users will actually require it.

The problem occurs because the gating circuitry in the 8100A/1 slows the recovery of the 8100A/1's dual-band compressor instead of "freezing" the gain. This permits the gain to recover to its maximum value if the gate stays on long enough.

The XT2 chassis typically introduces another 5dB of gain beyond that ordinarily produced by the 8100A/1 in its normal, non-XT2 mode. Use of the PRESENCE and BRILLIANCE controls may further exaggerate noise. Thus, noise which was not objectionably increased by the 8100A/1 in its normal mode may well become objectionable when further increased by use of the XT2, unless this modification is performed. The modification forces the gain to slowly move to 10dB gain reduction instead of 0dB gain reduction when the gate is on, thus achieving 10dB less noise during long quiet sections.

Component Required:

6.2-megohm, 1/4-watt, ±5% carbon resistor
 If you cannot obtain this part locally, please contact Orban Customer Service at the address shown on the following page.

CAUTION

To avoid damaging the PC card, please follow the techniques described in the section on "Replacement Of Components On Printed Circuit Boards" in Appendix F of the 8100A/1 Operating Manual.

PROCEDURE:

- 1) Remove Card #5 from the 8100A/1 (follow card access instructions in Appendix C of the 8100A/1 Operating Manual).
- Remove 22-megohm, 1/4-watt, ±5% carbon resistor R550. Set it aside for use in step 3. This resistor is located in the area behind the RELEASE TIME control (see the Card #5 assembly drawing in Section 6 of this manual).

3) Install the 22-megohm resistor removed in step 2 into the holes for R552.

These holes should be empty. You may have to clear the holes of solder with a vacuum-operated desoldering tool before installing the resistor.

- 4) Install a 6.2-megohm, 1/4-watt, ±5% carbon resistor into the holes for R553.
- 5) Replace Card #5 in its slot, and reassemble the 8100A/1.
- 6) Test your work by applying power to the system and verifying that with no input signal applied, the 8100A/1's GATE lamp is lit and the 8100A/1's TOTAL MASTER, COMPRESSION MASTER, and TOTAL BASS G/R meters drift slowly to "-10" (±2).

The TOTAL BASS G/R meter will drift to "-10" only if the 8100A/1's BASS COUPLING control is set at "10".

4. TECHNICAL SUPPORT

If the above troubleshooting procedures don't help you solve your problem, contact Orban Customer Service. Be prepared to accurately describe the problem, including the results of diagnostic tests you have performed. Know the serial numbers of your 8100A/1 and of your 8100A/XT2.

Telephone:	(1) 415/351-3500	or Write:
or Fax: or E-Mail:	(1) 415/351-0500 custserv@orban.com	

Customer Service Orban 1525 Alvarado Street San Leandro, CA 94577 USA

5. FACTORY SERVICE

Before you return a product to the factory for service, we recommend that you refer to this manual. Make sure you have correctly followed installation steps and operation procedures. If you are still unable to solve a problem, contact our Customer Service for consultation. Often, a problem is relatively simple and can be quickly fixed after telephone consultation.

If you have to return a product to the factory for service, we recommend you include a letter describing the problem. See below for shipping instructions.

Please refer to the terms of your Limited One-Year Standard Warranty, which extends to the first end-user. After expiration of the warranty, a reasonable charge will be made for parts, labor, and packing if you choose to use the factory service facility. Returned units will be returned C.O.D. if the unit is not under warranty. Orban will pay return shipping if the unit is still under warranty. In all cases, transportation charges to the factory (which are usually quite nominal) are paid by the customer.

6. SHIPPING INSTRUCTIONS

Use the original packing material if it is available. If it is not, use a sturdy, double-wall carton no smaller than 22" x 16" x 6" (56cm x 41cm x 15cm) with a minimum bursting test rating of 200 pounds. Place the chassis in a plastic bag (or wrap it in plastic) to protect the finish, then pack it in the carton with at least 2" (5cm) of cushioning on all sides of the unit. "Bubble" packing sheets, foam "popcorn", thick fiber blankets, and the like are acceptable cushioning materials; folded newspaper is not. Wrap cushioning materials tightly around the unit and tape them in place to prevent the unit from shifting out of its packing. Close the carton without sealing it and shake it vigorously. If you can hear or feel the unit move, use more packing. Seal the carton with 3" (8cm) reinforced fiberglass or polyester sealing tape, top and bottom in an "H" pattern. Narrower or parcel-post type tapes will not withstand the stresses applied to commercial shipments.

Mark the package with the name of the shipper, and with these words in red:

DELICATE INSTRUMENT, FRAGILE!

Insure the package appropriately. Ship prepaid, not collect. Do not ship parcel post.

1. SPECIFICATIONS (Supplementary)*

^{*} These specifications describe the performance of an 8100A/1 + XT2 System which has been set up according to the instructions provided in this manual. These specifications supersede identically labelled specifications in the 8100A/1 Operating Manual. The specification in the 8100A/1 Operating Manual applies if a supplementary specification is not given here. All specifications subject to change without notice.

2. CIRCUIT DESCRIPTION

On the following pages, a detailed description of each circuit's function is accompanied by a component-by-component description of that circuit. Keywords are highlighted throughout the circuit descriptions to help you quickly locate the information you need.

See the 8100A/1 Operating Manual for detailed information about 8100A/1 circuitry. The relationship between 8100A/1 and XT2 circuitry is discussed here.

Whenever circuitry is duplicated for the left and right channels, only the left channel will be described.

1) OVERVIEW

The BLOCK DIAGRAM in Section 6.4 illustrates the following overview of XT2 functions.

Together, the XT2 and 8100A/1 form an integrated audio processing system. The XT2 adds bass equalization, six-band limiting, and multiband distortion-cancelling clipping between the 8100A/1's high-frequency limiter and its distortion-cancelling 15kHz low-pass filter.

The 8100A/1 automatically senses when the XT2 is plugged into Accessory Port #2 and puts the **high-frequency limiter** and **main clipper** in PROOF mode, since these functions are now performed by the XT2. The 8100A/1's dual-band compressor, distortion-cancelling 15kHz low-pass filter, and COMPRESSOR and LIMITER control lines operate differently when the XT2 is in use, as described below. Virtually all other 8100A/1 circuitry remains active and retains its normal function.

To prevent the 8100A/1's dual-band compressor from "fighting" the XT2's six-band limiter due to time-constant incompatibilities, the time-constants of the dual-band compressor are altered. The 8100A/1's RELEASE TIME control adjusts the speed of compressor response. Settings toward SLOW retain transient definition and permit the compressor to function as a slow "hand on the pot", riding gain without affecting short-term density or texture. Settings toward FAST result in increased density. The MASTER G/R meters on the 8100A/1 will exhibit less gain reduction and will move more slowly in the 8100A/1 + XT2 System than they would in an 8100A/1 without the XT2.

The input signal (already pre-emphasized by the 8100A/1) is applied to a **bass equalizer**, which can provide 0–10dB of peaking boost with a center frequency of 65Hz and a "Q" of 1.4 (approximately 1 octave). Because the XT2 often increases the brightness of program material, some bass boost is usually desirable to keep the sound spectrally well-balanced. The boost frequency has been chosen to create very "punchy" bass, particularly on speakers with reasonably extended bass response.

The six-band limiter follows the bass equalizer. A set of six parallel filters divides the signal into frequency bands. The highest and lowest bands are low-pass and high-pass respectively; the other bands are band-pass.

The XT2's six bands enable significant correction of midrange frequency balances and production of a more consistent, intelligible, and pleasing sound in situations where the frequency balance of the input program material tends to vary uncontrollably. The six-band limiter is especially useful in enhancing the intelligibility of low-grade speech from telephone calls or other actualities.

To permit large amounts of limiting without interaction and pumping, the filters have been designed with 12dB/octave slopes. When the filters' outputs are summed after the multiband clipper (which contains further filtering — see below), the resulting output is typically flat ± 0.25 dB over the frequency range of OPTIMOD-FM. Careful computer-aided design of the filters has eliminated audible "holes" in the frequency response under dynamic conditions.

Each filter (except the 6.2kHz band's filter) is followed by its own limiter. The characteristics of these limiters are extremely critical if proper frequency response and artifact-free operation are to be obtained under dynamic program conditions. For this reason, we have made only a few limiter characteristics adjustable.

The DENSITY control adjusts overall drive level into the limiters. In addition, the PRESENCE and BRILLIANCE controls adjust the drive levels into the two highest frequency bands, enabling use of the XT2 as a high-frequency equalizer. The DENSITY control determines how much gain reduction will be produced for a given setting of the CLIPPING control. The CLIPPING control adjusts the threshold of limiting for all limiters simultaneously, thus determining their average output level and the drive level into the following multiband clipper. Together, the DENSITY and CLIPPING controls determine the amount of multiband limiting produced under operating conditions: turning the DENSITY control clockwise and/or turning the CLIPPING control counterclockwise will produce more limiting.

Because it operates in several frequency bands and exploits the "masking effect", the sixband limiter section is capable of far more *fast* gain control without audible side-effects than are the wider bands used in the unmodified 8100A/1 compressor. We call the six-band limiter the "density augmentation" section because the individual limiters operate with fast release times and substantially decrease the peak-to-average ratio of the signal without the spectral intermodulation effects which would result if only one limiter were used for the entire frequency spectrum.

If input levels are not well-controlled, multiband automatic gain control (AGC) devices can introduce so much gain difference between bands that program material sounds unnatural (due to non-flat frequency response). As the average gain reduction in the multiband section increases, these problems tend to worsen. To avoid such potential difficulties, average levels into the six-band limiter section are controlled by the slow AGC located in the 8100A/1, so that excessive gain reduction never occurs in the six-band limiter.

Finally, the XT2 provides **multiband distortion-cancelling clipping**. The outputs of four of the six bands are routed to their own individual clippers. These clippers are followed by filters to reduce the out-of-band harmonic and/or IM distortion caused by the clipping. The distortion caused by clipping the upper two bands is sharply cancelled below 2.2kHz by a feedforward distortion-cancelling sidechain that works in parallel with the main 15kHz low-pass filter (both filters are located in the 8100A/1).

The result of the distortion filtering and cancellation is an effective reduction of the peakto-average ratio of the signal without the expected distortion build-up due to clipping — an unusually favorable trade-off between loudness and distortion. A notable advantage of this scheme is that the summed outputs of the four clippers can be applied to a safety clipper for final peak limiting without the need for further broadband gain control, thereby avoiding potential pumping and modulation effects. In the 8100A/1 + XT2 System, the 8100A/1's FCS Overshoot Compensator serves as a "band-limited safety clipper" to effectively control peak modulation without introducing out-of-band energy which could cause losses of dynamic separation and increases in main-to-sub crosstalk. (This design is protected by US Patents #4,208,548 and #4,412,100.)

For more information about 8100A/1 circuitry, see the 8100A/1 Operating Manual.

2) HIGH-FREQUENCY FILTER AND MAIN CLIPPER DEFEAT

The signal is **pre-emphasized** by the 8100A/1, then sent to the XT2 from the output of the 8100A/1's **high-frequency limiter**. Whenever the XT2 is plugged into the 8100A/1, this HF limiter is forced into PROOF mode by a jumper (within the XT2) that completes a connection between the 8100A/1's +15V power supply and its limiter proof bus; this also defeats the **main clippers** on Cards #8 and #9. The $\pm 4.2V$ supply on the 8100A/1's Card #6 (which activates the the 8100A/1's FCS Overshoot Compensator and safety clipper) is isolated from this jumper by means of a diode, and remains operational unless the 8100A/1's LIMITER switch is set to PROOF.

Component-level description:

Further information about the **HF** limiter and main clipper can be found in the Operating Manual for OPTIMOD-FM.

3) BASS EQUALIZER Card #A1

The input signal to the XT2 is first applied to a **bass equalizer**. This produces a **peaking boost** (i.e., bell-shaped curve) with a center frequency of 65Hz, a "Q" of 1.4, and a boost variable from 0 to +10dB.

Boost is produced by subtracting the output of an inverting second-order band-pass filter from the main signal (resulting in an overall addition).

Component-level description:

A bell-shaped **bass boost** is achieved by subtracting (in IC19b) the output of inverting band-pass filter IC19a and associated components from the filter's input. (Note that IC19b is *inverting* for the main signal and *non-inverting* for the output of IC19a.) For a discussion of the inverting band-pass filter, see (for example) Chapter 6 in Wong and Ott's *Function Circuits* (McGraw-Hill, New York, 1976).

If the equalizer fails, first check IC19. If this fails to correct the problem, the passive components R70, R71, R73, C23, C24 must then be checked out on an impedance bridge.

4) 6-BAND LIMITER, DISTORTION-CANCELLING MULTIBAND CLIPPER

The six-band limiter is so intimately integrated within the multiband clipper that the two functions must be considered as one. Their overall function is discussed here. Descriptions of component circuits follow.

The signal from the bass equalizer is first divided into six frequency bands by a pre-limiter crossover filter. Each crossover filter (except that of the 6.2kHz band) drives its own limiter. (The gains of the 6.2kHz and 3.7kHz limiters are *both* controlled by the 3.7kHz limiter, so that the 6.2kHz limiter tracks the 3.7kHz limiter. The PRESENCE and BRILLIANCE controls allow additional adjustment of these bands' gain — see Section 3.) The outputs of the 3.7kHz and 6.2kHz limiters, and the sum of the 150Hz and 400Hz limiters all drive individual clippers followed by individual post-limiter filters. The characteristics of the pre- and post-limiter filters are such that the final summation of the bands can be made to be very flat (better than ± 0.5 dB.)

These 6dB/octave **post-limiter filters** *following* the clippers provide first-order reduction of clipper-induced distortion. The first-order filtered distortion induced by clipping in the upper two bands is derived by subtracting each clipper's output from its input and then filtering this distortion signal with a filter identical to the **post-crossover filter**. The sum of these filtered distortion signals from the upper two bands is passed through a 2.2kHz low-pass filter.

Meanwhile, the clipped, filtered sum of all of the bands is passed through a **phase-corrected 15kHz** filter with a delay which matches that of the 2.2kHz low-pass filter. (The 2.2kHz and 15kHz filters are located on the 8100A/1's Cards #8 and #9). The outputs of the 15kHz and 2.2kHz filters are summed, sharply **cancelling clipper-induced distortion** below 2.2kHz (the "flat" part of the FM pre-emphasis curve).

It should be noted that it is normal for sine waves to modulate less than 100% when applied to the system in its normal OPERATE mode. There are two principal reasons for this:

- 1) Some headroom is left between the threshold of the multiband distortion-cancelling clipper and the threshold of the subsequent FCS Overshoot Corrector in order to accommodate the normal level build-up due to summation of the bands, and also to accommodate the distortion-corrector signal. A sine wave only occupies one or two bands, and no distortioncorrector signal is produced. Thus, the headroom is not used, and full 100% modulation does not occur.
- 2) Sine waves have a very low peak-to-average ratio and high loudness potential compared to program material of identical peak levels. The audio processing, in order to maintain natural sound quality, pushes sine waves down in level as it would any other similar program material with low peak-to-average ratio. In general, any audio processor which produces 100% modulation on sine waves tends to sound somewhat unnatural because this psychoacoustic factor has not been taken into account.

(This design is protected by U.S. Patent #4,412,100.)

5) PRE-LIMITER CROSSOVERS Card #A1

The crossovers are realized as follows:

Band 1 (150Hz low-pass):	Second-order 420Hz low-pass filter cascaded with second-order 150Hz low-pass filter.
Band 2 (420Hz band-pass):	Second-order 420Hz low-pass filter cascaded with third-order 420Hz high-pass filter.
Band 3 (700Hz band-pass):	Second-order low-pass filter cascaded with third-order high-pass filter.
Band 4 (1.6kHz band-pass): Band 5 (3.7kHz band-pass): Band 6 (6.2kHz high-pass):	Two cascaded second-order stagger-tuned band-pass filters. Two cascaded second-order stagger-tuned band-pass filters. Second-order 6.2kHz high-pass filter.
Daliu 0 (0.2km2 lligit-pass).	Scolle-older other inght pass mont

Bands 3 through 6 are fed from a first-order all-pass filter which provides phase correction for the crossover summation.

Component-level description:

All filters are built with second-order sections of the type found in any modern text on active filter design (see, for example, Wong and Ott, *op. cit.*). Some filters are of the "multiple feedback" type, and are basically negative-feedback filters. Others are of the "Sallen and Key" type, and are positive-feedback filters. The two types are mixed as necessary to achieve desired inverting (negative feedback) or non-inverting (positive feedback) responses.

6) VOLTAGE-CONTROLLED AMPLIFIERS (VCAs) Card #A3

The voltage-controlled gain block used throughout the XT2 is a proprietary Class-A VCA which operates as a two-quadrant analog divider with gain inversely proportional to a current injected into the gain-control port. A specially-graded Orban IC contains two matched, non-linear gain-control blocks with differential inputs and current outputs. The first of these is employed in the feedback loop of an opamp to perform the gain control function. The inputs of the first and second gain-control blocks are connected in parallel, and the output of the second block is a distortion-corrected *current* which is transformed into the desired gain-controlled voltage by an opamp current-to-voltage converter.

Component-level description:

This is a general description of the VCA circuitry used throughout the XT2. Only band 1 will be specifically described.

The operation of the VCAs is based on precisely matched pairs of gain control blocks with differential voltage inputs and current-source outputs. The gain of each block is controlled by a control current.

If used alone, one such gain-control block would introduce considerable distortion. Therefore, the first of the two matched blocks (IC13a) is used as the **feedback element** in an operational amplifier, IC1a. The second of the matched blocks (IC13b) is then driven by the predistorted output of IC1a. The output of IC1a is first attenuated by R4, R5 and then applied to the input of the feedback element IC13a. The output of IC1a is pre-distorted as necessary to force the current *output* of IC13a to precisely and linearly cancel the audio input into the "virtual ground" summing junction of IC1a. This same predistorted voltage is also connected to the input of IC13b. Thus, the output of IC13b is an undistorted current, which is converted to a voltage in current-to-voltage converter IC1b, R9, R10, C1, C2. The output of IC1b is the output of the VCA. Because IC13a is in the feedback loop of IC1a, the gain of the VCA is *inversely* proportional to the gain of IC13a. Thus, if the control current is applied to the control port of IC13a (through R11), then the VCA behaves like a two-quadrant analog *divider*.

A fixed current is applied to the control port of IC13b through R8 to set the gain of IC13b. R8 is fed by a \pm 1.2V source common to all VCAs on a card: R85, CR4, CR5. The diodes provide temperature compensation.

Second-harmonic distortion is introduced by the differential offsets in either IC13a or IC13b. This distortion is cancelled by applying a nulling voltage directly to the input of IC13b by means of resistor network R3b, R6, R7.

If the VCA is not perfectly balanced, "thumps" due to control current feedthrough can appear at the output. These are equivalent to multiplying the control current by DC. If a correct DC offset is applied to the VCA input, then this equivalent DC multiplication can be nulled to zero and the "thumps" eliminated. Such an adjustable DC offset is provided by R3a, R2.

The current-controlled gain of the compressor/ limiter is inversely proportional to the control current. This must be transformed into a gain which is proportional to a control voltage in dB. This is done in the exponential current converter consisting of IC25a and associated components.

IC29a, IC29d, and associated components form a **log/antilog multiplier** which multiplies the current flowing in R88 by the exponential of the voltage on the base of IC29a. The current gain of the multiplier increases as the voltage on the base of IC29a becomes more positive.

The exponential-converter transistors for all of the VCAs in a given group of bands (1-3 or 4-6) are located within a monolithic array. IC29 serves this purpose for bands 1–3. One transistor within

this array (IC29d) is dedicated to providing a reference for all of the exponential converters. The emitters of all the exponential-converter transistors are connected to this common source.

This reference (approximately -0.6V) is produced by forcing a constant current through IC29d. The voltage across R88 is held at 15 volts by the feedback action of IC26a; this determines the current through IC29e and thus its base-to-emitter voltage. C22 prevents IC26a from oscillating, and IC29c protects IC29d from a reverse bias latchup condition.

The output current of the log/antilog multiplier appears on the collector of IC29a. Since it is the wrong polarity and level to correctly drive IC13a's control-current port, it is applied to a current inverter IC25a, Q1, R13, R14, C3. This circuit has a gain of 6.66x, and operates as follows:

A voltage proportional to the current output of IC29a is developed across R14 because of the feedback action of IC25a (C3 stabilizes IC25a against oscillations). Feedback forces IC25a's "-" and "+" inputs to be at the same voltage. Thus, the same voltage which appears across R14 also appears across R13, and current flows in R13 in proportion to the ratio between the values of R14 and R13.

This current flows out of the "+" input line of IC25a into the emitter of Q1. Because Q1's base current is small compared to its emitter current, essentially the same current flows out of Q1's collector into the gain-control port of IC13a.

Since the base of Q1 is grounded, its emitter sits at +0.6V. This forces both "+" and "-" inputs of IC25a to also sit at +0.6V.

CR1 protects Q1 from reverse base-emitter voltage which could otherwise cause junction breakdown and latch-up of the entire current-inverter circuit.

_

The output of each band's VCA (except that of the 6.2kHz band) feeds a voltage divider which, in turn, feeds a dual-comparator IC. If the output of the voltage divider exceeds a positive or negative threshold of 0.5 to 1.0V set by the CLIPPING control, the comparator will generate an output pulse which is smoothed by the timing module to produce a control voltage which reduces the gain of the VCA. The drive to the clippers following the compressors and pre-emphasis/high-frequency limiters is thus determined by the setting of the CLIPPING control, which simultaneously adjusts all comparator thresholds (and thus the average VCA output level).

The timing circuits process the signal in logarithmic form, and have low-impedance outputs. These drive exponential converters which provide control-current outputs for their respective VCAs. This timing circuitry is proprietary, and is located within sealed modules.

The DENSITY control provides a DC control voltage which offsets the logging transistors in the reference logarithmic converters in the VCAs. This control voltage can vary the gains of all VCAs by as much as 20dB while maintaining extremely accurate tracking. Thus, left and right channels remain correctly balanced.

Component-level description:

Other than component values, the control circuits for all six bands are identical — except the 6.2kHz band, which receives the control signal from the 3.7kHz band. Only the control circuit for band 1 (150Hz) will be discussed in detail.

The output of the band 1 VCA is applied to voltage divider R1, R2 which protects IC1 (a 711 dual comparator) from being driven beyond its ratings. IC1 produces a positive-going pulse that is approximately +4.5V if the output of voltage divider R1, R2 exceeds the comparator threshold voltage generated by IC12 (on Card #A1) and associated circuitry. The threshold of limiting is thus determined by two factors: 1) the loss in voltage divider R1, R2 (the more loss, the higher the voltage at the VCA output before IC1 turns on); and 2) the threshold voltage applied to IC1. This voltage can be varied from ± 0.5 to $\pm 1.0V$

by the CLIPPING control R160 (on Card #A1), which varies the threshold of limiting (and thus the average output level of the band VCAs) by feedback.

The output of IC1 is applied to unity-gain inverter and level shifter Q1, R5, R7. The waveform at the collector of Q1 consists of pulses which go 4.5V below the +12V collector supply voltage. These pulses develop approximately 4V across R6, the emitter resistor of Q2. The current which flows through R6 is essentially identical to that flowing from the collector of Q2 into the timing module. The value of R6 determines the attack time by scaling this current.

The timing module integrates this current and produces a voltage which is buffered by unitygain FET-input opamp IC13a. IC13a's output is a dB-linear control voltage which determines the gain of the band VCA (in dB).

8) POST-LIMITER CROSSOVERS, CLIPPERS, DISTORTION-CANCELLING SYSTEM Card #A1

The upper two bands (3.7kHz and 6.2kHz) are treated differently than the bottom three bands (150Hz, 420Hz, and 700Hz). The 1.6kHz band is unique in that it is not followed by a clipper.

Difference-frequency intermodulation (IM) due to clipping is cancelled below 2.2kHz by a feedforward distortion-cancelling sidechain (US patent #4,412,100). The output of each of the two upper bands is applied to two identical filters (one inverting and one non-inverting) with 6dB/octave slopes. The 6.2kHz band filter is high-pass; the 3.7kHz band filter is band-pass.

A clipper is located before the inverting filter, so that the inverting filter filters the clipped signal, somewhat reducing out-of-band clipper-induced distortion.

The outputs of the inverting and non-inverting filters are added in the **distortion-cancelling** summing amplifiers. If no clipping occurs, the outputs of the inverting and non-inverting filters will cancel, and no output will be produced by the distortion-cancelling summing amplifiers. If clipping *does* occur, then the output of the distortion-cancelling summing amplifiers will represent the difference between the clipper's input and output as filtered by the inverting filter (i.e., the *distortion added by the clipper*, as filtered through the inverting filter).

Since the upper two bands are handled by the distortion-cancelling summing amp, the output of this amplifier represents the sum of the filtered clipper-induced distortion produced by the two clippers in these bands. This signal is applied to the distortion-cancelling filter (a 2.2kHz low-pass filter with constant delay).

Meanwhile, the outputs of the inverting filters *alone* (containing the clipped, filtered outputs of the upper two bands) are summed by the **band-summation amplifier**. The output of this amplifier is applied to the input of the 15kHz phase-linear low-pass filter.

The outputs of the 15kHz filter and 2.2kHz filter are summed. Considering for a moment the case where only *one* band is passing signal, the clipper-induced distortion component contributed by this band to the 2.2kHz filter's output is equal to, and out-of-phase with, the same distortion component in the 15kHz filter's output. Thus, this distortion component is cancelled by better than 30dB within the 2.2kHz bandwidth of the distortion-cancelling filter. Because the summation process and both of the 15kHz and 2.2kHz filters are linear, superposition holds and the distortion component in *each* of the two top bands is cancelled even when more than one band is active.

The three low-frequency bands are not treated by the distortion-cancellation sidechain. Simple **low-pass filtering** of the clipped signal is employed for distortion reduction.

The output of the **150Hz band** is applied to a pair of cascaded 6dB/octave low-pass filters before it is summed with the rest of the bands in the band summation amplifier. A clipper is located between the first and second of these filters. The output of the 420Hz band is applied to this clipper, and then through the second low-pass filter to the band-summation amplifier. The clipper thus clips the *sum* of the 420Hz band and the filtered 150Hz band.
The output of the **700Hz band** is **clipped** independently of the two lower bands. The output of the 700Hz clipper is **low-pass filtered** at 6dB/octave and **summed** by the band-summation amplifier.

Component-level description:

Since the distortion-cancellation system works almost identically on bands 5 and 6, the description of band 5 (3.7kHz) also applies to band 6 (6.2kHz), which uses a pair of high-pass filters instead of band-pass filters.

The output of the band's VCA is applied to the **upper 6dB/octave band-pass filter** R16, R17, C6, C7. Clipper diodes CR7, CR8 are embedded between R16 and R17 and **clip** the output of the band VCA before it is applied to the band-pass filter. The band-passed signal is summed into IC1a (the **band-summing amplifier**) through R18, and into **sidechain summing amplifier** IC3a through R19. The output of the band's VCA is also applied to a **lower band-pass filter** R24, C8, C9. The frequency response of this filter associated with CR7 and CR8.

The lower band-pass filter's output is summed through R25 into IC3b. IC3a's output (containing the *inverted* contribution of the upper band-pass filter) is summed through R21 into IC3b. When clippers CR7 and CR8 are non-conductive, total cancellation (within the limitation of component tolerances) therefore occurs, because the upper and lower filters are identical and their contributions are summed out-of-phase. Thus, no signal appears at the output of sidechain summing amplifier IC3b.

When the clippers conduct, all signal is cancelled at the output of IC3b except for the distortion added by the clipping process, as filtered by the upper band-pass filter.

The output of the **band 1** VCA is **low-pass filtered** by R2, R3, C1, and then **summed** with the output of **band 2** in IC1b. The sum is **clipped** by CR3, CR4, and **low-pass filtered** again through R6, R7, and C2 before being summed by **bandsumming amplifier** IC1a.

The output of **band 3** is clipped by CR5, CR6, and filtered through low-pass filter R11, R12, C3, before being summed by IC1a.

The output of **band 4** is not clipped, but is simply **summed** by IC1a through **band-pass filter** R13, R14, R15, C4, C5.

The output of IC1a feeds the 15kHz low-pass filter on the 8100A/1's Cards #8 and #9. Meanwhile, the output of distortion-cancelling summing amp IC3b feeds the 2.2kHz low-pass filter on the 8100A/1's Cards #8 and #9. The outputs of these filters are summed, which sharply cancels clipper-induced distortion below 2.2kHz.

3. PARTS LIST

trr: 4ns max.)

Parts are listed by ASSEMBLY, then by TYPE, then by REFERENCE DESIGNATOR. See drawings in Section 6.4 for location of components. Widely used common parts are not listed; such parts are described generally below (examine the part to determine exact value).

SIGNAL DIODES, if not listed by reference designator in the following parts list, are:

Orban part number 22101-000, Fairchild (FSC) part number 1N4148, also available from many other vendors. This is a silicon, small-signal diode with ultra-fast recovery and high conductance. It may be replaced with 1N914 (BAY-61 in Europe). (BV: 75V min. @ $I_r = 5\mu A I_r$: 25nA max. @ $V_r = 20V V_f$: 1.0V max. @ $I_f = 100mA$

See Miscellaneous list for ZENER DIODES (reference designator VRxx).

RESISTORS should only be replaced with the same style and with the *exact* value marked on the resistor body. If the value marking is not legible, consult the schematic or the factory. Performance and stability will be compromised if you do not use exact replacements. Unless listed by reference designator in the following parts list, resistors are:

Metal film resistors have conformally-coated bodies, and are identified by five color bands or a printed value. They are rated at 1/8 watt @ 70°C, \pm 1%, with a temperature coefficient of 100 PPM/°C. Orban part numbers 20038-xxx through 20045-xxx, USA Military Specification MIL-R-10509 Style RN55D. Manufactured by R-Ohm (CRB-1/4FX), TRW/IRC, Beyschlag, Dale, Corning, Matsushita.

Carbon film resistors have conformally-coated bodies, and are identified by four color bands. They are rated at 1/4 watt @ 70°C, \pm 5%. Orban part numbers 20001-xxx, Manufactured by R-Ohm (R-25), Piher, Beyschlag, Dale, Phillips, Spectrol, Matsushita.

Carbon composition resistors have molded phenolic bodies, and are identified by four color bands. The 0.090" x 0.250" (2.3mm x 6.4mm) size is rated at 1/4 watt, and the 0.140" x 0.375" (3.6mm x 9.5mm) size is rated at 1/2 watt, both $\pm 5\%$ @ 70° C. Orban part numbers 2001x-xxx, USA Military Specification MIL-R-11 Style RC-07 (1/4 watt) or RC-20 (1/2 watt). Manufactured by Allen-Bradley, TRW/IRC, Matsushita.

Cermet trimmer resistors have 3/8" (9mm) square bodies, and are identified by printing on their sides. They are rated at 1/2 watt @ 70°C, ±10%, with a temperature coefficient of 100 PPM/°C. Orban part numbers 20510-xxx and 20511-xxx. Manufactured by Beckman (72P, 68W- series), Spectrol, Matsushita.

Obtaining spare parts:

Special or subtle characteristics of certain components are exploited to produce an elegant design at a reasonable cost. *It is therefore unwise to make substitutions for listed parts*. Consult the factory if the listing of a part includes the note "selected" or "realignment required".

Orban normally maintains an inventory of tested, exact replacement parts that can be supplied quickly at nominal cost. Standardized spare parts kits are also available. When ordering parts from the factory, please have available the following information about the parts you want:

Orban part number Reference designator (e.g., C3, R78, IC14) Brief description of part Model, serial, and "M" (if any) number of unit (see rear-panel label)

To facilitate future maintenance, parts for this unit have been chosen from the catalogs of well-known manufacturers whenever possible. Most of these manufacturers have extensive worldwide distribution and may be contacted through their local offices. The USA headquarters addresses are given at the end of this parts list.

8100A/1 card:

Card #5	COMPRESSOR CONTROL	Assembly Drawing	30715-000-03	6-30
		Schematic	60035-VER-07	6-31

(Card #5 drawings are provided here to support 8100A units which have been upgraded with Retrofit Kit RET-27. 8100A/1 owners should refer to the 8100A/1 Operating Manual for the most current schematics.)

These drawings reflect actual construction of your unit as accurately as possible. If changes are made, they will be described in an addendum to this manual. If there is a discrepancy between these drawings and your unit, it is more likely an error in documentation than an error in the construction of your unit.

If you intend to replace parts, please see the introduction to the preceding PARTS LIST.

Warranty

United States Warranty

Limited Warranty

Valid only in the United States. We warrant Orban products against defects in material or workmanship for a period of one year from the date of original purchase for use, and agree to repair or, at our option, replace any defective item without charge for either parts or labor.

Important: This warranty does not cover damage resulting from accident, misuse or abuse, lack of reasonable care, the affixing of any attachment not provided with the product, loss of parts, or connecting the product to any but the specified receptacles. This warranty is void unless service or repairs are performed by an authorized service center. No responsibility is assumed for any special, incidental or consequential damages. However, the limitation of any right or remedy shall not be effective where such is prohibited or restricted by law.

Simply take or ship your Orban product prepaid to our service department. Be sure to include your sales slip as proof of purchase date. (We will not repair transit damage under the no-charge terms of this warranty). Orban will pay return shipping.

Note: No other warranty, written or oral is authorized for Orban products.

This warranty gives you specific legal rights, and you may also have other rights which vary from state to state. Some states do not allow the exclusion of limitations of incidental or consequential damages or limitations on how long an implied warranty lasts, so the above exclusion and limitations may not apply to you.

International Warranty

Bedingungen

Orban gewährt 1 Jahr Garantie ab Verkaufsdatum auf nachweisbare Material- und Fabrikationsfehler. Der Garantieanspruch erlischt bei unsachgemäßer Handhabung, elecktrischer oder mechanischer Beschhädigung durch mißbräuchliche Anwendung sowie bei unsachgemäßer Reparatur durch nichtautorisierte Werkstätten. Voraussetzung für die Garantieleistung ist die Vorlage der ordnungsgemäß durch den Fachhändler ausgefüllten Garantiekarte sowie der Kaufrechnung. Transport- und Portospesen, welche aus der Einsendung des Gerätes zur Garantiereparatur erwachsen, können von Orban nicht übernommen werden, das Risiko der Zusendung trägt der Kunde. Die Garantie wird ausschließblich für den ursprünglichen Käufer geleistet.

Warranty Conditions

Orban warrants Orban products against evident defects in material and workmanship for a period of one year from the date of original purchase for use. This warranty does not cover damage resulting from misuse or abuse, or lack of reasonable care, and inadequate repairs performed by unauthorized service centers. Performance of repairs or replacements under this warranty is subject to submission of this Warranty/Registration Card, completed and signed by the dealer on the day of purchase, and the sales slip. Shipment of the defective item for repair under this warranty will be at the customer's own risk and expense. This warranty is valid for the original purchaser only.

Conditions de garantie

Pour toute mise en œvre de garantie ou de service après-vente, vous devez vous adresser à votre revendeur. Notre société assure au revendeur le remplacement gratuit des pièces détachées nécessaires à la réparation pendant un an, à partir de la date de votre facture, sauf en cas de non respect des prescritions d'utilsation ou lorsqu' une cause étrangère à l'appareil est responsable de la défaillance. Les dispositions stipulées ci-dessus ne sont pas exclusives du bénéfice au profit de l'acheteur de la garantie légale pour défaut et vice cachés qui s'applique, en tout état de cause, dans les conditions des articles 1641 et suivants du Code Civil.

Condizioni di garanzia

L'Orban presta garanzia per un anne dalla data della vendita per difetti di materiale e fabbriccazione che possono essere provati. Il diritto di garanzia cessa in caso di manipolazione impropria, danneggiamento electtrico o meccanico attraverso i'uso non approriato e riparazione inesperta eseguita da officine non autorizzate. E' indispensabile, per la prestazione della garanzia, presentare la carta di garanzia debitamente riempita dal rivenditore autorizzato e la fattura di vendita. Spese di trasporto che risultano dall'invio dell'implanto per la riparazione in garanzia, non possono essere assunte dall'Orban i'invio è a rischio e pericolo del cliente. La garanzia verrà data solo al primo acquirente.

Condiciones de garantia

Orban concede 1 añe de garantia por defectos comprobables de material o de fabricación a partir de la fecha de venta. El derecho de garantia caduca en caso de procederse a uno manipulación inadecuada en caso de producirse daño electrico o mecánico por uso indebido, así como también en caso de reparaciones inadecuados por parte de talleres no autorizados. La prestación de la garantia está sujeta a la presentación de la Tarjeta de Garantia rellenada correctamente por el vendedor autorizado, y de la factura de compra. Orban no assume ningún gasto de transporte o correo incurrido por el envio del aparato defectuoso para la reparación bajo garantia; el riesgo del envio ha de ser asumido por el cliente. La garantia se concede única y exclusivamente al comprador original.
