REFERENCE

This manual refers to the following units:

Dual Bar Graph PPM	1.913.111
Dual Bar Graph VU	1.913.112
8 Channel Bar Graph PPM	1.913.411
8 Channel Bar Graph VU	1.913.412

1. Technical Description

The output meter, whatever it may be called, is one of the most important tools in audio engineering. Wherever audio signals are being processed, it is an essential, because the output level is an important criterion. On the one hand, maximum output level is needed for achieving the best signal-to-noise ratio, on the other hand the reference level should not be exceeded, particularly in digital recordings, otherwise distortion will increase dramatically.

Two types of output meters with different dynamic characteristics have proven themselves useful in recording studios:

Volume Unit Meter (VU)

The most frequently used instrument for measuring audio frequency signal levels is the VU-meter. In the ANSI standard (American National Standards Institute, Inc.), the mechanical and electrical behavior of the VU-meter was already defined in 1954. The rule is that the indication shall be 99% of the ultimate value (0 VU) when a signal of 0.3 s (300 ms) duration is applied. The overshooting of the indication shall be between 1...1.5%. The rise and decay time are identical in the VU-meter.

In the conventional version a VU-meter consists of a suitable moving coil instrument and a full-wave rectifier connected to the input.

Peak Program Meter (PPM)

The PPM is a more recent instrument. Its behavior is defined in the applicable DIN or IEC standards. The principal difference to the VU-meter is in the integration time: the PPM is a quasi peak value instrument with a long release time. A peak value will be indicated even for very short peaks in a music program.

If a sine wave voltage is applied for 10 ms that yields a level of 0dB, the indication should be -1dB. A release time of 1.7 s is desired for levels down to -20dB (IEC).

Instrument Types

An advanced alternative to electromechanical analog displays are the gas discharge bargraph displays. Neon gas that is induced to glow between two glass plates emits visible light. The plasma display has some decisive advantages over all the other displays. For example: large reading angle and high contrast combined with low power consumption and long life. Its disadvantages are: high anode voltage (250 V), high price, and sophisticated electronic circuitry. Despite these drawbacks this excellent type of display has become the de-facto standard in professional studio applications.

Implementation of the Studer Bargraph Output Meters

The design specifications for a precision metering instrument that would not be too costly but still have a modular design resulted in the following arrangement; two individual circuit boards, one for the two-channel signal processing paths and one for the digital section with the switching power supply. In this way it became feasible to achieve a modular design: four signal modules for eight channels but only one digital module.

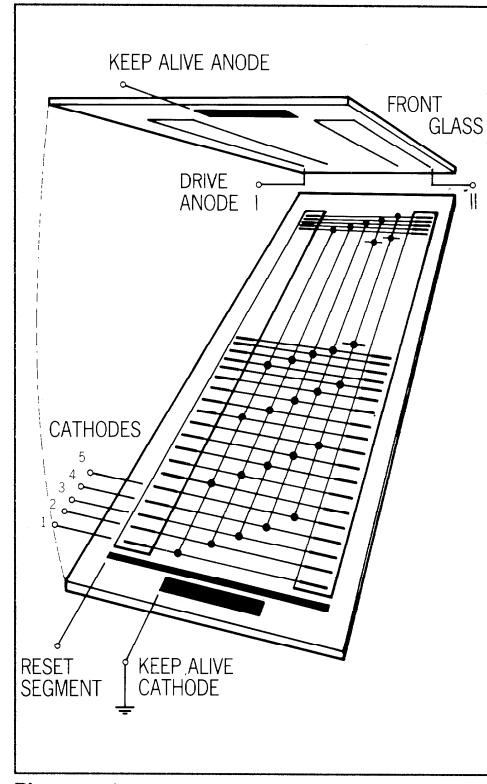

BARGRAPH

The operating principle of the individual elements that make up the bargraph display is depicted in the following picture:

Plasma Tube

After the 250 VDC supply voltage has been applied, a continuous glow discharge is triggered between the pre-ionization anode and cathode. Since the area around the pre-ionization segment is not physically isolated from the neighboring segments, the charge carriers diffuse into the area of the reset cathode. When the latter is energized first, a glow discharge occurs also here. The same effect causes the first segment to light up (ignite), if the reset cathode is switched off while cathode 1 is switched on. Although each 5th segment is electrically interconnected, only the lowest one glows because sufficient charge carriers are located in its vicinity.

The cathodes 1-2-3-4-5 / 1-2-3-4...etc. are now controlled in this order. The glow discharge migrates segment by segment to the last segment. A new cycle is then initiated by means of the reset segment.

Plasma tube

The length of the bargraph is controlled by the power-on duration of the corresponding anode while the cathodes are controlled cyclically in the dark segment. This design requires only 8 connections or driver stages (2 anodes, 1 reset cathode and 5 write cathodes) for controlling the 2 x 200 segments. In order to create a flicker-free bargraph the refresh rate must be at least 70 Hz. Unnoticeable to the viewer is, however, that only one segment glows at any one moment!

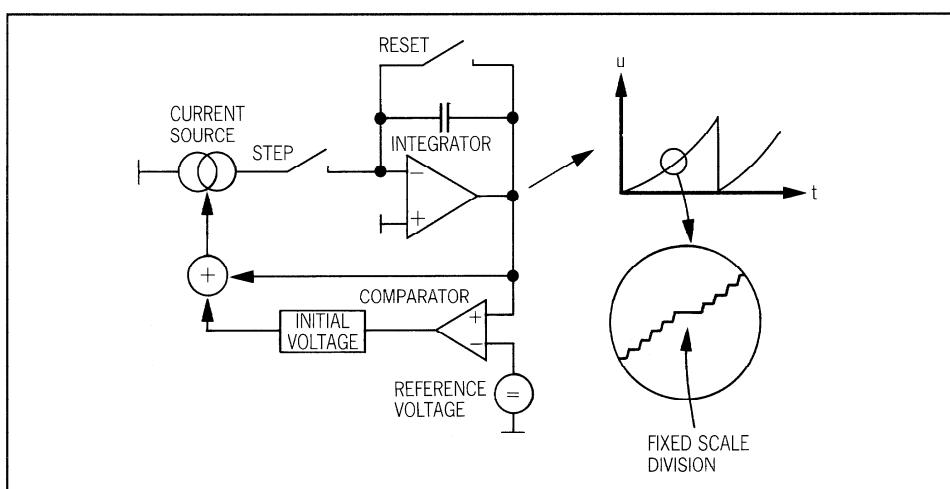

Analog Electronics

The audio section is shown in the block diagram (see p.12). The isolated AF signal is taken to the level stage; the large working range permits the connection of almost any level. For very small levels a +20 dB amplifier is provided. The low-pass filter of the 3rd order attenuates frequencies of over 20 kHz. This circuit is followed by a sophisticated rectifier stage that compensates very carefully with respect to the offset voltages.

For the VU representation, the rectified signal is fed to a filter that duplicates the characteristic of mechanical moving coil instruments. For the PPM representation, the peak value of the rectified signal is formed.

Digital Electronics

The digital section performs various functions. Not only does it process the signals for the plasma tube, it also is responsible for generating the ramp. A totally new approach has been selected for the ramp generation. Normally the audio signal is converted to logarithmic characteristic in an amplifier in order to achieve dB representation. The resulting signal is subsequently compared with a time-linear ramp. However, the same can be accomplished by comparing the linear AF signal with an exponential ramp, without the typical problems of a logarithmic circuit (temperature dependence, offset). In addition, more instruments can be controlled by means of a ramp (in the digital section); no logarithmic circuits are required.

**Ramp generator**

While a capacitor is charged with a constant current, the terminal voltage rises linearly. If this source is equipped with a positive feedback that converts the continually rising voltage to a continually increasing current, we obtain an exponentially progressing terminal voltage.

If the capacitor is discharged after a while, the initial voltage for starting the cycle is missing. A control circuit is available that prepares the initial voltage in such a way that a reference value is achieved after a certain time.

For inserting fixed scale divisions, the capacitor charging is interrupted during three cycle units. As a result the corresponding segment glows three times longer and consequently appears to be brighter.

By disconnecting the above mentioned positive feedback, the linear ramp is again obtained for representing VU values or representable DC values.

The ramp oscillator also supplies the input signal for a binary counter that increments until reset. The outputs of the counter are address lines for an EPROM which generates the 5-phase signal and a reset signal for creating the fixed scale divisions as well as a reset signal for the counter. With the two remaining address lines it is possible to insert different scale divisions.

Future Application

The new bargraph instrument also features a LED column for indicating limiter or compressor gain reduction signals. With the externally controllable selection of VU or PPM characteristic it is also possible to display DC voltages on linear or logarithmic scale. The built-in switching power supply supports a large range of DC supply voltages.

For PCM recordings a faster response time ($t = 0.1$ ms) may be selected by a switch.

BARGRAPH

2. Technical Data

PEAK PROGRAM METER SPECIFICATION

Reference Indication	0 dB = 0 dBu + 15 dBu				
Indicating Range	+ 5 dB - 40 dB				
Error	± 0.2 dB (± 2 segments) within + 5 dB and - 40 dB				
Frequency Response	± 0.5 dB between 31.5 Hz and 16 kHz at 0° C 50° C				
Dynamic Response	according to IEC publication 268-10 1974:				
	SINGLE BURST	FREQUENCY	DEFLECTION VALUE	SLOW TOLERANCE	DEFLECTION FAST
	10 ms	3 kHz	- 1 dB	± 0.5 dB	-0.3 dB
	5 ms	3 kHz	- 2 dB	± 1 dB	-0.6 dB
	3 ms	3 kHz	- 4 dB	± 1 dB	-0.8 dB
	0.4 ms	10 kHz	- 15 dB	± 3 dB	-1.0 dB

Overswing

none

Return Time0 dB - 20 dB: 1.7 ± 0.3 seconds

VU-METER SPECIFICATION

Reference Indication	0 VU = - 4 dBu + 11 dBu				
Indicating Range	+ 3 VU - 20 VU, voltage linear				
Frequency Response	+ 1.0/- 0.0 dB at 0 VU and 31.5 Hz; Temperature range 0° C 50° C				
Response Time	207 ms (± 30 ms) to - 1 VU of reference indication				
Overswing	1 ... 1.5 %				
Return Time	207 ms (± 30 ms).				

DC METER SPECIFICATION**Display Range**

INDICATION	NORMAL			REVERSE
TOP END	0 V	0 V	- 1 V	+ 1 V
BOTTOM	+ 10 V	+ 6 V	+ 6 V	- 10 V

There is mutual influence between the alignment of 'Top End' and 'Bottom' indication. The values in the row 'Normal' are ment to be examples for possible settings.

GENERAL SPECIFICATIONS

Input Impedance	> 10 kOhm
Source Impedance	< 1 kOhm
Reversibility Error	< 0.5 dB
Temperature Range	error \pm 0.5 dB in the range - 10° C + 60° C (reference: 1 kHz at 25° C)
Supply Voltage	24 V ... 34 V (or \pm 15 V)

Power Consumption	dual unit: 3.5 W typ., 5.0 W max. 8 channels: 9.5 W typ., 14.5 W max.
--------------------------	--

Mechanical Dimensions	dual unit: 40 mm(W) x 170 mm(H) x 130 mm(D) 8 channel unit: 160 mm(W) x 170 mm(H) x 130 mm(D)
------------------------------	--

Weight	dual unit: 640 g 8 channel unit: 1600 g
---------------	--

GR METER SPECIFICATION

Input Range	\pm 2 V \pm 5 V for + 20 dB indication
--------------------	---

BARGRAPH

3. Alignments and Settings

Note: The Analog Print 1.913.117 contains two channels, so each adjustment pot exists twice. All adjustments have to be performed on all channels.

The Digital Print 1.913.118 exists only once per unit, be it a two or eight channel device.

3.1 Adjustments

Level Setting

For adaptation to different line levels only the following adjustment is necessary:

- Feed reference level 1 kHz (e.g. +6 dBu)
- adjust 0 dB indication on bargraph with R 5 (R 105) Potentiometer is marked **AUDIO GAIN**

Complete Adjustment

In case of part exchange a full adjustment procedure may be necessary. In this case proceed in the following steps:

AC Input: Set unit to "PPM", "+20 dB off", and "Not fast" (see below)

- Disconnect input, terminate input with 200 Ohm
- adjust minimal level (0 ± 1 mV) at pin 7 of IC 6 (internal potentiometer)
- Feed reference level 1 kHz (e.g. +6 dBu)
- adjust 0 dB indication on bargraph with R 5 (R 105). Potentiometer is marked **AUDIO GAIN**
- Feed 20 dB below reference level 1 kHz (e.g. -14 dBu)
- adjust -20 dB indication with R 64 (potentiometer on digital print; do not readjust after the first channel has been properly adjusted)
- Feed 30 dB below reference level 1 kHz (e.g. -24 dBu)
- adjust -30 dB indication with R 30 (R 130). Potentiometer is marked **AUDIO OFFSET**
- Repeat all steps until all indications are correct.

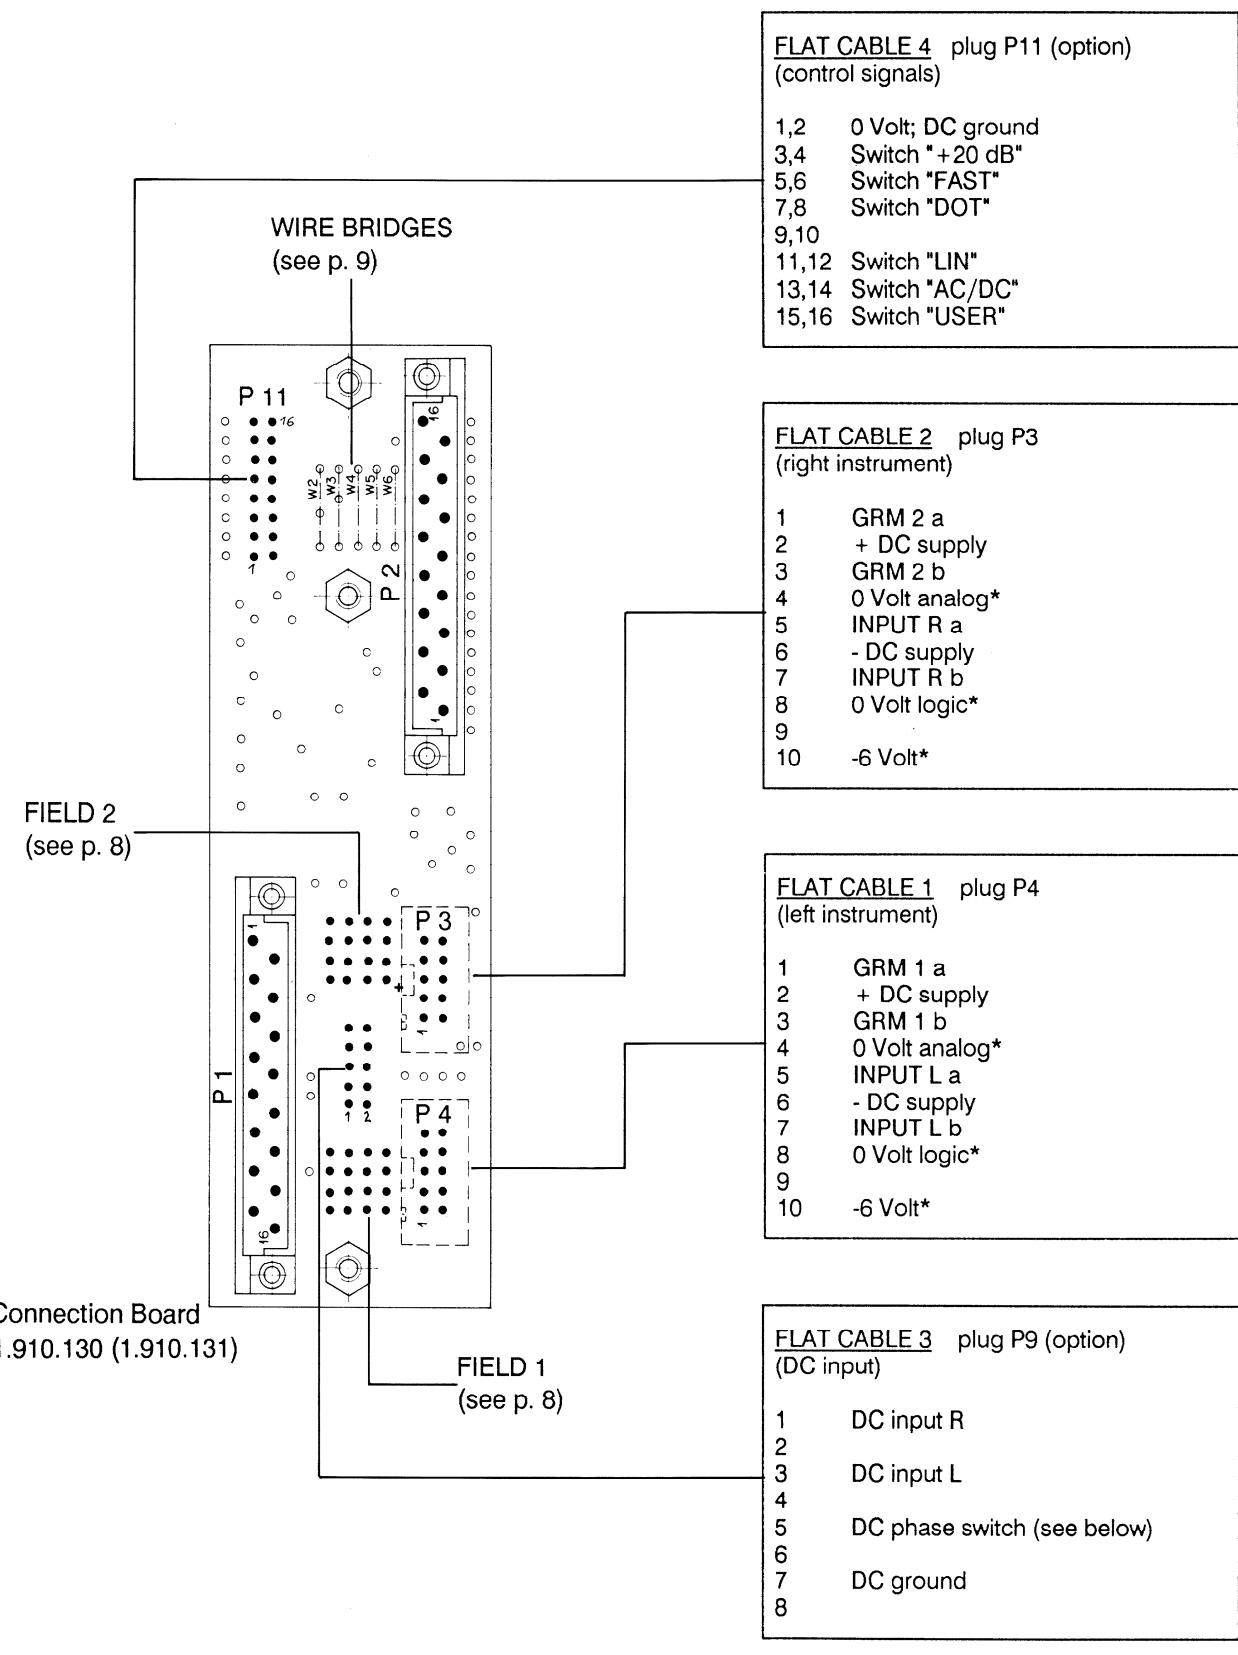

DC Input: Set unit to "DC" and adjust the wanted input phase configuration (see below).

- Feed maximum DC voltage.
- Adjust maximum indication with R 55 (R 155). Potentiometer is marked **DC GAIN**
- Feed minimum DC voltage
- Adjust minimum indication with R 63 (R 163). Potentiometer is marked **DC REF**
- Repeat all steps until all indications are correct.

GRM Input: ■ Feed level 1 kHz required for a indication of +20 dB on the gain reduction meter.

- Adjust indication with R 60 (R 160). Potentiometer is marked **GRM**

3.2 Connections

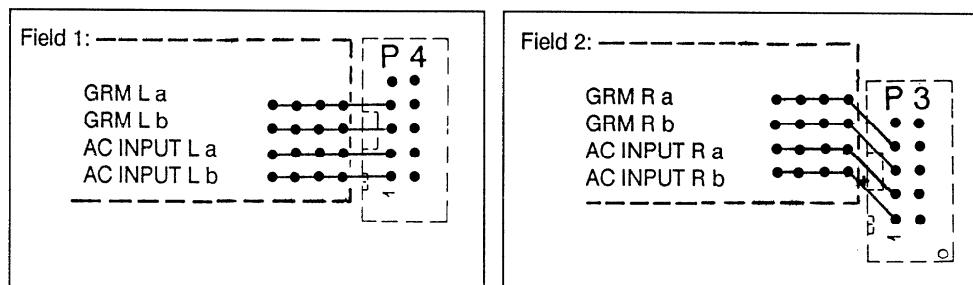

BARGRAPH

If the unit is powered by an unstabilized DC supply, an additional C may be installed (1000 µF, 40 Volt, Order No. 59.22.6102).

Signals marked with an asterisk (*) are not required for the bargraph.

The lines carrying the AC bargraph input and the GRM input signals may also be soldered to the unit (instead of feeding those signals via the flat cables; especially useful for operation outside STUDER mixers). The connection points are:

**DC Supply**

DC can be fed either via flat cable 1 or 2 or directly to the pins marked "+" and "-".

3.3 Function Settings

Some functions can be set both by wire bridges and by external switches. Do not duplicate!

Wire Bridges

BRIDGE	ON	OFF	
W2	■	■	INSTRUMENT ATTACK TIME 0.1 ms STANDARD ATTACK TIME (10 ms in PPM mode)
W3	■	■	GRM INDICATION AS SINGLE DOT GRM INDICATION AS BAR
W4			(reserved for future use)
W5 W6	■	■	PPM INDICATION
W5 W6	■	■	VU INDICATION
W5 W6	■	■	DC LOG INDICATION
W5 W6	■	■	DC LIN INDICATION

External Switches

"ON" means that either the pin is connected to ground (pin 1/2) or that a TTL low level is connected. "OFF" means that either the switch is open (internal pull-up resistor) or that a TTL high level is connected.

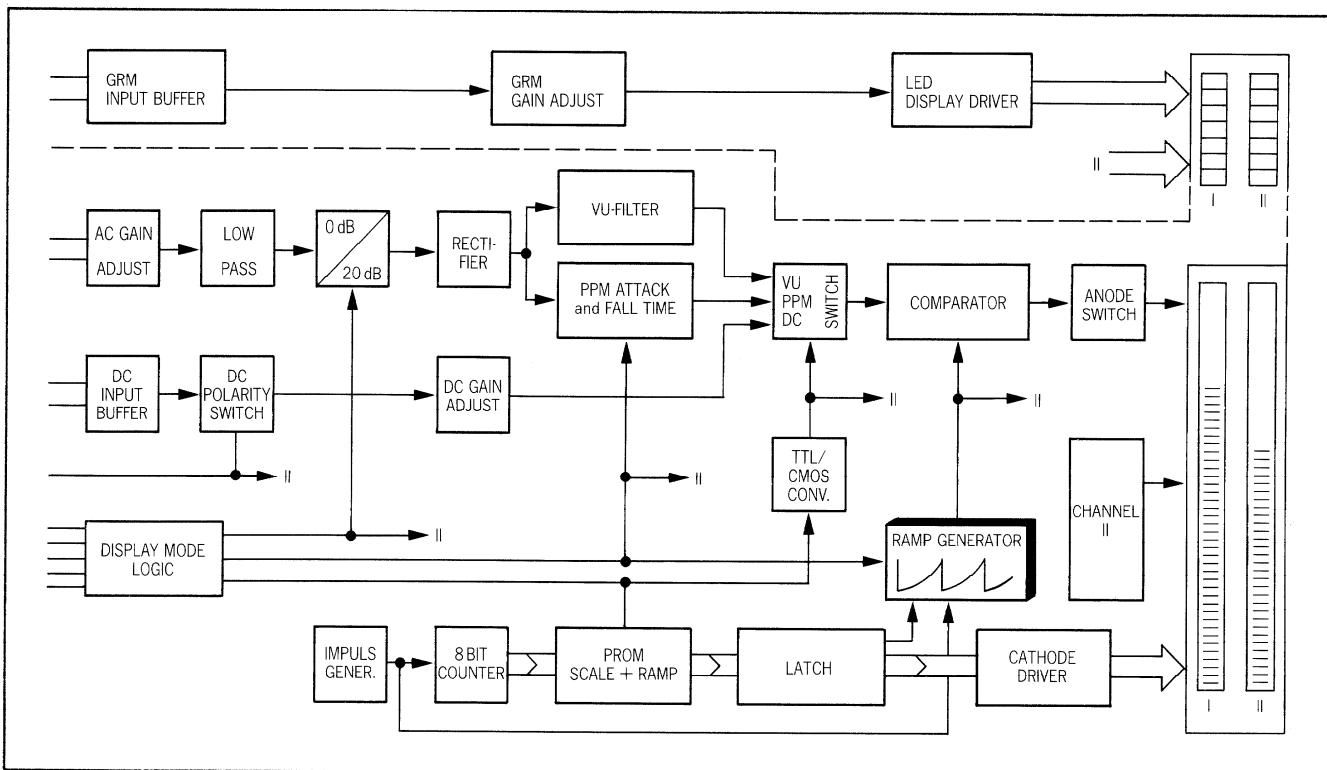

All external switches are connected via flat cable 4 (see above).

PIN	ON	OFF	
1,2			0 VOLT
3,4	■	■	AC GAIN +20 dB AC GAIN 0 dB
5,6	■	■	INSTRUMENT ATTACK TIME 0.1 ms STANDARD ATTACK TIME (10 ms in PPM mode)
7,8	■	■	GRM INDICATION AS SINGLE DOT GRM INDICATION AS BAR
11,12	■	■	LIN INDICATION (if DC selected), VU INDICATION (if AC selected, see 13/14) LOG INDICATION (if DC selected), PPM INDICATION (if AC selected, see 13/14)
13,14	■	■	DC AC
15,16	■	■	USER SWITCH: LED ON FRONT PLATE ON LED ON FRONT PLATE OFF
