SERVICE MANUAL

X-3

Stereo Tape Deck

Effective: September, 1980 A00013

57[illegible]006600

1 SPECIFICATIONS AND SERVICE DATA

SPECIFICATIONS

Track System 4-Track Two-Channel Stereo
Head System 3 heads: erase, record, playback
Reel Size 7" and 5"
Tape Speed 19 cm/s (7-1/2 ips) and 9.5 cm/s (4-3/4 ips)
Inputs (level and impedance)
MIC: Specified input level: −60 dB (0.775 mV)/10 kohms
Min. input level: −70 dB (245 μV)
LINE IN: Specified input level: −12 dB (195 mV)/100 kohms
Min. input level: −22 dB (61.5 mV)
Outputs (level and impedance)
OUTPUT: Specified output level: −5 dB (436 mV)/10 kohms
Max. OUTPUT level: +1 dB (0.869 V)
PHONES: Specified OUTPUT level: −24 dB (48.9 mV)/8 ohms
Playback Equalization
19 cm/s: 3,180 μs + 50 μs (NAB)
9.5 cm/s: 3,180 μs + 90 μs (NAB)
Motors
1 DC Servo Capstan Motor
2 induction Reel Motor
Bias Frequency 100 kHz
Operating Position Vertical, horizontal
Power Requirements
100/117/220/240 V AC, 50/60 Hz, 85 W
(General Export Model)
117 V AC, 60 Hz, 70 W (USA/Canada Model)
220 V AC, 50 Hz, 85 W (Europe Model)
240 V AC, 50 Hz, 85 W (UK/AUS Model)
Weight 14 kg (30-14/16 lbs) net

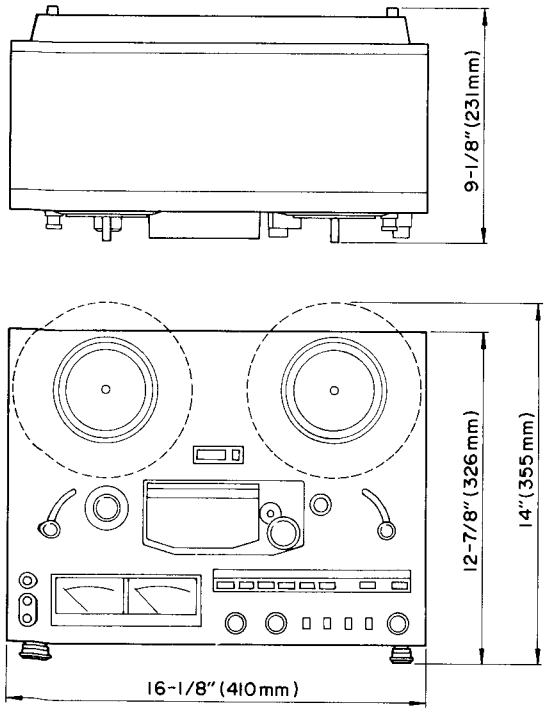

Fig. 1-1 Dimensions

SERVICE DATA

MECHANICAL

Tape Speed Deviation 3,000 Hz ±30 Hz
Tape Speed Drift 20 Hz
Wow and Flutter
Playback: 0.06% (WRMS), 0.12%(RMS) at 19 cm/s
0.10% (WRMS), 0.15% (RMS) at 9.5 cm/s
Record/Playback: 0.08% (WRMS) at 19 cm/s
0.15% (WRMS) at 9.5 cm/s
Pinch Roller Pressure 1.8 ~ 2.2 kg (3.97 ~ 4,85 (lbs)
Reel Torque (Play mode)
Take-up 330 ~ 470 g-cm (4.58 ~ 6.53 oz-inch)
Back tension 220 ~ 280 g-cm (3.06 ~ 3.89 oz-inch)
Brake Torque
Forward direction: 1000 ~ 1300 g-cm (13.9 ~ 18.1 oz-inch)
Reverse direction: 500 ~ 700 g-cm (6.94 ~ 9.72 oz-inch)
Left/right deviation: 200 g-cm (2.78 oz-inch)
Fast Winding Time 140 seconds or less for 550 m (1800 feet)

ELECTRICAL

Frequency Response
Playback:

19 cm/s	40 Hz	+3, −3 dB	9.5 cm/s	40 Hz +3, −3 dB
	400 Hz	0 dB (Ref.)		400 Hz 0 dB (Ref.)
	20 kHz	+3, −3 dB		14 kHz +3, −3 dB

Overall: (BIAS sw: 1, EQ sw: 1)

19 cm/s	40 Hz	+3, −3 dB	9.5 cm/s	40 Hz +3, −3 dB
	400 Hz	0 dB (Ref.)		400 Hz 0 dB (Ref.)
	16 kHz	+3, −3 dB		10 kHz +3, −3 dB
	20 kHz	+3, −4 dB		14 kHz +3, −4 dB

Signal to Noise Ratio
Playback: 49 dB min. at 19 cm/s
47 dB min. at 9.5 cm/s
Overall: 47 dB min. at 19 cm/s
45 dB min. at 9.5 cm/s
Erase efficiency 70 dB min. at 1 kHz (measured with input 10 dB higher than the specified input level)
Channel Separation 50 dB min. at 1 kHz
Adjacent Track Crosstalk 40 dB min. at 125 Hz
Total Harmonic Distortion 1.5% or less at 1 kHz

NOTES:
- Improvements may result in SPECIFICATIONS AND SERVICE DATA changes.
- Value of "dB" in the data refers to 0 dB (0.775 V), except where specified.

CAUTION
⚠ Parts marked with this sign are safety critical components. They must always be replaced with identical components – refer to the TEAC parts list and ensure exact replacement.

2 MECHANICAL ADJUSTMENTS AND CHECKS

2-1 CAPSTAN THRUST CLEARANCE

1. There must be a clearance of 0.1 to 0.3 mm between the capstan shaft and the thrust plate. Check to see that the clearance is within this range. If not, loosen the two screws on the flywheel, adjust the clearance, and retighten the screws.

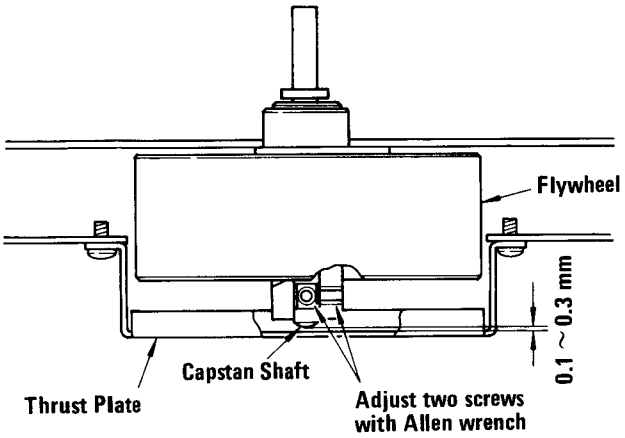

Fig. 2-1

2-2 SHUT-OFF SWITCH POSITION

1. There must be a clearance of 1 to 1.5 mm between the cam and actuator(A) when the microswitch is off, and 0.5 mm between the micro switch and actuator(B) when the microswitch is on. Check to see that the clearance is within these values. If not, adjust as necessary.

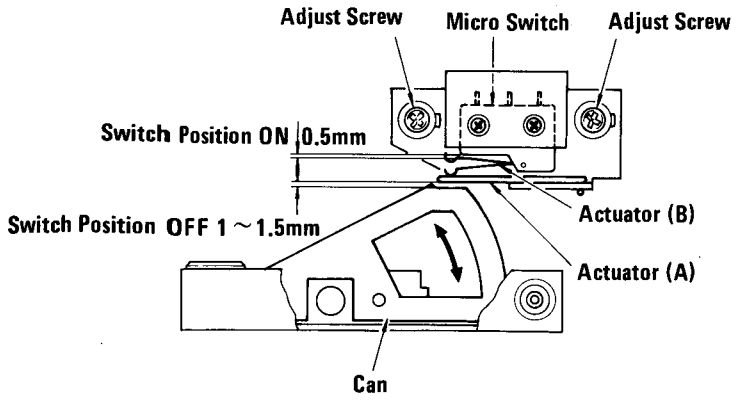

Fig. 2-2

2-3 BRAKE MECHANISM

NOTE: Be sure that the power is turned off prior to making any adjustments to the brakes.

1. Screw(A) for the left brake (as viewed from the front) must be adjusted so that there is a clearance of 1 mm between lever(C) and lever(E). Screw(A) for the right brake must then be adjusted so that lever(B) is parallel to lever(C).
2. Push the plunger until there is contact at (a); i.e., until the clearance has been eliminated, but make sure that the plunger is not pushed so strongly that the levers (E), (C), and (B) are deflected – they must remain in a horizontal plane.
3. Position the solenoid housing, while the plunger is pushed as described in step #2 above, so that the gap at (f) (the distance between the leftmost edge of the plunger and the leftmost edge of the solenoid housing) is between 11 to 12 mm. When the solenoid housing is so positioned, the plunger should be able to be deflected between 1 to 2 mm when pushed strongly.

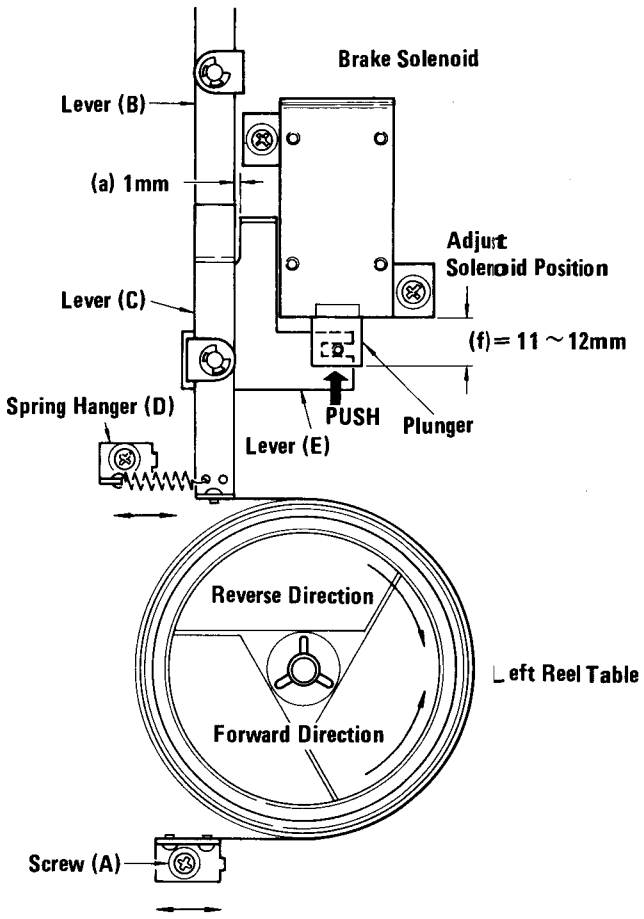

Fig. 2-3

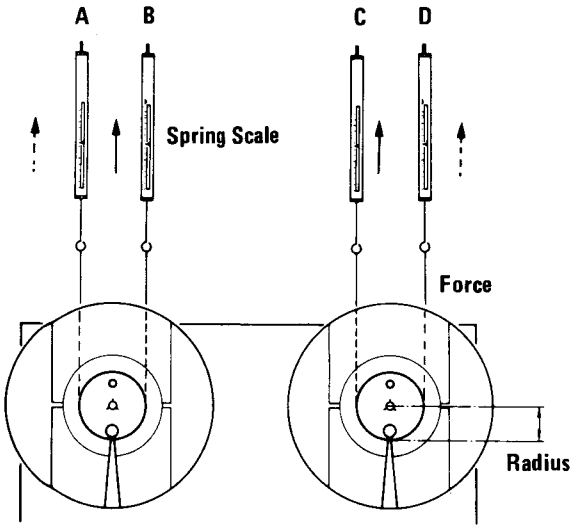
2-4 BRAKE TORQUE

NOTE: Before making any brake adjustments or measurements, make sure the power is off.

1. Mount an empty 7" reel onto either reel table and attach a spring scale to the reel with a string.
2. Smoothly pull the scale away from the reel under test and note the torque value when the reading on the scale is steady. The proper torque values are given in the chart below.
3. Follow steps 1 and 2 for each measuring condition; i.e., (A) through (D) in Fig. 2-4.
4. If the forward-direction torque is not correct, change the hooking position of the spring hanger (reference (D) in Fig. 2-3) for the corresponding brake requiring adjustment. If, after the forward-direction torque has been properly adjusted and the reverse-direction torque is not correct, or the forward-direction torque is still not correct, check to see if the brake felt pad is worn, and also check that the brake mechanism is properly aligned as explained in Section 2-3, "Brake Mechanism". If necessary, replace the entire reel table.



↑ Forward direction (B) (C)	1000 – 1300 g-cm (13.9 – 18.1 oz-inch)
↑ Reverse direction (A) (D)	500 – 700 g-cm (6.94 – 9.72 oz-inch)
Left/Right deviation	200 g-cm (2.78 oz-inch)

Torque calculating formulas:

1. Torque (in g-cm or oz-inch)
   = Force or Weight (in g or oz) x Radius (in cm or inch)
2. Conversion of g-cm to oz-inch:
   g-cm x 0.0139 = oz-inch

Fig. 2-4

2-5 REEL MOTOR TORQUE

(See Fig. 2-5)

NOTE: For torque calculation, refer to the formulas above.

2-5-1 TAKE UP TORQUE

1. Hold the right tension arm up using a rubber band.
2. Mount an empty 7" reel onto the take-up (right) reel table, and attach a spring scale to the reel with a string.
3. Place the deck in the play mode.
4. Allow the rotation of the reel to slowly pull the scale toward the reel.
5. Hold the spring scale with enough force to allow steady reading.
6. The proper value is between 330 g-cm (4.58 oz-inch) to 470 g-cm (6.53 oz-inch).
7. There is no specially-provided adjustment for take-up torque, so if correction is needed, repair or replace the defective part and/or circuit.

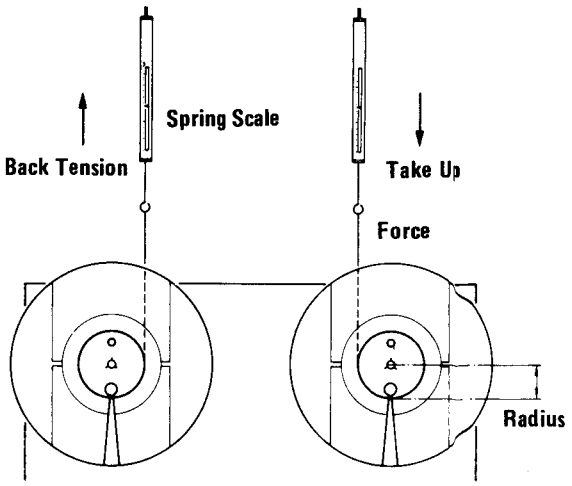


Fig. 2-5

2-5-2 BACK TENSION

1. Hold the right tension arm up using a rubber band.
2. Mount an empty 7" reel onto the supply (left) reel table, and attach a spring scale to the reel with a string.
3. Place the deck in the play mode.
4. Using a steady, smooth motion, pull against the motor torque to draw the scale away from the reel.
5. After making sure that the reel motion is smooth (the string should not be rubbing against the reel flanges), note the value indicated on the scale.
6. The proper value is between 220 g-cm (3.06 oz-inch) and 280 g-cm (3.69 oz-inch).
7. If necessary, adjust the slider of the resistor (R802) until the proper torque value is obtained. See Fig. 2-6.

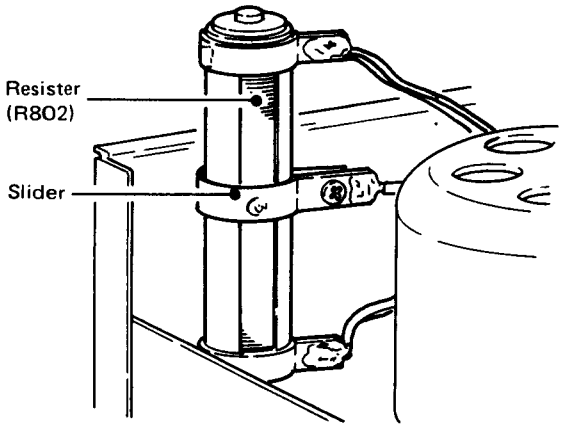

Fig. 2-6

2-6 PINCH ROLLER PRESSURE

1. Hold the right tension arm using a rubber band, string, etc.
2. Place the deck in the play mode without threading any tape.
3. Attach a spring scale to the pinch roller as shown in Fig. 2-7.
4. Pull the pinch roller away from the capstan shaft (on a plane intersecting the center of the capstan shaft and the pinch roller) until the capstan shaft and the pinch roller are separated.
5. Ease pressure on the scale until the pinch roller just begins to turn. The scale should then be read 1.8 kg to 2.2 kg (3-15/16 lbs to 4-7/8 lbs).

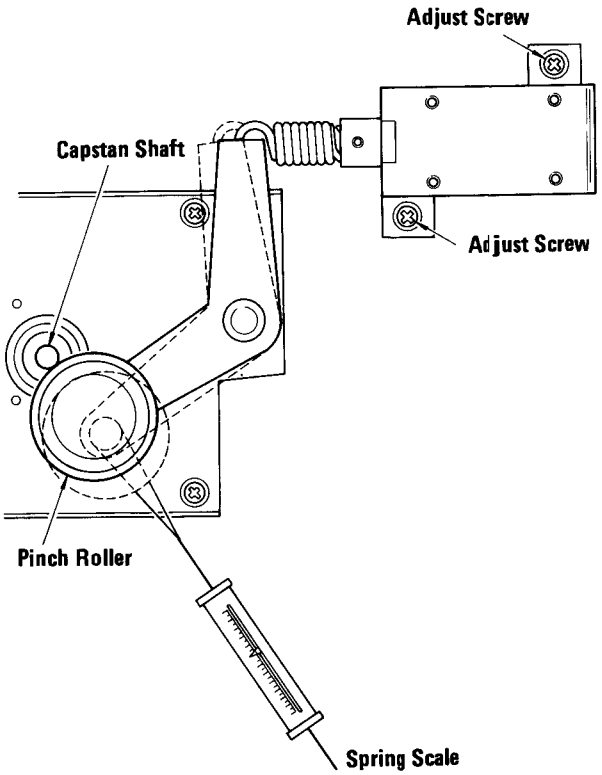

Fig. 2-7

2-7 REEL TABLE HEIGHT

1. As a general reference, the height of the reel table should roughly correspond to a distance of 38 mm (1-7/16") between the chassis of the deck and the rubber mat on the reel table. If checking reveals any large deviation from this value, loosen the two adjustment screws on the reel table, adjust the height, and retighten the screws.
2. For fine-adjustment, check that, while in fast-forward (forward direction) or rewind (reverse direction) modes starting at the beginning of the tape, the tape does not touch the upper or lower reel flanges. If it does, fine-adjust accordingly.

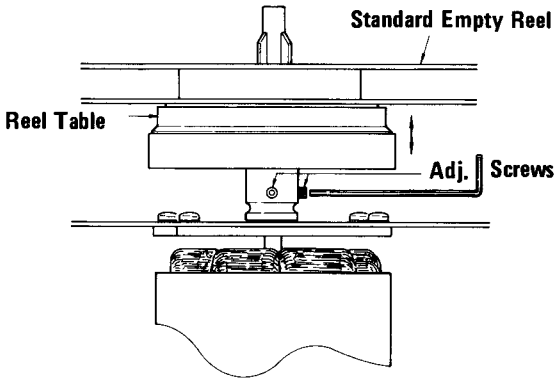

Fig. 2-8

2-8 TAPE SPEED

1. Connect a frequency counter to either OUTPUT jack. (See Fig. 2-9).
2. Load a TEAC YTT-2003 test tape containing a 3000-Hz test tone, and set the SPEED switch to HIGH (19 cm/sec or 7-1/2 ips).
3. Play the middle of the test tape and adjust the HIGH speed trimmer resistor until the frequency counter indicates a reading of 3000 Hz. See Fig. 2-10.(CAUTION: Use an insulated screwdriver to prevent shorting.)
4. Playing the tape at both the beginning and the end, check that the tape speed does not vary any more than the limits prescribed in the specifications, so that there is never a total deviation of more than ±30 Hz from the 3000-Hz test tone, nor a drift of more than 20 Hz at any given time.
5. Using a TEAC YTT-2002 test tape, repeat steps #3 and #4 above with the SPEED switch set to LOW (9.5 cm/sec or 3-3/4 ips). In step #3, the speed may be adjusted for the proper initial setting by using the LOW speed trimmer resistor.

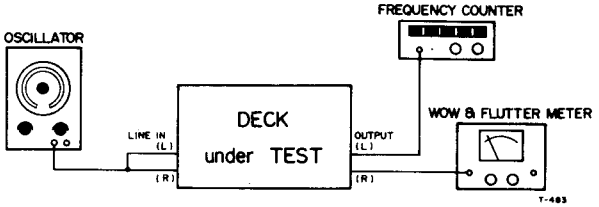

Fig. 2-9

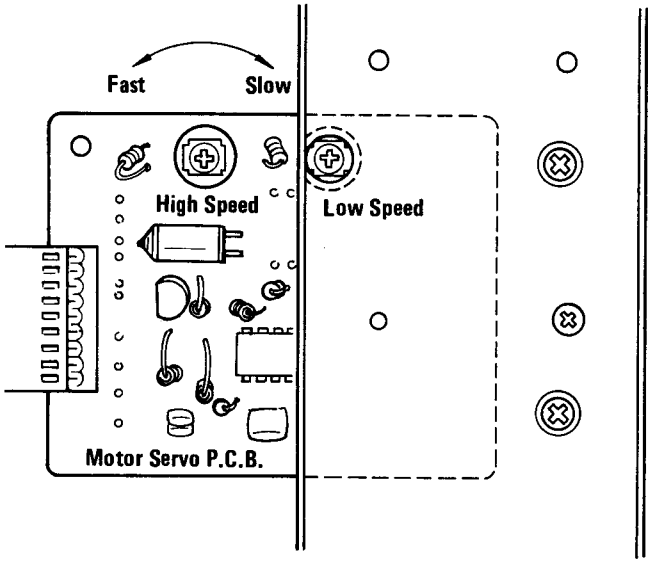

Fig. 2-10

2-9 WOW AND FLUTTER

(See Fig. 2-9)

PLAYBACK

1. Connect a wow-and-flutter meter to the deck as shown in Fig. 2-9.
2. Load a TEAC YTT-2003 test tape to check the wow and flutter when the deck is set to HIGH speed, or a YTT-2002 test tape to check when set to LOW speed.
3. Play the beginning and end of the respective test tape for each speed setting. The measured wow and flutter should be at least 0.06% (WRMS) and 0.12% (RMS) for the HIGH speed setting and at least 0.10% (WRMS) and 0.15% (RMS) for the LOW speed setting.

OVERALL

4. Load a TEAC YTT-8013 test tape and record a 3000-Hz signal on it in both HIGH and LOW speed settings and at the beginning and end of the tape, and while recording the signal, simultaneously monitor the signal from the play head by setting the MONITOR switch to the TAPE position (raised position).
5. The wow-and-flutter meter should indicate a reading of no more than 0.08% (WRMS) in the HIGH speed setting and no more than 0.15% (WRMS) in the LOW speed setting.

2-10 HEAD AND TAPE PATH ALIGNMENT

2-10-1 HEAD CONFIGURATION

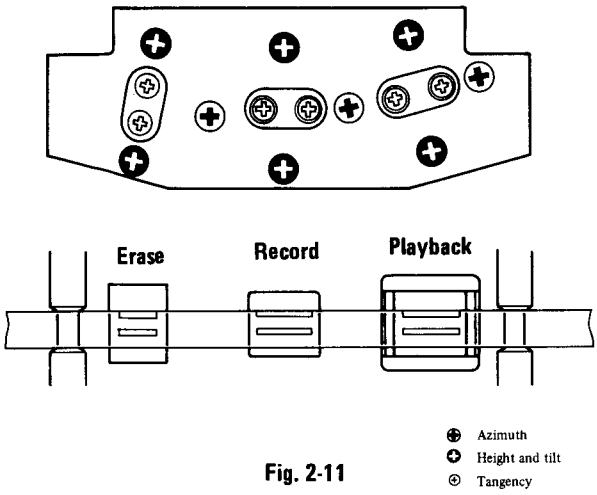

Fig. 2-11

2-10-2 ALIGNMENT CONDITIONS

Adjust each head to satisfy each of the following conditions:

Condition	Example of Mis-alignment
TILT The head surface should be parallel to the tape guide pin surface.	
AZIMUTH The gap of the head core should be perpendicular to the tape path.	
HEIGHT The upper edge of the upper core of the head should be level with the upper edge of the tape.	
TANGENCY The dotted line should be perpendicular to the surface of the tape.	

Fig. 2-12 Head regulation elements

2-10-3 ALIGNMENT PROCEDURE

1. By visual observation, align the erase, record, and playback heads so that the proper tilt is obtained for each.
2. Coarse-adjust the azimuth of the erase, record, and playback heads by observing each without a tape threaded.
3. Load a TEAC YTT-8013 test tape and play it.
4. The erase head core should protrude 0.1 mm above the tape while in motion. If not, readjust the azimuth and recheck the tilt and height. Adjust as necessary.
5. Fine-adjust the height of the record and playback heads until the brass-colored spacers appear above the moving tape. (The brass-colored spacers appear about as thin as a pencil line.) When adjusting, make sure all the screws are turned proportionately so that the tilt and azimuth previously adjusted is not altered.
6. If required, make a coarse adjustment of any head requiring tangency correction, while the tape is running.

2-11 FREQUENCY AND VOLTAGE CONVERSION

General Export Models Only:

If it is necessary to change the frequency and line voltage settings, follow the instructions below:

ALWAYS DISCONNECT THE POWER LINE CORD BEFORE MAKING THESE ADJUSTMENTS.

1. Remove the metal housing* covering the top and sides of the deck by unscrewing the three screws from each side.
2. Locate the voltage selector on the right (as seen from the front). The frequency selectors are located near each motor as illustrated.

Voltage Conversion:

3. Turn the slotted center post of the selector with a screwdriver or coin as illustrated until the proper setting is obtained.

Frequency Conversion:

4. For each reel motor, loosen the screws on the respective frequency selector bar and jumper the bar to the terminal corresponding to the AC line frequency of your area, then retighten the screws.
5. Replace the housing and retighten the screws.

* Decks in some areas have a wooden case which can be removed by unscrewing the screws on the bottom (feet) and sides.

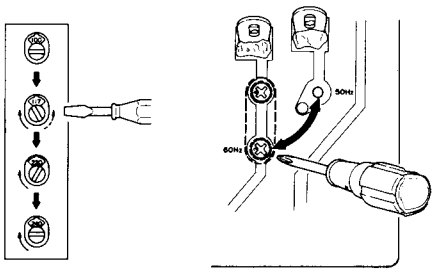

Fig. 2-13

2-12 LUBRICATION

Oiling is needed after every 1,000 hours of operation or once a year if the deck is used infrequently. TEAC spindle oil (from TEAC TZ-255 oil kit), Mobil D.T.E. Oil Light, and similar types of oil are recommended. Lubrication is normally not necessary except at the points shown.

1. Place the deck in a horizontal position.
2. Apply a few drops of oil to the respective spindles shown, except the capstan and the reel motors. Spread the oil evenly on the spindle surfaces using a cotton cloth or similar applicator.
3. For the capstan and reel motors, apply a few drops to the indicated positions but do not spread the oil.
4. After oiling all points, operate the deck for 1 to 2 hours until the oil is thoroughly absorbed.

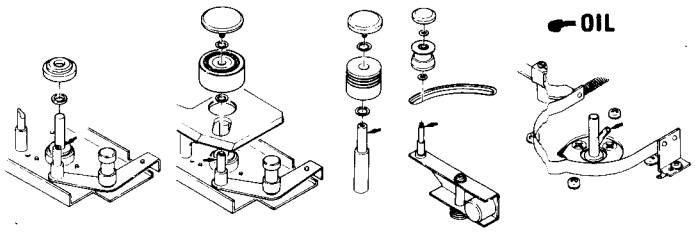

Fig. 2-14

3 ELECTRICAL ADJUSTMENTS AND CHECKS

NOTES:
1. Clean and demagnetize the entire tape path prior to making any adjustments or checks.
2. Make sure that the deck is properly set for the voltage in your area.
3. Adjustments and checks are generally done in order of L-ch, then R-ch. Double reference numbers indicate L-ch/R-ch.
   (Example: R121/R221)
4. The value of "dB" refers to 0 dB (0.775 V). If an AC voltmeter calibrated to 0 dB (1 V) is used, compensation should be made accordingly.
5. An AC voltmeter with an input impedance of 1 M ohms or more must be used.

3-1 POWER SUPPLY CHECK

1. Connect a DC voltmeter to pin 15 of U101 on the Record/Play back PCB.
2. The DC voltage should be +12 V. (See Fig. 3-1)

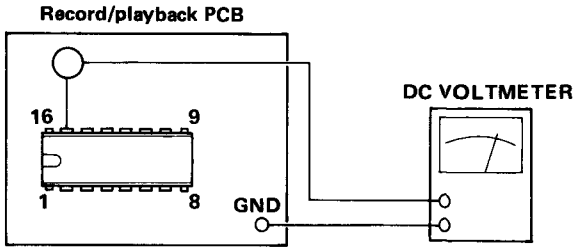

Fig. 3-1

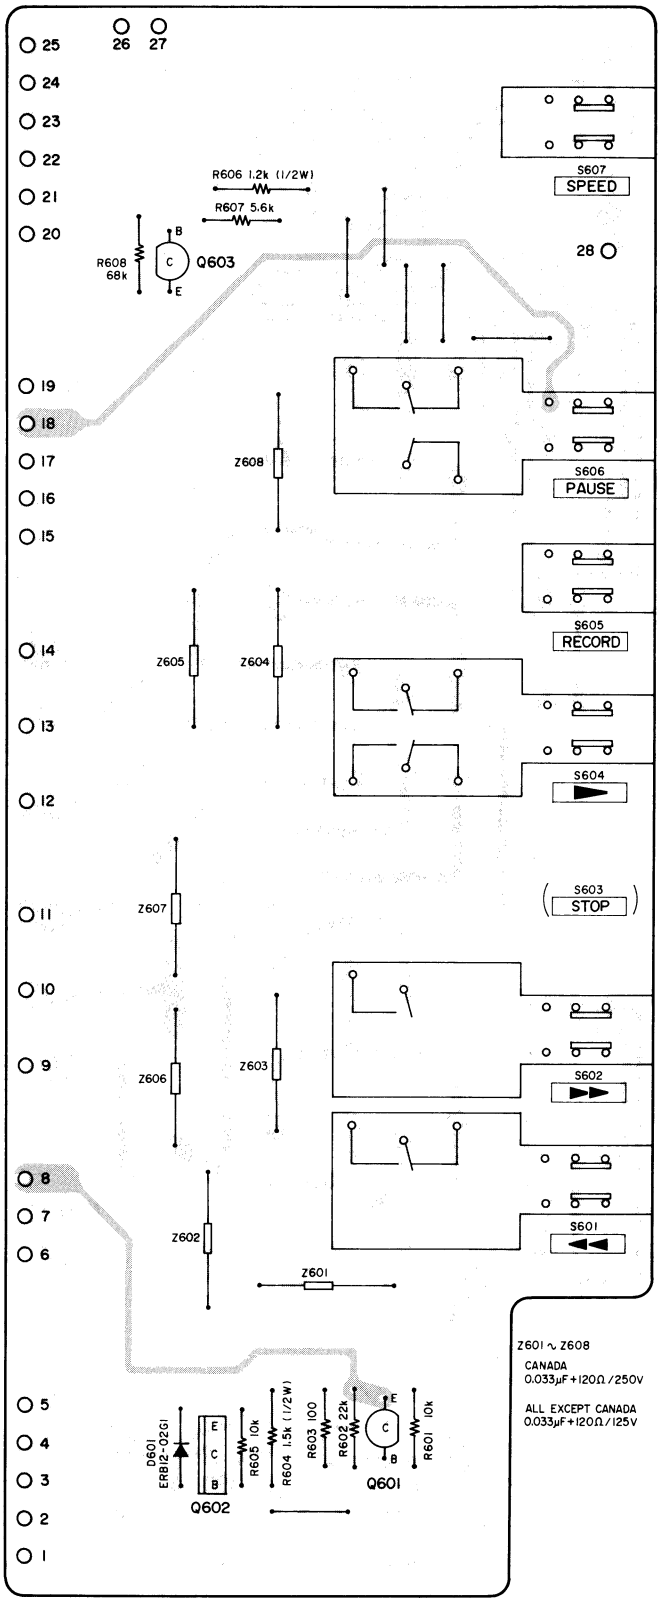
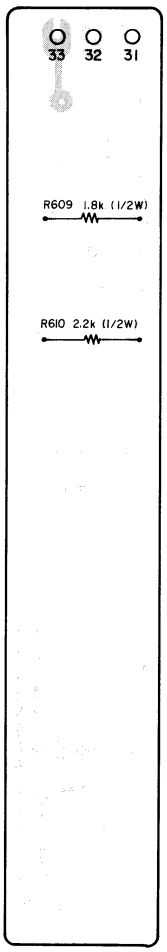
7 PC BOARDS AND PARTS LIST

PC Boards shown viewed from foil side except CONTROL PCB B ASSY.

CONTROL PCB A ASSY

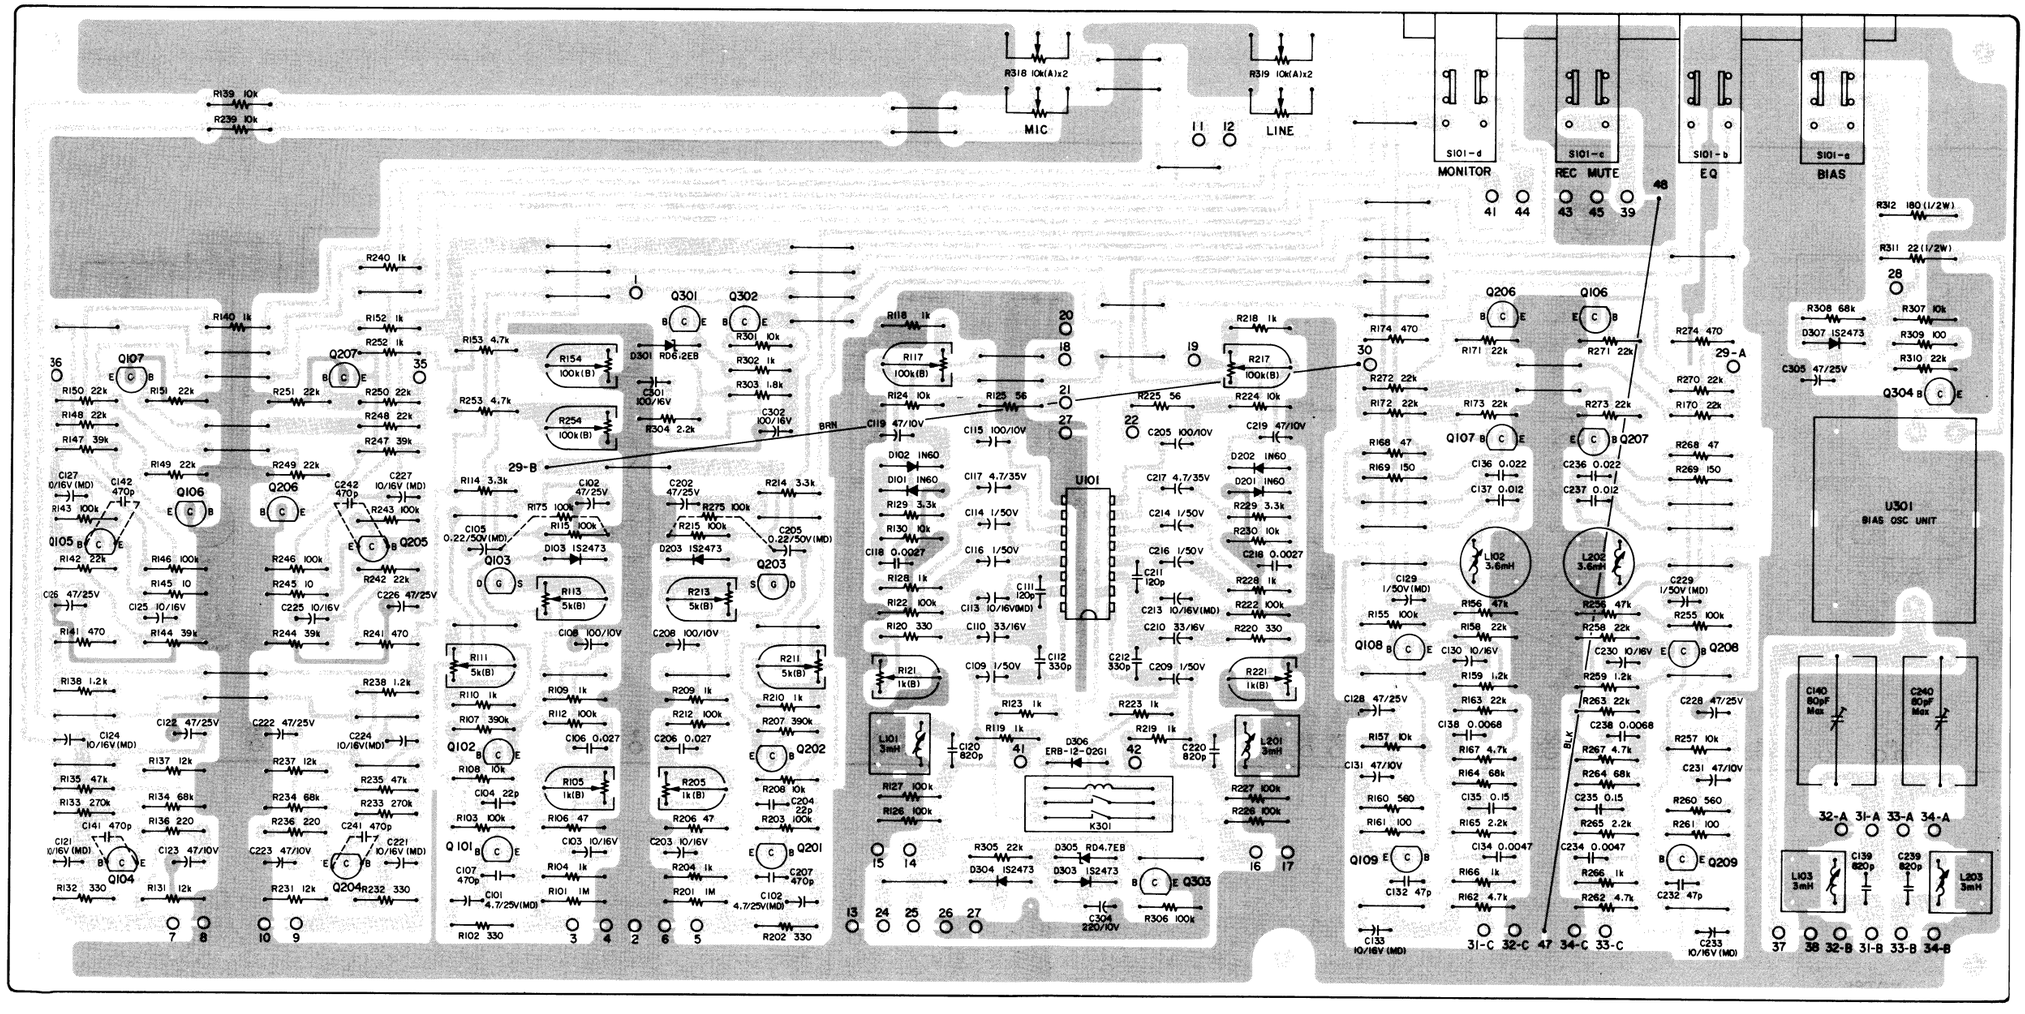


CONTROL PCB B ASSY

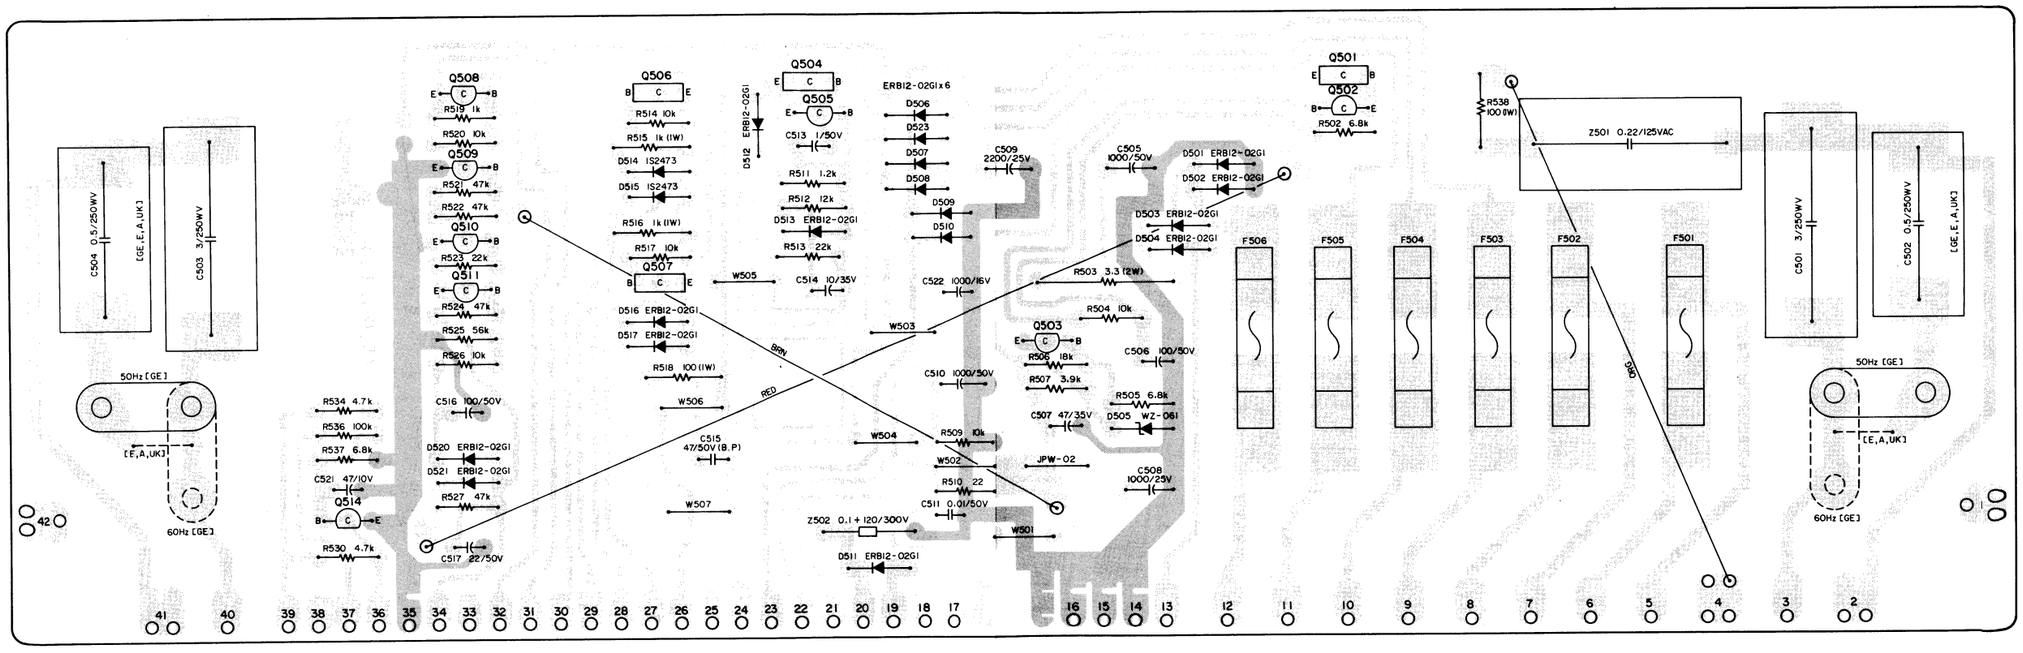


PC Board shown viewed from component side.

REC/PLAY AMPL PCB ASSY



POWER SUPPLY PCB ASSY



NOTES

1. The colors used on the PCB illustrations have the following significance:
   - ▭ +B power supply circuit
   - ▭ : GND
   - ▭ : Other
2. Resistor values are in ohms (k = 1,000 ohms, M = 1,000,000 ohms).
3. All capacitor values are in microfarads (p = picofarads).

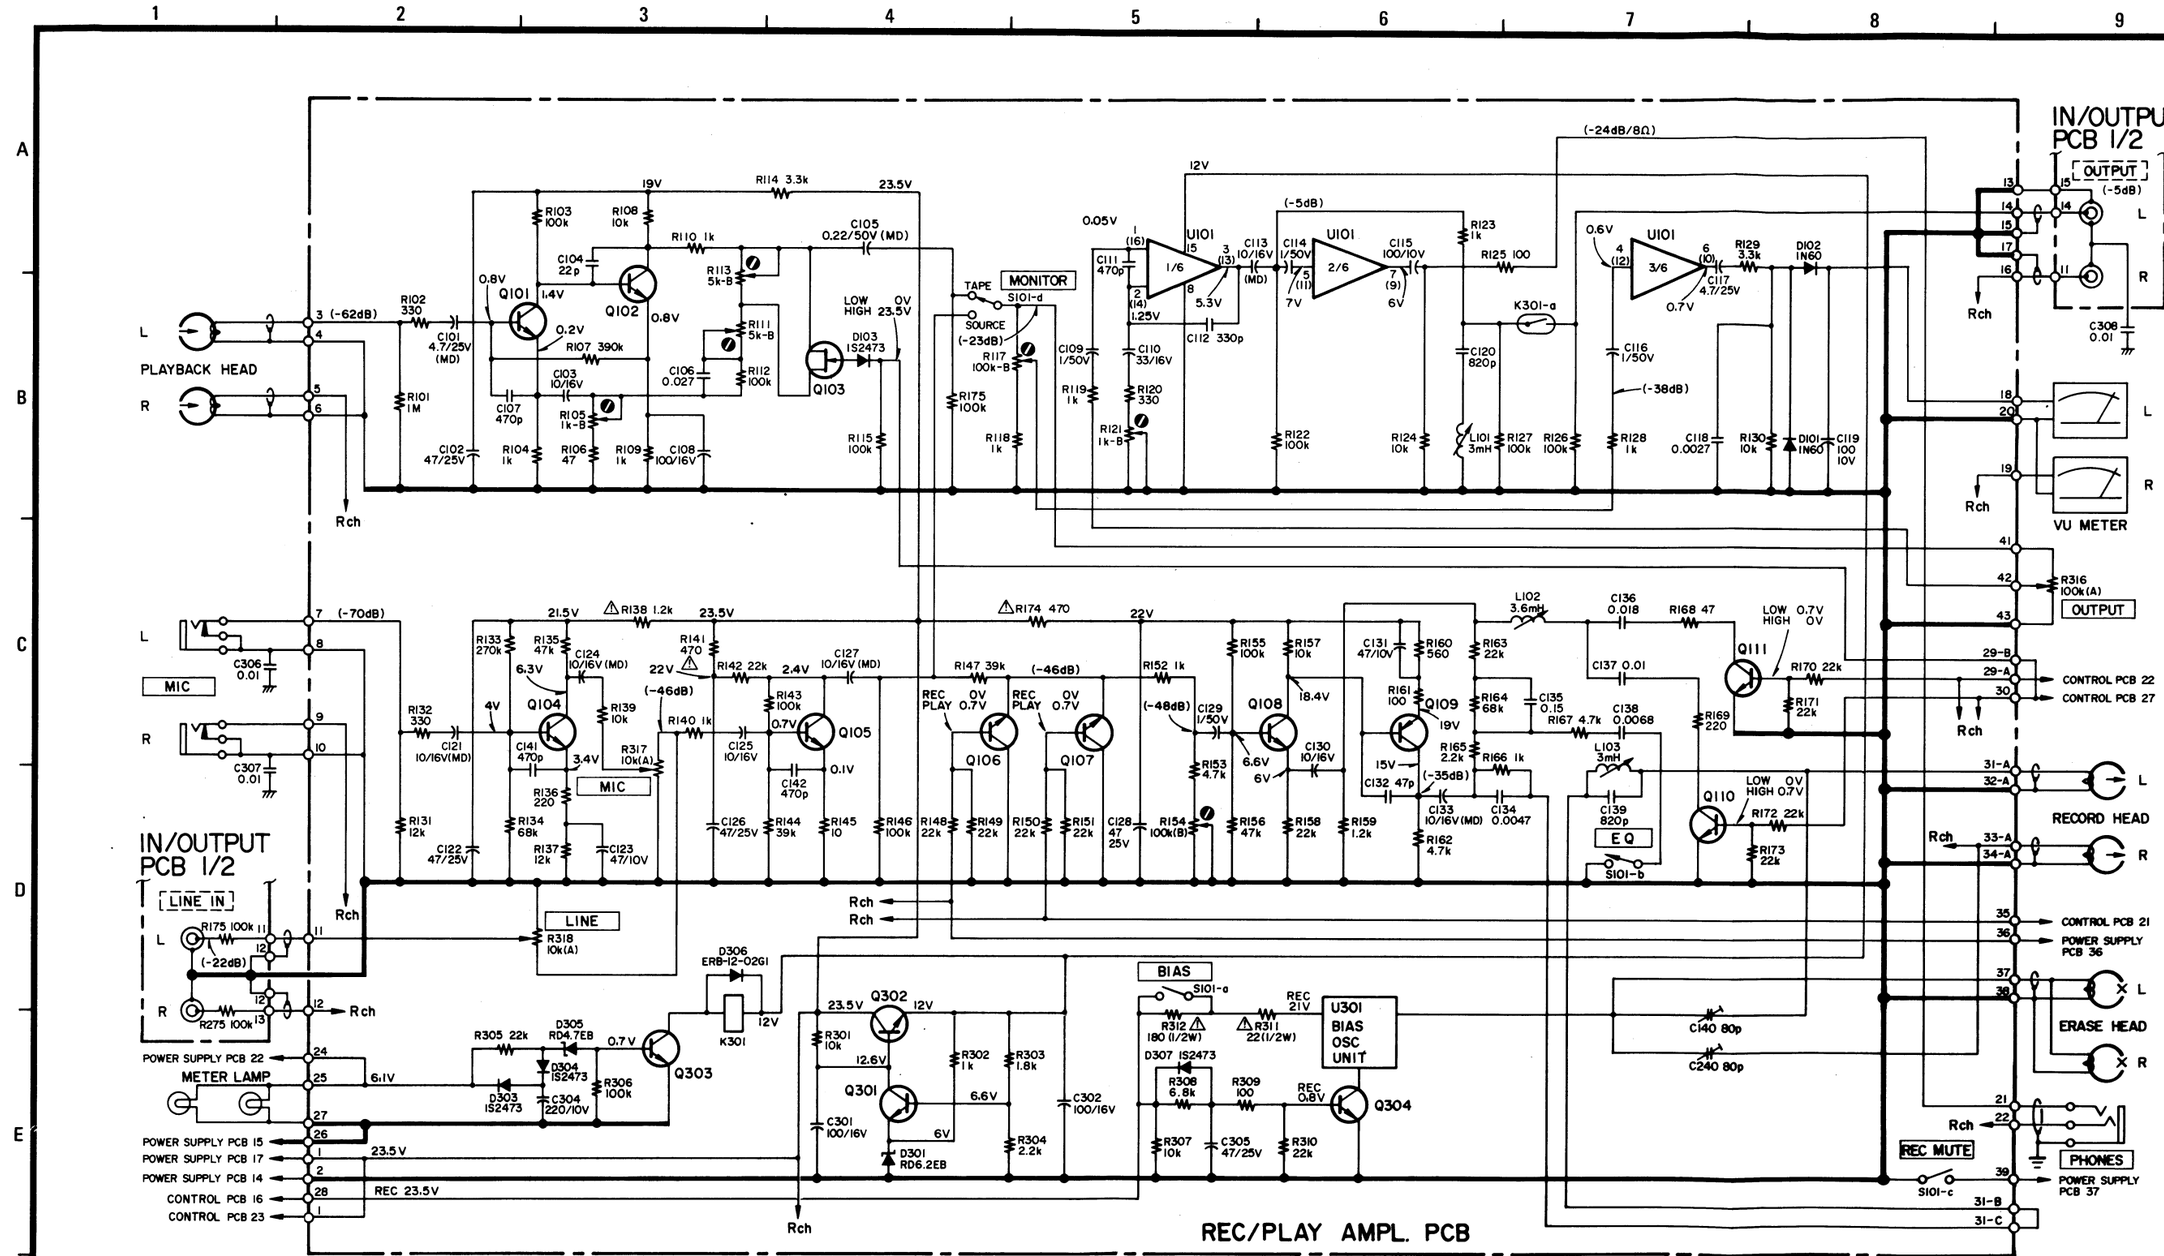
TEAC SCHEMATIC DIAGRAM (AMPLIFIER)



NOTES

1. Schematic diagram shown for left channel except for some of the components.
2. All resistors are ¼ watt, ±5%, unless marked otherwise.
   Resistor values are in ohms (k = 1,000 ohms, M = 1,000,000 ohms).
3. All capacitor values are in microfarads (p = picofarads).
4. ⚠ Parts marked with this sign are safety critical components. They must always be replaced with identical components-refer to the TEAC parts list and ensure exact replacement.
5. Voltage and level values are for reference only.
6. DC voltages were measured during REC/PAUSE mode unless otherwise noted.
7. 0 dB = 0.775V
8. ——— +B power supply circuit
