## ■ IMPORTANT NOTICE

# IMPORTANT NOTICE

This manual has been provided for the use of authorized Yamaha Retailers and their service personnel. It has been assumed that basic service procedures inherent to the industry, and more specifically Yamaha Products, are already known and understood by the users, and have therefore not been restated.

**WARNING:** Failure to follow appropriate service and safety procedures when servicing this product may result in personal injury, destruction of expensive components and failure of the product to perform as specified. For these reasons, we advise all Yamaha product owners that all service required should be performed by an authorized Yamaha Retailer or the appointed service representative.

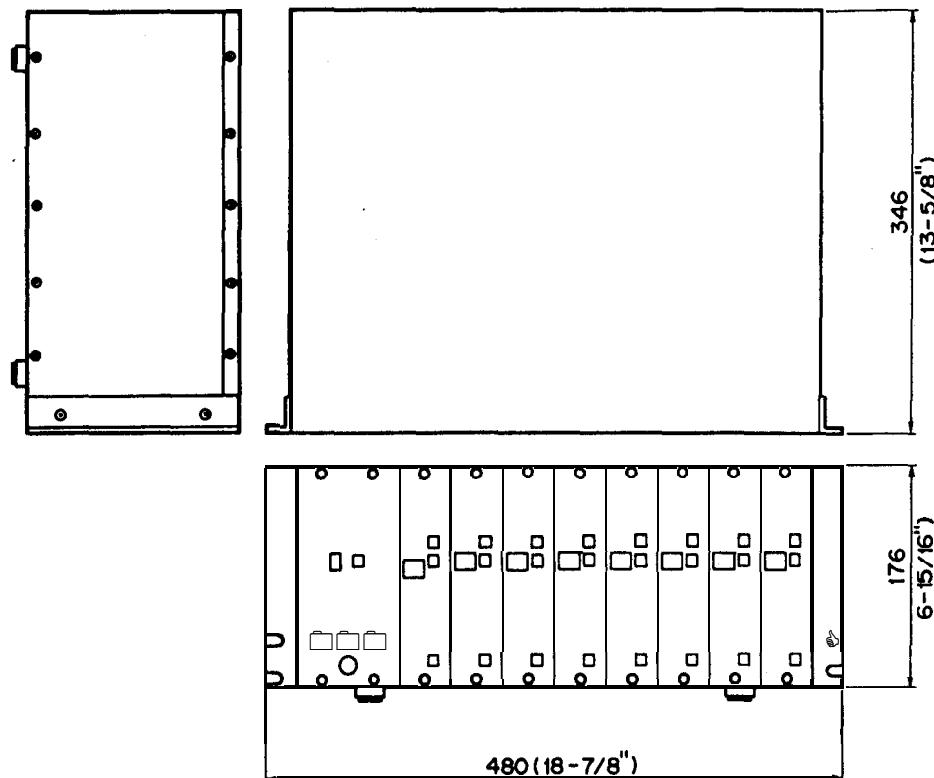

**IMPORTANT:** The presentation or sale of this manual to any individual or firm does not constitute authorization, certification, recognition of any applicable technical capabilities, or establish a principleagent relationship of any form.

The data provided is believed to be accurate and applicable to the unit/s indicated on the cover. The research, engineering, and service departments of Yamaha are continually striving to improve Yamaha products. Modifications are, therefore, inevitable and changes in specification are subject to change without notice or obligation to retrofit. Should any discrepancy appear to exist, please contact the distributor's Service Division.

**WARNING:** Static discharges can destroy expensive components. Discharge any static electricity your body may have accumulated by grounding yourself to the ground buss in the unit (heavy gauge black wires connect to this buss).

**IMPORTANT:** Turn the unit OFF during disassembly and parts replacement. Recheck all work before you apply power to the unit.

## ■ DIMENSIONS

<b>DIMENSIONS</b> (WxHxD)	480x176x346 mm (18-7/8"x6-15/16"x13-5/8")
<b>WEIGHT</b>	600 g (1 lbs. 5 oz.)
<b>STANDARD ACCESSORIES</b>	MIDI Cable (1.5 m (5 ft.11 Socket wrench

### ERROR DISPLAYS

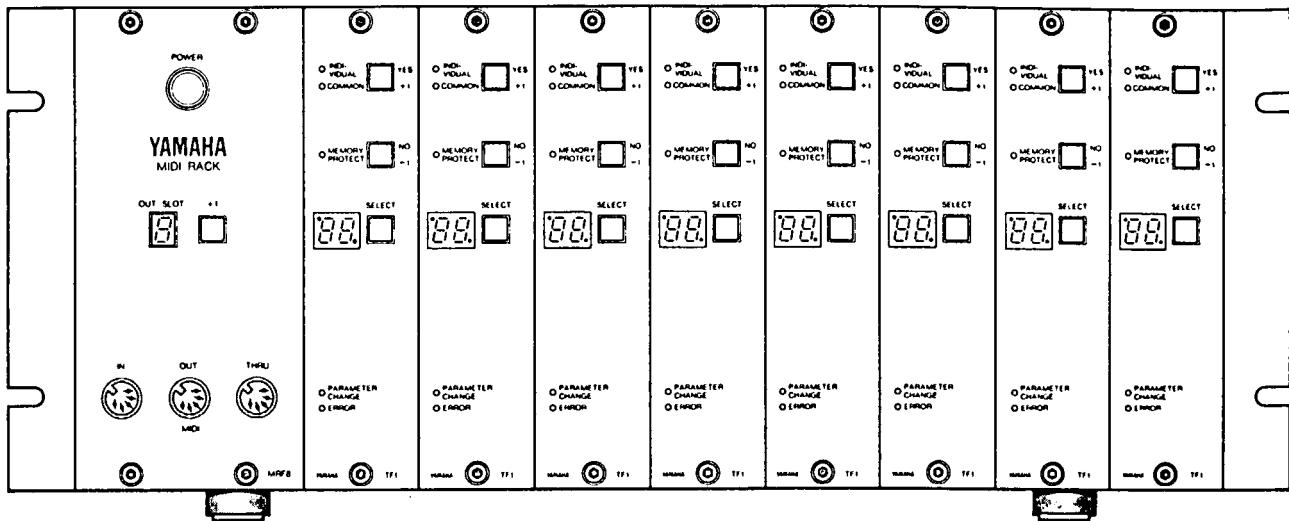

A number of error displays are built into each TFI to let you know if any internal problems are occurring. The red Error LED will light, and a number will appear in the LED Display to inform you of the type of problem. You can cancel the error display by pressing any of the three keys on the front of the module. The following chart lists the ten types of errors, and how to deal with them.

LED DISPLAY	ERROR	REMEDY
1	Data Receive Error	Indicates that data has not been properly received. Adjust the data at the source and transmit data again
2	Receive Buffer Full	
3	Bulk Data Check Sum Error	
4	Low Battery Level	Replace Battery
5	ROM Hardware Error	These errors are all caused by a fault in the internal circuitry
6	RAM1 Hardware Error	the TFI, and you will need to contact Your nearest Yamaha dealer.
7	RAM2 Hardware Error	
8	RAM3 Hardware Error	
9	RAM4 Hardware Error	
10	Trap Error	

All specifications are subject to change without notice.

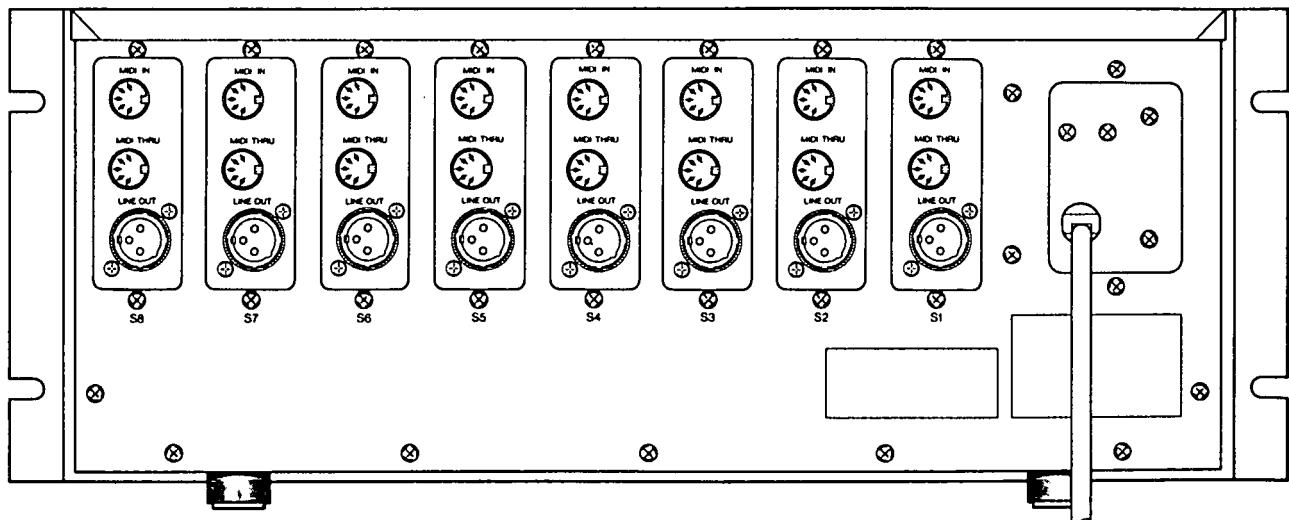

## ■ PANEL LAYOUT

- FRONT PANEL

TX816

- REAR PANEL

TX816

## ■ TX816 BRIEF DESCRIPTION

### 1. TX816 Configuration

The TX816 consists of an MIDI rack main frame and eight TF1 FM tone modules. The TF1 is similar to the DX7, excluding the keyboard. The TF1 rear panel is equipped with the MIDI IN and THRU jacks and an XLR balanced output connector. The MIDI rack main frame is equipped with a power supply unit, MIDI IN, OUT, and THRU jacks, and MIDI out slot selector. When the TF1 "INDIVIDUAL" LED is on, the TF1 receives an MIDI message through the TF1 rear panel MIDI IN. If the "COMMON" LED is on, the TF1 receives messages through the front panel MIDI IN. The MIDI OUT transmits a TF1 MIDI message with a number which is displayed on the OUT SLOT LED. The power supply unit is very similar to the one used in the DX1.

### 2. TF1 circuit

The TF1 MPU is HD6303X. This MPU contains Asynchronous Communications Interface Adapter (ACIA), I/O port, and RAM. The ACIA is used for MIDI message transmission/reception, and the I/O port is used for switch on/off detection and LED lighting. The FM tone generator LSIs (EGS and OPS) are the same as those used in the DX7.

#### 2.1 MPU (HD6303X)

- **Vcc and Vss**  
Vcc represents a +5V supply voltage, and Vss represents a GND terminal.
- **XTAL and EXTAL**  
A 4 MHz crystal resonator is connected between these two terminals. The 4 MHz clock is divided by four and becomes a 1 MHz system clock.
- **MP<sub>0</sub> and MP<sub>1</sub>**  
These terminals are used to set the MPU operation mode, that is, MP<sub>0</sub> = "High" and MP<sub>1</sub> = "Low".
- **RES**  
This terminal is used to reset the MPU.
- **STBY**  
This terminal is used to set the MPU in a standby mode. However, this is not used in this circuit, and its fixed to "High" logic level.
- **NMI**  
This is a nonmaskable interrupt terminal. However, this is not used in this circuit, and its fixed to "High" logic level.
- **Port 2**  
The ports P<sub>20</sub> through P<sub>27</sub> are used for the following purposes in this circuit:
  - P<sub>20</sub> (out): MIDI IN INDIVIDUAL/COMMON changeover
  - P<sub>21</sub> (out): "INDIVIDUAL" LED lighting
  - P<sub>22</sub> (out): "COMMON" LED lighting
  - P<sub>23</sub> (in): MIDI message receiving
  - P<sub>24</sub> (out): MIDI message transmission
  - P<sub>25</sub> (out): "MEMORY PROTECT" LED lighting
  - P<sub>26</sub> (out): "PARAMETER CHANGE" LED lighting
  - P<sub>27</sub> (out): "ERROR" LED lighting

- Port 5

Ports  $P_{50}$  through  $P_{57}$  are used for the following purposes in this circuit:

- $P_{50}$  (in): Battery voltage detection
- $P_{51}$  (in): MIDI OUT slot switching
- $P_{52}$  (in): This is a memory ready terminal to lengthen the E (enable) clock "High" period.  
This terminal is fixed to "High" logic level, so the E clock is a normal continuous clock.
- $P_{53}$  (in): This is a HALT terminal to stop execution of the command and open the bus. This terminal is fixed to "High", so the halt mechanism cannot be initiated.
- $P_{54}$  (in): This is fixed to "High" logic level because it is not used.
- $P_{55}$  (in): "INDIVIDUAL/COMMON" switch detection
- $P_{56}$  (in): "MEMORY PROTECT" switch detection
- $P_{57}$  (in): "SELECT" switch detection

- Port 6

The ports  $P_{60}$  through  $P_{67}$  are connected to the HA17408 Digital to Analog Converter (IC10), which outputs the data for the level attendant and battery voltage comparator.

- Bus

$A_0$  through  $A_{15}$  represent the address bus, and  $D_0$  through  $D_7$  represent the data bus.

- BA

This is a bus available terminal will outputs "High" logic level when the MPU receives a HALT command and the buses become available. This terminal is not used in this circuit.

- LIR

This terminal indicates whether the command operation code is loaded in the data bus. This terminal is not used in this circuit.

- R/W

This outputs a "High" logic level when the MPU is in the read mode, and a "Low" logic level when the MPU is in the write mode.

- WR

This outputs a "Low" logic leve when the MPU is in the write mode.

- RD

This outputs a "Low" logic level when the MPU is in the read mode.

- E

This is an enable terminal to output the system clock.

## 2.2 System reset

When power is on, IC20 (PST518) generates a system reset signal. Pin 12 (IC20) outputs a RES signal, and Pin 10 (IC20) outputs a RES signal. The RES signal is sent to the EGS, the battery backup circuit and the output muting circuit.

## 2.3 MIDI IN

The MIDI IN is provided with a rear panel INDIVIDUAL MIDI jack and a front panel COMMON MIDI jack. If the MIDI IN is switched to INDIVIDUAL with the INDIVIDUAL/COMMON switch, the MPU port  $P_{21}$  will be "Low" and LED 1 will light. Simultaneously, the MPU port  $P_{20}$  will be "Low" and the MIDI message is input to the panel MIDI IN jack will be input to the MPU port  $P_{23}$ . If the MIDI IN is switched to COMMON, port  $P_{22}$  will be "Low" and LED 2 will light. And simultaneously port  $P_{20}$  will be "High" and the MIDI message is input from the panel MIDI IN jack to port  $P_{23}$ . The received MIDI message is written in the intra-MPU ACIA receive shift register.

## 2.4 MIDI OUT

If a "Low" logic level is input to the MPU port  $P_{51}$  with the panel OUT SLOT switch, the MIDI message which is read by the intra-MPU ACIA transmit shift register is output from port  $P_{24}$  and then sent to the front panel MIDI OUT jack.

## 2.5 Digital to analog (D/A) converter

MPU Port 6, 8 bits of data is converted into an analog current by the IC10, and into an analog voltage by the IC32. This analog voltage is generally used to drive the level attenuator photocoupler, but, in the case of the UTILITY mode, it is used for comparison with battery voltage so that the backup battery voltage can be displayed. The current through the photocoupler LED will then be reduced instantly. But this poses no problems with audibility, due to slow photocoupler response speed.

## 2.6 Address decoder and address map

The IC13 (74LS138 decoder) decodes higher order 5 bits of the address, and selects ROM or I/O ICs. The address map is listed below.

0000-001F: Intra-MPU register

0040-00FF: Intra-MPU RAM

4000-47FF: RAM 1 (IC5)

4800-4FFF: RAM 2 (IC6)

5000-57FF: RAM 3 (IC7)

5800-5FFF: RAM 4 (IC8)

6000-60FF: EGS (IC2)

6800-6801: OPS (IC3)

77FF: Display data latch (IC11)

7800: Display data latch (IC12)

C000-FFFF: ROM (IC4)

## 2.7 Tone generator

The intra-EGS registers are selected by addresses A0 through A7, and data to produce sound is written into each register. The EGS terminals E1 through E12 send envelope data to the OPS, and the F1 through F14 terminals send frequency data to the OPS. Data which is output from the OPS terminals DA1 through DA12 is converted into an analog current by the D/A converter, and into an analog voltage by IC24. The intra-OPS output register consists of 16 bits. However, because a 12-bit D/A converter is used, the OPS outputs shifted 12-bit data in case of a lower level.

This means that lower level bits are expanded and output from the IC24. Then IC26 returns the expanded level to the original level by switching to different points of the resistive ladder. The output of IC25 does not form a complete waveform. This waveform is divided into two parts by the IC27 and IC28 to be sampled and held, and then mixed by IC30 to form a stair step waveform. This waveform then passes through the low pass filter to form a complete analog signal. This analog signal is output from the XLR connector, through the photo-coupler level attenuator and electronic balanced circuit.

## 3. MIDI rack main frame circuit

The MIDI rack main frame circuitry consists of the MIDI out slot switching circuit, clock generator and power supply.

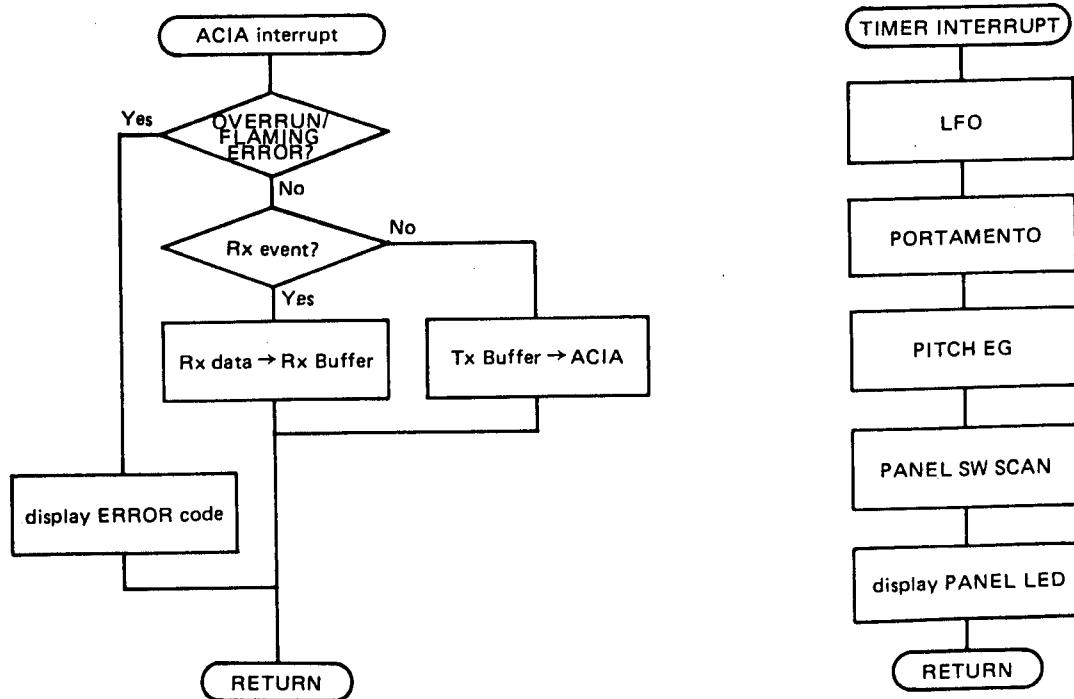

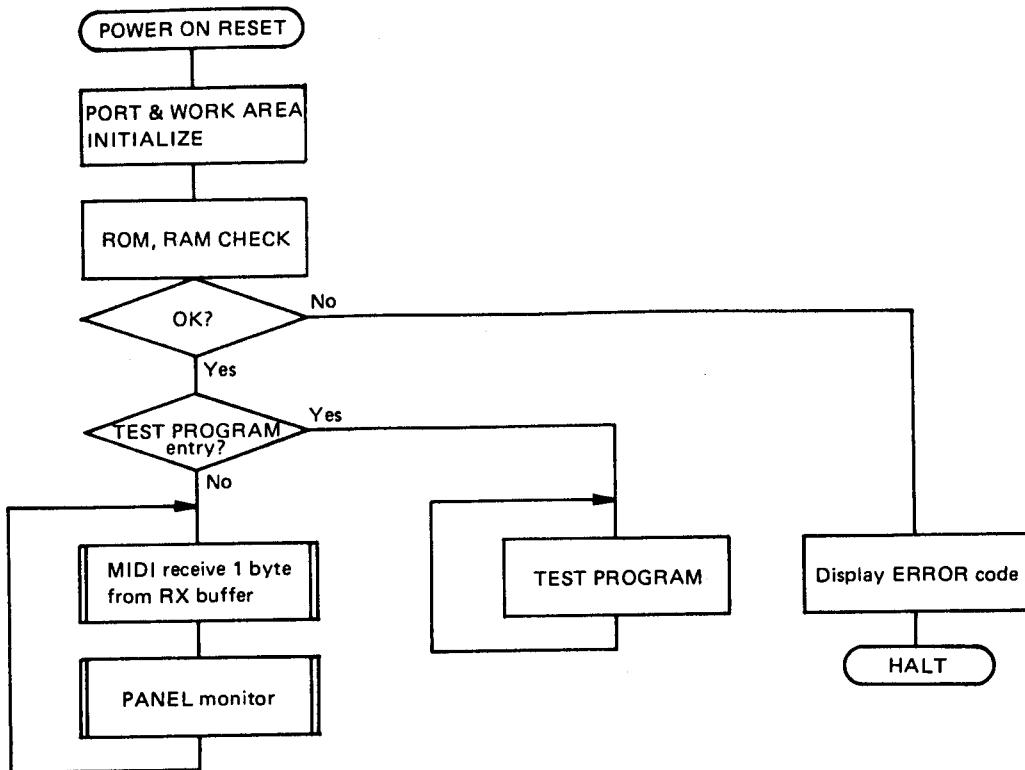

### 3.1 Out slot switching circuit

Pressing the +1 switch (main frame front panel) increments the count data of IC1 (74LS293 counter) IC2 (74LS138 decoder) decodes this data to select one of the eight TF1 MIDI OUTs. This data is then added with "1" by IC3 (74LS283 adder), decoded and driven by IC4 (74LS247 7 segment decoder/driver), and displayed on the LED.

### 3.2 Clock generator

The CB circuit board provides with a 9.4265 MHz clock generator. The TX816 divides the 9.4265 MHz clock by two, which is then used by the EGS and OPS as  $\phi_1$  and  $\phi_2$  clock sources.

## ■ TX816 FLOW CHART

The fundamental structure of the TX816 is exactly the same as DX7.

### 1. Main routine

Data stored in the receive buffer is fetched and interpreted one byte at a time through the ACIA interrupt routine. When the message is complete, an operation which corresponds to it is executed.

MIDI receive 1 byte  
from RX buffer

The panel switch event which is detected by the timer interrupt routine changes the mode/submode and executes the job.

PANEL monitor

Note: An initial ROM/RAM check is performed every time the unit is turned on and it is part of the main routine.

### 2. ACIA interrupt routine

When one byte of data is received in the ACIA, the ACIA interrupt is generated, and this routine is initiated. Data is read from the ACIA, and is stored temporarily in the receive buffer.

### 3. Timer interrupt routine

- Realtime sound source control --- Calculates data such as LFO, PORTAMENTO, and PITCH EG, which vary from moment to moment, and loads it to the sound source.
- Panel switch scan --- Scans the panel switches at a fixed interval, and performs auto-repeat processing.
- Panel LED drive --- Performs LED lighting, time sharing display, and blinking.

This routine is activated by the built-in timer every 2.6 sec.

## ■ TEST PROGRAM

- 1) To enter the test program, the three TF1 panel switches must be depressed and held down during power-up. The display reads **FF** indicating test entry. To exit the test program, turn the Power off.

Check whether the common panel out-slot is set to 1.

- 2) Depress the YES/+1 switch and program will advance to the first test.  
 3) Use the YES/+1 switch to increment to the next test. Use the NO/-1 switch to decrement back to the previous test.  
 4) TEST 1 Output level and pitch check

When you enter this test, the display reads **11**.

During Test 1 the module (TF1) under test outputs a  $440.1\text{ Hz} \pm 0.1\text{ Hz}$  sine wave which has an output level of  $-4\text{ dBm} \pm 3\text{ dBm}$ .

- 5) TEST 2 LED lighting test

The LED indicators and numeral LED segments light successively.

- 6) TEST 3 RAM read/write test

When you enter this test, the display leads **F3**.

When this test is conducted, the internal memory data is not erased.

OK: The green indicator (parameter change LED) lights.

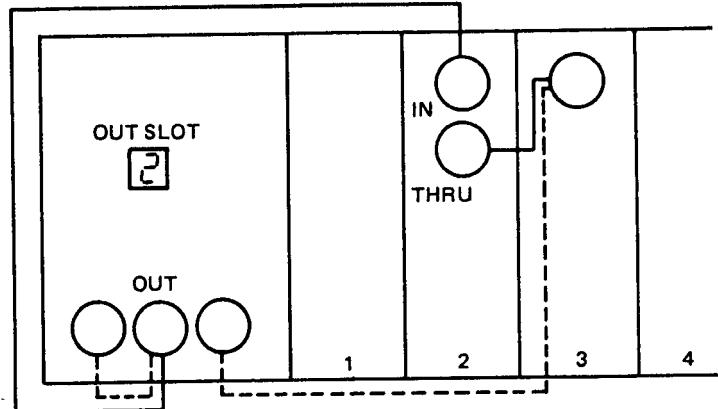

Error: The red indicator (error LED) lights, and the error number is displayed on the LED display.

- 7) TEST 4 Auto-scaling

When you enter this test the display reads **F4**.

Scaling C<sub>1</sub> through C<sub>6</sub> is repeated. At the same time, a voice message is output from the MIDI OUT in a pitch higher by 2 notes. Check the input/output function of the MIDI signal.

The signal is output on the MIDI OUT only when the OUT SLOT number is set to the appropriate TF1 module.

— SLOT 2 test

---- COMMON test

The COMMON/INDIVIDUAL LED indicator of the module which receives the channel voice message flashes. COMMON/INDIVIDUAL can be switched by the SELECT button.

- 8) TEST 5 Photocoupler

When you enter this test the display reads **F5**.

Check whether the level can be changed by the SELECT button as listed in the following table.

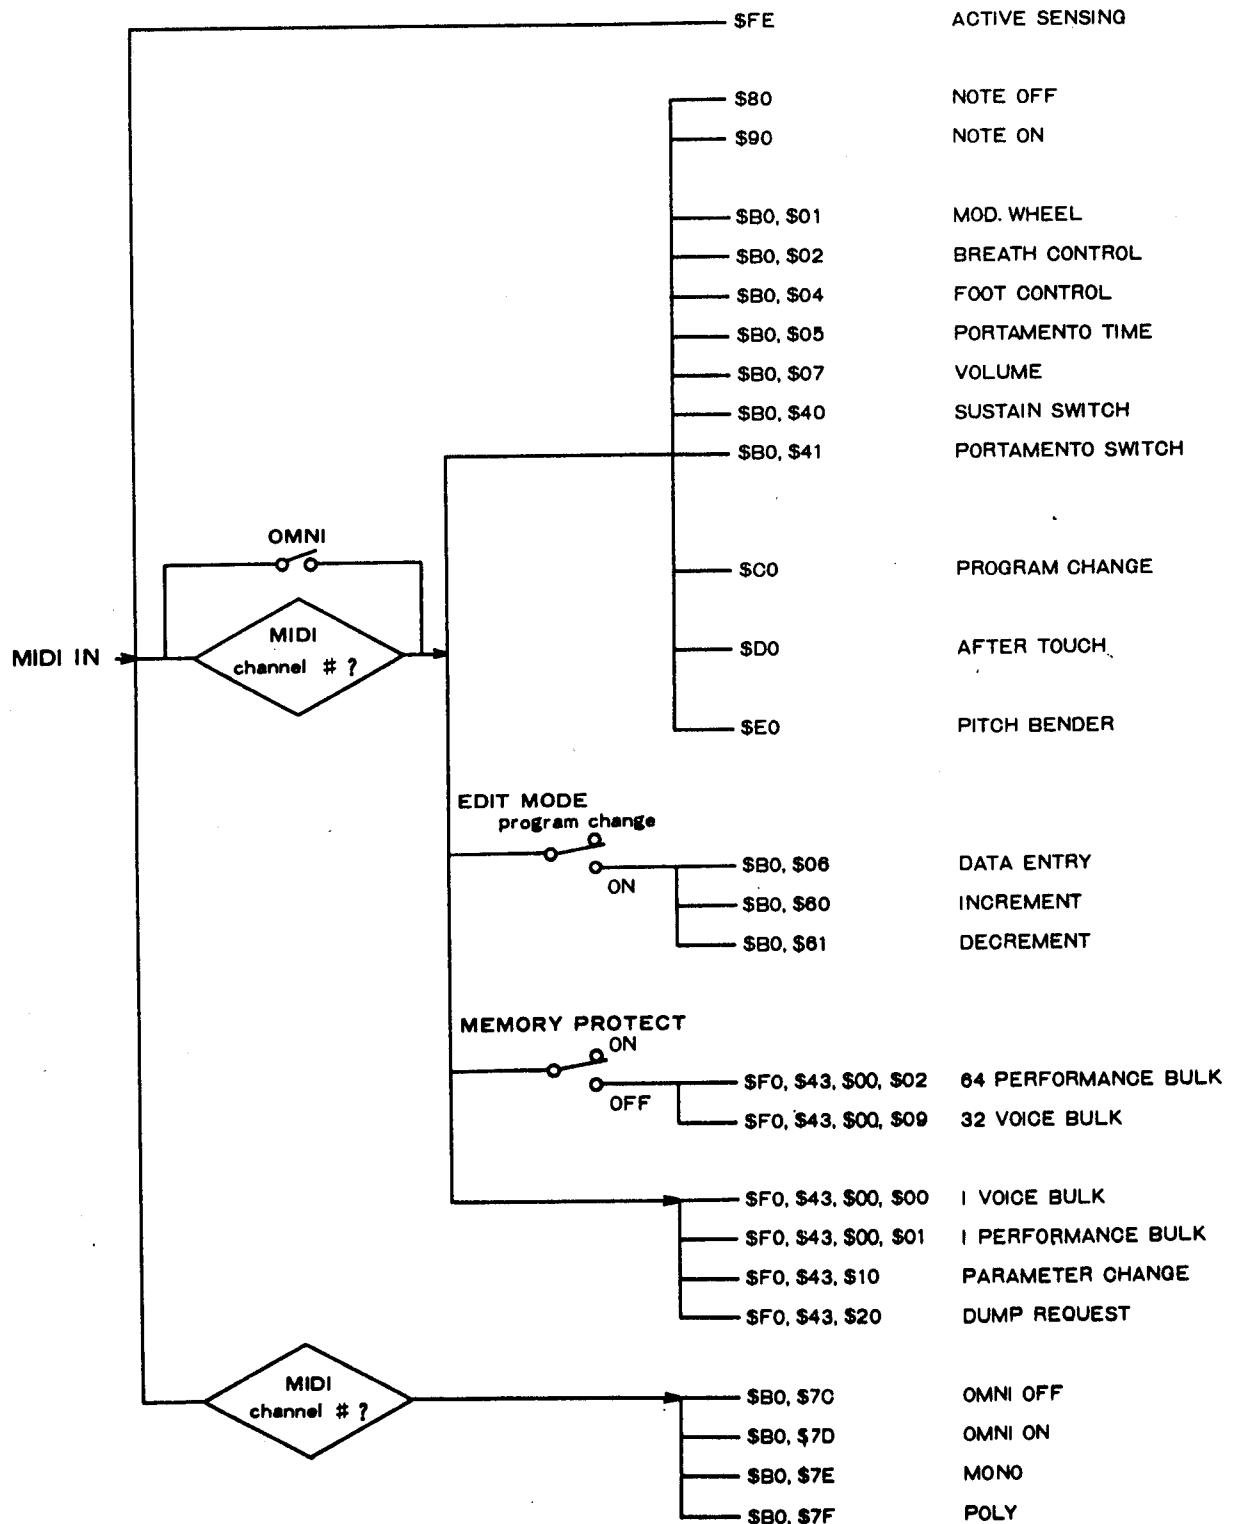

OUTPUT LEVEL ATTENUATE	L7	L6	L5	L4	L3	L2	L1	L0
Output Level (dBm)	$-4 \pm 2$	(-9)	(-14)	(-20)	(-26)	(-34)	(-41)	$-48 \pm 8$

Reference values indicated in parentheses

# ■ TX816 MIDI DATA FORMAT

## 1. RECEPTION CONDITIONS

This chart shows all the reception signals that can be received by the TX1. All byte numbers are expressed in hexadecimal form.

## 2. RECEPTION DATA

**NOTE:** The meaning of letters used in byte numbers will only be given once, to save repetition. For example, the letter n in byte number 1000nnnn (Key Off Status) means MIDI channel number and will mean the same when it appears in all other byte numbers.

### 2-1. Reception Channel and Omni

When the TF1 is in the Play mode, you can use the keys on the front panel to set the MIDI input channel (from 1 to 16) and switch the Omni function on or off. The Omni function permits the TF1 to receive MIDI signals on all of the 16 channels. The MIDI channel and Omni settings are memorized by the TF1, and will not change even if the power is turned off.

### 2-2. Channel Voice Message

When MIDI channel voice messages are received, either the INDIVIDUAL or the COMMON LED will rapidly turn off then on, depending on whether the signal is input at the COMMON or INDIVIDUAL MIDI IN terminal.

#### 2-2-1. Key Off

Status	1000nnnn
	n = MIDI channel number
Note Number	Okkkkkkk
	k= 0 (note C-2) to 127 (note G8)
Key Velocity	Ovvvvvvv v:ignore

#### 2-2-2. Key On/OFF

Status	1001nnnn
Note Number	Okkkkkkk
	k= 0 (note C-2) to 127 (note G8)
Key Velocity	Ovvvvvvv v= 0 (key off) v= 1 - 127 (key on)

#### 2-2-3. Control Change

Status	1011nnnn
Control Number	0ccccccc
	C= 0 - 127
Control Value	Ovvvvvvv v= 0 - 127

#### (a) Control Numbers For Fixed Input

C = 1	Modulation Wheel	v = 0 - 127
C = 2	Breath Control	v = 0 - 127
C = 3	Foot Control	v = 0 - 127
C = 5	Portamento	v = 0 - 127
C = 7	Volume	v = 0 - 127
C = 64	Sustain Switch	v = 0, 127
C = 65	Portamento Switch	v = 0, 127

#### (b) Control Numbers For Front Panel Settings

These control numbers apply to the following sub-modes only: Tune Master Pitch (Play mode), Select Program Number For Edit, and Attenuate Output Level (Edit mode).

A: Tune Master Pitch  
B: Select Program Number for Edit  
C: Attenuate Output Level

			A	B	C
c=6	Data Entry	v=0-127	yes	yes	yes
c=96	Increment	v:neglect	yes	yes	no
c=97	Decrement	v:neglect	yes	yes	no

In the Select Program sub-mode you can alter voice or function parameters selected with Parameter Change in system exclusive..

#### 2-2-4. Program Change

Status	1100nnnn
Program Number	0ppppppp
	Ignore the first two bits. Select 1 to 32.

**2-2-5. After Touch**

Status	1101nnnn
Pressure	0vvvvvvv

.....  
155 bytes of  
voice data sent  
d=0 to 127

Check Sum Oeeeeeee  
EOX 11110111

**2-2-6. Pitch Bend**

Status	1110nnnn
Value (LSB)	0uuuuuuu
Value (MSB)	0vvvvvvv

8 bits resolution.  
MS 8 bits are  
recognized.

This format is for the input of the data of a single voice. The green Parameter Change LED flashes when data is received. The 155 bytes of voice data go into the Edit buffer, replacing any existing data there.

**2-3. Channel Mode Message**

Status	1101nnnn
	0ccccccc
	0vvvvvvv

C = 124 V=0	Omni Mode OFF / ALL NOTES OFF
C = 125 V=0	Omni Mode OFF / ALL NOTES OFF
C = 126 V=0	Mono Mode OFF / ALL NOTES OFF
C = 127 V=0	Poly Mode OFF / ALL NOTES OFF

Omni status (ON/OFF) is controlled on the front panel (in the Omni ON/OFF sub-mode) and has final priority. Changes in mode are accompanied by a compulsory voice dump and cleaning of the Key Assigner.

## (ii) 1 Performance Bulk Data

Status	11110000
I.D.	01000011
Sub-status/Ch.	0000nnnn
Format Number	00000001
Byte Count	00000000
Byte Count	01011110
Data	Oddddddd

.....  
94 bytes of  
function data  
sent

Check Sum	Oeeeeeee
EOX	11110111

**2-4. System Real Time Message**

Status	11111110
--------	----------

Active Sensing

This format is for the input of the function data of a single voice. The green Parameter Change LED flashes when data is received. Out of the 94 bytes sent, only the data corresponding to the TF1 goes into the Edit Buffer, altering the function data of any voice currently in the Edit Buffer.

## (iii) 64 Performance Bulk Data

**2-5. System Exclusive Message****2-5-1. Bulk Dump**

## (ii) 1 Voice Bulk Data

Status	11110000
I.D.	01000011
Sub-status/Ch.	0000nnnn
Format Number	00000000
Byte Count	00000001
Byte Count	00011011
Data	Oddddddd

Status	11110000
I.D.	01000011
Sub-status/Ch.	0000nnnn
Format Number	00000010
Byte Count	00100000
Byte Count	00000000
Data	Oddddddd

.....  
4096 bytes of  
data sent

	0ddddd
Check Sum	0eeeeeee
EOX	11110111

This format is for loading function data in to the TF1 Memory. It can only be input when the Memory Protect is OFF. When data is input, the Memory Protect LED will light for about 2 seconds. Only the first 32 of the 64 batches of data are function data, and they are loaded in order into the function memories of program destinations 1 thru 32.

#### iv) 32 Voice Bulk Data

Status	11110000
I.D.	01000011
Sub-status/Ch.	0000nnnn
Format Number	00001001
Byte Count	00100000
Byte Count	00000000
Data	0ddddd
	.....
	4096 bytes of data sent
	.....
	0ddddd
Check Sum	0eeeeeee
EOX	11110111

This format is for loading voice data only into the TF1 memory. It can only be input when the Memory Protect is OFF. When data is input, the Memory Protect LED will light for about 2 seconds. The voice data for all 32 programs will be changed.

#### 2-5-2. Parameter Change

Status	11110000
I.D.	01000011
Sub-status/Ch.	0001nnnn
Parameter	
Group Number	oggggghh
Parameter No.	Oppppppp
EOX	11110111

g = 0, 1, 2, 3      p = 0 - 127

The green Parameter Change LED will flash when data is received, and voice or function data in the Edit Buffer will be changed.

#### 2-5-3. Dump Request

Status	11110000
I.D.	01000011
Sub-status/Ch.	0010nnnn
Format Number	0fffffff
	f = 0, 1, 2, 9, 125
EOX	11110111

The corresponding bulk data will be dumped through the MIDI OUT terminal.

### 3. OUTPUT DATA

Data is only output when a dump request signal is received from an external source or by direct panel switching. Since the only output is the COMMON MIDI OUT terminal, you must select the OUTPUT SLOT number corresponding to the number of the module from which you are outputting data. Data is always sent via MIDI channel 1 and consists of voice and function data in System Exclusive.

#### 3-1. Output Conditions

##### (a) Output for Dump Request

The following five kinds of data dump can be done, according to the selected format number () .

```

f = 0 1 Voice Bulk Data
      Outputs voice data in the Edit Buffer
f = 1 1 Performance Bulk Data
      Outputs function data in the Edit
      Buffer
f = 2 64 Performance Bulk Data
      Outputs all function data from
      programs 1 thru 32 in order.
f = 9 32 Voice Bulk data
      Outputs all voice data from programs
      1 thru 32

```

(Formatting for the above is the same as for input).

**f = 125 Condition Acknowledge**

Status	11110000
I.D.	01000011
Sub-status/Ch.	00000000
Format Number	01111101
Byte Count	00000000
Byte Count	00010000
Data	Oddddddd
	⋮
	Oddddddd
Check Sum	0eeeeeee
EOX	11110111

**(b) Output in the Program Change sub-mode**

When you select a program using the front panel keys, the corresponding voice and function data will be output in the following order:

1. 1 Performance Bulk Data
2. 1 Voice Bulk Data

**(c) Output in the Dump sub-mode**

Data is output in the following order when you press the "YES" key (SW1):

1. 32 Voice Bulk Data
2. 64 Performance Bulk Data

## 4. SYSTEM EXCLUSIVE DATA FORMAT

## 4-1. DX7 Voice Parameter Change (g=0)

Sub-group Number h	Parameter Number p	Parameter	Data	Notes
