### **RANGE ROVER**

### 1987 MODEL YEAR IMPROVEMENTS

### **INTRODUCTION**

As part of the 1987 model year programme Land Rover Ltd is continually looking at ways to improve the quality and characteristics of its products. This bulletin contains servicing details of the Lucas A127/65 alternator now fitted to Range Rover models.

The A127 alternator incorporates a combined regulator and brush box assembly readily detachable from the rear of the alternator body.

This bulletin also includes the latest main circuit diagrams for both left and right hand drive models plus a revised electric mirror circuit diagram.

# **04** GENERAL SPECIFICATION DATA

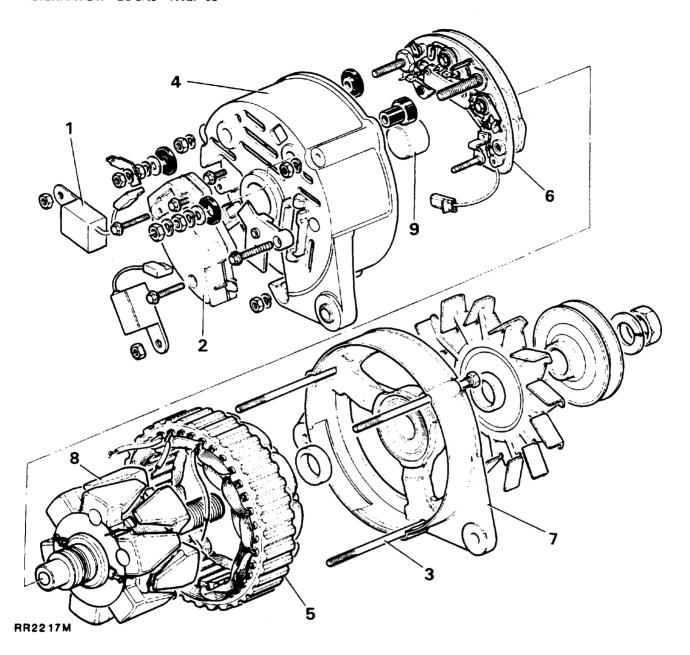

## **ALTERNATOR**

Manufacturer	Lucas
Type	A127/65
Polarity	Negative earth
Maximum operating speed	15000 rev/min
Maximum DC output at 6000 rev/min	65 amp
Stator windings	
Stator winding resistance	0.15 ohm/phase
Regulator type	21TR
Regulator controlled voltage	13.6-14.4V
Field winding rotor poles	
Rotor winding resistance	3.2 ohms
Brush length - new	17 mm(0.67 in) )From
Renew regulator/brushbox assembly at	5 mm(0.20 in) )moulding
Brush spring pressure	3
- flush with brushbox moulding	1.3-2.7N(4.7-9.8oz)

# 06 TORQUE WRENCH SETTINGS

ALTERNATOR	Nm	lbf ft
Alternator shaft nut	. 50-70	37-52
Alternator through bolts		4.0
Alternator rectifier screws	. 3.5	2.5
Regulator/brushbox screws		2.0
Terminal nut - main output		3.0
Terminal nut - phase		3.0

#### **ALTERNATOR - LUCAS - A127-65**

#### **Description**

The model A127 alternator is a three phase, field sensed unit, the rotor and stator windings generate three phase alternating current (AC) which is rectified to direct current (DC). The electronic voltage regulator unit controls the alternator output voltage by high frequency switching of the rotor field circuit.

It is essential that good electrical connections are maintained at all times. Of particular importance are those in the charging circuit (including those at the battery) which should be occasionally inspected to see that they are clean and tight. In this way any significant increase in circuit resistance can be prevented.

Do not disconnect battery cables while the engine is running or damages to the semi-conductor devices may occur. It is also inadvisable to break or make any connections in the alternator charging and control circuits while the engine is running.

The Model 21TR electronic voltage regulator employs micro-circuit techniques resulting in improved performance under difficult service conditions. The whole assembly is encapsulated in silicone rubber and housed in an aluminium heat sink, ensuring complete protection against the adverse effects of temperature, dust, and moisture etc.

The brushbox assembly is incorporated in the regulator unit.

Surge protection is incorporated in the regulator unit.

The regulating voltage is set during manufacture to give the required regulating voltage range of 13.6 to 14.4 volts, and no adjustment is necessary. The only maintenance needed is the occasional check on terminal connections and wiping with a clean dry cloth.

The alternator system provides for direct connection of a charge (ignition) indicator warning light, and eliminates the need for a field switching relay or warning light control unit. As the warning lamp is connected in the charging circuit, lamp failure will cause loss of charge. Lamp should be checked regularly and a spare carried.

When using rapid charge equipment to re-charge the battery, the battery must be disconnected from the vehicle.

#### Dismantle, Overhaul, Test components

NOTE: Alternator charging circuit - The ignition warning light is connected in series with the alternator field circuit. Bulb failure would prevent the alternator charging, except at very high engine speed, therefore, the bulb should be checked before suspecting an alternator failure.

#### **Precautions**

Battery polarity is NEGATIVE EARTH, which must be maintained at all times.

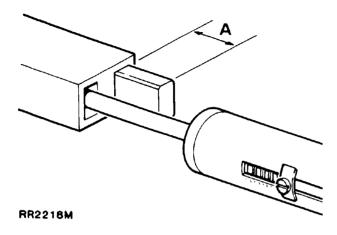

No separate control unit is fitted; instead a voltage regulator of micro-circuit construction is mounted on the slip ring end bracket.

Battery voltage is applied to the alternator output cable even when the ignition is switched off, the battery must be disconnected before commencing any work on the alternator. The battery must also be disconnected when repairs to the body structure are being done by arc welding.

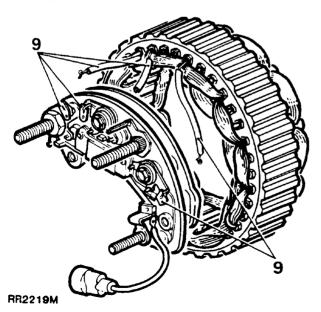

#### **Dismantle**

- 1. Withdraw the connectors from the alternator.
- 2. Remove the alternator
- Remove the nuts from the through bolts, disconnect the connectors and remove two suppression capacitors.
- 4. Remove three screws, disconnect one lead and withdraw the regulator and brushbox assembly.

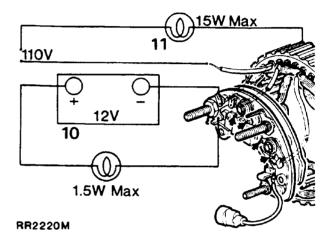

5. Check the brush lengths by measuring length of protrusion from moulding. If dimension A is 5mm (0.20in) or less, change the assembly.

- 6. Check brush spring pressure using a push type spring gauge. Gauge should register 136 to 279 g (5 to 10 oz) when brush is pressed until face is flush with housing. If reading is outside these limits, renew assembly.
- 7. Mark the relative positions of the end brackets and stator. Remove through bolts and withdraw slip ring end bracket and stator assembly. Carefully tap the mounting lugs with a mallet if necessary.
- 8. Remove nuts, washers and insulators from stud terminals noting their position for reassembly. Remove two screws and insulation cover and withdraw rectifier and stator from slip ring end bracket.

- 9. Release the stator winding cable ends from the rectifier by applying a hot soldering iron to the terminal tags of the rectifier. Prise out the cable ends when the solder melts, and separate the rectifier and stator. Further dismantling of the rectifier is not required.
- 10. Check the diodes. Connect the test equipment as shown and test each diode in turn, note whether lamp lights, then reverse test lead connections. The lamp should light in one direction only. Renew the rectifier assembly if a faulty diode is diagnosed.

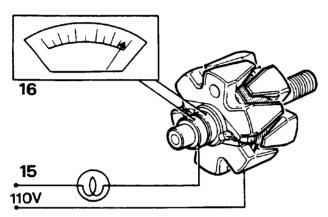

- 11. Visually inspect the stator windings for signs of damage or burning. Check the stator insulation using a suitable 110 volt test lamp. Connect the test leads to the laminated yoke and to each of the three leads in turn. If test lamp lights, fit a new stator.
- 12. Remove the fan and pulley assembly. Push out the rotor shaft from the bearing using a suitable press and remove the spacer from the shaft.

Continued

# 86 ELECTRICAL

- 13. Clean surfaces of slip rings using a solvent moistened cloth.
- 14. Inspect slip ring surfaces for signs of burning, remove burn marks using extra fine glasspaper. On no account should emery cloth or similar abrasives be used, or any attempt made to machine the slip rings.
- 15. Check the insulation of the rotor field windings, using a suitable 110 volt test lamp connected between one of the slip rings and one of the rotor poles. If the test lamp lights, the rotor must be renewed.

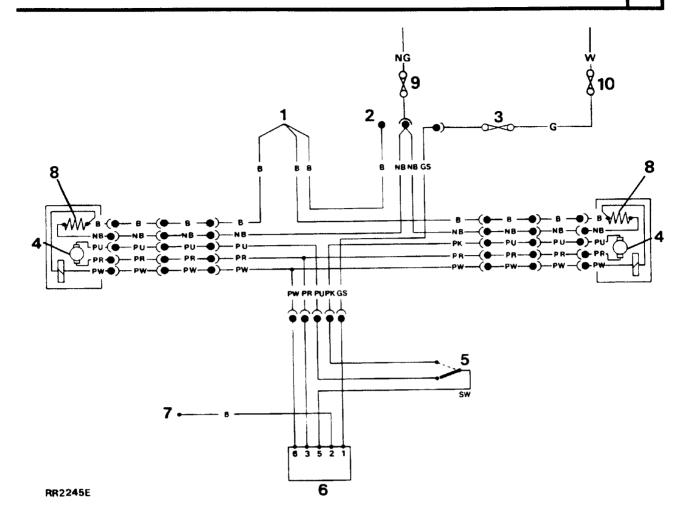

#### RR2221M

- 16. Check the resistance/continuity of the rotor field windings by connecting an ohmmeter to the slip rings as shown. A reading of 3.2 ohms should be obtained.
- 17. Check condition of bearings. If signs of rubbing between rotor poles and stator is evident, both bearings are excessively worn, and must be renewed.
- 18. Use a suitable press, applying pressure from the rear of the slip ring end bracket, to withdraw or refit the bearing. Note that the drive end bracket and bearing are only supplied as a unit.

#### Reassembling

- 19. Fit the spacer and press the rotor into the drive end bracket. Insert the through bolts. Fit the spacer, fan, pulley and spring washer to the shaft. Fit and tighten the pulley nut to the correct torque.
- 20. Fit the stator and rectifier assembly to the drive end bracket in the position previously marked.
- 21. Fit the slip ring end bracket in the position previously marked, locating the regulator lead through its aperture. Fit the insulation cover and tighten two rectifier securing screws.
- 22. Fit and tighten the through bolt nuts evenly and to the correct torque.
- 23. Connect the lead to the regulator, locate the brushes on the slip rings and secure the regulator/brushbox assembly, taking care not to damage the brushes.
- 24. Fit both suppression capacitors.
- 25. Refit the alternator.
