NOTICE -

This Service Manual describes the most typical product of this model. If there are any specific differences between this Manual and the servicing unit, please contact GoldStar Precision sales office in your area.

## 1. General

The OS-7020 is a compact-type and advanced class oscilloscope which covers a frequency bandwidth from DC to 20MHz

- 1) CRT(Cathode-Ray Tube) has a viewing area 8x10 div and high intensity quantitative measurement is possible by means of the stable accelerating potential of 2KV.
- 2) Vertical deflection factor is from 5mV/div to 5V/div in a 1-2-5 sequence. x5 Magnifier increases sensitivity of each deflection.
- 3) Horizontal deflection system provides sweep rates from 0.2 $\mu$ S/div to 0.2S/div in a 1-2-5 sequence. 10 times sweep magnification and X-Y operation for Lissajou's pattern.
- 4) The Trigger system provides an internal triggering, external triggering and TV-triggering.

## 2. SPECIFICATIONS

### CRT(Cathode-Ray Tube)

#### Type

6" screen with internal graticule parallax free acceleration potential : Approximately 2KV

#### Phosphor

P31(standard)

#### Useful screen area

8x10div(1 div= 10mm)

Trace Rotation                  Provided

Intensity Control              Provided

Focus Control                  Possible

Scale illumination .         Variable

### Vertical Deflection system

#### Frequency Response & Rise Time

DC to 20MHZ(-3dB) and 17.5nS or less

DC to at least 7MHZ and 50nS or less at x5 Magnifier extends

AC coupled lower(-3dB) frequency is 10Hz or less

#### Deflection factor

VARIABLE is pushed(x1)

5mV/div to 5V/div in 10 calibrated steps in a 1-2-5 sequence(accuracy  $\pm 3\%$ , 10°C - 35°C)

VARIABLE is pulled(PULL x 5MAG)

The uncalibrated continuous control extends deflection factor from 1mV/div to at least 12.5V/div in the 5V/div position(accuracy  $\pm 5\%$ , 10°C - 35°C)

#### Display mode

CH1(normal or add), CH2(normal or invert), Alternate, chopped (approximate 250KHZ)

**Input impedance**

1Mohm in parallel with 20pF(+2pF)

**Maximum input voltage**

300V(DC + peak AC) or 500Vp-p AC(1KHz or less)

**Input coupling**

AC - GND - DC

### **Horizontal Deflection system**

**Sweep rate**

0.2 $\mu$ s/div to 0.2s/div in 19 calibrated steps in a 1-2-5 sequence. Uncalibrated continuous control extends deflection factor to at least 0.5 seconds per division in the 0.2s/div position(accuracy  $\pm$  3%, 10°C - 35°C)  
x10MAG extends maximum sweep rate to 20ns/div(accuracy  $\pm$ 5%, 10°C - 35°C)

### **Triggering system**

**MODE**

Automatic, Normal, TV-V, TV-H

**SOURCE**

CH1, CH2, LINE, External

**COUPLING**

AC : 25HZ to full bandwidth

HF Rejection : use signal below 15KHz

LF Rejection : use signal over 15KHz

DC : DC to full bandwidth

**HOLD OFF**

Variable

**Slope**

+ or -

**TV sync polarity**

TV(-)

## Sensitivity and frequency

	20HZ - 2MHZ	2MHZ - 20MHZ
INT	0.5div	1.5div
EXT	200mV	800mV

## TV-V Sensitivity

Trigger level is 1 division or more with displayed amplitude of sync signal portion of composite signal.

## External trigger input impedance

1Mohm in parallel with 20pF( $\pm 2\text{pF}$ )

maximum input voltage

300V(DC + peak AC) or 500Vp-p AC(1KHz or less)

## X-Y Operation

CH1 : Horizontal

CH2 : Vertical

## Deflection factor

same as vertical deflection

## Accuracy

X ;  $\pm 3\%$  (10°C - 35°C)

Y ;  $\pm 3\%$  (10°C - 35°C)

Additional error for magnifier  $\pm 2\%$

## X-bandwidth

DC to at least 500KHz

## Phase error

3° or less from DC to 20KHz

## Z-AXIS input

Positive-going signal decrease intensity 5Vp-p

noticeable modulation at normal intensity for DC-2MHz

Input impedance 47Kohm

Maximum input voltage 30V(DC + peak AC)

coupling DC

### **Calibrator**

Approximate 1KHz frequency 0.5V(+3%) square wave.

### **CH1 Signal output**

Output voltage is at least 20mV/div into a 50ohm Load.

Bandwidth is 50Hz to at least 4MHz.

### **Power supply**

Votlage(50/60HZ)	Fuse
100V(90~110V)	2A
120V(108~132V)	2A
220V(198~242V)	1A
240V(216~264V)	1A

Power supply frequency 50,60,400Hz

Power consumption      Approx. 35W

### **Environment**

Limit of operation temperature      0~40°C(32~104°F)

Limit of operation humidity      35~85%

Rated range of use temperature      10~35°C ( 50~95°F)

Rated range of use humidity      45~85%

Storage and transport temperature      -20~70°C(-4 ~ 158°F)

### **Dimension and weight**

Approx. 290(W) x 145(H) x 375(D)mm

(11.6(W) x 5.8(H) x 15(D) inches)

Approx. 8.0Kg(17.6Ibs)

## **3. ACCESSORIES**

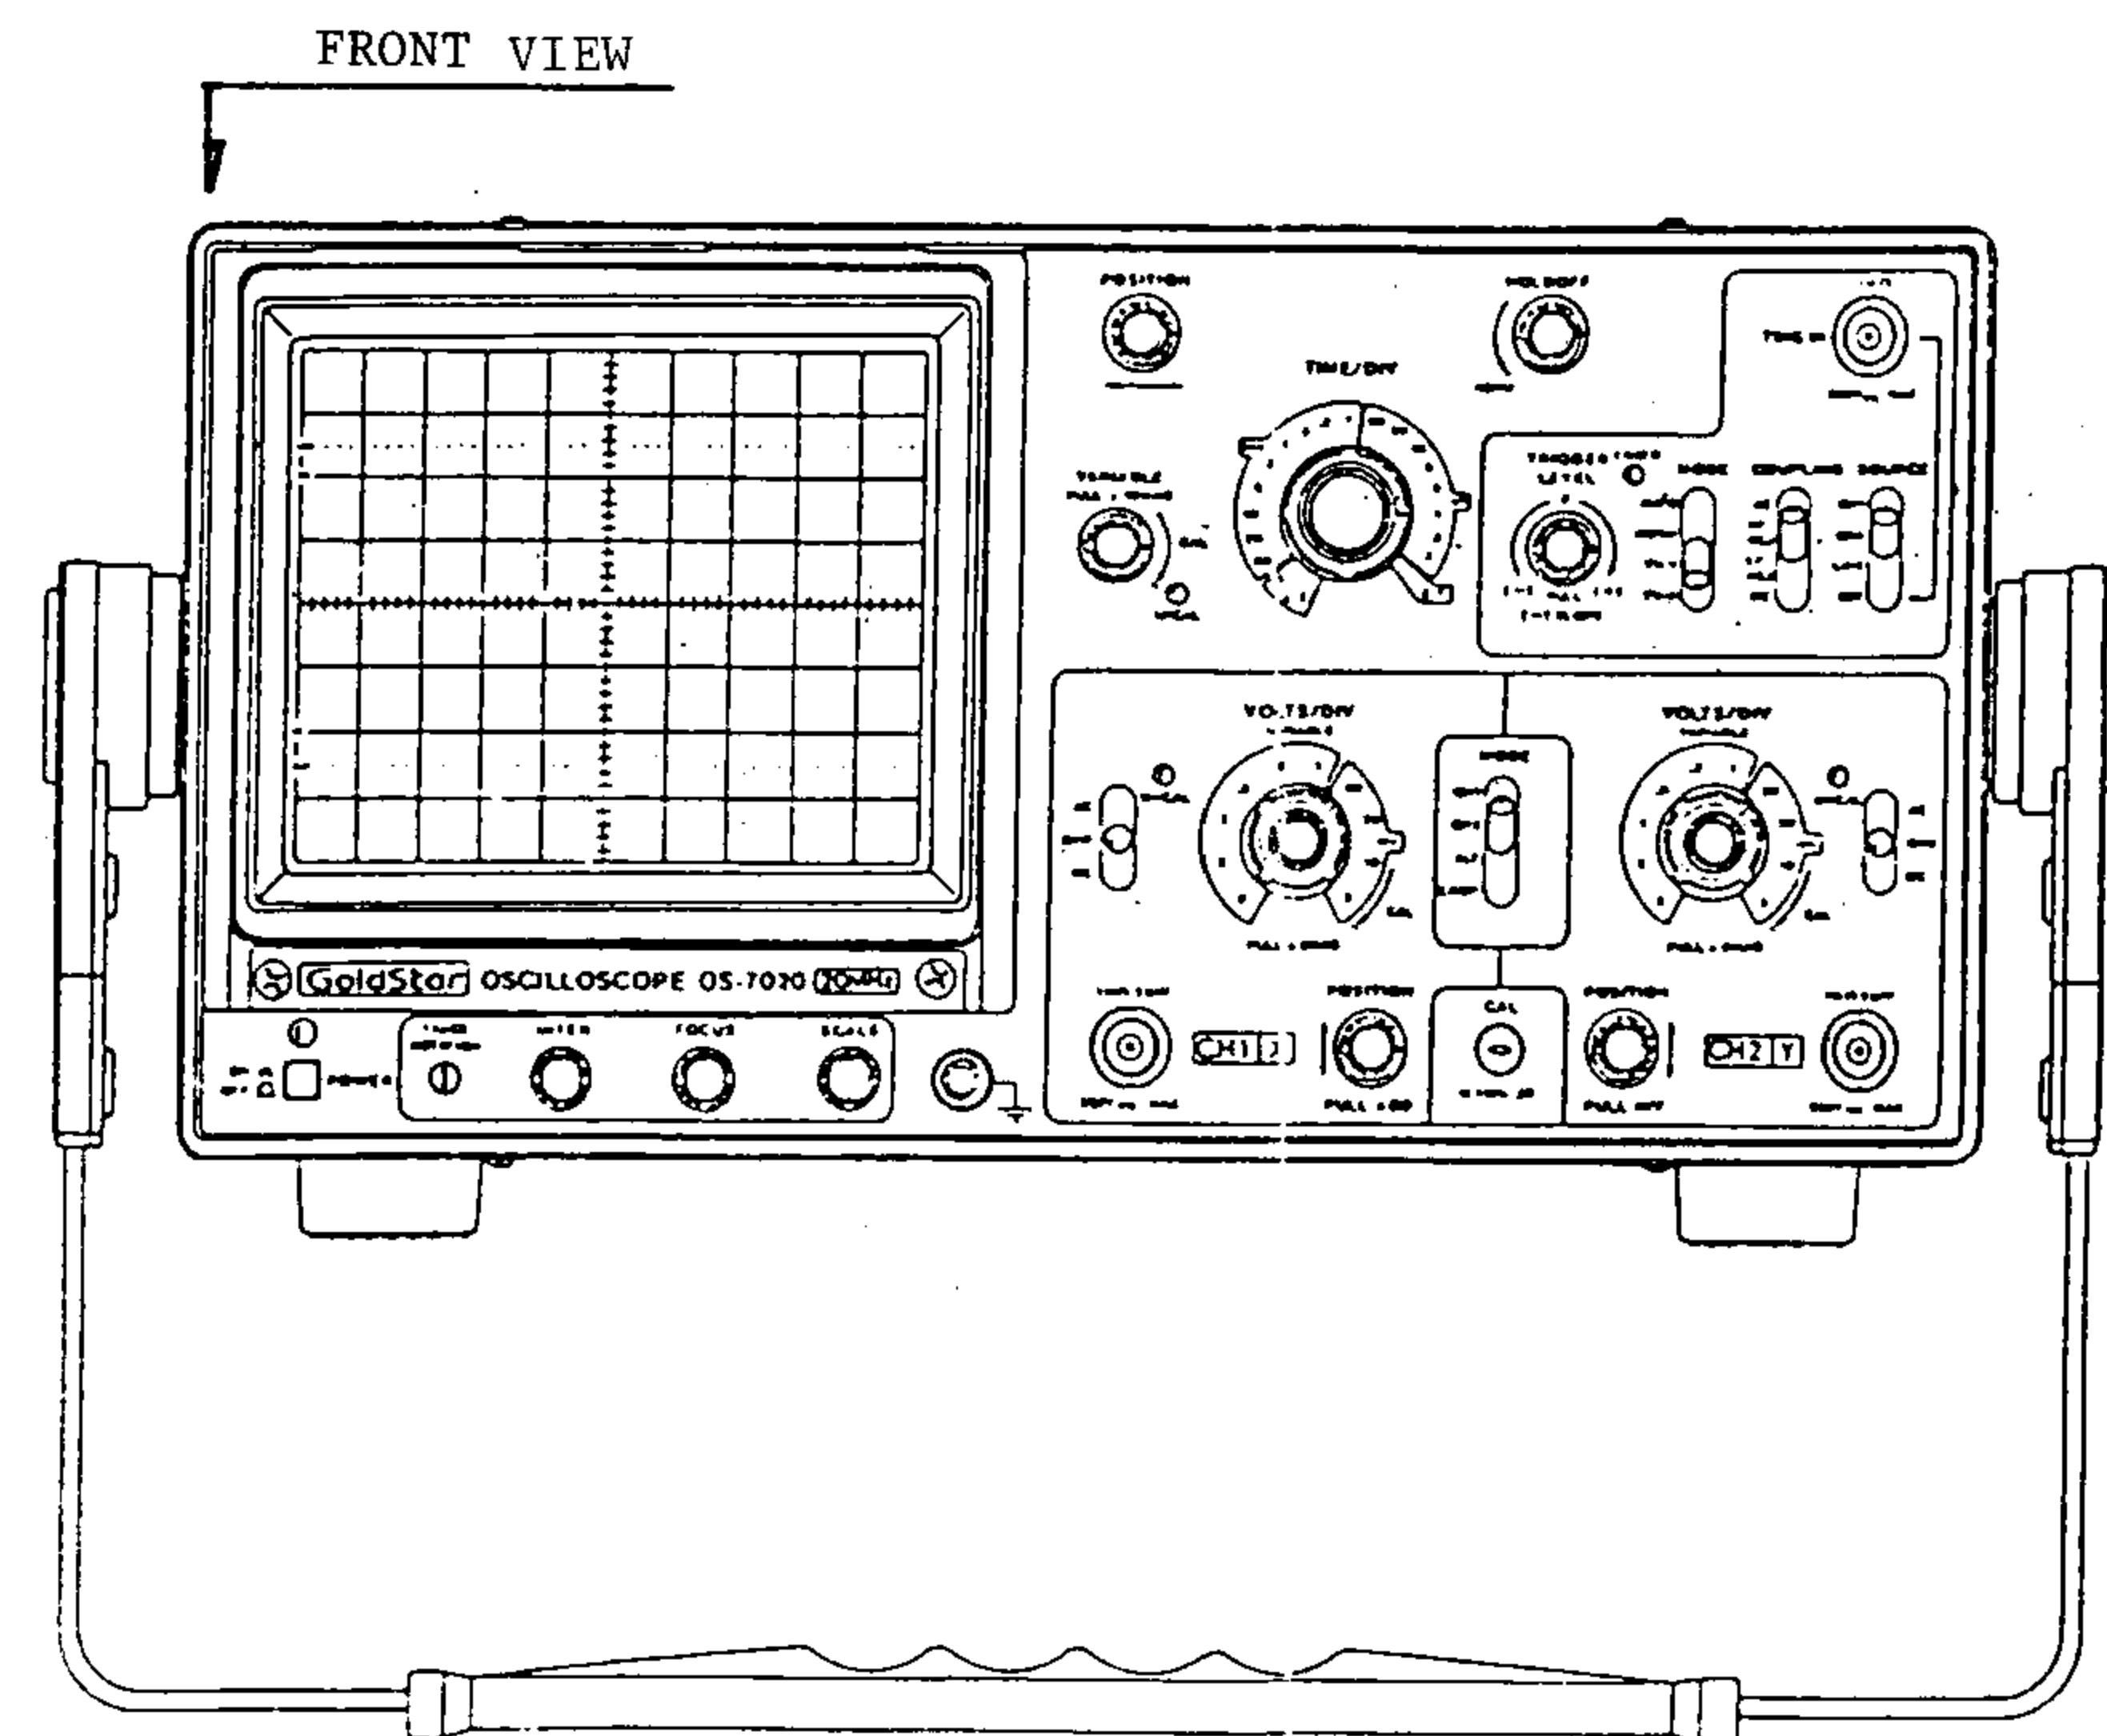

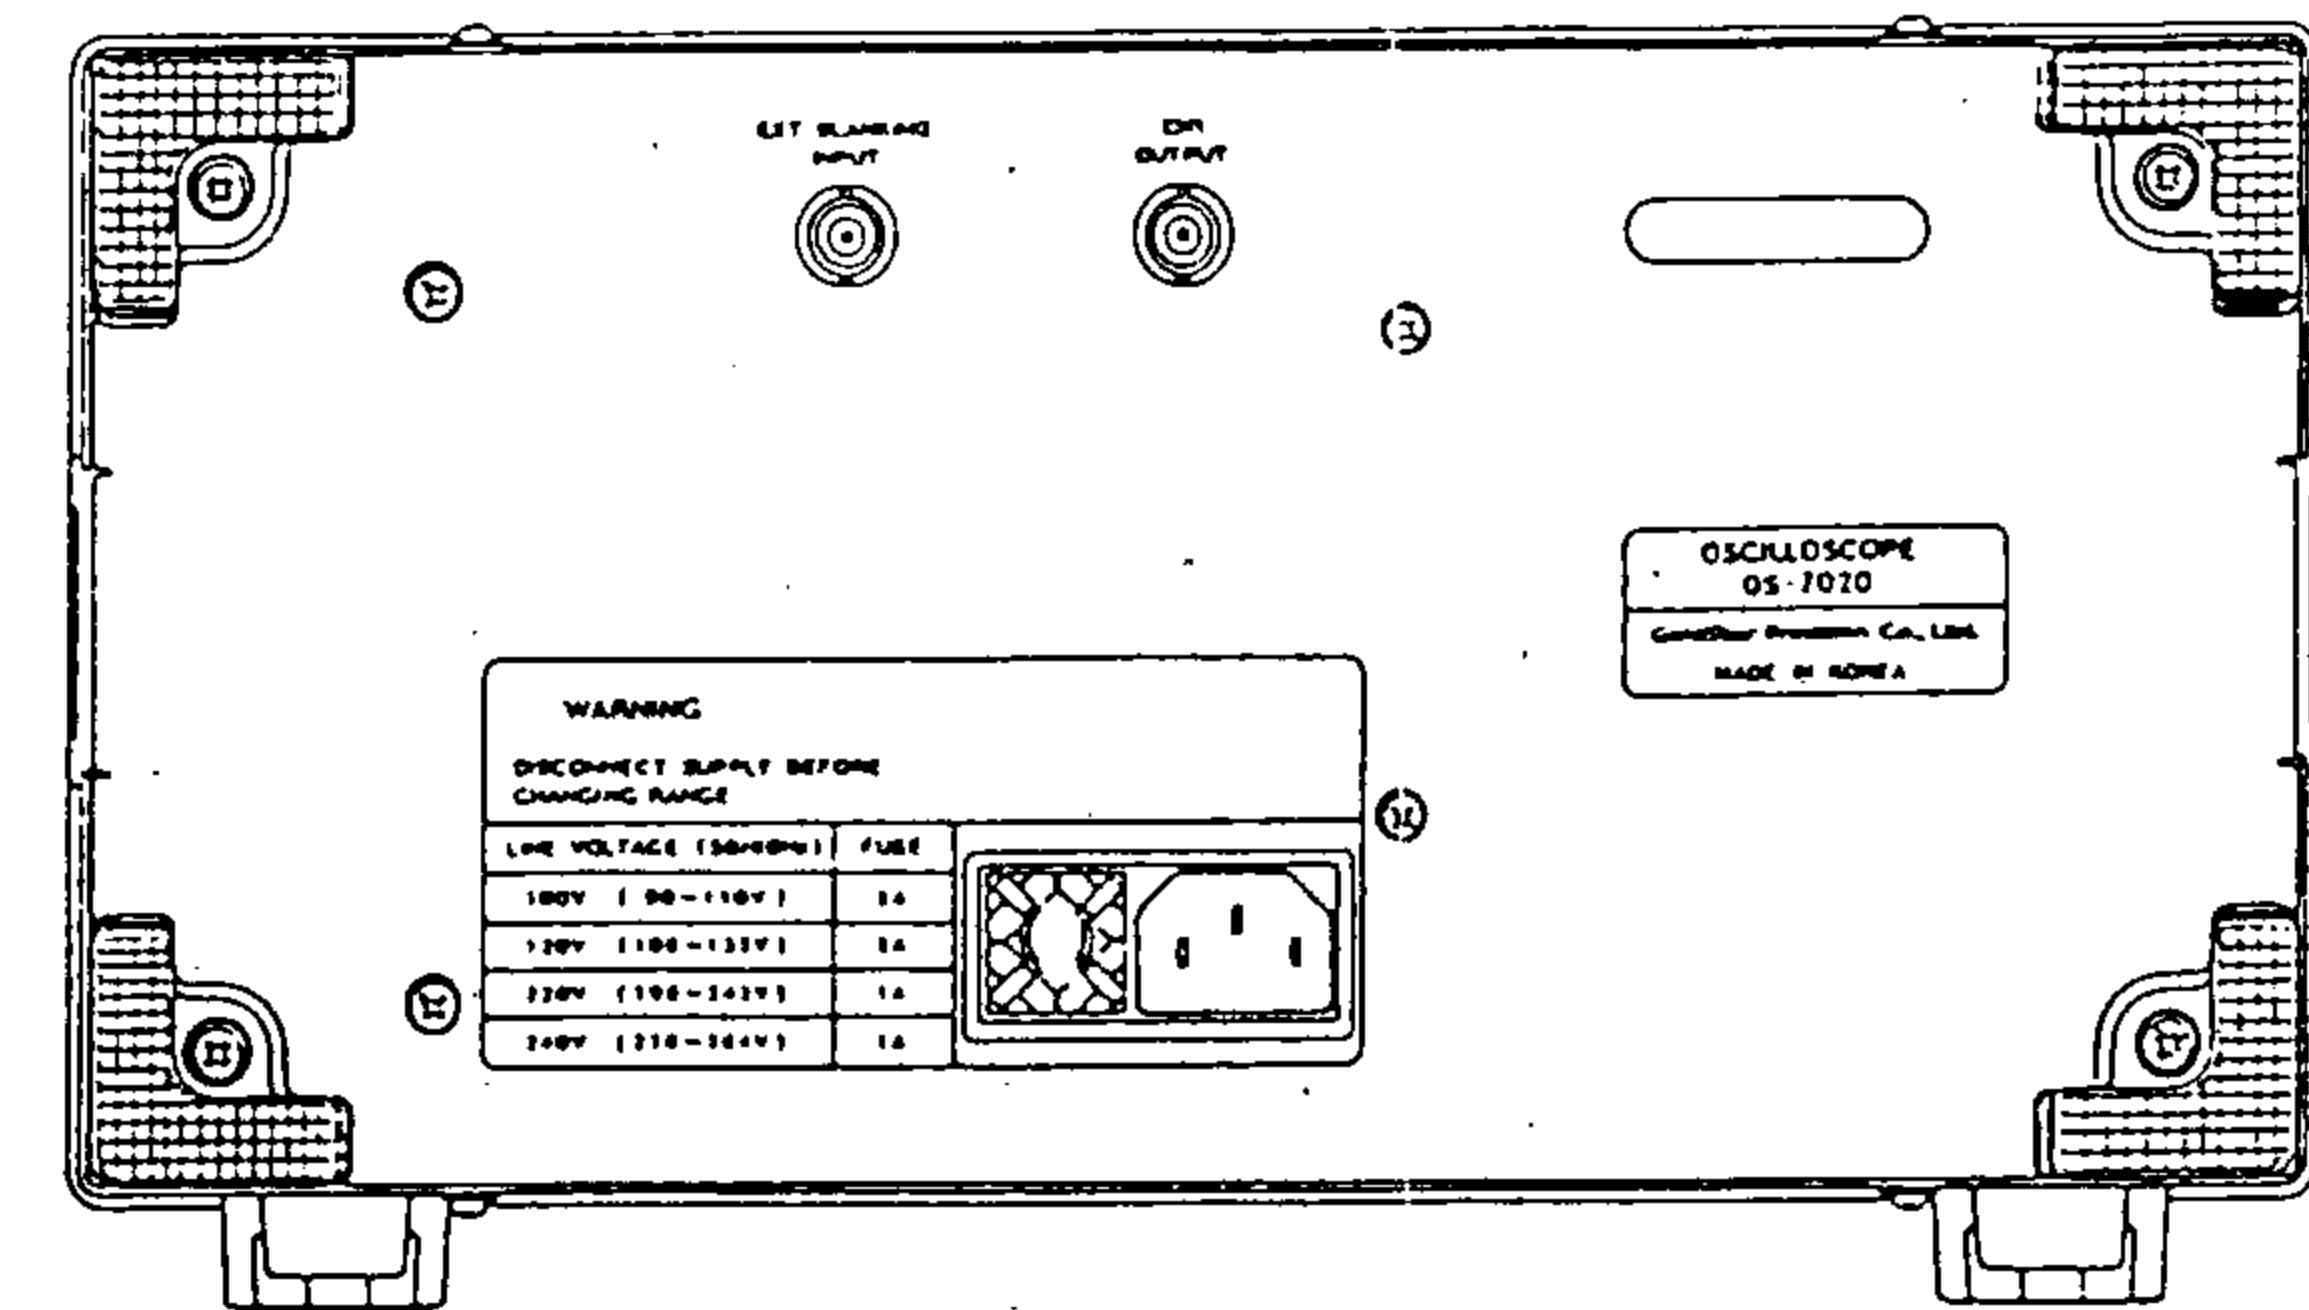

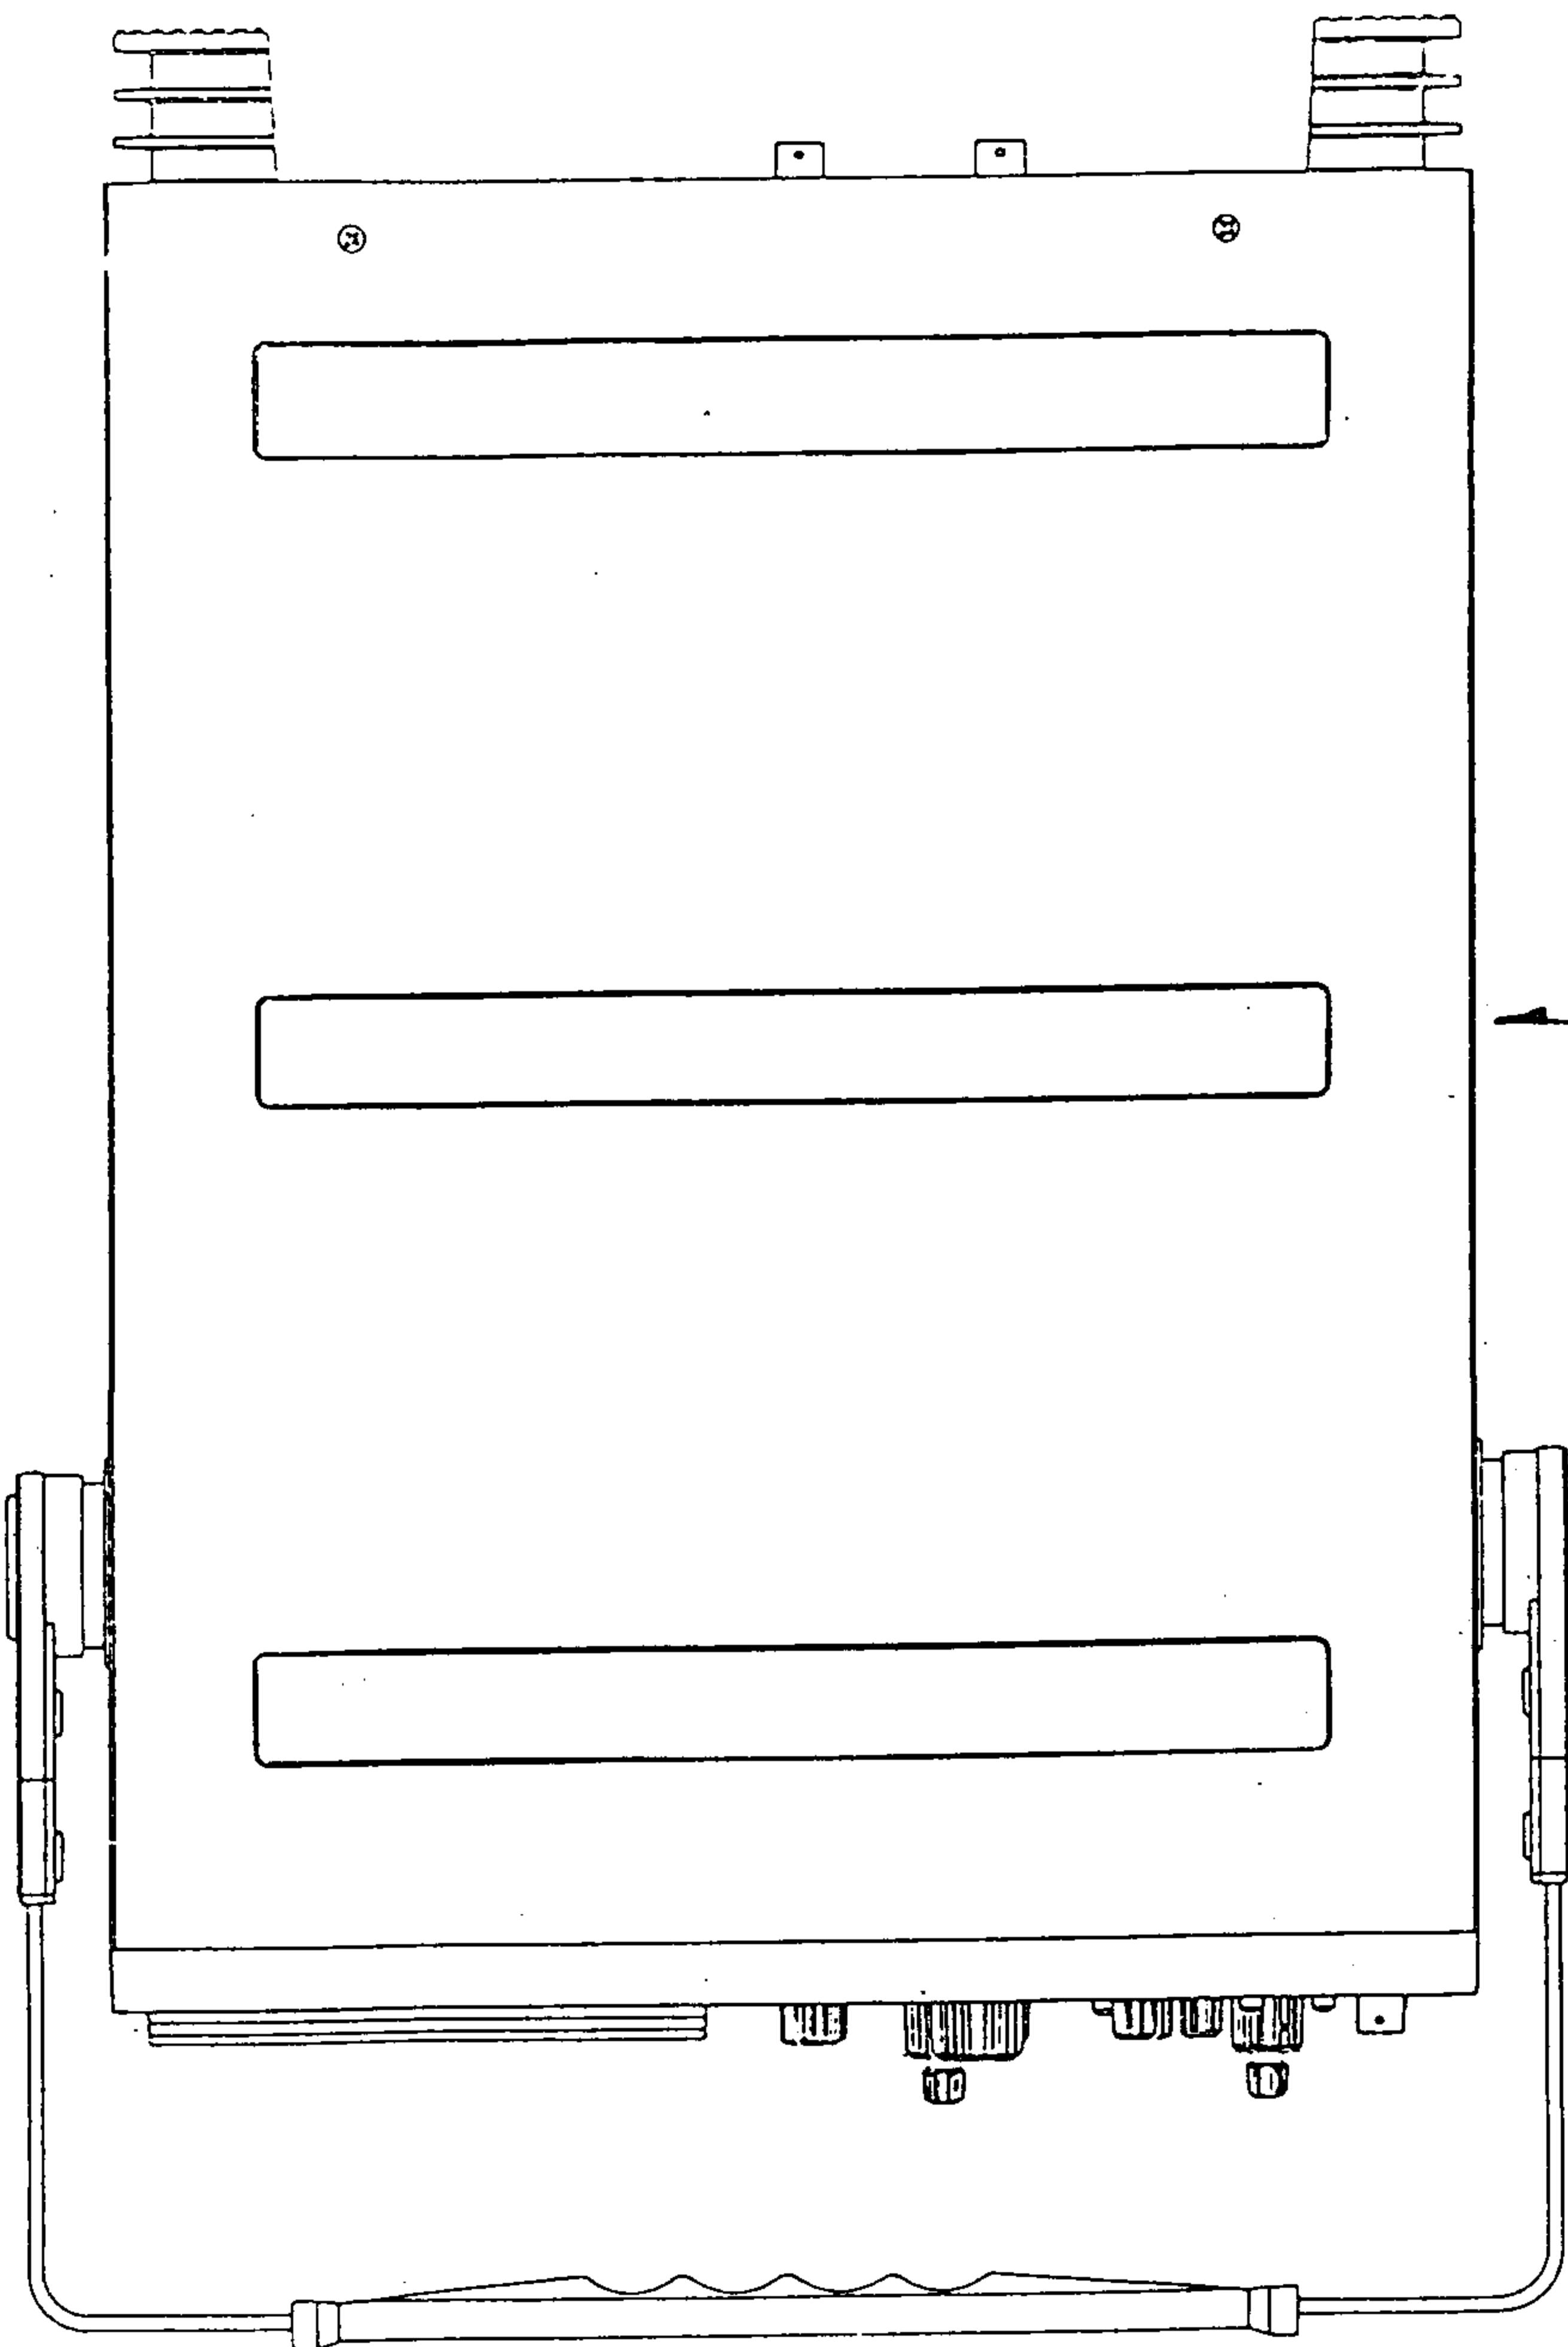

This instrument is shipped along with following accessories

FUSE                    1

AC power cord        1

Operation manual    1

4. EXTERNAL VIEW

## 5. PREVENTIVE MAINTENANCE

These are the precautions on preventive maintenance which will protect the instrument from trouble and keep it clean for a long time.

### 5-1 Cleaning

Since the extent of instrument smearing depends on the ambient condition in which the oscilloscope is used, the frequency of the cleaning operations cannot be defined initially.

Cleaning should be accomplished as required.

Dust deposited inside the instrument affects the normal flow of cooling air and invites the local overheating of components parts of results in trouble.

Smeared switch contacts of connector pins can be the cause of defective contact, and smearing of the circuit can cause arcing between circuits, particularly in moist season.

Cleaning agents recommended and those prohibited are listed as below.

Recommended agent	Alcohol, gasoline or kerosene
Prohibited agent	Acetone, tri-ethyl-ketone lacquer thinner or agent containing ketone series solvent

#### Cleaning the cover

Normal smearing of the cover can be cleaned by washing the cover with a neutral chemical cleaner. For greasy smearing, use a recommended agent with a soft cloth.

#### Front and other panels.

Clean the smeared panel with a soft cloth moistened with a recommended agent.

### Dust in-instrument

The best way to remove dust inside the instrument is the blowing of compressed air. Remove persistent dust with a soft painting brush and blow the air again.

### CRT

The CRT screen will be smeared if it is used for too long without the filter. Ordinary dust of finger print left on the CRT can be cleaned by a soft cloth. Use a soft cloth moisted with alcohol to remove persistent smearing.

### Filter

The filter may be clogged when used for a long time. Dust or fingerprint can be cleaned with a dry soft cloth. Use a soft cloth moisted with alcohol to remove persistent smearing.

## 5-2 Visual inspection

The instrument should be inspected occasionally for such defects as broken connections, improperly seated transistors, damaged circuit boards, and heat-damaged parts. The corrective procedure for most visible defects is apparent ; however, particular care must be taken if heat-damaged components are found.

Overheating usually indicates other trouble in the instrument; therefore, correcting the cause of the overheating is important to prevent the recurrence of the damage.

## 5-3 Periodical Calibration

In order to use the oscilloscope accurately, periodical calibration of circuit is essential. When this oscilloscope is used frequently, a calibration will be required at every 1,000hours of operation.

The frequency of calibration may be extended to 6 months, if the oscilloscope is used infrequently.

## 6. MEASURING INSTRUCTION

### 6-1 Probe phase Adjustment

Proper adjustment of the probe phasing is required before measurements as the incorrect phasing results in erroneous measurements when the  $\times 10$  position is selected.

1. Set the controls as follows ;

VOLTS/DIV                    0.1V

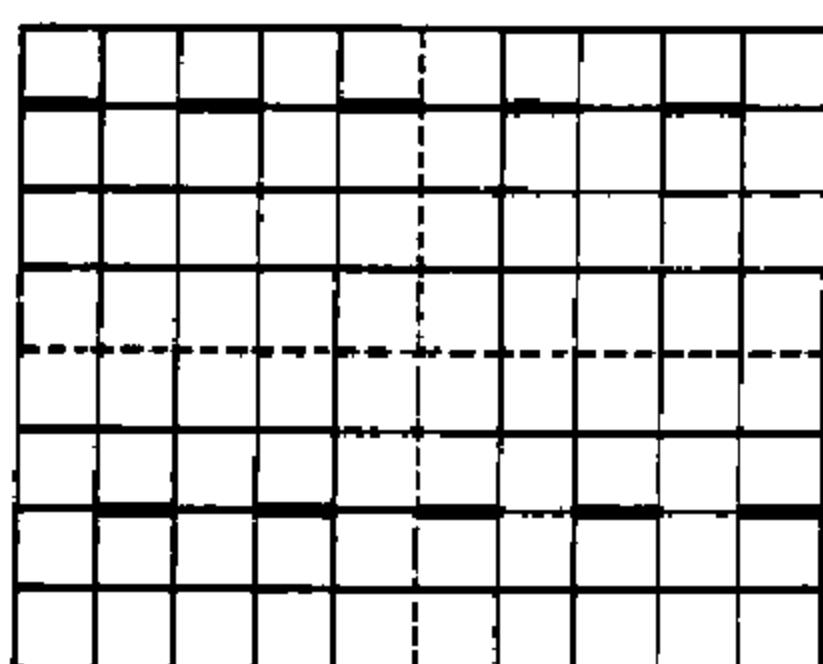

VARIABLE                    CAL

TIME/DIV                    0.5mS

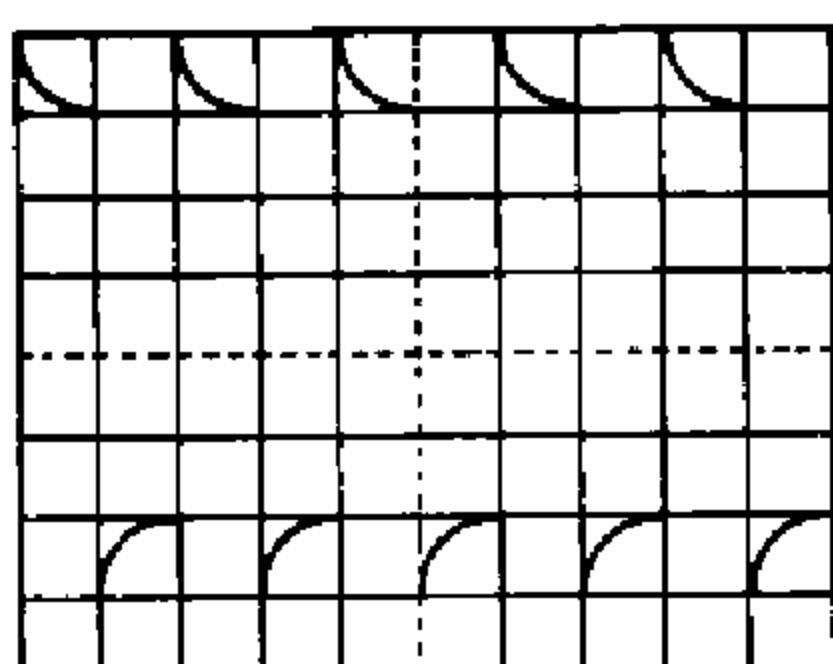

(sweep)VARIABLE            CAL

(Horizontal)POSITION CENTER

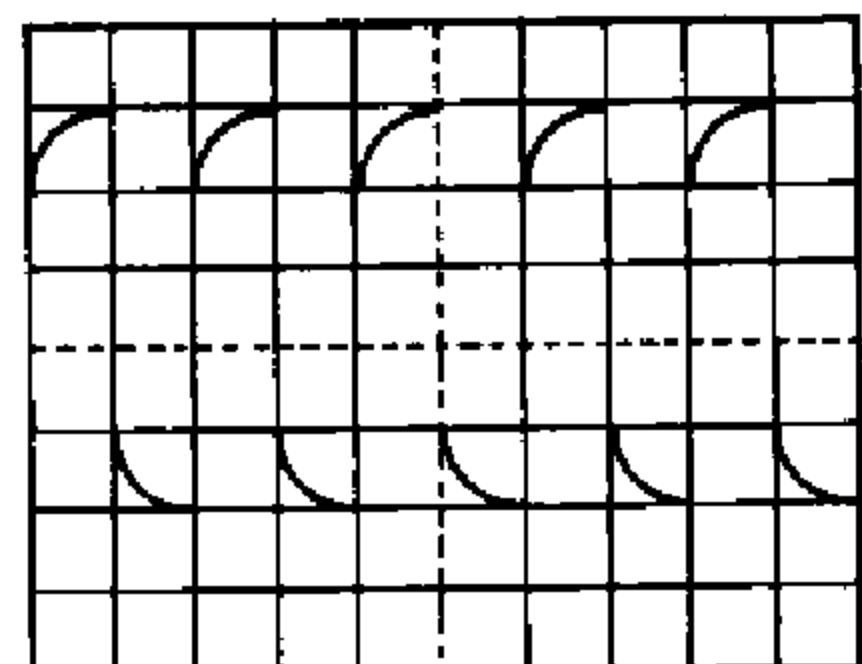

2. Set the probe switch to  $\times 10$  and connect the probe between the input connector and the CAL OUT terminal.
3. Display the calibration voltage waveform with 5 divisions amplitude
4. Adjust the variable capacitor of the probe using the small driver, and set the top of the waveform to the correct phasing shown in Fig. 6-1

correct

OVER - Shoot

UNDER - Shoot

Fig 6-1. Phasing of probe & Waveform

## 6-2 Voltage measurement

### 6-2-1 DC Voltage Measurement

1. Set the AC-GND-DC switch to GND. The vertical position of the trace in this case is used as 0-volt reference line as shown in Fig. 6-2. Adjust the vertical position control in order to place the trace exactly on a horizontal graticule, which facilitates the reading of signal voltage.
2. Set the trigger MODE switch to AUTO.  
Select a sweep rate so that the trace may not flicker.
3. Set the AC-GND-DC switch to DC, and apply the voltage to be measured to the input connector. The vertical displacement of the trace gives the voltage amplitude of the signal. When the trace shifts upward, the measured voltage is positive with regard to the ground potential when the trace shifts downward, the voltage is negative.

The voltage can be obtained by Equation(1) or (2).

- a. Measurement with the x1 position of the probe

$$\text{Voltage(V)} = \text{VOLTS/DIV setting value(V/div)} \\ \times \text{Displayed amplitude of input} \\ \text{signal(div)} \quad \text{--- (1)}$$

- b. Measurement with the X10 position of the probe

$$\text{Voltage(V)} = \text{VOLTS/DIV setting value(V/div)} \\ \times \text{Displayed amplitude of input} \\ \text{signal(div)} \times 10 \quad \text{--- (2)}$$

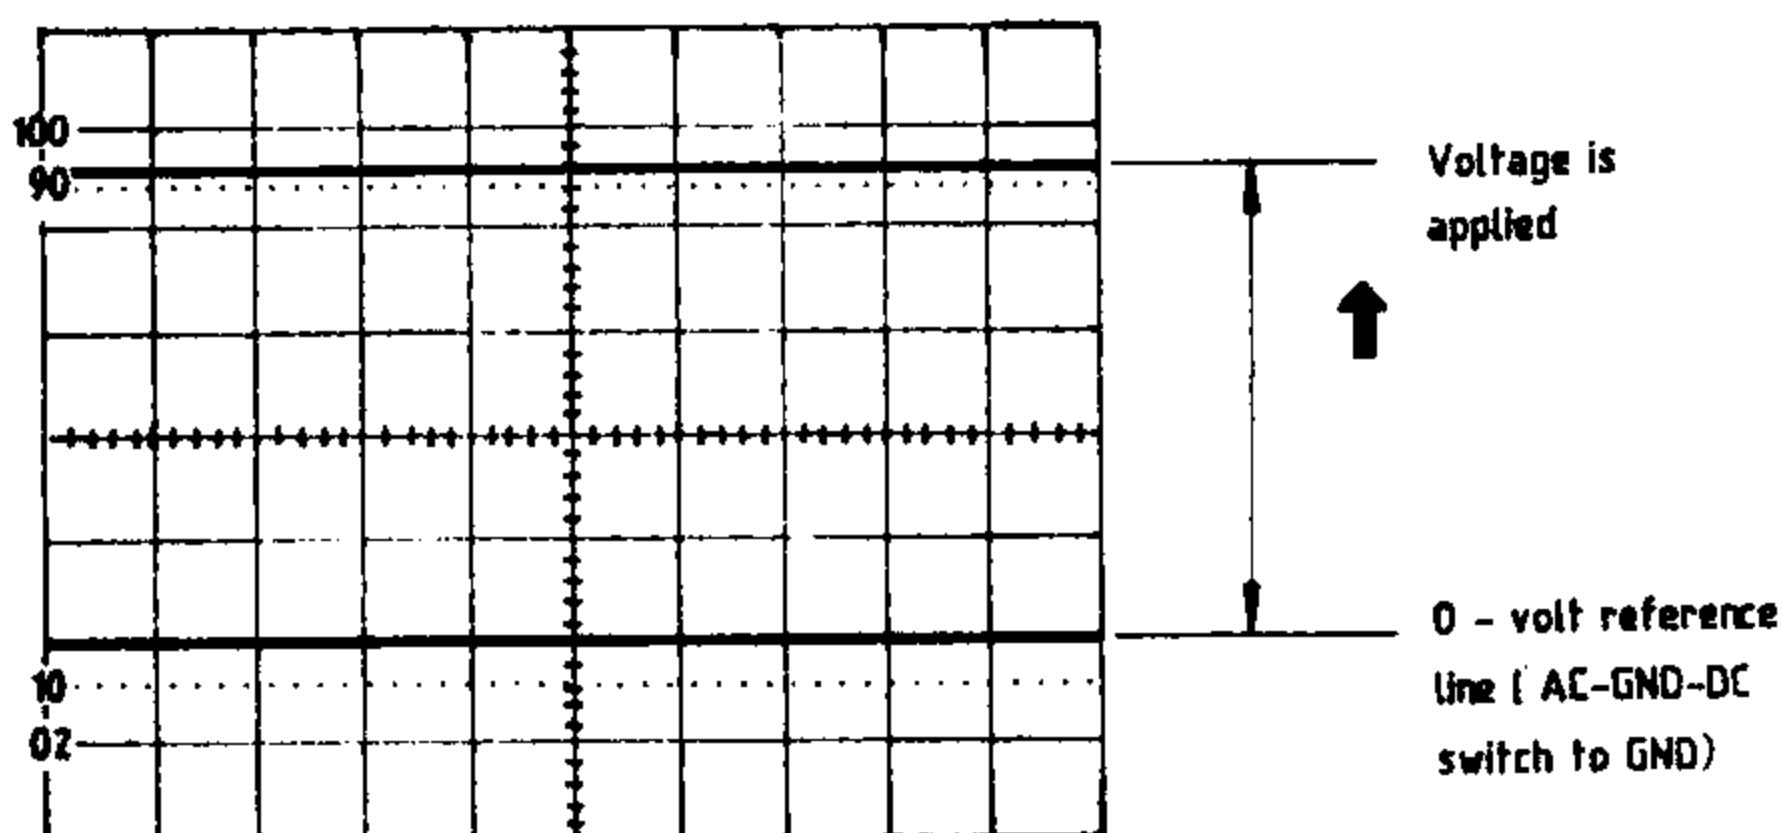

Fig 6-2. DC Voltage measurement

### 6-2-2 AC voltage measurement

The measurement of the voltage waveform is performed as follows ; Set the VOLTS/DIV switch in order to obtain the amplitude for easy reading, read the amplitude as shown in Fig. 6-3 and calculate by equation(1) or (2).

When the waveform superimposed on DC current is measured, set the AC-GND-DC switch to DC in order to measure the value including DC component, or set this switch to AC in order to measure AC component only.

The measured value by means of this procedure is peak value( $V_{p-p}$ ). Effective value( $V_{rms}$ ) of a sine wave signal can be given by Equation(3).

$$\text{Effective voltage} (V_{rms}) = \frac{\text{Peak voltage} (V_{p-p})}{2\sqrt{2}} \quad \text{--- (3)}$$

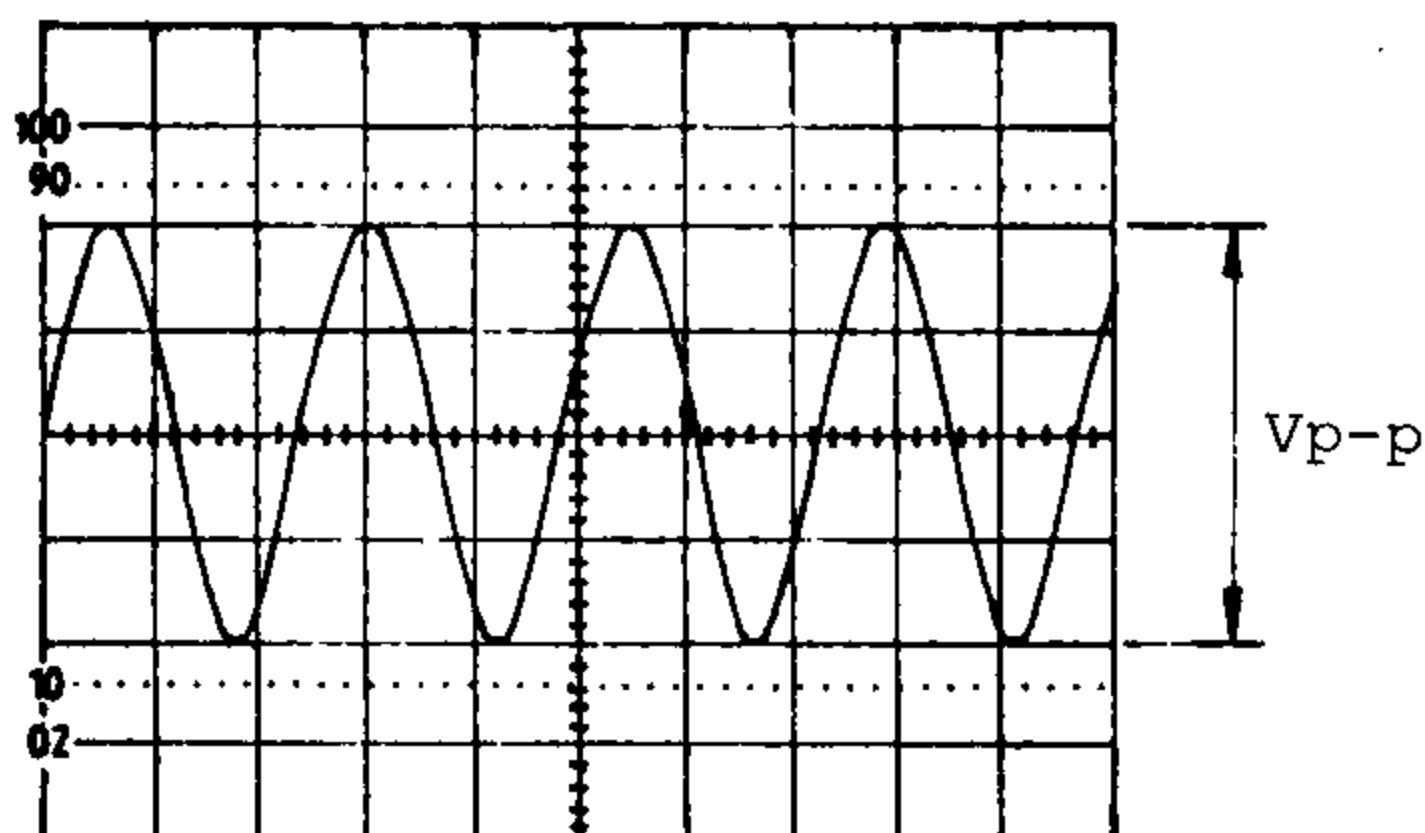

Fig 6-3. AC Voltage measurement

### 6-3 Frequency measurement

The first method ; Calculate the one cycle time(interval) of the input signal and obtain the frequency by equation(4)

$$\text{Frequency(Hz)} = \frac{1 \text{ (C)}}{\text{PERIOD(S)}} \quad \text{----- (4)}$$

The second method ; Count the repetition number N per 10 divisions in the viewing area, and calculate the frequency by Equation (5)

$$\text{Frequency(Hz)} = \frac{N(C)}{\text{TIME/DIV setting value(s/div)} \times 10(\text{div})} \quad \text{----- (5)}$$

When N is large(30~50), the second method can give a high accuracy level than that obtained with the first method.

This accuracy is approximately equal to the rated accuracy of sweep rate. However, when N is small, the count below decimal point becomes very ambiguous, which results in considerable error.

For the measurement of comparatively low frequencies having a simple pattern such as sine wave, square wave, triangle wave, and sawtooth wave, measurement with high accuracy can be effected by the following method ; Operate the oscilloscope as an X-Y scope, make the Lissajou's pattern by applying the signal of which frequency is known, and read the necessary value.

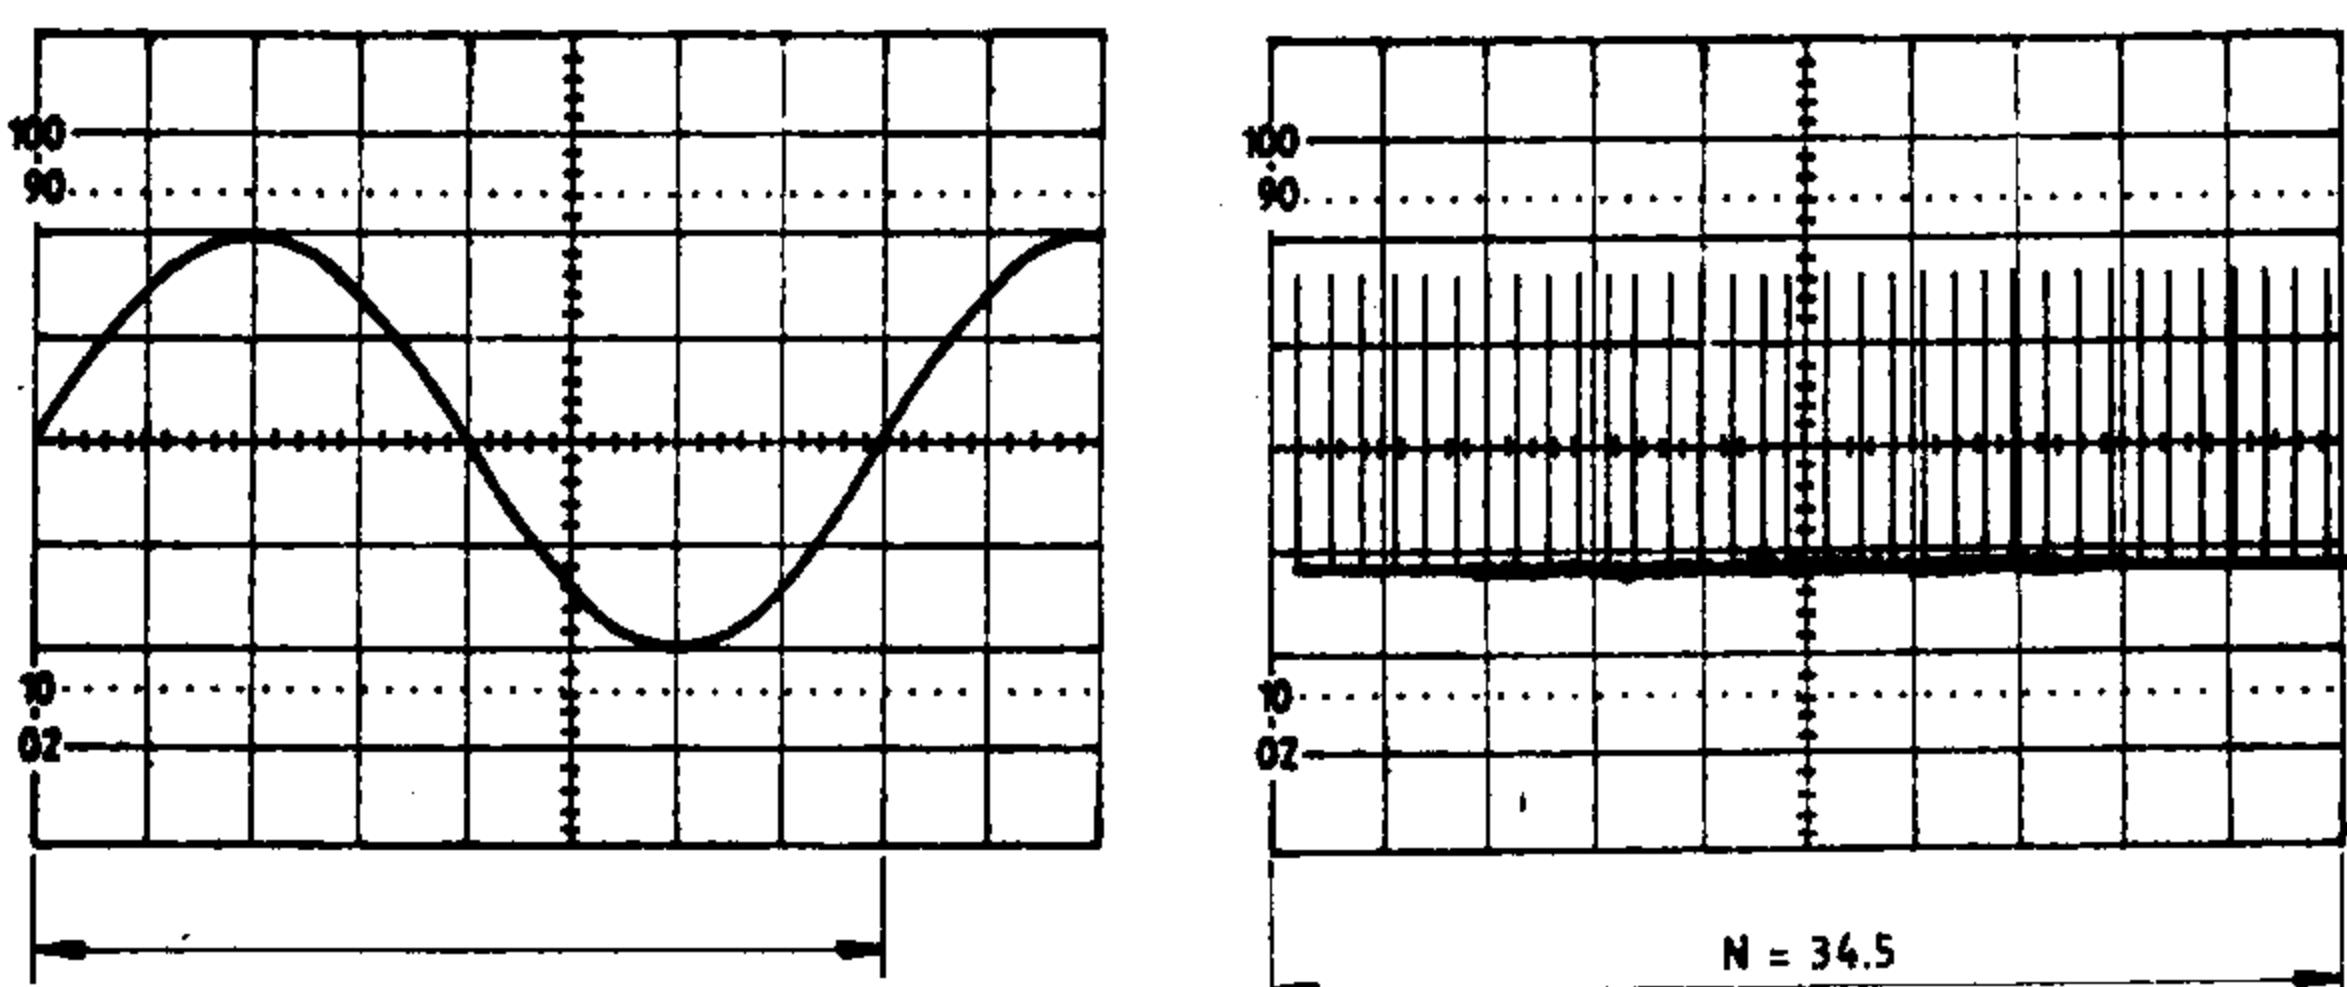

Fig 6-4. Frequency measurement

#### 6-4 Rise(Fall) time measurement

1. Display the pulse waveform vertically and horizontally in the same manner as for the pulselwidth measurement procedure.
2. Turn the horizontal POSITION control in order to set the upper 10% point of the waveform on the vertical center line of the graticule. Read the distance T1 between the vertical center line and the point at which the rising (falling) edge crosses the horizontal center line.
3. Shift and set the lower 10% point of the waveform to the vertical center line of the graticule as shown by the dotted line in Fig 6-5. Read the distance T2 between the vertical center line and the point at which the rising (or falling) edge crosses the horizontal center line.
4. Calculate the rise(or fall) time by substituting the sum of T1 and T2

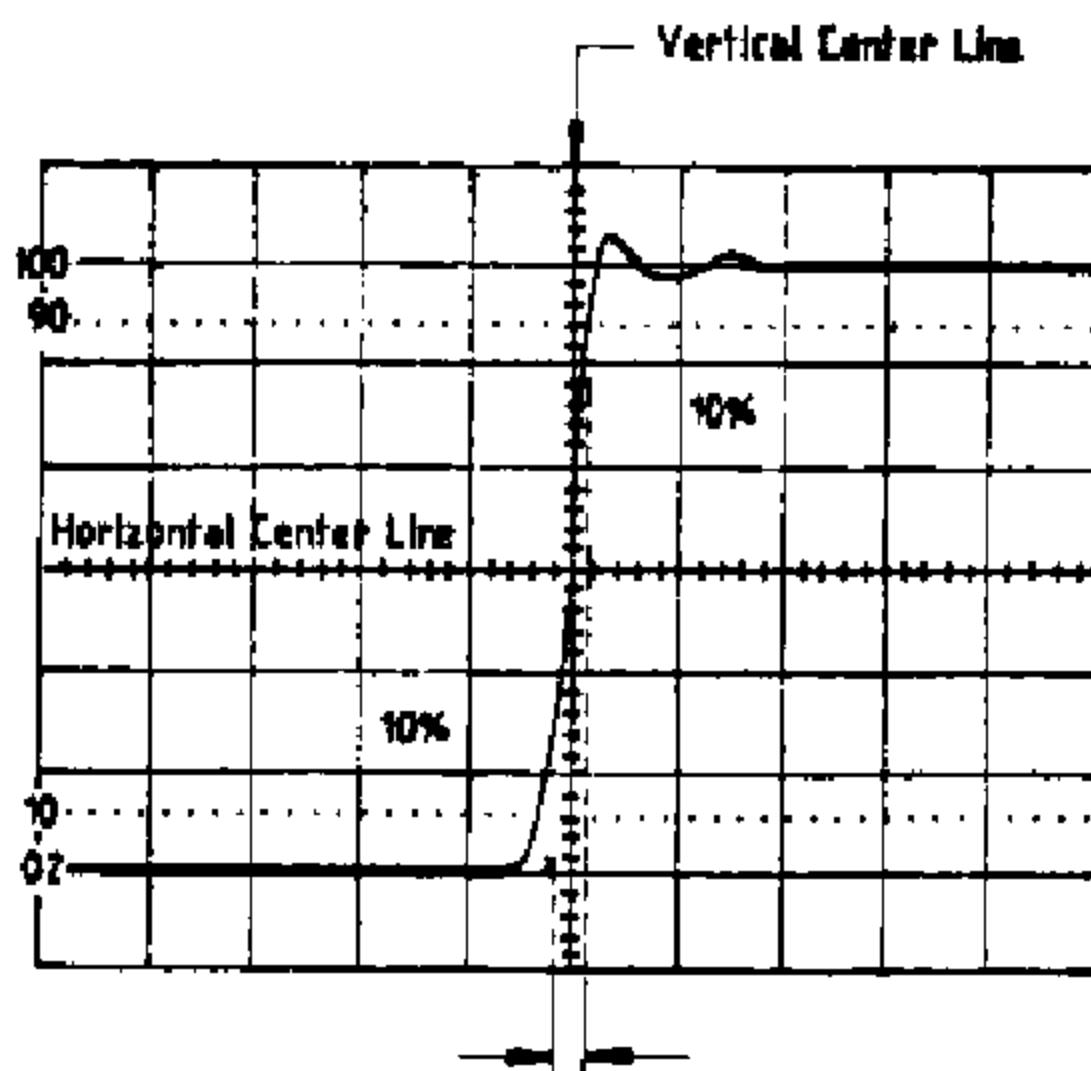

Fig 6-5 Rise(or fall) time measurement

## 6-5 Pulsewidth Measurement

The basic pulsewidth measurement procedure is as follows :

1. Display the pulse waveform vertically so that the distance between the top part of the pulse waveform and the horizontal center line of the graticule may be equal to the distance between the bottom part of the pulse and the horizontal center line as shown in Fig. 6-6

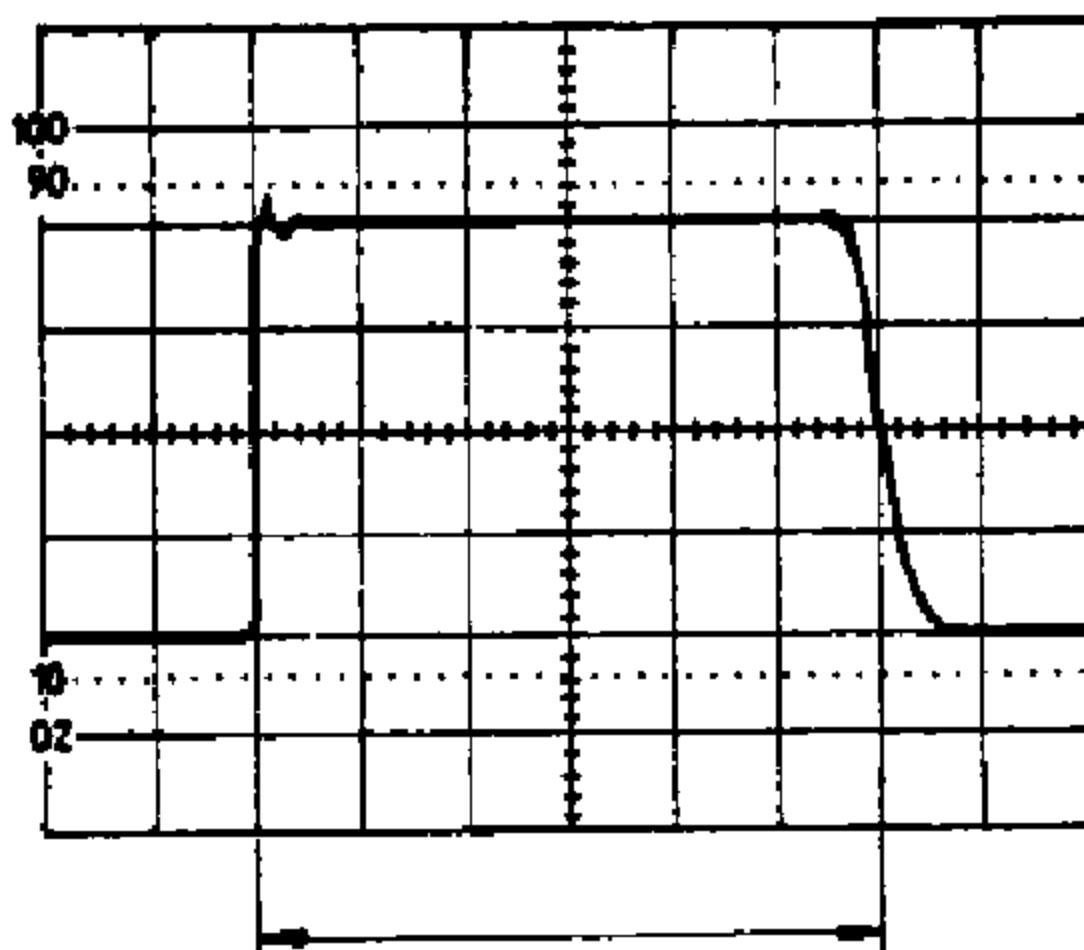

Fig 6-6 Pulsewidth measurement

2. Set the TIME/DIV switch in order to make the easy observation of the signal.
3. Read the distance between centers of rising and falling edges, i.e., the distance between two points at which pulse edges cross the horizontal center line of the graticule.

## 6-6 Phase Measurement

The measurement of phase difference between two signals, there are the following two methods ;

The first one is the Lissajou's pattern method by using the instrument as an X-Y scope. The phase difference of

signals can be calculated from the amplitude A and B of the pattern shown in Fig 6-7 and by Equation(6)

$$\text{Phase difference(deg)} = \sin^{-1} \frac{A}{B} \quad \text{----- (6)}$$

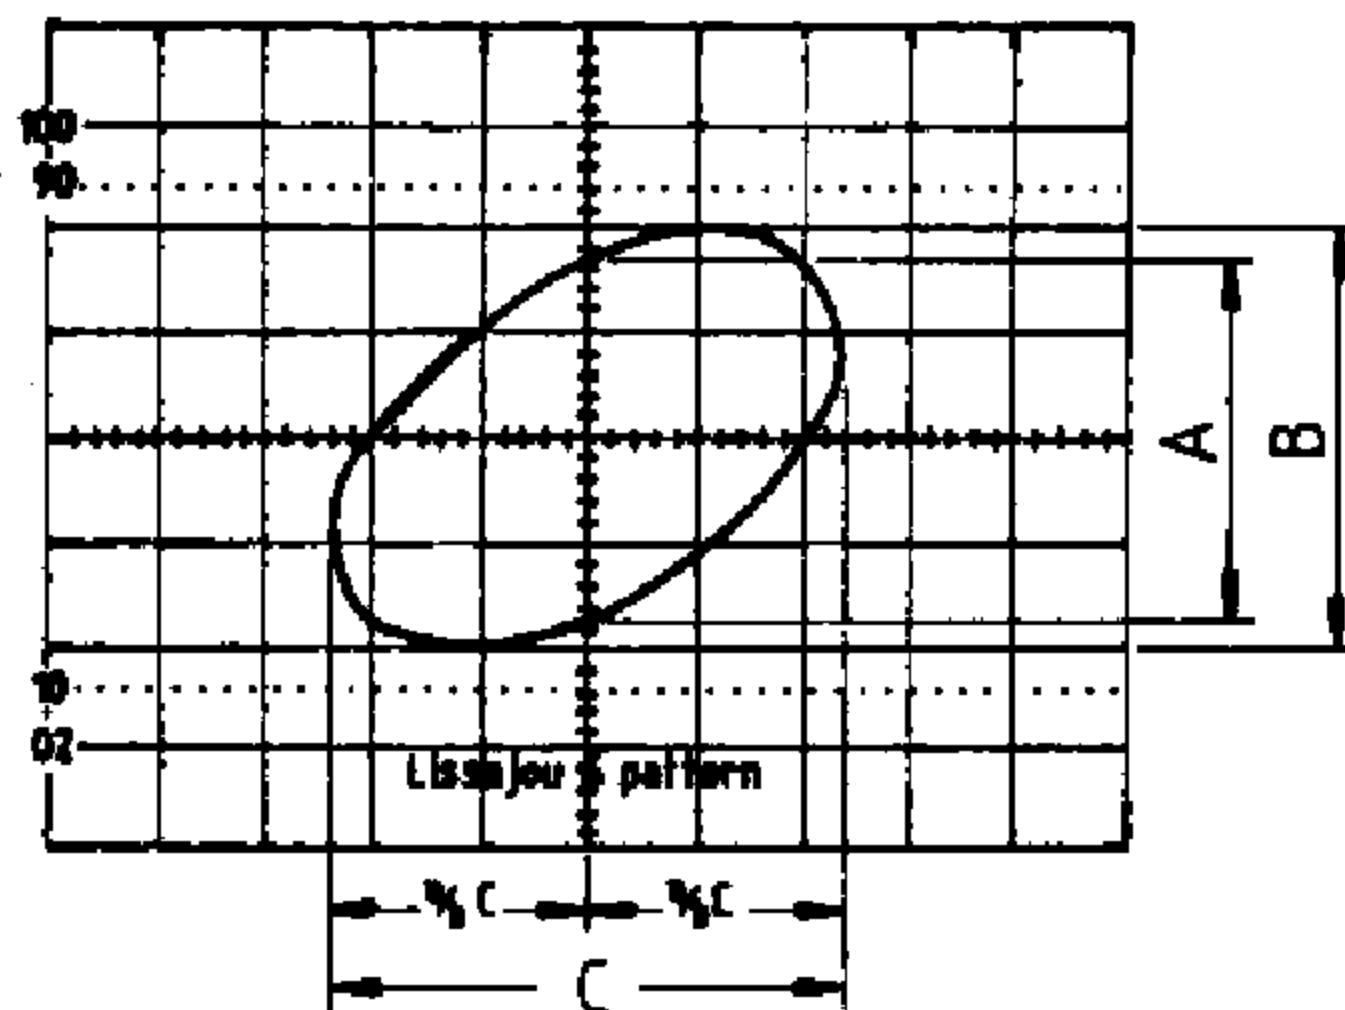

Fig 6-7 Phase difference measurement using X-Y operation

The second method is an application of dual-trace function

Fig 6-8 shows an example of dual-trace display of leading and lagging sine wave signals having the same frequency.

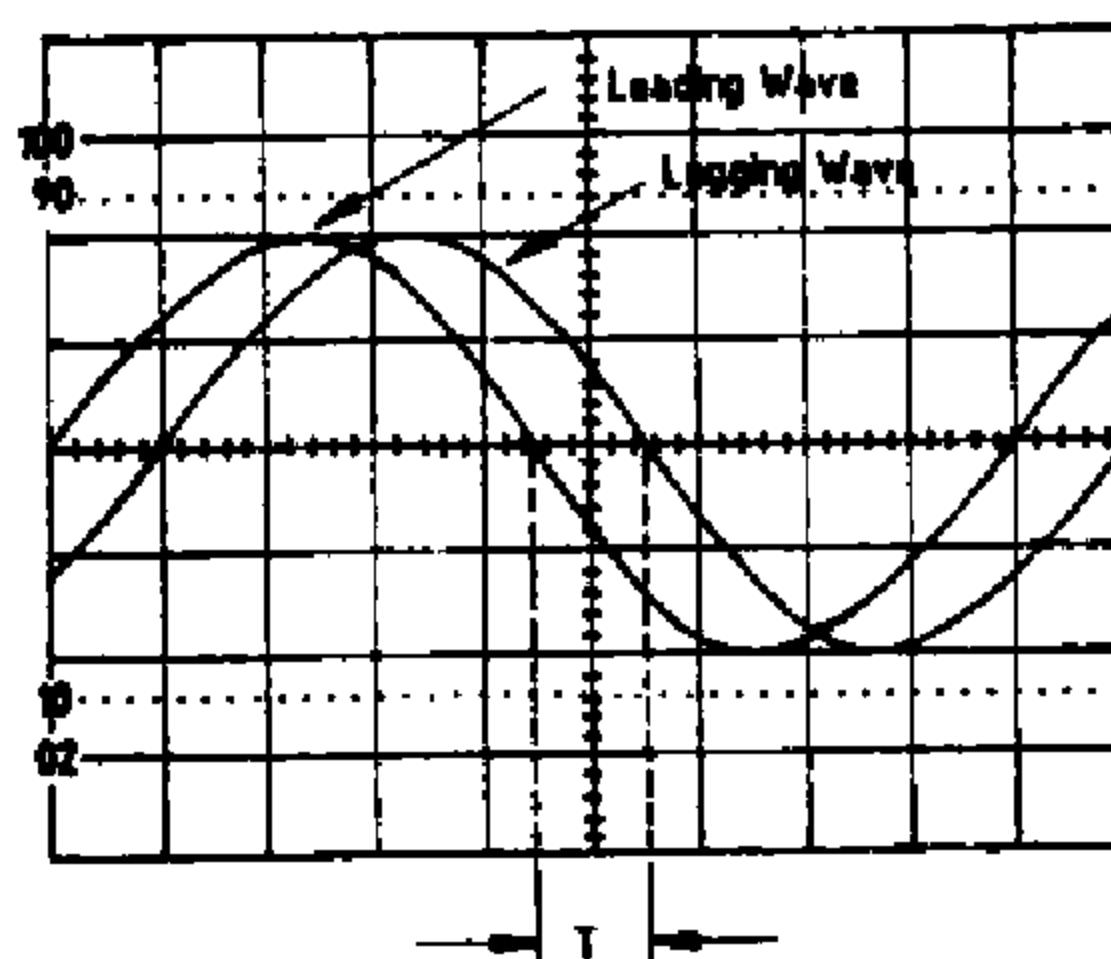

Fig 6-8 Phase difference measurement by dual-trace display

## 7. CIRCUIT DESCRIPTION

The block diagram (page 62) shows the overall relationship between all of the circuits. Complete schematics of each circuit are also given in section schematic diagrams (page 63-to 75).

Refer to these diagrams throughout the following circuit description for electrical values and relationship.

### Channel 1 & 2 Vertical Preamp

Input signals for vertical deflection on the CRT can be connected to the "CH1 X" and(or) "CH2 Y" input connectors.

In the X-Y mode of operation, CH1 input signal provides the horizontal(X-axis) deflection and CH2 input signal provides the vertical(Y-axis) deflection.

The Channel 1 and 2 Vertical Preamp circuits provide control of input coupling, vertical deflection factor, DC balance, Vertical position and vertical gain.

They also contain a stage to provide a sample of the input signal to the Tigger Preamp circuit for internal triggering from the Channel 1 and(or) Channel 2 signal only.

### Vertical switching circuit

The vertical switching circuit determines whether the CH1 or CH2 or both Vertical Preamp output signals are connected to the Vertical Output Amplifier circuit.

In the ALT and CHOP modes, both channels are alternately displayed on a shared time basis.

### Vertical Output Amplifier

The Vertical Output Amplifier circuit provides the final amplification for the signal before it is applied to the vertical deflection plates of the CRT.

### **Trigger Preamp**

The Trigger Preamp circuit amplifies the internal trigger signal to the level necessary to drive the Trigger Generator circuit. Input signal for the Trigger Preamp circuit is obtained by sampling the signal applied to channel 1 or the composite vertical signal from the Vertical Switching circuit. This circuit also provides a signal to the Horizontal Amplifier for X-Y operation.

### **Trigger Generator**

The Trigger Generator circuit produces trigger pulses to start the Sweep Generator circuit. These trigger pulses are derived either from the internal trigger signal from the vertical deflection system, an external signal connected to the external TRIG Input connector or a sample of the line voltage applied to the instrument.

Controls are provided in this circuit to select trigger level, slope and source. The trigger MODE switch determines the operating mode for the trigger circuit. In the NORM position, a sweep is produced only when a trigger pulse is received from the Trigger Generator circuit. Operation in the AUTO position is the same mode as NORM position, except that a free-running trace is displayed when a trigger pulse is not present or when the amplitude of the trigger signal is not adequate.

### **Sweep Generator**

The Sweep Generator circuit produces a sawtooth voltage which is amplified by the Horizontal Amplifier circuit to provide horizontal deflection on the CRT. This sawtooth voltage is generated on command(trigger pulse) from the Trigger Generator circuit.

The Sweep Generator circuit also produces an unblanking gate to unblank the CRT during sweep time.

### **Horizontal Amplifier**

The Horizontal Amplifier circuit provides the output signal to the CRT horizontal deflection plates. In all positions of the TIME/DIV select switch except X-Y, the horizontal deflection signal is a sawtooth from the Sweep Generator circuit. In the X-Y position, the horizontal deflection signal is obtained from the Channel 1 Vertical Preamp through the Trigger Preamp circuit. In addition, the horizontal amplifier contains the horizontal magnifier and the horizontal positioning circuits.

### **Power Supply**

The low-voltage Power Supply circuit provides the operation power for this instrument from five regulated supplies and one unregulated supply. The Power Input stage is provided with a Voltage Selector Assembly. This selector allows selection of the nominal operating voltage and regulating range for the instrument.

### **Calibrator**

The Calibrator circuit produces a square-wave output with accurate amplitude and frequency. This output is available as a squarewave voltage at the CAL 0.5V(1KHz) connector.

The effect of these input signals is to either increase or decrease the trace intensity, or to completely blank portions of the display.

### **CRT Circuit**

The CRT Circuit provides the high-voltage and control circuits necessary for operation of the Cathod-Ray Tube(CRT).

**TEST EQUIPMENT REQUIRED**

Description	Minimum specification	Usage	Example of applicable test equipment
1. Constant amplitude signal generator	50kHz reference frequency; maximum frequency 70MHz; variable amplitude	Check horizontal, vertical and trigger bandwidth.	
2. Standard amplitude calibrator	Amplitude accuracy: 0.25%, variable amplitude; 5mV to 40V; frequency: 1 kHz square wave	Check horizontal and vertical gain.	
3. Square-wave generator	Variable frequency: 10Hz to 1MHz; output amplitude; 10mV to 100V	Check probe and vertical compensation.	
4. Digital voltmeter	0.1% accuracy	Check power supply.	
5. Time mark generator	0.1% accuracy	Check horizontal timing.	
6. Cable	Impedance, 50 ohms; type, RG-58/U; length, 42 inches, connectors, BNC	External trigger operation check. Horizontal gain check and adjustment.	
7. Termination	Impedance, 50 ohms; connectors, BNC	Vertical amplifier compensation checks and adjustment.	
8. Attenuator	Ratio, 1/10; connectors, BNC; impedance, 50 ohms	Vertical amplifier bandwidth check.	
9. T-connector	Connectors, BNC	External trigger operation checks.	

#### 8-4. Preliminary control settings

Set the instrument controls as follows, when starting the calibration procedures.

Controls	Settings	Controls	Settings
FOCUS	Midrange		
TRACE ROTATION	As desired		
- VERT -			
V. POSITION	Midrange, pushed in	SWP VAR	Fully clockwise
V. VARIABLE	CAL, fully clockwise		
INPUT COUPLING	GND (AC-GND-DC)	- TRIG -	
VOLTS/DIV	5 mV/DIV	TRIG. COUPLE	AC
V.MODE	CH1	LEVEL	Midrange, Normal
CH2 INV	Normal, Pushed in	SLOPE	+ Normal
- HORZ -			
H. POSITION	Midrange	MODE	AUTO
PULL X10 MAG	Normal, Pushed in		
TIME/DIV	1 ms	TRIG. SOURCE	CH1

#### 8-5. Initial starting procedure

1. Rotate the INTENsity control to the midrange and set the POWER switch to ON.
2. Wait a few seconds for the cathode ray tube (CRT) to warm up. A trace should appear on the CRT.
3. If trace disappears; increase (clockwise) the INTENsity control setting until the trace is easily observed, or roughly check/adjust the DC balance to get a trace as same as ⑩.
4. Adjust the FOCUS control for the best focused display.
5. Readjust the POSITION controls if necessary, to center the trace.

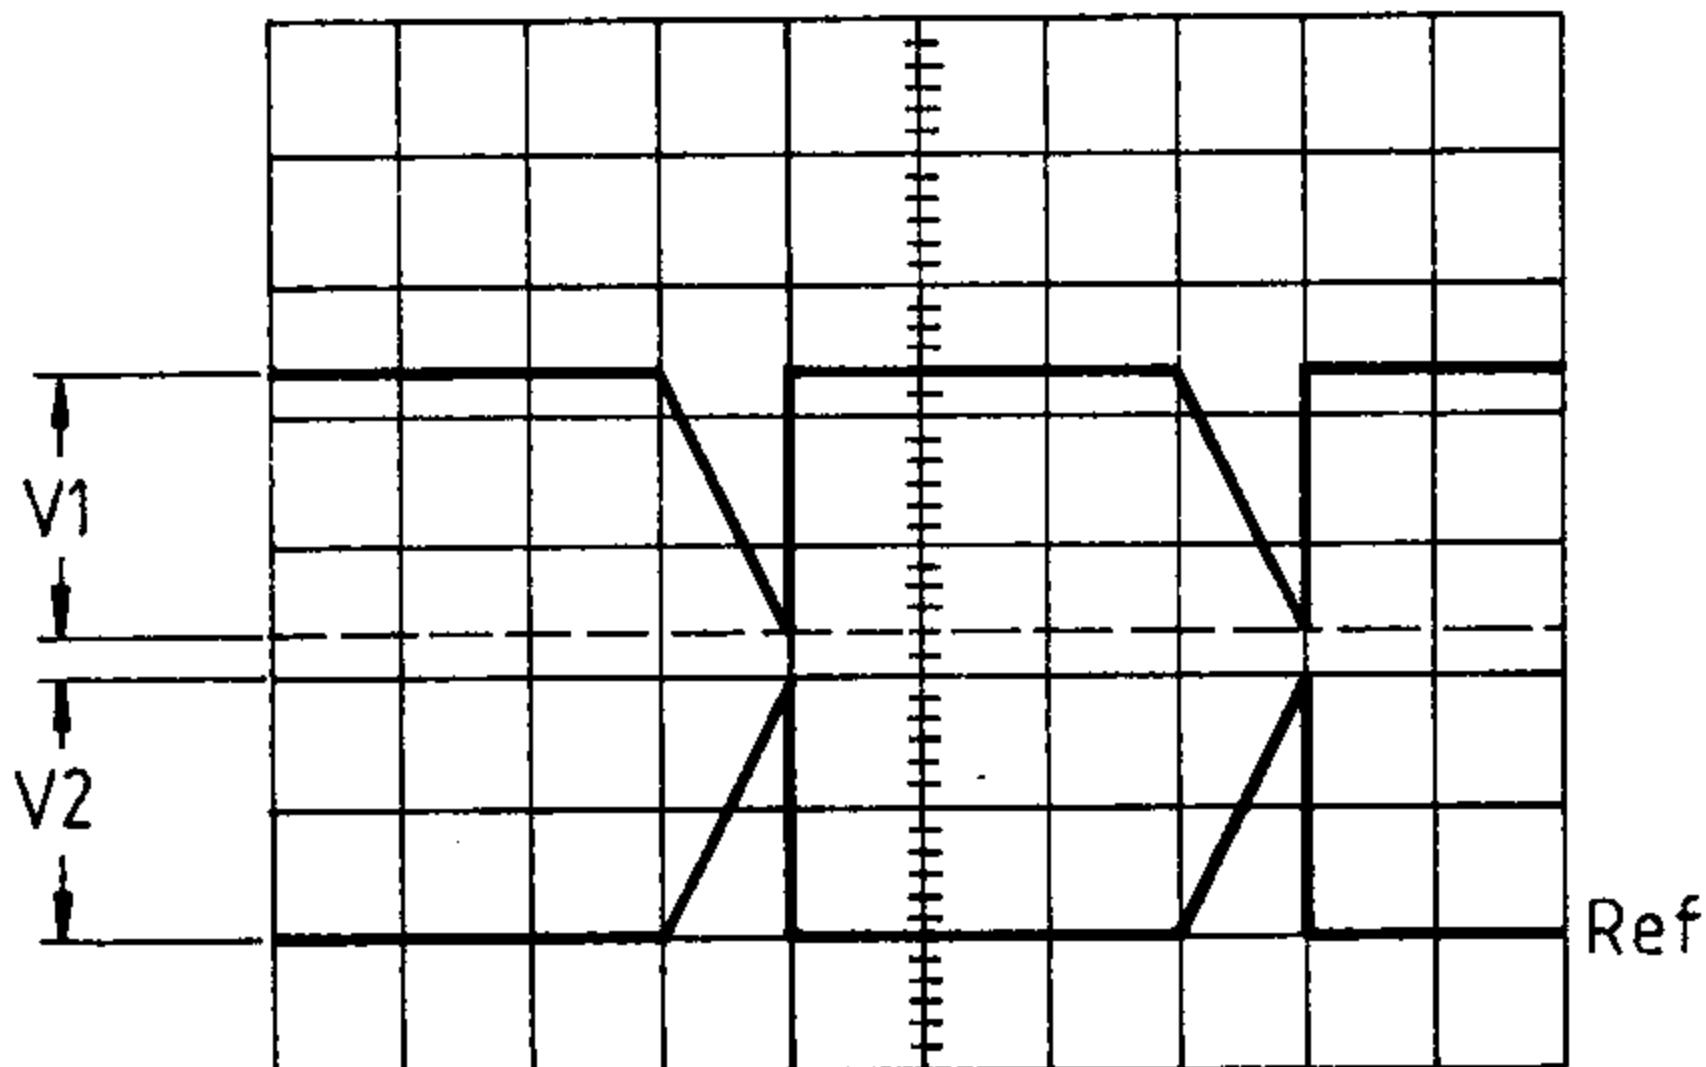

## Power Supply System

\* NOTE : Before you start operation, see the adjustment locations in the pullout pages.

### Control setting

Preset the controls as given in the preliminary control setting.

- (1) Check low voltage supply, if necessary.
    - a. Connect the digital voltmeter(DVM) between the +12V line (P810-4) and ground.  
; +11.7 to +12.5V
    - b. Connect the DVM between the -12V Line(P810 -2) and ground.  
; -12.5 to -11.7V
    - c. Connect the DVM between the +5V line(P810 -3) and ground.  
; +4.8 to 5.2V
    - d. Connect the DVM between the +51V line(P810 -5) and ground.  
; +50.5 to 51.5V
      - i) Conect THE PROB(10x1) with X+(R674) and X-(R663) on the horizontal board.
      - ii) Set O'SCOPE VOLT/DIV to 5V. RANGE and also, the lines of wave form of CH1 and CH2 must be coincided with Ref Line.
- NOTE ; Ref to figure as following.
- iii) Set the H-POSITION to the left side.
  - iv) Adjust VR805 as following ;

$$(V_1 = V_2)$$

V1 MUST BE SAME AS V2

- e. Connect the DVM between the +160V line(P810 -6) and ground.  
; +150 to +170V
  - f. Connect the DVM between the +180V line(J810 -7) and ground.  
; +170 to 190V
  - g. Connect the DVM between the +18V line(P804-1) and ground.  
; +17 to +19V
2. Check high voltage supply
- a. Connect the DVM between the H.V.(P612-6) and ground with a high voltage probe.
  - b. Check for a reading of -1, 995 to -1, 805V

## DISPLAY

### Control setting

Preset the controls as given in the preliminary control setting.

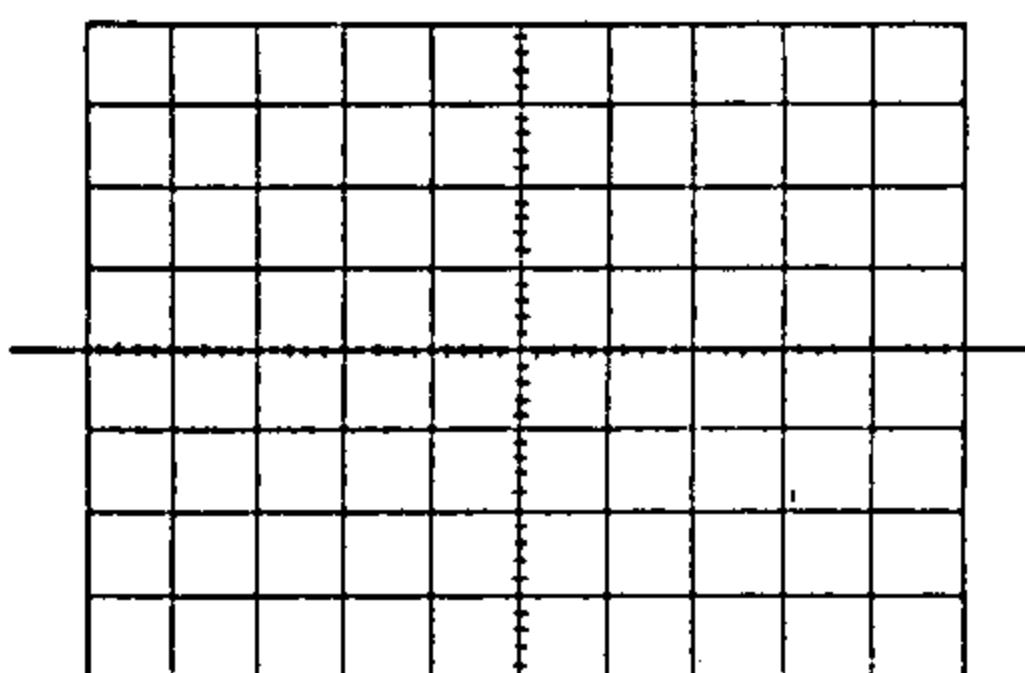

#### ③ Check/adjust INTEN ADJ.

Set the Trig MODE switch to the AUTO, and set the TIME/DIV switch to the 1 ms.

- a. Connect the digital voltmeter (DVM) to the R688 (or CR614) and ground.
- b. Adjust the INTENSITY control so that the DVM indicates 20 V.
- c. Observe the trace of CRT.
- d. Adjust the grid bias adjustment VR610 for the trace makes a just appear.

#### ④ Check/adjust trace rotation.

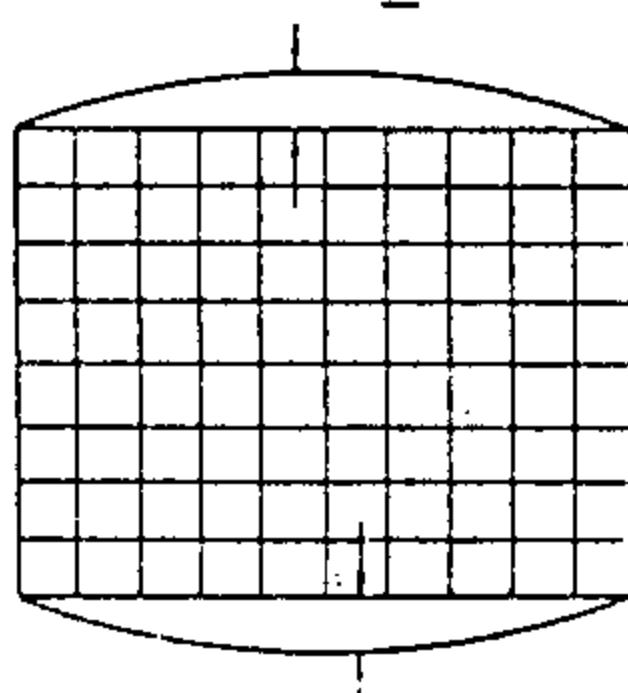

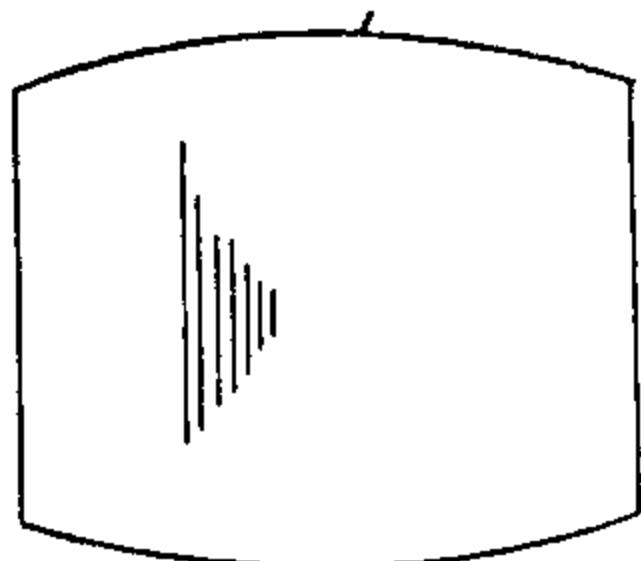

- a. Position the trace to the center graticule line.
- b. Check that the trace is in parallel with the center horizontal line.
- c. Adjust TRACE ROTATION (screwdriver adjustment on front panel) for a trace that is in parallel with the horizontal graticule lines.

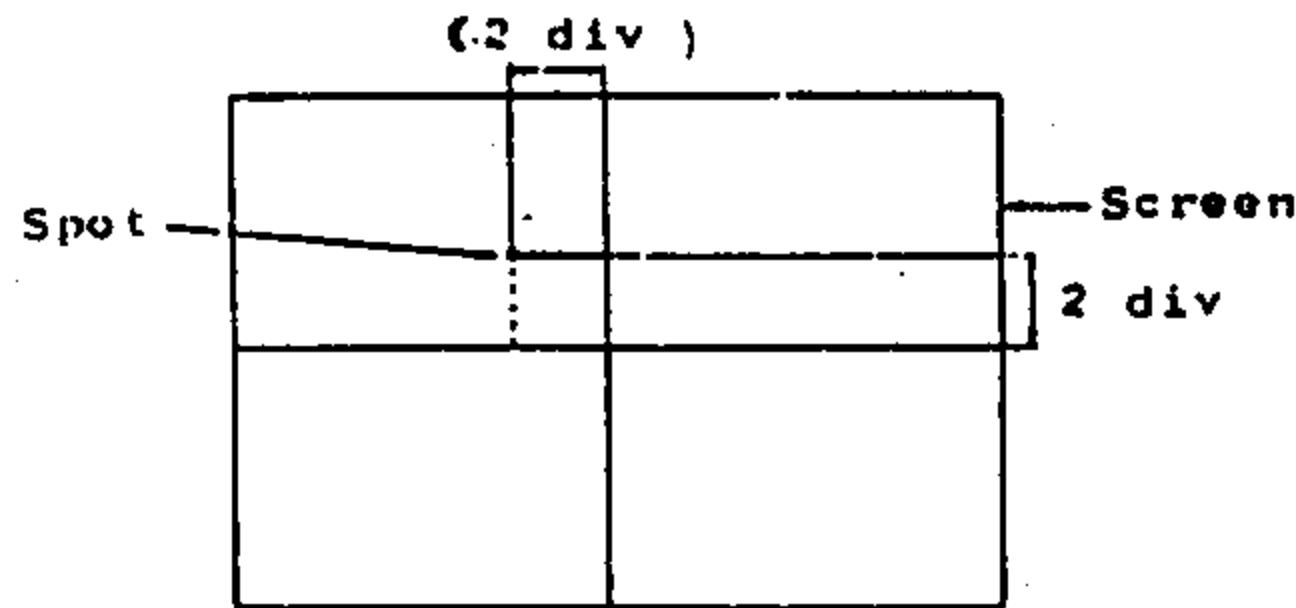

#### ⑤ Check/geometry

- a. Set the TIME/DIV to the 0.1 ms, and the input coupling switch to DC.
- b. Connect the constant amplitude signal generator to the input.
- c. Set the VOLTS/DIV switch setting for a full-screen (8 division) deflection.
- d. Check that horizontal bowing is less than  $\pm 0.35$  division.

Less than  $\pm 0.35$  div

- ⑥ Check/adjust astigmatism and FOCUS.
- Set the TIME/DIV switch to the X-Y position, and the input coupling switch to GND.
  - Set the INTENsity control for a small spot, as the following figure, using the position controls.

- Check that the spot is round.
- Adjust the FOCUS adjustment and astig. adjustment VR803 for a round spot.

## HORIZONTAL SYSTEM

### Control settings

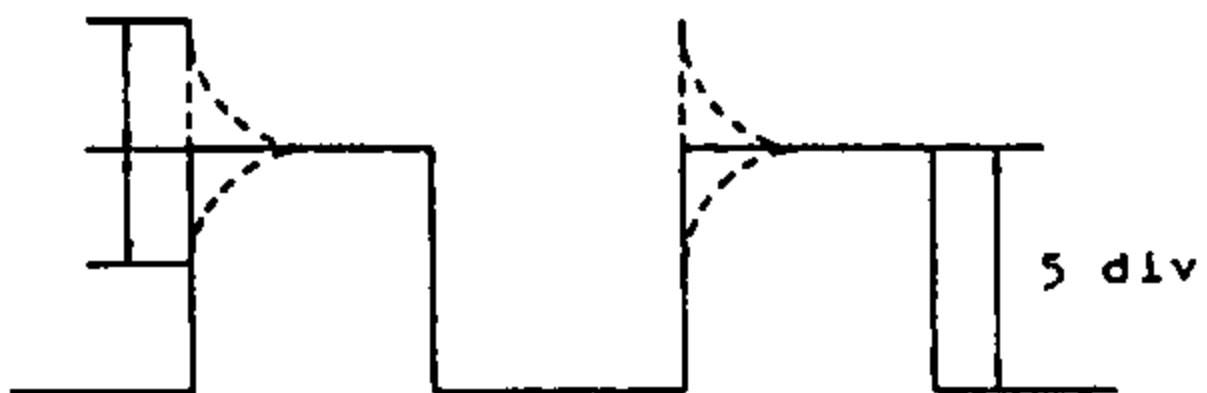

Preset the controls as given in the preliminary control settings.

- ⑦ Check/adjust horizontal gain.
- Set the input AC-GND-DC to DC.
  - Connect the cable to the output of the time mark generator.
  - Set the time mark generator for 0.5ms time marks.
  - Check that the time marks align with the graticule lines over the center eight divisions, within 3 %.
  - Adjust the H GAIN adjustment VR605 so that the time marks coincide with the middle eight graticule lines.
- ⑧ Check/adjust Horizontal  $\times 10$  MAG Gain.
- Set the TIME/DIV switch to 0.5ms.
  - Set  $\times 10$  MAG (pull out the knob of the POSITION control).
  - Check that the one-cycle time marks align with the ten-divisions graticule lines, within 5 %.

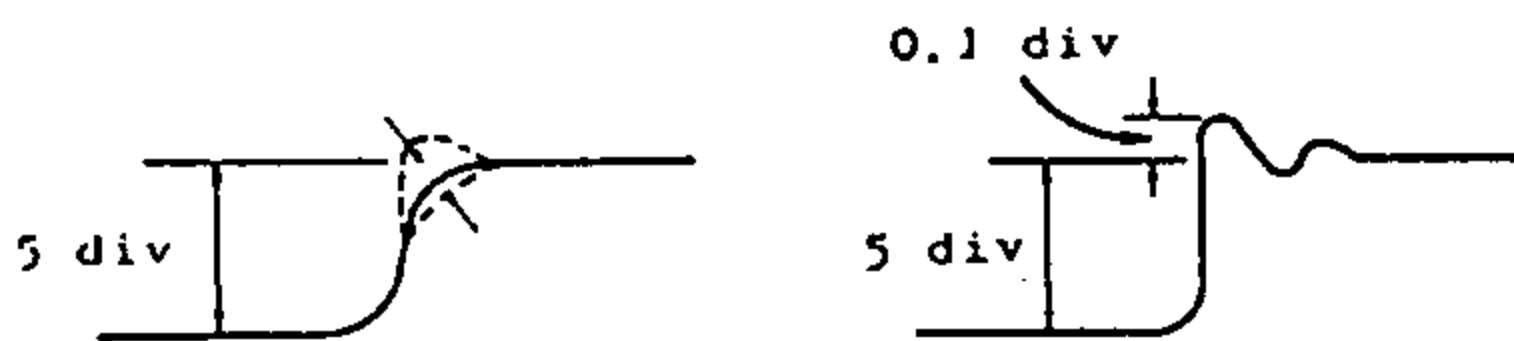

- d. Adjust the MAG GAIN adjustment VR606 so that one-cycle time marks coincide with the ten-division graticule lines.
  - e. Push in the POSITION control after adjustment and check.
- ⑨ Check/adjust MAG CENT.
- a. Set the TIME/DIV switch to 0.5ms.
  - b. So that the knob of H.POSITION is pulled out ( $\times 10$  MAG), the left end of the trace is brought to the center point and then the knob of H.POSITION is depressed.
  - c. Observe the movement of the left end of the trace.
  - d. Adjust the MAG CENT adjustment VR607 for the movement of the left end of the trace within  $\pm 0.2$  div.
- ⑩ Check/adjust low speed sweep accuracy.
- a. Set the time mark generator for 5 ms time marks.
  - b. Set the TIME/DIV switch to 5 ms.
  - c. Check that the time marks align with the graticule lines over the middle eight divisions, within 3 %.
  - d. Adjust the 5 ms/DIV adjustment VR609 so that the time marks coincide with the middle eight graticule lines.
- ⑪ Check/adjust high speed sweep accuracy.
- a. Set the input coupling switch to DC.
  - b. Set the time mark generator for 5  $\mu$ s time marks.
  - c. Set the TIME/DIV switch to 5  $\mu$ s.
  - d. Check that the time marks align with the graticule lines over the middle eight divisions.
  - e. Adjust VC601 so that the time marks coincide with middle eight graticule lines.

## VERTICAL SYSTEM

- ⑫ Check/adjust DC balance (Step attenuator balance).
  - a. Set the VOLTS/DIV switch to the 5 mV position.
  - b. Position the trace to the horizontal center line.
  - c. Change the VOLTS/DIV switch to the 10 mV position.
  - d. Check that the trace is within  $\pm 1.0$  division of the center horizontal line.
  - e. Adjust the CH1 (CH2) DC balance adjustment, VR301(CH1) or VR401 (CH2), for a trace at the horizontal center line.
  - f. Repeat the part (a) through (e) until less than  $\pm 0.05$  division shift is noted when changing the VOLTS/DIV setting.
- ⑬ Check/adjust vertical position center.
  - a. Set the POSITION control of CH1(CH2) to center Position.
  - b. Set the V-MODE control to ALT mode.
  - c. Adjust the CH1(CH2) position center adjustment, VR304(VR404), for a trace at the horizontal center line.
- ⑭ Check/adjust  $\times 1$  AC GAIN.
  - a. Set the TIME/DIV switch to the 1 ms position.
  - b. Set the VOLTS/DIV switch to the 10 mV position.
  - c. Set the input coupling switch to DC.
  - d. Connect the square-wave generator (using 1 kHz output range).
  - e. Adjust the output amplitude of that generator for 5 division deflection of screen.
  - f. Check the high-voltage level of pulse is flat.

- g. Adjust the  $\times 1$  AC GAIN VR302 (CH1), VR402 (CH2) adjustment for a flat level.
- ⑯ Check/adjust vertical gain.
  - a. Set the VOLTS/DIV switch to the 10 mV position and the input coupling switch to DC.
  - b. Connect the standard amplitude calibrator to the input connector.
  - c. Set the standard amplitude calibrator for a 50 mVp-p (5 divisions for display) signal.
  - d. Check for a display of five divisions.
  - e. Adjust the GAIN adjustment VR303 (CH1), VR403 (CH2) for a display of 5 divisions within 3%.
  - f. Check all the VOLTS/DIV switch settings.
- ⑰ Check/adjust input capacity (ATT:  $\div 1$ ).
  - a. Set the VOLTS/DIV switch to the 10 mV position.
  - b. Set the input coupling switches to DC.
  - c. Connect the L-C meter to the input terminals.
  - d. Check the input capacity for approx. 23 pF.
- ⑱ Check/adjust vertical step response.
  - a. Set the VOLTS/DIV switch to the 5 mV position.
  - b. Set the TIME/DIV switch to the 0.5  $\mu$ s position.
  - c. Connect the fast-rise, positive output (50 mV, 1 MHz) of the square-wave generator to the input. Use a  $50 \Omega$  termination and cable.
  - d. Adjust the square-wave generator output for a 5-divisions display.
  - e. CH1 - Adjust VC501 so that a square wave is flat.  
CH2 Then, adjust VC502 for overshoot of  $\pm 0.1$  div.

**⑮ Check/adjust attenuation compensation.**

(ATT :  $\div 10$ ,  $\div 100$ )

- Set the input coupling switch to DC.
- Connect the square-wave generator to the CH1 (CH2) input terminal check for a square wave that is flat (flat top) under the following settings.

ATT	VOLTS/DIV	Square-wave generator output
$\div 10$	0.1 V	0.5 V
$\div 100$	1 V	5 V

- Adjust the trimmer capacitors (refer to the circuit board illustration with adjustment location - page 60) for a square wave that is flat (flat top) under the following settings.

ATT	VOLTS/DIV	Square-wave generator output	Adjust CH1 (CH2)
$\div 10$	0.1 V	0.5 V	VC302(VC402)
$\div 100$	1 V	5 V	VC 304(VC404).

**⑯ Check/adjust input capacity (ATT:  $\div 10$ ,  $\div 100$ ).**

- Connect the L-C meter to the input connector.
- Check the input capacity for approximately 20 pF.
- Adjust the trimmer capacitors for a 2 pF input capacity under the following settings.

ATT	VOLTS/DIV	Adjust CH1 (CH2)
÷1	5mV	—
÷10	0.1V	VC301(VC401)
÷100	1V	VC303(VC403)

⑩ X-Y operation

20-1 Check/adjust X gain.

- a. Set the TIME/DIV switch to X-Y, the input coupling switch of CH1 to AC, the input coupling switch of CH2 to GND.
- b. Set the VOLTS/DIV switch to the 10mV position.
- c. Connect the standard amplitude calibrator to the CH1 input connector.
- d. Set the standard amplitude calibrator for 50mV.
- e. Check for a display of five divisions.
- f. Adjust the X GAIN adjustment VR608 for a display of five divisions within 6%.

20-2 Check/adjust X position center.

- a. Set the TIME/DIV switch to the X-Y position, and the horizontal POSITION control to the midposition, the input coupling switch of CH1 to GND.
- b. Check to see that the round spot is near the center graticule and is within ±0.2'division against horizontal line.
- c. Adjust the X CENT adjustment VR305 to the position spot at the center.

20-3 Adjust and repeat in accordance to Par. 20-1-f and Par. 20-2-C in order to the same as Par. 20-1 and Par. 20-2.

⑪ Check/adjust TRIG CENT.

- a. Set the TRIG COUPLE switch to AC, the TRIG SOURCE switch to CH1, the TRIG SLOPE knob push in, the VOLTS/DIV switch to 50mV, the TIME/DIV switch to 10uS.

- b. Connect the sine-wave generator to the input connector for a 0.5 div (50 kHz).
- c. Set the TRIG LEVEL knob to the midposition.
- d. Adjust VR602, so that synchronization is effected on the waveform, 0.5 div on the screen.
- e. Next, set the TRIG SLOPE to - (pulled out state) and insure that the waveform is triggered. After confirmation, leave the TRIG SLOPE in depressed state. Readjust when stepped out.

② Check/Adjust DC TRIG.

- a. Set the TRIG. COUPLE switch to DC, the TRIG. SOURCE to CH1, the VOLTS/DIV. to 50mV, the TIME/DIV. to 10uS.
- b. Connect the sine-wave generator to the input connector of CH1 for a 0.5 div(50KHz).
- c. Set the TRIG. level knob to the midposition.
- d. Adjust VR306 so that synchronization is effected on the waveform, 0.5 div on the screen.
- e. Next, set the TRIG. SLOPE to - (pull out state) and insure that the waveform is triggered. After confirmation, leave the TRIG. SLOPE in depressed state. Readjust when stepped out.
- f. Repeat from a to e in CH2 with VR405 instead of VR306.

## CALIBRATOR

- ㉓ Check/Adjust CAL. terminal(0.5Vp-p, 1KHz)
  - a. Connect the CAL. terminal to the input of frequency counter(FC-5015)
  - b. Adjust VR408 so that the the frequency be  $1\text{KHz}\pm20\text{Hz}$ .
  - c. Next, connect the CAL. terminal to the input of CH1.
  - d. Adjust VR407 so that 5 div. be aberved.
  - e. VOLTS/DIV. is set to 0.1mV

## 9. SEMICONDUCTOR LEAD CONFIGURATIONS
