Programming Guide

Agilent Technologies DC Electronic Loads Models N3300A, N3301A, N3302A, N3303A N3304A, N3305A, N3306A, and N3307A

Part No. 5964-8198 Microfiche No 5964-8199 Printed in Malaysia March, 2002

Safety Summary

The beginning of the electronic load User's Guide has a Safety Summary page. Be sure you are familiar with the information on this page before programming the electronic load from a controller.

Printing History

The edition and current revision of this manual are indicated below. Reprints of this manual containing minor corrections and updates may have the same printing date. Revised editions are identified by a new printing date. A revised edition incorporates all new or corrected material since the previous printing date. Changes to the manual occurring between revisions are covered by change sheets shipped with the manual.

General Information

About this Guide

This manual contains programming information for the Agilent Technologies N3301A, N3302A, N3303A, N3304A, N3305A, N3306A, and N3307A Electronic Load modules when installed in an Agilent Technologies N3300A and N3301A Electronic Load mainframes. These units will be referred to as "electronic load" throughout this manual. You will find the following information in the rest of this guide:

- Chapter 1 Introduction to this guide.
- Chapter 2 Introduction to SCPI messages structure, syntax, and data formats.
- Chapter 3 Introduction to programming the electronic load with SCPI commands.
- Chapter 4 Dictionary of SCPI commands.
- Appendix A SCPI command tree.
- Appendix B Error messages
- Appendix C Comparison With Earlier Models

Documentation Summary

The following documents that are related to this Programming Guide have additional helpful information for using the electronic load.

- Quick Start Guide located in the front part of the User's Guide. Information on how to quickly get started using the electronic load.
- User's Guide. Includes specifications and supplemental characteristics, how to use the front panel, how to connect to the instrument, and calibration procedures.

External References

SCPI References

The following documents will assist you with programming in SCPI:

- Beginner's Guide to SCPI. Part No. H2325-90001. Highly recommended for anyone who has not had previous experience programming with SCPI.
- Tutorial Description of the GPIB . Part No. 5952-0156. Highly recommended for those not familiar with the IEEE 488.1 and 488.2 standards.

To obtain a copy of the above documents, contact your local Agilent Technologies Sales and Support Office.

1 - General Information

GPIB References

The most important GPIB documents are your controller programming manuals - GW BASIC, GPIB Command Library for MS DOS, etc. Refer to these for all non-SCPI commands (for example: Local Lockout).

The following are two formal documents concerning the GPIB interface:

- ANSI/IEEE Std. 488.1-1987 IEEE Standard Digital Interface for Programmable Instrumentation. Defines the technical details of the GPIB interface. While much of the information is beyond the need of most programmers, it can serve to clarify terms used in this guide and in related documents.
- ANSI/IEEE Std. 488.2-1987 IEEE Standard Codes, Formats, Protocols, and Common Commands. Recommended as a reference only if you intend to do fairly sophisticated programming. Helpful for finding precise definitions of certain types of SCPI message formats, data types, or common commands.

The above two documents are available from the IEEE (Institute of Electrical and Electronics Engineers), 345 East 47th Street, New York, NY 10017, USA.

VXIplug&play Power Products Instrument Drivers

VXI*plug&play* instrument drivers for Microsoft Windows 95 and Windows NT are now available on the Web at http://www.agilent.com/find/drivers. These instrument drivers provide a high-level programming interface to your Agilent Technologies electronic load. VXI*plug&play* instrument drivers are an alternative to programming your instrument with SCPI command strings. Because the instrument driver's function calls work together on top of the VISA I/O library, a single instrument driver can be used with multiple application environments.

Supported Applications

- Agilent VEE
- Microsoft Visual BASIC
- Microsoft Visual C/C++
- Borland C/C++
- National Instruments LabVIEW
- National Instruments LabWindows/CVI

System Requirements

The VXI*plug&play* instrument driver complies with the following:

- Microsoft Windows 95
- Microsoft Windows NT 4.0
- HP VISA revision F.01.02
- National Instruments VISA 1.1

Downloading and Installing the Driver

NOTE: Before installing the VXIplug&play instrument driver, make sure that you have one of the supported applications installed and running on your computer.

- 1. Access Agilent Technologies Web site at http://www.agilent.com/find/drivers.
- 2. Select the instrument for which you need the driver.
- 3. Click on the driver, either Windows 95 or Windows NT, and download the executable file to your PC.
- Locate the file that you downloaded from the Web. From the Start menu select Run <path>:\agxxxx.exe - where <path> is the directory path where the file is located, and agxxxx is the instrument driver that you downloaded .
- 5. Follow the directions on the screen to install the software. The default installation selections will work in most cases. The readme.txt file contains product updates or corrections that are not documented in the on-line help. If you decide to install this file, use any text editor to open and read it.
- 6. To use the VXI*plug&play* instrument driver, follow the directions in the VXI*plug&play* online help for your specific driver under "Introduction to Programming".

Accessing Online Help

A comprehensive online programming reference is provided with the driver. It describes how to get started using the instrument driver with Agilent VEE, LabVIEW, and LabWindows. It includes complete descriptions of all function calls as well as example programs in C/C++ and Visual BASIC.

To access the online help when you have chosen the default Vxipnp start folder, click on the Start button and select Programs | Vxipnp | Agxxxx Help (32-bit).
 where Agxxxx is the instrument driver.

Introduction to Programming

GPIB Capabilities of the Electronic Load

All electronic load functions except for setting the GPIB address are programmable over the GPIB. The IEEE 488.2 capabilities of the electronic load are described in Table 2-1. Refer to Appendix A of your User's Guide for its exact capabilities.

GPIB Capabilities	Response	Interface Function
Talker/Listener	All electronic load functions except for setting the GPIB address are programmable over the GPIB. The electronic load can send and receive messages over the GPIB. Status information is sent using a serial poll. Front panel annunciators indicate the present GPIB state of the electronic load.	AH1, SH1, T6. L4
Service Request	The electronic load sets the SRQ line true if there is an enabled service request condition. Refer to <i>Chapter 3 - Status Reporting</i> for more information.	SR1
Remote/Local	In local mode, the electronic load is controlled from the front panel but will also execute commands sent over the GPIB. The electronic load powers up in local mode and remains in local mode until it receives a command over the GPIB. Once the electronic load is in remote mode the front panel RMT annunciator is on, all front panel keys (except Local) are disabled, and the display is in normal metering mode. Pressing Local on the front panel returns the electronic load to local mode. Local can be disabled using local lockout so that only the controller or the power switch can return the electronic load to local mode.	RL1
Device Trigger	The electronic load will respond to the device trigger function.	DT1
Group Execute Trigger	The electronic load will respond to the group execute trigger function.	GET
Device Clear	The electronic load responds to the Device Clear (DCL) and Selected Device Clear (SDC) interface commands. They cause the electronic load to clear any activity that would prevent it from receiving and executing a new command (including *WAI and *OPC?). DCL and SDC do not change any programmed settings.	DCL, SDC

GPIB Address

The electronic load operates from a GPIB address that is set from the front panel. To set the GPIB address, press the **Address** key on the front panel and enter the address using the Entry keys. The address can be set from 0 to 30. The GPIB address is stored in non-volatile memory.

RS-232 Capabilities of the Electronic Load

The electronic load provides an RS-232 programming interface, which is activated by commands located under the front panel **Address** key. All SCPI commands are available through RS-232 programming. When the RS-232 interface is selected, the GPIB interface is disabled.

The EIA RS-232 Standard defines the interconnections between Data Terminal Equipment (DTE) and Data Communications Equipment (DCE). The electronic load is designed to be a DTE. It can be connected to another DTE such as a PC COM port through a null modem cable.

NOTE: The RS-232 settings in your program must match the settings specified in the front panel Address menu. Press the front panel **Address** key if you need to change the settings.

RS-232 Data Format

The RS-232 data is a 10-bit word with one start bit and one stop bit. The number of start and stop bits is not programmable. However, the following parity options are selectable using the front panel Address key:

EVEN	Seven data bits with even parity
ODD	Seven data bits with odd parity
MARK	Seven data bits with mark parity (parity is always true)
SPACE	Seven data bits with space parity (parity is always false)
NONE	Eight data bits without parity

Parity options are stored in non-volatile memory.

Baud Rate

The front panel Address key lets you select one of the following baud rates, which is stored in non-volatile memory:

300 600 1200 2400 4800 9600

RS-232 Flow Control

The RS-232 interface supports the following flow control options that are selected using the front panel Address key. For each case, the electronic load will send a maximum of five characters after holdoff is asserted by the controller. The electronic load is capable of receiving as many as fifteen additional characters after it asserts holdoff.

RTS-CTS The electronic load asserts its Request to Send (RTS) line to signal hold-off when its input buffer is almost full, and it interprets its Clear to Send (CTS) line as a hold-off signal from the controller. **NONE** There is no flow control.

Flow control options are stored in non-volatile memory.

Introduction to SCPI

SCPI (Standard Commands for Programmable Instruments) is a programming language for controlling instrument functions over the GPIB and RS-232 interface. SCPI is layered on top of the hardware-portion of IEEE 488.2. The same SCPI commands and parameters control the same functions in different classes of instruments.

Conventions Used in This Guide

Angle brackets	< >	Items within angle brackets are parameter abbreviations. For example,
Vertical bar		Vertical bars separate alternative parameters. For example, NORM TEXT indicates that either "TEXT" or "NORM" can be used as a parameter.
Square Brackets	[]	Items within square brackets are optional. The representation [SOURce:]. VOLTage means that SOURce: may be omitted.
Braces { }		Braces indicate parameters that may be repeated zero or more times. It is used especially for showing arrays. The notation <a>{<,B>} shows that parameter "A" must be entered, while parameter "B" may be omitted or may be entered one or more times.
Computer font		Computer font is used to show program lines in text. OUTPUT 723 "TRIGger:COUNt:CURRent 10" shows a program line.

Types of SCPI Commands

SCPI has two types of commands, common and subsystem.

- Common commands generally are not related to specific operation but to controlling overall electronic load functions, such as reset, status, and synchronization. All common commands consist of a three-letter mnemonic preceded by an asterisk: *RST *IDN? *SRE 8
- Subsystem commands perform specific electronic load functions. They are organized into an inverted tree structure with the "root" at the top. The following figure shows a portion of a subsystem command tree, from which you access the commands located along the various paths. You can see the complete tree in Appendix A.

Figure 2-1. Partial Command Tree

2 - Introduction to Programming

Multiple Commands in a Message

Multiple SCPI commands can be combined and sent as a single message with one message terminator. There are two important considerations when sending several commands within a single message:

- Use a semicolon to separate commands within a message.
- There is an implied header path that affects how commands are interpreted by the electronic load.

The header path can be thought of as a string that gets inserted **before** each command within a message. For the first command in a message, the header path is a null string. For each subsequent command the header path is defined as the characters that make up the headers of the previous command in the message up to and including the last colon separator. An example of a message with two commands is:

```
CURR:LEV 3; PROT:STAT OFF
```

which shows the use of the semicolon separating the two commands, and also illustrates the header path concept. Note that with the second command, the leading header "CURR" was omitted because after the "CURR:LEV 3" command, the header path became defined as "CURR" and thus the instrument interpreted the second command as:

CURR: PROT: STAT OFF

In fact, it would have been syntactically incorrect to include the "CURR" explicitly in the second command, since the result after combining it with the header path would be:

```
CURR:CURR:PROT:STAT OFF
```

which is incorrect.

Moving Among Subsystems

In order to combine commands from different subsystems, you need to be able to reset the header path to a null string within a message. You do this by beginning the command with a colon (:), which discards any previous header path. For example, you could clear the output protection and check the status of the Operation Condition register in one message by using a root specifier as follows:

```
OUTPut:PROTection:CLEAr;:STATus:OPERation:CONDition?
```

The following message shows how to combine commands from different subsystems as well as within the same subsystem:

VOLTage:LEVel 20; PROTection 28; :CURRent:LEVel 3; PROTection:STATE ON

Note the use of the optional header LEVel to maintain the correct path within the voltage and current subsystems, and the use of the root specifier to move between subsystems.

Including Common Commands

You can combine common commands with subsystem commands in the same message. Treat the common command as a message unit by separating it with a semicolon (the message unit separator). Common commands *do not affect the header path*; you may insert them anywhere in the message.

```
VOLTage:TRIGgered 17.5;:INITialize;*TRG
```

Using Queries

Observe the following precautions with queries:

- Set up the proper number of variables for the returned data. For example, if you are reading back a measurement array, you must dimension the array according to the number of measurements that you have placed in the measurement buffer.
- Read back all the results of a query before sending another command to the electronic load. Otherwise a *Query Interrupted* error will occur and the unreturned data will be lost.

Types of SCPI Messages

There are two types of SCPI messages, program and response.

- A program message consists of one or more properly formatted SCPI commands sent from the controller to the electronic load. The message, which may be sent at any time, requests the electronic load to perform some action.
- A response message consists of data in a specific SCPI format sent from the electronic load to the controller. The electronic load sends the message only when commanded by a program message called a "query."

The following figure illustrates SCPI message structure:

Figure 2-2. Command Message Structure

The Message Unit

The simplest SCPI command is a single message unit consisting of a command header (or keyword) followed by a message terminator. The message unit may include a parameter after the header. The parameter can be numeric or a string.

ABORt<NL> VOLTage 20<NL>

Headers

Headers, also referred to as keywords, are instructions recognized by the electronic load. Headers may be either in the long form or the short form. In the long form, the header is completely spelled out, such as VOLTAGE, STATUS, and DELAY. In the short form, the header has only the first three or four letters, such as VOLT, STAT, and DEL.

2 - Introduction to Programming

Query Indicator

Following a header with a question mark turns it into a query (VOLTage?, VOLTage:PROTection?). If a query contains a parameter, place the query indicator at the end of the last header (VOLTage:PROTection? MAX).

Message Unit Separator

When two or more message units are combined into a compound message, separate the units with a semicolon (STATus:OPERation?;QUEStionable?).

Root Specifier

When it precedes the first header of a message unit, the colon becomes the root specifier. It tells the command parser that this is the root or the top node of the command tree.

Message Terminator

A terminator informs SCPI that it has reached the end of a message. Three permitted messages terminators are:

- newline (<NL>), which is ASCII decimal 10 or hex 0A.
- end or identify (<END>)
- ♦ both of the above (<NL><END>).

In the examples of this guide, there is an assumed message terminator at the end of each message.

NOTE: All RS-232 response data sent by the electronic load is terminated by the ASCII character pair <carriage return><newline>. This differs from GPIB response data which is terminated by the single character <newline> with EOI asserted.

SCPI Data Formats

All data programmed to or returned from the electronic load is ASCII. The data may be numerical or character string.

Numerical Data Formats

Symbol	Data Form
	Talking Formats
<nr1></nr1>	Digits with an implied decimal point assumed at the right of the least-significant digit. Examples: 273
<nr2></nr2>	Digits with an explicit decimal point. Example: .0273
<nr3></nr3>	Digits with an explicit decimal point and an exponent. Example: 2.73E+2
	Listening Formats
<nrf></nrf>	Extended format that includes <nr1>, <nr2> and <nr3>. Examples: 273 273. 2.73E2</nr3></nr2></nr1>
<nrf+></nrf+>	Expanded decimal format that includes <nrf></nrf> and MIN MAX . Examples: 273 273 .
	2.73E2 MAX. MIN and MAX are the minimum and maximum limit values that are
	implicit in the range specification for the parameter.
<bool></bool>	Boolean Data. Example: 0 1 or ON OFF

Suffixes and Multipliers

Class	Suffix	Unit	Unit with Multiplier
Amplitude	V	volt	MV (millivolt)
Current	А	ampere	MA (milliampere)
Power	W	watt	MW (milliwatt)
Resistance	OHM	ohm	MOHM (megohm)
Slew Rate	A/s	amps/second	
	R/s	ohms/second	
	V/s	volts/second	
Time	S	second	MS (millisecond)
	Co	mmon Multipliers	
	1E3	K	kilo
	1E-3	Μ	milli
	1E-6	U	micro

Response Data Types

Character strings returned by query statements may take either of the following forms, depending on the length of the returned string:

- **<CRD>** Character Response Data. Permits the return of character strings.
- <AARD> Arbitrary ASCII Response Data. Permits the return of undelimited 7-bit ASCII. This data type has an implied message terminator.
- **<SRD>** String Response Data. Returns string parameters enclosed in double quotes.

SCPI Command Completion

SCPI commands sent to the electronic load are processed either sequentially or in parallel. Sequential commands finish execution before a subsequent command begins. Parallel commands allow other commands to begin executing while the parallel command is still executing. Commands that affect trigger actions are among the parallel commands.

The *WAI, *OPC, and *OPC? common commands provide different ways of indicating when all transmitted commands, including any parallel ones, have completed their operations. The syntax and parameters for these commands are described in chapter 4. Some practical considerations for using these commands are as follows:

*WAI	This prevents the electronic load from processing subsequent commands until all pending operations are completed.
*OPC?	This places a 1 in the Output Queue when all pending operations have completed. Because it requires your program to read the returned value before executing the next program statement, *OPC? can be used to cause the controller to wait for commands to complete before proceeding with its program.
*OPC	This sets the OPC status bit when all pending operations have completed. Since your program can read this status bit on an interrupt basis, *OPC allows subsequent commands to be executed.
NOTE:	The trigger system must be in the Idle state in order for the status OPC bit to be true. Therefore, as far as triggers are concerned, OPC is false whenever the trigger system is in the Initiated state.

Using Device Clear

You can send a device clear at any time to abort a SCPI command that may be hanging up the GPIB interface. The status registers, the error queue, and all configuration states are left unchanged when a device clear message is received. Device clear performs the following actions:

- The input and output buffers of the electronic load are cleared.
- The electronic load is prepared to accept a new command string.

The following statement shows how to send a device clear over the GPIB interface using GW BASIC:

CLEAR 705 IEEE-488 Device Clear

The following statement shows how to send a device clear over the GPIB interface using the GPIB command library for *C* or *QuickBASIC*:

IOCLEAR (705)

NOTE:

For RS-232 operation, sending a Break will perform the same operation as the IEEE-488 device clear message.

RS-232 Troubleshooting

If you are having trouble communicating over the RS-232 interface, check the following:

- The computer and the electronic load must be configured for the same baud rate, parity, number of data bits, and flow control options. Note that the electronic load is configured for 1 start bit and 1 stop bit (these values are fixed).
- The correct interface cables or adapters must be used, as described under RS-232 Connector. Note that even if the cable has the proper connectors for your system, the internal wiring may be incorrect.
- The interface cable must be connected to the correct serial port on your computer (COM1, COM2, etc.).

SCPI Conformance Information

SCPI Conformed Commands

The Electronic Load conforms to SCPI Version 1995.0.

Introduction

This chapter contains examples on how to program your electronic load. Simple examples show you how to program:

- Input functions such as voltage, current, and resistance
- Transient functions, including lists
- Measurement functions
- The status and protection functions

NOTE: These examples in this chapter show which commands are used to perform a particular function, but do not show the commands being used in any particular programming environment.

Programming the Input

Power-on Initialization

When the electronic load is first turned on, it wakes up with the input state set OFF. The following commands are given implicitly at power-on:

*RST *CLS *SRE 0 *ESE 0

*RST is a convenient way to program all parameters to a known state. Refer to the *RST command in chapter 4 to see how each programmable parameter is set by *RST. Refer to the *PSC command in chapter 4 for more information on the power-on initialization of the *ESE and the *SRE registers.

Enabling the Input

To enable the input, use the command:

INPut ON

Input Voltage

The input voltage is controlled with the VOLTage command. For example, to set the input voltage to 25 volts, use:

VOLTage 25

Maximum Voltage

The maximum input voltage that can be programmed can be queried with:

VOLTage? MAXimum

Input Current

All models have a programmable current function. The command to program the current is:

CURRent <n>

where <n> is the input current in amperes.

Maximum Current

The maximum input current that can be programmed can be queried with:

CURRent? MAXimum

Overcurrent Protection

The electronic load can also be programmed to turn off its input if the current protection level is reached. As explained in chapter 4, this protection feature is implemented the following command:

```
CURRent:PROTection:STATe ON | OFF
```

NOTE: Use CURRent:PROTection:DELay to prevent momentary current limit conditions caused by programmed input changes from tripping the overcurrent protection.

Setting the Triggered Voltage or Current Levels

To program voltage or current triggered levels, you must specify the voltage or current level that the input will go to once a trigger signal is received. Use the following commands to set a triggered level:

```
VOLTage:TRIGgered <n> or
CURRent:TRIGgered <n>
```

```
NOTE: Until they are explicitly programmed, triggered levels will assume their corresponding immediate levels. For example, if a electronic load is powered up and VOLTage:LEVel is programmed to 6, then VOLTage:LEVel:TRIGger will also be 6 until you program it to another value. Once you program VOLTage:LEVel:TRIGger to a value, it will remain at that regardless of how you subsequently reprogram VOLTage:LEVel. Then, when the trigger occurs, the VOLTage:LEVel is set to the VOLTage:LEVel:TRIGger value.
```

Generating Triggers

You can generate a single trigger by sending the following command over the GPIB:

TRIGger: IMMediate

Note that this command will always generate a trigger. Use the TRIGger:SOURce command to select other trigger sources such as the mainframe's external trigger input.

Programming Transients

Transient operation is used to synchronize input changes with internal or external trigger signals, and simulate loading conditions with precise control of timing, duration, and slew. The following transient modes can be generated:

Continuous	Generates a repetitive pulse stream that toggles between two load levels.
Pulse	Generates an load change that returns to its original state after some time period.
Toggled	Generates a repetitive pulse stream that toggles between two load levels. Similar to Continuous mode except that the transient points are controlled by explicit triggers instead of an internal transient generator.
NOTE:	Before turning on transient operation, set the desired mode of operation as well as all of the parameters associated with transient operation. At *RST all transient functions are set to OFF.

Continuous Transients

In continuous operation, a repetitive pulse train switches between two load levels, a main level (which can be either the immediate or triggered level) and a transient level. The rate at which the level changes is determined by the slew rate (see slew rate descriptions for CV, CR, or CV mode as applicable). In addition, the frequency and duty cycle of the continuous pulse train are programmable. Use the following commands to program continuous transients:

This example assumes that the CC mode is active and the slew rate is at the default setting (maximum rate). The load module starts conduction at the main level (in this case 5 amps). When transient operation is turned on (no trigger is required in continuous mode), the module input current will slew to and remain at 10 amps for 40% of the period (400 μ s). The input current will then slew to and remain at 5 amps for the remaining 60% (600 μ s) of that cycle.

Pulse Transients

Pulsed transient operation generates a load change that returns to its original state after some time period. It is similar to continuous operation with the following exceptions:

- a. To get a pulse, an explicit trigger is required. To specify the trigger source, use TRIGger:SOURce. See "Triggering Transients".
- b. One pulse results from each trigger. Therefore, frequency cannot be programmed.

Use the following commands to program pulsed transients:

This example assumes that the CC mode is active, the slew rate is at the factory default setting (maximum rate), and a trigger signal is connected to the mainframe's external trigger input. The load module starts conduction at the main current level setting (5 amps). When the transient mode is turned on and an external trigger signal is received, the input level starts increasing at a rate determined by the slew rate. When the value specified by the transient level setting (10 amps) is reached, it stays there for the remainder of the time determined by the pulse width setting (10 milliseconds). After this time has elapsed, the input level decreases to the main level again at the rate specified by the slew setting and remains there until another trigger is received. Any triggers that occur during the time the transient level is in effect will re-trigger the pulse, extending the pulse by another pulse-width value.

Toggled Transients

Toggled transient operation causes the module input to alternate between two pre-defined levels as in continuous operation except that the transient transitions are controlled by explicit triggers instead of the internal transient generator. See "Triggering Transients". Use the following commands to program toggled transients:

This example assumes that the CC mode is active, the slew rate is at the factory default setting (maximum rate), and a trigger signal is connected to the mainframe's external trigger input. Toggled transient operation is similar to that described for continuous and pulse operation, except that each time a trigger is received the input alternates between the main and transient input current levels.

Programming Lists

List mode lets you generate complex sequences of input changes with rapid, precise timing, which may be synchronized with internal or external signals. This is useful when running test sequences with a minimum amount of programming overhead.

You can program up to 50 settings (or steps) in the list, the time interval (dwell) that each setting is maintained, the number of times that the list will be executed, and how the settings change in response to triggers. All list data is can be stored in nonvolatile memory when saved in locations 0, 7, 8, or 9 using the *SAV command. This means that the programmed data for any list will be retained when the electronic load is turned off. Use the *RCL command to recall the saved state. *RST clears the presently active list but will not clear the lists saved in locations 0, 7, 8, or 9.

List steps can be either individually triggered, or paced by a separate list of dwell times that define the duration of each step. Therefore, each of the up to 50 steps has an associated dwell time, which specifies the time (in seconds) that the input remains at that step before moving on to the next step. The following procedure shows how to generate a simple 9-step list of current and voltage changes.

- **Step 1** Set the mode of each function that will participate in the sequence to LIST. For example: CURRent:MODE LIST
- **Step 2** Program the list of input values for each function. The list commands take a comma-separated list of arguments. The order in which the arguments are given determines the sequence in which the values will be input. For example, to vary the input current of the electronic load to simulate a 25%, 50%, and 100% load, a list may include the following values:

LIST:CURRent[:LEVel] 15, 30, 60, 15, 30, 60, 15, 30, 60

You must specify a list for all current functions, whether or not the functions will be used. For example, to synchronize the previous current list with another list that varies the slew rate from $0.01A/\mu s$, to $1.A/\mu s$, to $1.A/\mu s$ (programmed in A/s), the lists may include the following values:

```
LIST:CURRent[:LEVel] 15, 30, 60, 15, 30, 60, 15, 30, 60
LIST:CURRent:SLEW 1E+5, 1E+5, 1E+5, 1E+6, 1E+6, 1E+6, 1E+7, 1E+7, 1E+7
LIST:CURRent:RANGE 60
LIST:CURRent:TLEVel 0
```

All lists must have the same number of data values or points, or an error will occur when the list system that starts the sequence is initiated. The exception is when a list has only one item or point. In this case the single-item list is treated as if it had the same number of points as the other lists, with all values being equal to the one item. For example:

LIST:CURRent 15, 30, 45, 60;SLEW 1E+6

is the same as:

LIST:CURRent 15, 30, 45, 60 LIST:CURRent:SLEW 1E+6, 1E+6, 1E+6, 1E+6

Step 3 Determine the time interval that the input remains at each level or point in the list before it advances to the next point. The time is specified in seconds. For example, to specify five dwell intervals, use:

LIST:DWELL 1, 1.5, 2, 2.5, 3

The number of dwell points must equal the number of input points. If a dwell list has only one value, that value will be applied to all points in the input list.

Step 4 Determine the number of times the list is repeated before it completes. For example, to repeat a list 10 times use:

LIST:COUNt 10

Entering INFinity makes the list repeat indefinitely. At *RST, the count is set to 1.

Step 5 Determines how the list sequencing responds to triggers. For a closely controlled sequence of input levels, you can use a dwell-paced list. To cause the list to be paced by dwell time use:

LIST:STEP AUTO

As each dwell time elapses, the next point is immediately input. This is the *RST setting.

If you need the input to closely follow asynchronous events, then a trigger-paced list is more appropriate. In a trigger-paced list, the list advances one point for each trigger received. To enable trigger-paced lists use:

LIST:STEP ONCE

The dwell time of each point determines the minimum time that the input remains at that point. If a trigger is received before the previous dwell time completes, the trigger is ignored. Therefore, to ensure that no triggers are lost, program the dwell time to "MIN".

Step 6 Use the list trigger system to trigger the list. See "Triggering Transients and Lists".

Programming Lists for Multiple Channels

You can program separate lists for individual channels on a load mainframe. Once lists have been programmed for each channel, they can all be triggered at the same time using the list trigger system.

NOTE:	All lists must have the same number of data values or points, or an error will occur when the list system that starts the sequence is initiated.
Step 1	Select the channel for which you want to program the list. All subsequent list commands will be sent to this channel until another channel is selected.
	CHANnel 1
Step 2	Program the list of values for each function for that channel. The list commands take a comma- separated list of arguments. For example:
	LIST:CURRent 15, 30, 60, 15, 30, 60, 15, 30, 60 LIST:CURRent:SLEW 1E+5, 1E+5, 1E+5, 1E+6, 1E+6, 1E+6, 1E+7, 1E+7, 1E+7
	Add other list functions.
Step 3	Select the next channel for which you want to program a list. All subsequent list commands will now be sent to this channel.
	CHANnel 2
Step 4	Program the list of values for each function for that channel. You can program different functions for each channel, however all functions must have the same number of steps
	LIST:VOLTage 30, 60, 30, 30, 60, 30, 30, 60, 30 LIST:VOLTage:SLEW 1E+5, 1E+5, 1E+5, 1E+6, 1E+6, 1E+6, 1E+7, 1E+7, 1E+7
	Add other list functions. You do not have to program the same number of functions for each channel.

- **Step 5** Repeat steps 3 and 4 for any other channel that you wish to program.
- Step 6 Use the list trigger system to trigger the list. This is described under "Triggering Transients and Lists".

Triggering Transients and Lists

Continuous, pulse, and toggled transient modes respond to triggers as soon as the trigger is received. This is not the case for lists. Lists have an independent trigger system that is similar to the measurement trigger system. This section describes the list trigger system. The measurement trigger system is described under "Triggering Measurements".

SCPI Triggering Nomenclature

In SCPI terms, trigger systems are called sequences. When more than one trigger system exists, they are differentiated by naming them SEQuence1 and SEQuence2. SEQuence1 is the list trigger system and SEQuence2 is the measurement trigger system. The electronic load uses aliases with more descriptive names for these sequences. These aliases can be used instead of the sequence forms.

Sequence Form	Alias
SEQuence1	LIST
SEQuence2	ACQuire

List Trigger Model

Figure 3-3 is a model of the list trigger system. The rectangles represent states. The arrows show the transitions between states. These are labeled with the input or event that causes the transition to occur.

Figure 3-3. Model of List Triggers

Initiating List Triggers

When the electronic load is turned on, the list trigger system is in the idle state. In this state, the list system ignores all triggers. Sending the following commands at any time returns the list system to the Idle state:

```
ABORt
*RST
*RCL
```

The INITiate commands move the list system from the Idle state to the Initiated state. This enables the list system to receive triggers. INITiate commands are not channel-specific, they affect all installed load modules. To initiate the list system for a single triggered action, use:

```
INITiate:SEQuence1 or
INITiate:NAME LIST
```

NOTE: Whenever a list is initiated or triggered, the $\phi 1$ annunciator is lit on the front panel.

After a trigger is received and the action completes, the list system will return to the Idle state. Thus it will be necessary to initiate the list system each time a triggered action is desired.

To keep the list system initiated for multiple actions without having to send an Initiate command for each trigger, use:

```
INITiate:CONTinuous:SEQuence1 ON or INITiate:CONTinuous:NAME LIST, ON
```

Specifying a Trigger Delay

A time delay can be programmed betweent he receipt of the trigger system and the start of the triggered action. This delay applies to both list and measurement triggers. At *RST the trigger delay is set to 0, which mens there is no trigger delay. To program a trigger delay use:

TRIGger:DELay <n>

Generating Transient and List Triggers

Use one of the following triggering methods to generate transients and lists:

TRIGger:SOURce BUS | EXTernal | HOLD | LINE | TIMer

After you have specified the appropriate trigger source, you can generate triggers as follows:

Single triggers over	Send one of the following commands over the GPIB:	
the bus	TRIGger:IMMediate	
	*TRG	
	a group execute trigger	
Continuous triggers	Send the following command over the GPIB:	
synchronized with the ac line frequency	TRIGger:SOURce LINE	
Continuous triggers	Send the following commands over the GPIB:	
synchronized with the internal timer	TRIGger:TIMer <time></time>	
	TRIGger:SOURce TIMer	
External trigger	Apply a low to high signal to the external trigger input at the back of the mainframe.	

Making Measurements

The electronic load has the ability to make several types of voltage or current measurements. The measurement capabilities of the electronic load are particularly useful with applications that draw current in pulses.

All measurements are performed by digitizing the instantaneous input voltage or current for a defined number of samples and sample interval, storing the results in a buffer, and then calculating the measured result. Many parameters of the measurement are programmable. These include the number of samples, the time interval between samples, and the method of triggering. Note that there is a tradeoff between these parameters and the speed, accuracy, and stability of the measurement in the presence of noise.

There are two ways to make measurements:

- Use the MEASure commands to immediately start acquiring new voltage or current data, and return measurement calculations from this data as soon as the buffer is full. This is the easiest way to make measurements, since it requires no explicit trigger programming.
- Use an acquisition trigger to acquire the data. Then use the FETCh commands to return calculations from the data that was retrieved by the acquisition trigger. This method gives you the flexibility to synchronize the data acquisition with a trigger. FETCh commands do not trigger the acquisition of new measurement data, but they can be used to return many different calculations from the data that was retrieved by the acquisition trigger.

Making triggered measurements with the acquisition trigger system is discussed under "Triggering Measurements".

NOTE: For each MEASure form of the query, there is a corresponding query that begins with the header FETCh. FETCh queries perform the same calculation as their MEASure counterparts, but do not cause new data to be acquired. Data acquired by an explicit trigger or a previously programmed MEASure command are used.

Voltage and Current Measurements

The SCPI language provides a number of MEASure and FETCh queries, which return various measurement parameters of voltage and current waveforms.

DC Measurements

To measure the dc input voltage or current, use:

MEASure:VOLTage? or MEASure:CURRent?

DC voltage and current is measured by acquiring a number of readings at the selected time interval, optionally applying a Hanning window function to the readings, and averaging the readings. Windowing is a signal conditioning process that reduces the error in dc measurements made in the presence of periodic signals such as line ripple. At power-on and after a *RST command, the following parameters are set:

```
SENSe:SWEep:TINTerval 10E-6
```

SENSe:SWEep:POINts 1000

This results in a data acquisition time of 10 milliseconds. Adding a command processing overhead of about 20 milliseconds results in a total measurement time of about 30 milliseconds per measurement sample.

Ripple rejection is a function of the number of cycles of the ripple frequency contained in the acquisition window. More cycles in the acquisition window results in better ripple rejection. If you increase the time interval for each measurement to 45 microseconds for example, this results in 5.53 cycles in the acquisition window at 60 Hz, for a ripple rejection of about 70 dB.

Note that the processing overhead time will vary, depending on the number of measurement samples. If you reduce the number of sample points, you will also reduce the command processing overhead. If you increase the number of sample point (up to a maximum of 4096) you increase the command processing overhead.

RMS Measurements

To read the rms content of a voltage or current waveform, use:

MEASure:VOLTage:ACDC? or

MEASure:CURRent:ACDC?

This returns the total rms measurement, including the dc portion.

Minimum and Maximum Measurements

To measure the maximum or minimum voltage or current of a pulse or ac waveform, use:

MEASure:VOLTage:MAXimum? MEASure:VOLTage:MINimum? MEASure:CURRent:MAXimum? MEASure:CURRent:MINimum?

Measurement Ranges

The electronic load has two current and two voltage measurement ranges. The commands that control the measurement ranges are:

SENSe:CURRent:RANGe MIN | MAX SENSe:VOLTage:RANGe MIN | MAX

When the range is set to MAX, the maximum current or voltage that can be measured is a function of the current and voltage rating of the load module that is being programmed (see Table 4-1).

Returning Measurement Data From the Data Buffer

The MEASure and FETCh queries can also return all data values of the instantaneous voltage or current buffer. The commands are:

FETCh:ARRay:CURRent?

FETCh:ARRay:VOLTage?

This is a useful feature if, for example, you have entered multiple measurements into the buffer as a result of measuring the response to a triggered list. Data is returned from the buffer in the same order in which it was entered into the buffer. Refer to "Synchronizing Transients and Measurements" for more information.

Triggering Measurements

You can use the data acquisition trigger system to synchronize the timing of the voltage and current data acquisition with a trigger source. Then use the FETCh commands to return different calculations from the data acquired by the measurement trigger.

SCPI Triggering Nomenclature

In SCPI terms, trigger systems are called sequences. When more than one trigger system exists, they are differentiated by naming them SEQuence1 and SEQuence2. SEQuence1 is the list trigger system and SEQuence2 is the measurement trigger system. The electronic load uses aliases with more descriptive names for these sequences. These aliases can be used instead of the sequence forms.

Sequence Form	Alias
SEQuence2	ACQuire

Measurement Trigger Model

Figure 3-1 is a model of the measurement trigger system. The rectangular boxes represent states. The arrows show the transitions between states. These are labeled with the input or event that causes the transition to occur.

Figure 3-1. Model of Measurement Triggers

Initiating the Measurement Trigger System

When the electronic load is turned on, the trigger system is in the idle state. In this state, the trigger system ignores all triggers. Sending the following commands at any time returns the trigger system to the Idle state:

```
ABORt
*RST
*RCL
```

The INITiate commands move the trigger system from the Idle state to the Initiated state. This enables the electronic load to receive triggers. INITiate commands are not channel-specific, they affect all installed load modules. To initiate a measurement trigger, use:

```
INITiate:SEQuence2 or
INITiate:NAME ACQuire
```

After a trigger is received and the data acquisition completes, the trigger system will return to the Idle state unless multiple measurements are programmed using the TRIGger:SEQuence2:COUNt command. Thus it will be necessary to initiate the system each time a triggered acquisition is desired.

NOTE: You cannot initiate measurement triggers continuously. Otherwise, the measurement data in the data buffer would continuously be overwritten.

Generating Measurement Triggers

Use one of the following triggering methods to generate measurements:

TRIGger:SOURce BUS | EXTernal | HOLD | LINE | TIMer

After you have specified the appropriate source, you can generate measurement triggers as follows:

Single triggers over	Send one of the following commands over the GPIB:	
the bus	TRIGger:IMMediate (this overrides TRIG:SOUR HOLD)	
	*TRG	
	a group execute trigger	
Continuous triggers	Send the following command over the GPIB:	
synchronized with the ac line frequency	TRIGger:SOURce LINE	
Continuous triggers	Send the following commands over the GPIB:	
synchronized with the internal timer	TRIGger:TIMer <time></time>	
	TRIGger:SOURce TIMer	
External trigger	Apply a low to high signal to the external trigger input at the back of the mainframe.	

When the acquisition finishes, any of the FETCh queries can be used to return the results. Once the measurement trigger is initiated, if a FETCh query is sent before the data acquisition is triggered or before it is finished, the response data will be delayed until the trigger occurs and the acquisition completes. This may tie up the controller if the trigger condition does not occur immediately.

One way to wait for results without tying up the controller is to use the SCPI command completion commands. For example, you can send the *OPC command after INITialize, then occasionally poll the OPC status bit in the standard event status register for status completion while doing other tasks. You can also set up an SRQ condition on the OPC status bit going true, and do other tasks until an SRQ interrupt occurs.

Controlling Measurement Samples

Varying the Sampling Rate

You can vary both the number of data points in a measurement sample, as well as the time between samples. You can also specify a delay from the trigger to the start of the measurement. This is illustrated in the following figure.

Figure 3-2. Sense Commands Used to Vary the Sampling Rate

At power-on, the input voltage and current sampling rate is 10 microseconds. This means that, not accounting for the command processing overhead, it takes about 41 milliseconds to fill up 4096 data points in the data buffer. You can vary this data sampling rate with:

```
SENSe:SWEep:TINTerval <sample_period>
SENSe:SWEep:POINts <points>
```

For example, to set the time interval to 50 microseconds per sample with 500 samples, use:

```
SENSe:SWEep:TINTerval 50E-6;POINts 500.
```

Measurement Delay

You can delay the start of a measurement in relation to the trigger. This is useful if you do not want to start taking measurements at the beginning of an input transient or list step during the time that the input voltage or current is still slewing or settling into its programmed value. To offset the measurement from the beginning of the input transient or list step, use:

SENSe:SWEep:OFFSet 10E-3

In this example, the measurement occurs 10 milliseconds after the start of the trigger. The offset can be set to a negative value, but this number cannot exceed the TRIGger:DELay value.

Multiple Measurements

The electronic load also has the ability to set up several acquisition triggers in succession and concatenate the results from each acquisition in the measurement buffer. This is useful for making measurements from lists. To set up the trigger system for a number of sequential acquisitions use:

```
TRIGger:SEQuence2:COUNt <number>
```

With this setup, the instrument performs each acquisition sequentially, storing the digitized readings in the internal measurement buffer. A trigger signal is required to make each measurement. It is only necessary to initialize the measurement once at the start; after each completed acquisition the instrument will wait for the next valid trigger condition to start another. The results returned by MEASure or FETCh will be the *average* of the total data acquired.

If you do not want the instrument to average the acquisition data, use the FETCh:ARRay commands to return the raw data from the voltage or current measurement buffer.

NOTE: The total number of data points cannot exceed 4096. This means that the trigger count multiplied by the number of points cannot exceed 4096; otherwise an error will occur.

Synchronizing Transients and Measurements

The transient and measurement systems are independent of each other. However, it possible to synchronize the two systems through the use of triggers. This is because when both transient and measurement systems have been initialized, the same trigger signal will affect both systems. For example, you may have an application where you need to measure the effects of a list step.

Measuring Triggered Transients or Lists

Measuring triggered transients or lists is generally a straightforward process because you are using the same trigger to generate the output transient and simultaneously take the measurement. The following example illustrates how to make measurements from a simple 3-step trigger paced list. Each list step has a duration of two seconds. Each step-measurement consists of three data points with an offset of 100 milliseconds.

Step 1 Set the mode of each function that will participate in the sequence to LIST. For example:

CURRent:MODE LIST

Step 2 Program the list of input values for each function.

LIST:CURRent 15, 30, 60 LIST:CURRent:SLEW 1E+6, 1E+6, 1E+6 LIST:CURRent:RANGe 60 LIST:CURRent:TLEVel 0

Step 3 Specify the number of triggered measurements that will be taken.

TRIGger:SEQuence2:COUNt 3

The number of measurements should match the number of steps in the list.

Step 4 Specify the time interval and the number of points in each triggered measurement.

```
SENSe:SWEep:TINTerval 100E-3
SENSe:SWEep:POINts 3
```

In this example, three measurements or data points are taken at each list step, separated by 100ms intervals. Make sure that all of the measurement samples complete within the step time interval. If another trigger occurs while a measurement is in progress, the measurement system will ignore the trigger. Also note that the number of data points specified in this step multiplied by the measurement count specified in step 3 cannot exceed 4096.

Step 5 Specify a delay time from the start of the trigger until the measurement is taken.

SENSe:SWEep:OFFset 100E-6

This specifies the offset in seconds, in this case, 100 microseconds
Step 6 Initiate both the transient (list) and the measurement trigger systems.

INITiate:SEQuence1 INITiate:SEQuence2

Step 7 Specify the trigger source and the timing that will control the list steps and the measurements.

TRIGger:TIMer 2 TRIGger:SOURce TIMer

In this example the trigger source is the internal trigger. Because the internal timer starts running as soon as the TRIGger:SOURce:TIMer command is executed, the trigger that starts the list and measurement will not occur until the **end** of the two-second timer window within which the trigger is received. After the initial trigger occurs, the list will remain at each step for two seconds before the next trigger occurs.

Step 8 Return the current measurements from the data array. In this case, a total of nine measurements were taken, three at each list step. To return the measurement data you must first dimension an array, then fetch the data.

Dimension an array here FETch:CURRent:ARRay ARRAY1

NOTE: Each load module retains its measurement data. If multiple lists have been executed, you must select each channel in turn, and fetch the measurement data from that channel.

Measuring Dwell-Paced Lists

The main difference between a trigger-paced list and a dwell-paced list is that *no* triggers occur between steps in a dwell-paced list. Only one measurement will be taken during the time the list is executed. Therefore, to capture measurement data for the entire time the list is executed, the total measurement time of a dwell paced list (time interval X number of points) must equal the total dwell time of the list.

- Step 1 Program the list as previously described under "Measuring Triggered Transients or Lists."
- **Step 2** Specify a dwell time for each list step. For example:

LIST:DWELL 1, 1.5, 2, 2.5, 3

- **Step 3** Add up the total number of dwell times to determine the time of the entire list. For the previous example, the total dwell time adds up to 10 seconds. This is the time it takes to execute the list.
- **Step 4** Specify the time interval and the number of points for the measurement.

SENSe:SWEep:TINTerval 100E-3 SENSe:SWEep:POINts 100

In this example, the measurement interval is set to take 100 measurement points at 100ms intervals. The total time of the measurement therefore equals the total dwell time of the list.

Step 5 Return the measurements from the data array.

Dimension an array here FETch:CURRent:ARRay ARRAY1

When you read back the measurement from the array, you must determine at what point during the list that the measurement occurred. One way to do this is to multiply the measurement number by the measurement interval. For example, multiply measurement #5 by 100ms, and you get 500ms, which is the time that the measurement was made.

Т

Programming the Status Registers

You can use status register programming to determine the operating condition of the electronic load at any time. For example, you may program the electronic load to generate an interrupt (assert SRQ) when an event such as a current protection occurs. When the interrupt occurs, your program can then act on the event in the appropriate fashion.

Table 3-1 defines the status bits. Figure 3-4 shows the status register structure of the electronic load. The Standard Event, Status Byte, and Service Request Enable registers and the Output Queue perform standard GPIB functions as defined in the *IEEE 488.2 Standard Digital Interface for Programmable Instrumentation.* The Operation Status and Questionable Status registers implement functions that are specific to the electronic load.

Bit	Signal	Meaning
0	CAL	Operation Status Group <i>Calibrating</i> . The electronic load is computing new calibration constants
5	WTG	<u>Waiting</u> . The electronic load is waiting for a trigger
0	VF	Channel Status Group <u>Voltage Fault</u> . Either an overvoltage or a reverse voltage has occurred. This bit reflects
1	ос	the active state of the FLT pin on the back of the unit. The bit remains set until the condition is removed and INP:PROT:CLE is programmed. <u>Overcurrent</u> . An overcurrent condition has occurred. This occurs if the current exceeds 102% of the rated current or if it exceeds the user-programmed current protection level. Removing the overcurrent condition clears the bit. If the condition persists beyond the
3	OP	user programmable delay time, bit 13 is also set and the input is turned off. Both bits remain set until the condition is removed and INP:PROT:CLE is programmed. <u>Overpower</u> . An overpower condition has occurred. This occurs if the unit exceeds the rated power of the input. Removing the overpower condition clears the bit. If the condition persists for more than 3 seconds, bit 13 is also set and the input is turned off. Both bits
4	ОТ	remain set until the condition is removed and INP:PROT:CLE is programmed. <u>Overtemperature</u> . An overtemperature condition has occurred. Both this bit and bit 13 are set and the input is turned off. Both bits remain set until the unit is cooled down and INP:PROT:CLE is programmed.
8	EPU	<u>Extended Power Unavailable</u> . When EPU status is true, an overpower condition that persists for more than 3 seconds will cause the input to be shut off and bit 13 to be set. When EPU satus is false, an overpower condition will be reported in bit 3, but this will not cause the input to be turned off. The state of the EPU bit is dependent on the internal temperature of the load.
9	RRV	<u>Remote Reverse Voltage</u> . A reverse voltage condition has occurred on the sense terminals. Both this bit and bit 0 are set. Removing the reverse voltage clears this bit but does not clear bit 0. Bit 0 remains set until INP:PROT:CLE is programmed.
10 11	UNR LRV	<u>Unregulated</u> . The input is unregulated. When the input is regulated the bit is cleared. <u>Local Reverse Voltage</u> . A reverse voltage condition has occurred on the input terminals. Both this bit and bit 0 are set. Removing the reverse voltage clears this bit but does not clear bit 0. Bit 0 remains set until INP:PROT:CLE is programmed.
12	OV	<u>Overvoltage</u> . An overvoltage condition has occurred. Both this bit and bit 0 are set and the FETs are turned on as hard as possible to lower the voltage. Both bits remain set until the condition is removed and INP:PROT:CLE is programmed.
13	PS	<u>Protection Shutdown</u> . The protection shutdown circuit has tripped because of an overcurrent, overpower, or overtemperature condition. The bit remains set until INP:PROT:CLE is programmed.

Table 3-1.	Bit Configurations of	Status Registers
	Dit ooningurutions of	olulus negisters

		Table 5-1. Bit configurations of otatus Registers (confinded)
		Questionable Status Group
		Same as Channel Status Group
		Standard Event Status Group
0	OPC	<u>Operation Complete</u> . The load has completed all pending operations. *OPC must be programmed for this bit to be set when pending operations are complete.
2	QYE	<u>Query Error</u> . The output queue was read with no data present or the data was lost. Errors in the range of –499 through –400 can set this bit.
3	DDE	<i>Device-Dependent Error</i> . Memory was lost or self test failed. Errors in the range of –399 through –300 can set this bit.
4	EXE	<u>Execution Error</u> . A command parameter was outside its legal range, inconsistent with the load's operation, or prevented from executing because of an operating condition. Errors in the range of –299 through –200 can set this bit.
5	CME	<u>Command Error</u> . A syntax or semantic error has occurred or the load received a <get> within a program message. Errors in the range of –199 through –100 can set this bit.</get>
7	PON	Power-On. The unit has been turned off and then on since this bit was last read.
		Status Byte and Service Request Enable Registers
2	CSUM	Channel Summary. Indicates if an enabled channel event has occurred.
3	QUES	Questionable Status Summary. Indicates if an enabled questionable event has occurred.
4	MAV	Message Available Summary. Indicates if the Output Queue contains data.
5	ESB	Event Status Summary. Indicates if an enabled standard event has occurred.
6	MSS	Master Status Summary. For an *STB? query, MSS is returned without being cleared.
	RQS	Request Service. During a serial poll, RQS is returned and cleared.
7	OPER	Operation Status Summary. Indicates if an operation event has occurred.

 Table 3-1. Bit Configurations of Status Registers (continued)

3 - Programming Examples

Power-On Conditions

Refer to the *RST command description in chapter 4 for the power-on conditions of the status registers.

Channel Status Group

The Channel Status registers record signals that indicate abnormal operation of a specific channel of the electronic load. As shown below, the group consists of a Condition, Event, and Enable register. The outputs of the Channel Status registers are logically-ORed into the Channel Summary Registers.

Register	Command	Description
Condition	STAT: CHAN: COND?	A read-only register that holds real-time status of the channel being monitored.
Event	STAT: CHAN: EVEN?	A read-only register that latches any condition. It is cleared when read.
Enable	STAT:CHAN:ENAB <n></n>	A read/write register that functions as a mask for enabling specific bits in the Event register.

Channel Summary Group

The Channel Summary registers summarize the abnormal operation of all channels of the electronic load. As shown below, the group consists of an Event and Enable register. The outputs of the Channel Summary registers are logically-ORed into the Channel SUMmary bit (2) of the Status Byte register.

Register	Command	Description	
Event	STAT:CSUM:EVEN?	A read-only register that latches any condition from all	
		channels. It is cleared when read.	
Enable	STAT:CSUM:ENAB <n></n>	A read/write register that functions as a mask for enabling	
		specific bits in the Enable register.	

Questionable Status Group

The Questionable Status registers record signals that indicate abnormal operation of the electronic load from all of the channels. The group consists of the same type of registers as the Channel Status group. The outputs of the Questionable Status group are logically-ORed into the QUEStionable summary bit (3) of the Status Byte register.

Register	Command	Description
Condition	STAT:QUES:COND?	A read-only register that holds real-time logically ORed status of all channels of the mainframe.
Event	STAT:QUES:EVEN?	A read-only register that latches any condition. It is cleared when read.
Enable	STAT:QUES:ENAB <n></n>	A read/write register that functions as a mask for enabling specific bits in the Enable register.

Standard Event Status Group

This group consists of an Event register and an Enable register that are programmed by Common commands. The Standard Event event register latches events relating to instrument communication status (see figure 3-4). It is a read-only register that is cleared when read. The Standard Event enable register functions similarly to the enable registers of the Operation and Questionable status groups.

3 - Programming Examples

Command	Action
*ESE	programs specific bits in the Standard Event enable register.
*PSC ON	clears the Standard Event enable register at power-on.
*ESR?	reads and clears the Standard Event event register.

The PON (Power On) Bit

The PON bit in the Standard Event event register is set whenever the electronic load is turned on. The most common use for PON is to generate an SRQ at power-on following an unexpected loss of power. To do this, bit 7 of the Standard Event enable register must be set so that a power-on event registers in the ESB (Standard Event Summary Bit), bit 5 of the Service Request Enable register must be set to permit an SRQ to be generated, and *PSC OFF must be sent. The commands to accomplish these conditions are:

*PSC OFF *ESE 128 *SRE 32

Operation Status Group

The Operation Status registers record signals that occur during normal operation. As shown below, the group consists of a Condition, PTR/NTR, Event, and Enable register. The outputs of the Operation Status register group are logically-ORed into the OPER(ation) summary bit (7) of the Status Byte register.

Register	Command	Description
Condition	STAT:OPER:COND?	A read-only register that holds real-time status of the circuits being monitored.
PTR Filter	STAT:OPER:PTR <n></n>	A read/write positive transition filter that functions as described in chapter 4 under STAT:OPER:NTR PTR.
NTR Filter	STAT:OPER:NTR <n></n>	A read/write negative transition filter that functions as described in chapter 4 under STAT:OPER:NTR PTR.
Event	STAT:OPER:EVEN?	A read-only register that latches any condition that is passed through the PTR or NTR filters. It is cleared when read.
Enable	STAT:OPER:ENAB <n></n>	A read/write register that functions as a mask for enabling specific bits from the Event register.

Status Byte Register

This register summarizes the information from all other status groups as defined in the *IEEE 488.2 Standard Digital Interface for Programmable Instrumentation*. The bit configuration is shown in Table 3-1.

Command Action

*STB? reads the data in the register but does not clear it (returns MSS in bit 6) clears RQS inside the register and returns it in bit position 6 of the response.

The MSS Bit

This is a real-time (unlatched) summary of all Status Byte register bits that are enabled by the Service Request Enable register. MSS is set whenever the electronic load has one or more reasons for requesting service. *STB? reads the MSS in bit position 6 of the response but does not clear any of the bits in the Status Byte register.

The RQS Bit

The RQS bit is a latched version of the MSS bit. Whenever the electronic load requests service, it sets the SRQ interrupt line true and latches RQS into bit 6 of the Status Byte register. When the controller does a serial poll, RQS is cleared inside the register and returned in bit position 6 of the response. The remaining bits of the Status Byte register are not disturbed.

The MAV Bit and Output Queue

The Output Queue is a first-in, first-out (FIFO) data register that stores electronic load-to-controller messages until the controller reads them. Whenever the queue holds one or more bytes, it sets the MAV bit (4) of the Status Byte register.

Determining the Cause of a Service Interrupt

You can determine the reason for an SRQ by the following actions:

Step 1	Determine which summary bits are active. Use: *STB? or serial poll
Step 2	Read the corresponding Event register for each summary bit to determine which events caused the summary bit to be set. Use:
	STATus:QUEStionable:EVENt? STATus:OPERation:EVENt? ESR?
	When an Event register is read, it is cleared. This also clears the corresponding summary bit.
Step 3	Remove the specific condition that caused the event. If this is not possible, the event may be disabled by programming the corresponding bit of the status group Enable register or

NTR|PTR filter if there is one. A faster way to prevent the interrupt is to disable the service request by programming the appropriate bit of the Service Request Enable register

Servicing Standard Event Status and Questionable Status Events

This example assumes you want a service request generated whenever the electronic load experiences a command execution error, or whenever the electronic load's overcurrent, overpower, or overtemperature circuits have tripped. From figure 3-4, note the required path for a condition at bit 4 (EXE) of the Standard Event Status register to set bit 6 (RQS) of the Status Byte register. Also note the required path for Questionable Status conditions at bits 1, 3, and 4 to generate a service request (RQS) at the Status Byte register. The required register programming is as follows:

- Step 1Program the Standard Event Status register to enable an event at bit 4. This allows the
event to be summed into the ESB bit of the Status Byte Register. Use:
*ESE 4
- Step 2 Program the Questionable Status register to allow an event at bits 1, 3, or 4 to be summed into the Questionable summary bit. Use:

STATus:QUEStionable:ENABle 26 (2+8+16=26)

Step 3 Program the Service Request Enable register to allow both the Standard Event Status and the Questionable summary bits from the Status Byte register to generate RQS. Use:

Step 4 When you service the request, read the event registers to determine which Operation Status and Questionable Status Event register bits are set, and clear the registers for the next event. Use:

STATus:OPERation:EVENt;QUEStionable:EVENt?

Programming Examples

NOTE: Because of the wide variety of input ratings between load modules, not all of the values used in the following programming examples will work with every module.

CC Mode Example

This example selects channel 1, sets the current level to 1.25 A and reads back the actual current value.

10 OUTPUT 705; "CHAN 1" 20 OUTPUT 705;"INPUT OFF" 30 OUTPUT 705;"FUNC CURR" 40 OUTPUT 705;"CURR:RANG MIN" 50 OUTPUT 705;"CURR 1.25" 60 OUTPUT 705;"INPUT ON" 70 OUTPUT 705;"MEAS:CURR?" 80 ENTER 705;A 90 DISP A 100 END

- Line 10: Selects the channel 1 module.
- Line 20: Turns off the input.
- Line 30: Selects the CC mode.
- Line 40: Selects the low current range.
- Line 50: Sets the current level to 1.25 amps.
- Line 60: Turns on the input.
- Line 70: Measures the actual input current and stores it in a buffer inside the electronic load.
- Line 80: Reads the input current value into variable A in the computer.
- Line 90: Displays the measured current value on the computer's display.

CV Mode Example

This example selects channel 2, presets the voltage level to 10 volts, and selects the external trigger source. When the external trigger signal is received, the channel 2 CV level will be set to 10 volts.

10 OUTPUT 705; "CHAN 2;:INPUT OFF" 20 OUTPUT 705;"FUNC VOLT" 30 OUTPUT 705;"VOLT 0" 40 OUTPUT 705;"VOLT:TRIG 10" 50 OUTPUT 705;"TRIG:SOUR EXT" 60 OUTPUT 705;"INPUT ON" 70 END

- Line 10: Selects channel 2 and turns off the input.
- Line 20: Selects the CV mode.
- Line 30: Sets the initial voltage level to 0 volts.
- Line 40: Sets the triggered voltage level to 10 volts.
- Line 50: Selects the external input as the trigger source.
- Line 60: Turns on the channel 2 input.

CR Mode Example

This example selects channel 1, sets the current protection limit to 2 amps, programs the resistance level to 100 ohms, and reads back the computed power.

10 OUTPUT 705;"CHAN 1;:INPUT OFF" 20 OUTPUT 705;"FUNC RES" 30 OUTPUT 705;"CURR:PROT:LEV 2;DEL 0.5" 40 OUTPUT 705;"CURR:PROT:STAT ON" 50 OUTPUT 705;"RES:RANG MAX" 60 OUTPUT 705;"RES 1000" 70 OUTPUT 705;"INPUT ON" 80 OUTPUT 705;"MEAS:POW?" 90 ENTER 705;A 100 DISP A 110 END

- Line 10: Selects channel 1 and turns off the input.
- Line 20: Selects the CR mode.
- Line 30: Sets the current protection limit to 2 amps with a trip delay of 5 seconds.
- Line 40: Enables the current protection feature.
- Line 50: Selects the high resistance range.
- Line 60: Sets the resistance level to 1000 ohms.
- Line 70: Turns on the input.
- Line 80: Reads the computed input power value and stores it in a buffer inside the electronic load.
- Line 90: Reads the computed input power level into variable A in the computer.
- Line 100: Displays the computed input power level on the computer's display.

Continuous Transient Operation Example

This example selects channel 2, sets the CC levels and programs the slew, frequency, and duty cycle parameters for continuous transient operation.

10 OUTPUT 705;"CHAN 2;:INPUT OFF" 20 OUTPUT 705;"FUNC CURR" 30 OUTPUT 705;"CURR 1" 40 OUTPUT 705;"CURR:TLEV 2;SLEW MAX" 50 OUTPUT 705;"TRAN:MODE CONT;FREQ 5000;DCYC 40" 60 OUTPUT 705;"TRAN ON;:INPUT ON" 70 END

- Line 10: Selects channel 2 and turns the input off
- Line 20: Selects the CC mode.
- Line 30: Sets the main current level to 1 ampere.
- Line 40: Sets the transient current level to 2 amps and the slew rate to maximum.
- Line 50: Selects continuous transient operation, sets the transient generator frequency to 5 kHz, and sets the duty cycle to 40%.
- Line 60: Turns on the transient generator and the input.

3 - Programming Examples

Pulsed Transient Operation Example

This example selects channel 1, sets the CR levels, selects the bus as the trigger source, sets the fastest slew rate, programs a pulse width of 1 millisecond, and turns on transient operation. When the *TRG command is received, a 1 millisecond pulse is generated at the channel 1 input.

10 OUTPUT 705;"CHAN 1;:INPUT OFF" 20 OUTPUT 705;"FUNC RES" 30 OUTPUT 705;"RES:RANG MAX; LEV 1000" 40 OUTPUT 705;"RES:TLEV 2000" 50 OUTPUT 705;"TRIG:SOUR BUS" 60 OUTPUT 705;"RES:SLEW MAX" 70 OUTPUT 705;"TRAN:MODE PULS;TWID .001" 80 OUTPUT 705;"TRAN ON;:INPUT ON"

200 OUTPUT 705;"*TRG" 210 END

- Line 10: Selects channel 1 and turns the input off.
- Line 20: Selects the CR mode.
- Line 30: Selects the high resistance range and sets the main resistance level to 100 ohms.
- Line 40: Sets the transient resistance level to 50 ohms.
- Line 50: Selects the HP-IB as the trigger source.
- Line 60: Sets the CR slew rate to the maximum value.
- Line 70: Selects pulsed transient operation and sets the pulse width to 1 millisecond.
- Line 80: Turns on the transient generator and the input.

Other commands are executed

Line 200: The *TRG command generates a 1 millisecond pulse at the channel 1 input.

Synchronous Toggled Transient Operation Example

This example programs channels 1 and 2 to generate synchronous transient waveforms. The channels can then be paralleled for increased current input. Each channel is set up to operate in the CC mode with toggled transient operation turned on. The electronic load's internal trigger oscillator is set up to produce trigger pulses at a frequency of 2 kHz in order to generate synchronous waveforms at the channel 1 and channel 2 inputs.

10 OUTPUT 705;"CHAN 1;:INPUT OFF" 20 OUTPUT 705;"FUNC CURR" 30 OUTPUT 705;"CURR 25" 40 OUTPUT 705;"CURR:TLEV 50; SLEW MAX" 50 OUTPUT 705;"TRAN:MODE TOGG" 60 OUTPUT 705;"TRAN ON;:INPUT ON" 70 OUTPUT 705; "CHAN 2;:INPUT OFF" 80 OUTPUT 705; "CURR 25" 100 OUTPUT 705; "CURR:TLEV 50; SLEW MAX" 110 OUTPUT 705; "CURR:TLEV 50; SLEW MAX" 110 OUTPUT 705; "TRAN ON;:INPUT ON" 120 OUTPUT 705; "TRAN ON;:INPUT ON" 130 OUTPUT 705; "TRIG:TIM .0005" 140 OUTPUT 705; "TRIG:SOUR TIM" 150 END

- Line 10: Selects channel 1 and turns the input off.
- Line 20: Selects the CC mode.
- Line 30: Sets the main current level to 25 A.
- Line 40: Sets the transient current level to 50 A and the slew rate to maximum.
- Line 50: Selects toggled transient operation.
- Line 60: Enables transient operation and turns on the channel 1 input.
- Line 70: Selects channel 2 and turns the input off.
- Line 80: Selects the CC mode.
- Line 90: Sets the main current level to 25 A.
- Line 100: Sets the transient current level to 50 A and the slew to maximum.
- Line 110: Selects toggled transient operation.
- Line 120: Enables transient operation and turns on the channel 2 input.
- Line 130: Sets the internal trigger oscillator frequency to 2 kHz (period of pulses = 0.0005).
- line 140: Selects the electronic load's internal oscillator as the trigger source. The oscillator starts running as soon as this line is executed.

Battery Testing Example

The principal measurement of a battery's performance is its rated capacity. The capacity of a fully charged battery, at a fixed temperature, is defined as the product of the rated discharge current in amperes and the discharge time in hours, to a specified minimum termination voltage in volts (see figure 3-5). A battery is considered completely discharged when it reaches the specified minimum voltage called the "end of discharge voltage" (EODV).

Figure 3-5. Typical Discharge Curve

In this example, the electronic load discharges three nickel-cadmium batteries to determine their discharge rates at a fixed temperature (see Figure 3-6). The batteries are connected in series so that when the EODV is reached, it is still above the minimum operating voltage of the electronic load. The EODV for nickel-cadmium batteries is typically 1.0 volts.

Power Supply Testing Example

A typical use for electronic loads when testing power supplies involves power supply burn-in. One of the problems associated with burn-in is what to do if the power supply fails before the test is over. One solution involves continuously monitoring the supply and removing the load if the supply fails during the test (see figure 3-7).

In this example, the electronic load is used to burn-in a power supply at its rated output current. Because the electronic load is operating in CC mode, if the power supply's output current drops below the rated output current during the test, the UNR (unregulated) condition will be set on the electronic load. This can be used to indicate that a failure has occurred on the power supply. If the unregulated condition persists for a specified time, the inputs of the electronic load are turned off.

The purpose of this example is not to illustrate power supply testing, but to explain how to program and use the status registers on the electronic load. The part of the program that runs the test simply monitors the supply at the rated output current for one hour and stops the test. You can replace this portion of the program with your own routine to test the power supply. Although SRQ (service request) is enabled to interrupt only on the UNR bit in this example, you can modify the program to interrupt on other conditions.

C++ Programming Example

This program demonstrates the use of lists and triggered measurements in an Agilent N3300A Electronic Load. The load is programmed to step through three values of current at 1 second intervals. At each current step, the load measures its own current by sampling it 50 times at 10 microsecong intervals. The program reads back all of the data, averages the 50 samples for each of the three current steps, and outputs the results. After each current step, the measurement is delayed by 100us to allow the current to settle.

```
#include <stdio.h>
#include <stdlib.h>
#include "sicl.h"
#define MEAS BUF SIZE 4096 /* Size of measurement buffer in load. */
/* SICL error handler */
void ErrorHandler(INST id, int error)
{
    printf("SICL error %d\n", error);
    exit(1);
}
/* Each triggered measurement consists of nPoints samples. If multiple
 * triggered measurements are taken, all of the samples (nPoints times the
* number of measurements) are placed in the load's measurement buffer.
 * This function averages the samples in the buffer that are associated
 * with one triggered measurement. When nIndex is 0, the first set of
 * nPoints samples are averaged; when nIndex is 1, the 2nd set of nPoints
 * samples are averaged; etc.
 */
```

```
int nStart, nEnd, i;
    double dSum = 0.0;
    nStart = nIndex * nPoints;
    nEnd = nStart + nPoints;
    for (i = nStart; i < nEnd; ++i)</pre>
        dSum += pData[i];
    return dSum / nPoints;
}
void main(int argc, char **argv)
    INST
            Load;
            i, nListSteps, nTotalPoints;
    int
    double aMeasData[MEAS_BUF_SIZE];
    /* This array contains the load current values, in Amps. */
    double aListData[] = {0.5, 1.0, 1.5};
    /* The current steps occur at 1 sec intervals. */
    double dListPeriod = 1.0;
    /* 50 measurement samples are taken at each current step. */
            nMeasPoints = 50;
    int
    /* The measurement samples are taken at 10us intervals. */
    double dMeasPeriod = 10e-6;
    /* The measurements are delayed by 100us after each current step. */
    double dMeasDelay = 100e-6;
    /* The total number of measurement samples may not exceed the size of
     * the load's measurement buffer.
     */
    nListSteps = sizeof(aListData) / sizeof(aListData[0]);
    nTotalPoints = nMeasPoints * nListSteps;
    if (nTotalPoints > MEAS_BUF_SIZE) {
        printf("Total number of measurement points exceeds buffer size.\n");
        exit(1);
    }

Language Dictionary

Introduction

This section gives the syntax and parameters for all the IEEE 488.2 SCPI subsystem and common commands used by the electronic loads. It is assumed that you are familiar with the material in chapter 2 "Introduction to Programming". Because the SCPI syntax remains the same for all programming languages, the examples given for each command are generic.

Syntax Forms	Syntax definitions use the long form, but only short form headers (or "keywords") appear in the examples. Use the long form to help make your program self-documenting.
Parameters	Most commands require a parameter and all queries will return a parameter. The range for a parameter may vary according to the model of electronic load. Parameters for all models are listed in the Specifications table in the User's Guide.
Channel	If a command only applies to individual channels of a mainframe, the entry Channel Selectable will appear in the command description.
Related Commands	Where appropriate, related commands or queries are included. These are listed because they are either directly related by function, or because reading about them will clarify or enhance your understanding of the original command or query.
Order of Presentation	 The dictionary is organized as follows: Subsystem commands, arranged by subsystem IEEE 488.2 common commands

Subsystem Commands

Subsystem commands are specific to functions. They can be a single command or a group of commands. The groups are comprised of commands that extend one or more levels below the root. The description of common commands follows the description of the subsystem commands.

The subsystem command groups are arranged according to function: Calibration, Channel, Input, List, Measurement, Port, Status, System, Transient, and Trigger. Commands under each function are grouped alphabetically under the subsystem. Commands followed by a question mark (?) take only the query form. When commands take both the command and query form, this is noted in the syntax descriptions.

Appendix A lists all subsystem commands in alphabetical order.

Δ

Common Commands

Common commands begin with an * and consist of three letters (command) or three letters and a ? (query). They are defined by the IEEE 488.2 standard to perform common interface functions. Common commands and queries are categorized under System, Status, or Trigger functions and are listed at the end of this chapter.

Programming Parameters

The following table lists the electronic load programming parameters. Refer to Appendix A of the User's Guide for programming accuracy and resolution.

Calibration Commands

Calibration commands let you:

- Enable and disable the calibration mode
- Change the calibration password
- Calibrate the input functions, current monitor offset and gain, and store new calibration constants in nonvolatile memory.

CALibrate:DATA

This command is only used in calibration mode. It enters a calibration value that you obtain by reading an external meter. You must first select a calibration level (with CALibrate:LEVel) for the value being entered. These constants are not stored in nonvolatile memory until they are saved with CALibrate:SAVE. If CALibrate:STATE OFF is programmed without a CALibrate:SAVE, the previous calibration constants are restored.

-	CALibrate:DATA <nrf> {,<nrf>,<nrf>} <external reading=""></external></nrf></nrf></nrf>		
	CAL:DATA 3222.3	CAL:DATA 5.000	
Related Commands	CAL:STAT CAL:SAV		

CALibrate:IMON:LEVel

This command can only be used in calibration mode. It is used to set the two calibration points of the analog current monitor signal.

Command Syntax	CALibrate:IMON:LEVel <level></level>	
Parameters	P1 P2	
Examples	CAL:LEV P2	
Related Commands	CAL:STAT CAL:SAV	

CALibrate:IPR:LEVel

This command can only be used in calibration mode. It is used to set the four calibration points for calibrating the gains of the analog current monitor signal and the analog current programming signal.

Command Syntax	CALibrate:IPRog:LEVel <level></level>	
Parameters	P1 P2 P3 P4	
Examples	CAL:LEV P2	
Related Commands	CAL:STAT CAL:SAV	

CALibrate:LEVel

This command can only be used in calibration mode. It is used to set the two calibration points of the presently selected FUNCtion and RANGe.

Command SyntaxCALibrate:LEVel <level>ParametersP1 | P2ExamplesCAL:LEV P2Related CommandsCAL:STAT

4 - Language Dictionary

CALibrate:PASSword

This command can only be used in calibration mode. It allows you to change the calibration password. The new password is not saved until you send the CALibrate:SAVE command. If the password is set to 0, password protection is removed and the ability to enter the calibration mode is unrestricted.

Command SyntaxCALibrate:PASSword <NRf>Parameters0 (default)ExamplesCAL:PASS N3301ACAL:PASS 02.1997Related CommandsCAL:STAT

CALibrate:SAVE

This command can only be used in calibration mode. It saves any new calibration constants (after a current or voltage calibration procedure has been completed) in nonvolatile memory.

Command SyntaxCALibrate:SAVEParametersNoneExamplesCAL:SAVERelated CommandsCAL:STAT

CALibrate:STATe

This command enables and disables calibration mode. The calibration mode must be enabled before the load will accept any other calibration commands. The first parameter specifies the enabled or disabled state. The second parameter is the password. It is required if the calibration mode is being enabled and the existing password is not 0. If the password is not entered or is incorrect, an error is generated and the calibration mode remains disabled. The query statement returns only the state, not the password.

Whenever the calibration state is changed from enabled to disabled, any new calibration constants are lost unless they have been stored with CALibrate:SAVE.

Command SyntaxCALibrate:STATe <bool> [,<NRf>]Parameters0 | 1 | OFF | ON [,<password>]*RST ValueOFFExamplesCAL:STAT 1, N3301AQuery SyntaxCALibrate:STATe?Returned Parameters<NR1>Related CommandsCAL:PASSCAL:SAVE

Channel Commands

These commands program the channel selection capability of the electronic load. The CHANnel and INSTrument commands are equivalent.

CHANnel INSTrument

These commands select the multiple electronic load channel to which all subsequent channel-specific commands will be directed. If the specified channel number does not exist or is outside the MIN/MAX range, an error code is generated (see appendix C). Refer to the installation section of the User's Guide for more information about channel number assignments.

Command Syntax	CHANnel[:LOAD] <nrf+> INSTrument[:LOAD] <nrf+></nrf+></nrf+>
Parameters	1 - 6
*RST Value	1
Examples	CHAN:LOAD 3 INST 2
Query Syntax	CHANnel? (NOTE: Use CHAN? MAX to return the number of channels installed in a load mainframe)
Returned Parameters	<nr1></nr1>

Input Commands

These commands control the input of the electronic load. The INPut and OUTput commands are equivalent. The CURRent, RESistance and VOLTage commands program the actual input current, resistance, and voltage.

[SOURce:]INPut [SOURce:]OUTPut

Channel Specific

These commands enable or disable the electronic load inputs. The state of a disabled input is a high impedance condition.

Command Syntax	[SOURce:]INPut[:STATe] <bool> [SOURce:]OUTPut[:STATe] <bool></bool></bool>			
Parameters	0 1 0)FF (NC	
*RST Value	ON			
Examples	INP 1		OUTP:STAT	ON
Query Syntax	INPut[:STATe]?			
	OUTPu	it[:STA	\Te]?	
Returned Parameters	0 1			
Related Commands	*RCL	*SA\	/	

[SOURce:]INPut:PROTection:CLEar [SOURce:]OUTput:PROTection:CLEar

Channel Specific

These commands clear the latch that disables the input when a protection condition such as overvoltage (OV) or overcurrent (OC) is detected. All conditions that generated the fault must be removed before the latch can be cleared. The input is then restored to the state it was in before the fault condition occurred.

Command Syntax	[SOURce:]INPut:PROTection:CLEar [SOURce:]OUTPut:PROTection:CLEar			
Parameters				
Examples	OUTP:PROT:CLE			
Related Commands		*SAV	*RCL	

[SOURce:]INPut:SHORt [SOURce:]OUTPut:SHORt

Channel Specific

This command programs the specified electronic load module to the maximum current that it can sink in the present operating range.

Command Syntax	[SOURce:]INPut:SHORt <bool> [SOURce:]OUTPut:SHORt <bool></bool></bool>		
Parameters	0 1 OF	F ON	
*RST Value	OFF

Related Commands	VOLT VOLT:MODE

Measurement Commands

Measurement commands consist of measurement and sense commands.

Two measurement commands are available: MEASure and FETCh. MEASure triggers the acquisition of new data before returning the readings from the array. FETCh returns previously acquired data from the array. Only input current and voltage are actually measured. Power is calculated from the stored voltage and current data. The input voltage and current are digitized whenever a measure command is given or whenever an acquire trigger occurs. The time interval of the measurement is set by SENSe:SWEep:TINTerval, and the position of the trigger relative to the beginning of the data buffer is determined by SENSe:SWEep:OFFSet.

Sense commands control the measurement range, the acquisition sequence, and the measurement window of the electronic load.

ABORt

This command resets the measurement and list trigger systems to the Idle state. Any measurement or list that is in progress is immediately aborted. ABORt also resets the WTG bit in the Operation Condition Status register (see chapter 3 under "Programming the Status Registers"). ABORt is executed at power turn-on and upon execution of *RCL, RST, or any implied abort command (see List Commands).

NOTE: If INITiate:CONTinuous ON has been programmed, the trigger system initiates itself immediately after ABORt, thereby setting the WTG bit.

Command SyntaxABORtParametersNoneExamplesABORRelated CommandsINIT*RST*TRGTRIG

MEASure:ARRay:CURRent? FETCh:ARRay:CURRent?

Channel Specific

These queries return an array containing the instantaneous input current.

Query Syntax	MEASure:ARRay:CURF FETCh:ARRay:CURRel	
Parameters	None	
Examples	MEAS: ARR: CURR?	<pre>FETC:ARR:CURR?</pre>
Returned Parameters	4096 NR3 values	
Related Commands	MEAS:ARR:VOLT?	

MEASure:ARRay:POWer? FETCh:ARRay:POWer?

Channel Specific

These queries return an array containing the instantaneous input power. The power is calculated from the instantaneous voltage and current data points.

Query Syntax	MEASure:ARRay:POV FETCh:ARRay:POWe	
Parameters	None	
Examples	MEAS:ARR:POW?	<pre>FETC:ARR:POW?</pre>
Returned Parameters	4096 NR3 values	
Related Commands	MEAS:ARR:VOLT?	

4 - Language Dictionary

MEASure:ARRay:VOLTage? FETCh:ARRay:VOLTage?

Channel Specific

These queries return an array containing the instantaneous input voltage.

Query Syntax	MEASure:ARRay:VOL FETCh:ARRay:VOLTa	
Parameters	None	
Examples	MEAS:ARR:VOLT?	FETC:ARR:VOLT?
Returned Parameters	4096 NR3 values	
Related Commands	MEAS:ARR:CURR?	

MEASure:CURRent? FETCh:CURRent?

Channel Specific

These queries return the average value of the input current.

Query Syntax	MEASure:[SCALa FETCh:[SCALar]:	ar]:CURRent[:DC]? CURRent[:DC]?
Parameters	None	
Examples	MEAS:CURR?	FETC:CURR?
Returned Parameters	<nr3></nr3>	
Related Commands	MEAS:VOLT?	

MEASure:CURRent:ACDC? FETCh:CURRent:ACDC?

Channel Specific

These queries return the total rms measurement, including the dc portion.

Query Syntax	MEASure:[SCALar]:CURRent:ACDC? FETCh:[SCALar]:CURRent:ACDC?	
Parameters	None	
Examples	MEAS:CURR:ACDC?	FETC:CURR:ACDC?
Returned Parameters Related Commands	<nr3> MEAS:VOLT:ACDC?</nr3>	MEAS:CURR:AMPL:MAX?

MEASure:CURRent:MAXimum? FETCh:CURRent:MAXimum?

Channel Specific

These queries return the value of the maximum data point in the input current measurement.

Query Syntax	MEASure:[SCALar]:CU FETCh:[SCALar]:CURF	
Parameters	None	
Examples	MEAS:CURR:MAX?	<pre>FETC:CURR:MAX?</pre>
Returned Parameters	<nr3></nr3>	
Related Commands	MEAS:CURR:ACDC?	

MEASure:CURRent:MINimum? FETCh:CURRent:MINimum?

Channel Specific

These queries return the value of the minimum data point in the input current measurement.

Query Syntax	MEASure:[SCALar]:CURRent:MINimum? FETCh:[SCALar]:CURRent:MINimum?	
Parameters	None	
Examples	MEAS:CURR:MIN?	<pre>FETC:CURR:MIN?</pre>
Returned Parameters	<nr3></nr3>	
Related Commands	MEAS:CURR:ACDC?	

MEASure:POWer? FETCh:POWer?

Channel Specific

These queries return the average value of the input power in watts.

Query Syntax	MEASure:[SCAL FETCh:[SCALar]	
Parameters	None	
Examples	MEAS: POW?	FETC:POW?
Returned Parameters	<nr3></nr3>	
Related Commands	MEAS:POW:MA	X?

MEASure:POWer:MAXimum? FETCh:POWer:MAXimum?

Channel Specific

These queries return the value of the maximum data point in the input power measurement.

Query Syntax	MEASure:[SCALar]:POWer:MAXimum? FETCh:[SCALar]:POWer:MAXimum?	
Parameters	None	
Examples	MEAS: POW: MAX	? FETC: POW: MAX?
Returned Parameters Related Commands	<nr3> MEAS:POW?</nr3>	MEAS:POW:MIN?

MEASure:POWer:MINimum? FETCh:POWer:MINimum?

Channel Specific

These queries return the value of the minimum data point in the input power measurement.

Query Syntax	MEASure:[SCALar]:POWer:MINimum? FETCh:[SCALar]:POWer:MINimum?
Parameters	None
Examples	MEAS:POW:MIN? FETC:POW:MIN?
Returned Parameters	<nr3></nr3>
Related Commands	MEAS:POW? MEAS:POW:MAX?

Query Syntax	MEASure:[SCALar]:VOLTage:MINimum? FETCh:[SCALar]:VOLTage:MINimum?		
Parameters	None		
Examples	MEAS:VOLT:MIN?	FETC:VOLT:MIN?	
Returned Parameters	<nr3> MEAS:VOLT:ACDC?</nr3>		
Related Commands	MEAS: VOLT: ACDC?	MEAS: VOL I ?	
SENSe:CURRent:RANGe

Channel Specific

This command sets the current measurement range. There are two current measurement ranges: **High Range:** model dependent, see Table 4-1 **Low Range:** model dependent, see Table 4-1

A value of infinity is returned if the measured value is outside the specified current measurement range.

Command Syntax	SENSe:CURRent:RANGe <nrf+></nrf+>
Parameters	0 through MAX MINimum MAXimum
Unit	A (amperes)
*RST Value	MAX (high range)
Examples	SENS:CURR:RANGE MIN
Query Syntax	SENSe:CURRent:RANGe?
Returned Parameters	<nr3></nr3>

SENSe:SWEep:POINts

Channel Specific

This command specifies how many data points are taken in any measurement. Applies to both voltage and current measurements. The number of points can be specified, from 1 to 4096.

Command Syntax	SENSe:SWEep:POINts <nrf+></nrf+>
Parameters	1 through 4096 MINimum MAXimum
*RST Value	1000
Examples	SENS:SWE:POIN 2048
Query Syntax	SENSe:SWEep:POINts?
Returned Parameters	<nr3></nr3>
Related Commands	SENS:SWE:TINT MEAS:ARR

SENSe:SWEep:OFFSet

Channel Specific

This command specifies a delay time after the trigger, but before the measurement is taken. The delay is specified in seconds. The measurement offset can be either positive or negative with respect to the trigger.

NOTE: Negative measurement offsets can only be programmed in conjunction with delayed triggers. The negative measurement offset cannot exceed the trigger delay value.

	SENSe:SWEep:OFI 0 through 0.032 MI seconds		
*RST Value	0 (zero)		
Examples	SENS:SWE:OFFS 0.01		
Query Syntax	SENSe:SWEep:OF	FSet?	
Returned Parameters	<nr3></nr3>		
Related Commands	SENS:SWE:TINT	MEAS:ARR	

SENSe:SWEep:TINTerval

Channel Specific

This command defines the time period between measurement points. The time interval can be programmed from 0.00001 to 0.032 seconds in 10 microsecond increments.

Command Syntax	SENSe:SWEep:TINTerval <nrf+></nrf+>		
Parameters	0.00001 - 0.032 MAXimum MINimum		
Unit	seconds		
*RST Value	10 μs		
Examples	SENS:SWE:TINT 100E-6		
Query Syntax	SENSe:SWEep:TINTerval?		
Returned Parameters	<nr3></nr3>		
Related Commands	SENS:SWE:OFFS:POIN MEAS:ARR		

SENSe:WINDow

Channel Specific

This command sets the window function that is used in dc and ac+dc rms measurement calculations. The following functions can be selected:

HANNing	A signal conditioning window that reduces errors in dc and rms measurement calculations in the presence of periodic signals such as line ripple. It also reduces jitter when measuring successive pulses. The Hanning window multiplies each point in the measurement sample by the function cosine ⁴ . Do not use the Hanning window when measuring single-shot pulses.
RECTangular	A window that returns measurement calculations without any signal conditioning.

NOTE: Neither window function alters the voltage or current data in the measurement array.

Command Syntax	SENSe:WINDow[:TYPE] <type></type>
Parameters	RECTangular HANNing
*RST Value	RECTangular
Examples	SENS:WIND HANN
Query Syntax	SENSe:WINDow?
Returned Parameters	<crd></crd>

SENSe:VOLTage:RANGe

Channel Specific

This command sets the voltage measurement range. There are two voltage measurement ranges: **High Range:** model dependent, see Table 4-1 **Low Range:** model dependent, see Table 4-1

A value of infinity is returned if the measured value is outside the specified voltage measurement range.

Command Syntax	SENSe:VOLTage:RANGe[:UPPer] <nrf+></nrf+>		
Parameters	0 through MAX MINimum MAXimum		
Unit	V (voltage)		
	MAX (high range)		
Examples	SENS: VOLT: RANGE MIN		
Query Syntax	SENSe:VOLTage:RANGe?		
Returned Parameters	<nr3></nr3>		
Related Commands	SENS:SWE:TINT MEAS:ARR		

Port Commands

These commands control the general purpose digital port on the electronic load modules.

PORT0

Channel Specific

This command sets the state of the general purpose digital port on the specified electronic load module. A value of 1 sets the state high, a 0 sets the state low.

Command SyntaxPORT0[:STATe] <bool>Parameters0 | 1 | OFF | ON*RST ValueOFFExamplesPORT0 1Query SyntaxPORT0[:STATe]?Returned Parameters0 | 1Related CommandsPORT1

PORT1

This command sets the state of the two general purpose digital ports on the mainframe. The value that you send is the equivalent of a 2-bit binary word. Use the following values to set the individual bits. Note that the digital port on the mainframe can also be programmed using lists.

value	Dig 2	Dig 1
0	Lo	Lo
1	Lo	Hi
2	Hi	Lo
3	Hi	Hi

Command Syntax		<nr1></nr1>	
Parameters	0 1 2 3		
*RST Value	0		
Examples	PORT1 1	PORT1	3
Query Syntax	PORT1?		
Returned Parameters	<nr3></nr3>		
Related Commands	PORT0		

List Commands

List commands let you program complex sequences of input changes with rapid, precise timing, and synchronized with trigger signals. Each function for which lists can be generated has a list of values that specify the input at each list step. MODE commands such as VOLTage:MODE LIST are used to activate specific functions. LIST:COUNt determines how many times the unit sequences through a list before that list is completed. LIST:DWELI specifies the time interval that each value (step) of a list is to remain in effect. LIST:STEP determines if a trigger causes a list to advance only to its next step or to sequence through all of its steps.

NOTE:	The LIST:DWELI command is active whenever any function is set to list mode. Therefore,
	a LIST:DWELI time must always be specified whenever any list function is programmed.

The list data is given in the list command parameters, which are separated by commas. The order in which the data is entered determines the sequence in which the data is programmed when a list is triggered. Changing list data while a list is running generates an implied ABORt.

All functions that are set to LIST mode must have the same number of steps (up to 50), or an error is generated when the INITiate command is sent. The only exception is a list consisting of only one step. Such a list is treated as if it had the same number of steps as the other lists, with all of the implied step having the same value as the one specified step. All list point data can be stored in nonvolatile memory.

[SOURce:]LIST:COUNt

This command sets the number of times that the list is executed before it is completed. The command accepts parameters in the range 1 through 9.9E37, but any number greater than 2E9 is interpreted as infinity. Use INFinity to execute a list indefinitely. This command is not channel specific, it applies to the entire mainframe.

Command Syntax	[SOURce:]LIST:COUNt <nrf+> INFinity</nrf+>			
Parameters	1 to 9.9E37	MINimum MA	Ximum INFin	ity
*RST Value	1			
		3 LIST:	COUN INF	
Query Syntax	[SOURce:]LIS	ST:COUNt?		
Returned Parameters	<nr3></nr3>			
Related Commands	LIST:CURR	LIST:FREQ	LIST:TTLT	LIST:VOLT

[SOURce:]LIST:CURRent [SOURce:]LIST:CURRent:POINts?

Channel Specific

This command specifies the current setting for each list step. Refer to Table 4-1 for model-specific programming ranges. LIST:CURRent:POINts returns the number of points programmed.

	[SOURce:]LIST:CURRent[:LEVel] <nrf+> {,<nrf+>} 0 through MAX MINimum MAXimum</nrf+></nrf+>	
	A (amperes)	
Examples	LIST:CURR 2.5,3.0,3.5	
-	LIST:CURR MAX,3.5,2.5,MIN	
Query Syntax	[SOURce:]LIST:CURRent[:LEVel]?	
	[SOURce:]LIST:CURRent:POINts?	
Returned Parameters	<pre></pre>	
Related Commands	CURR	

[SOURce:]LIST:CURRent:RANGe [SOURce:]LIST:CURRent:RANGe:POINts?

Channel Specific

This command sets the current range for each list step. There are two current ranges.High Range:model dependent, see Table 4-1Low Range:model dependent, see Table 4-1

When you program a range value, the load automatically selects the range that corresponds to the value that you program. If the value falls in a region where ranges overlap, the load selects the range with the highest resolution. LIST:CURRent:RANGe:POINts? returns the number of points programmed.

NOTE:	If the existing IMMediate, TRANsient, and TRIGgered current list settings are outside the
	new range, a list error is generated when the list is initiated and the list does not execute.

Parameters	[SOURce:]LIST:CURRent:RANGe <nrf+> {,<nrf+>} 0 through MAX MINimum MAXimum <i>A</i> (amperes)</nrf+></nrf+>
*RST Value	MAXimum (high range)
Examples	LIST:CURR:RANGE MIN

	[SOURce:]LIST:CURRent:RANGe:POINts?
Returned Parameters	<nr3> {,<nr3>}</nr3></nr3>
Related Commands	CURR:RANG

[SOURce:]LIST:CURRent:SLEW [SOURce:]LIST:CURRent:SLEW:POINts?

Channel Specific

This command sets the current slew rate for each step. This command programs both positive and negative going slew rates. MAXimum sets the slew to its fastest possible rate. MINimum sets the slew to its slowest rate. LIST:CURRent:SLEW:POINts? returns the number of points programmed.

Command Syntax	[SOURce:]LIST:CURRent:SLEW[:BOTH] <nrf+> {,<nrf+>}</nrf+></nrf+>		
Parameters	0 to 9.9E37 MAXimum MINimum		
Unit	A (amperes per second)		
*RST Value	MAXimum		
Examples	LIST:CURR:SLEW 50	LIST:CURR:SLEW MAX	
Query Syntax	[SOURce:]LIST:CURRent:SLEW[:BOTH]?		
	[SOURce:]LIST:CURRent:SLEW:POINts?		
Returned Parameters	<nr3> {,<nr3>}</nr3></nr3>		
Related Commands	CURR:SLEW		

[SOURce:]LIST:CURRent:SLEW:NEGative

Channel Specific

This command sets the negative current slew rate for each step. MAXimum sets the slew to its fastest possible rate. MINimum sets the slew to its slowest rate.

Command Syntax	[SOURce:]LIST:CURRent:SLEW:NEGative <nrf+> {,<nrf+>}</nrf+></nrf+>		
Parameters	0 to 9.9E37 MAXimum MINimum		
Unit	A (amperes per second)		
*RST Value			
Examples	LIST:CURR:SLEW:NEG 50	LIST:CURR:SLEW:NEG MAX	
Query Syntax	[SOURce:]LIST:CURRent:SLEW:NEGative?		
Returned Parameters	<nr3> {,<nr3>}</nr3></nr3>		
Related Commands	CURR:SLEW:NEG		

[SOURce:]LIST:CURRent:SLEW:POSitive

Channel Specific

This command sets the positive current slew rate for each step. MAXimum sets the slew to its fastest possible rate. MINimum sets the slew to its slowest rate.

Command Syntax	[SOURce:]LIST:CURRent:SLEW:POSitive <nrf+> {,<nrf+>}</nrf+></nrf+>		
Parameters	0 to 9.9E37 MAXimum MINimum		
Unit	A (amperes per second)		
*RST Value

	Examples			
	Query Syntax	x [SOURce:]LIST:FUNCtion?		
	Returned Parameters Related Commands			

[SOURce:]LIST:DWELI [SOURce:]LIST:DWELI:POINts?

This command sets the sequence of list dwell times. Each value represents the time in seconds that the input will remain at the particular list step point before completing the step. At the end of the dwell time, the input of the electronic load depends upon the following conditions:

- If LIST:STEP AUTO has been programmed, the input automatically changes to the next point in the list.
- If LIST:STEP ONCE has been programmed, the input remains at the present level until a trigger sequences the next point in the list.

The order in which the points are entered determines the sequence in which they are executed when a list is triggered. Changing list data while a subsystem is in list mode generates an implied ABORt. This command is not channel specific, it applies to the entire mainframe. LIST:DWELI:POINts? returns the number of points programmed.

Command Syntax	[SOURce:]LIST:DWELI <nrf+> {,<nrf+>}</nrf+></nrf+>	
Parameters	0 - 10s MINimum MAXimum	
	s (seconds)	
Examples	LIST:DWEL 2.5,1.5,.5	
Query Syntax	uery Syntax [SOURce:]LIST:DWELI?

Returned Parameters	<nr3> {,<nr3>}</nr3></nr3>		
Related Commands	RES		

[SOURce:]LIST:RESistance:RANGe [SOURce:]LIST:RESistance:RANGe:POINts?

Channel Specific

This command sets the resistance range for each list step. There are four resistance ranges, the values of which are model dependent. Refer to Table 4-1 for the resistance ranges of each Electronic Load model.

When you program a range value, the load automatically selects the range that corresponds to the value that you program. If the value falls in a region where ranges overlap, the load selects the range with the highest resolution. LIST:RESistance:RANGe:POINts? returns the number of points programmed.

NOTE:	If the existing IMMediate, TRANsient, and TRIGgered resistance list settings are outside
	the new range, a list error is generated when the list is initiated and the list does not
	execute.

Parameters	[SOURce:]LIST:RESistance:RANGe <nrf+> {,<nrf+>} 0 through MAX MINimum MAXimum</nrf+></nrf+>		
	Ω (ohms)		
*RST Value	MAXimum (high range)		
Examples	LIST:RES:RANGE MIN

Related Commands	RES:TLEV

[SOURce:]LIST:STEP

This command specifies how the list sequencing responds to triggers. The following parameters may be specified. This command is not channel specific, it applies to the entire mainframe.

ONCE Causes the list to advance only one point after each trigger. Triggers that arrive during a dwell delay are ignored

AUTO Causes the entire list to be executed sequentially after the starting trigger, paced by its dwell delays. As each dwell delay elapses, the next point is immediately executed.

Command Syntax	[SOURce:]LIST:STEP <step></step>
Parameters	ONCE AUTO
*RST Value	AUTO
Examples	LIST:STEP ONCE
Query Syntax	[SOURce:]LIST:STEP?
Returned Parameters	<crd></crd>
Related Commands	LIST:COUN LIST:DWEL

[SOURce:]LIST:TRANsient [SOURce:]LIST:TRANsient:POINts?

Channel Specific

This command turns the transient generator on or off for each step. LIST:TRANsient:POINts? returns the number of points programmed.

Command Syntax	[SOURce:]LIST:TRANsient[:STATe] <bool> {,<bool>}</bool></bool>
Parameters	0 1 OFF ON
	OFF
Examples	LIST:TRAN 1 LIST:TRAN 0

[SOURce:]LIST:TRANsient:MODE [SOURce:]LIST:TRANsient:MODE:POINts?

Channel Specific

This command selects the transient operating mode for each step. LIST:TRANsient:MODE:POINts? returns the number of points programmed.

CONTinuous	The transient generator puts out a continuous pulse stream.
PULSe	The transient generator puts out a single pulse upon receipt of a trigger.

	[SOURce:]LIST:TRANsient:MODE <mode> {,<mode>} CONTinuous PULSe</mode></mode>
	CONTinuous
	LIST:TRAN:MODE PULS
	[SOURce:]LIST:TRANsient:MODE?
	[SOURce:]LIST:TRANsient:MODE:POINTs?
Returned Parameters	<crd> {,<crd>}</crd></crd>
Related Commands	TRAN:MODE

[SOURce:]LIST:TRANsient:TWIDth [SOURce:]LIST:TRANsient:TWIDth:POINts?

Channel Specific

This command sets the transient pulse width for each step when the generator is in PULSe mode. LIST:TRANsient:TWIDth:POINts? returns the number of points programmed.

Command Syntax	[SOURce:] LIST:TRA	Nsient:TV	VIDth <nrf+> {,<nr< th=""><th>(f+>}</th></nr<></nrf+>	(f+>}
Parameters	0.00005s - 4s MAXi	imum M	INimum	
Unit	seconds			
	0.0005s			
Examples	LIST:TRAN:TWID .	.005	LIST:TRAN:TWID	5E-4
Query Syntax	[SOURce:]LIST:TRAN	Nsient:TV	/IDth?	
	[SOURce:]LIST:TRAN	Nsient:TV	/IDth:POINts?	
Returned Parameters	<nr3> {,<nr3>}</nr3></nr3>			
Related Commands	TRAN:TWID			

[SOURce:]LIST:VOLTage [SOURce:]LIST:VOLTage:POINts?

Channel Specific

This command specifies the voltage setting for each list step. Refer to Table 4-1 for model-specific programming ranges. LIST:VOLTage:POINts? returns the number of points programmed.

Parameters	[SOURce:]LIST:VOLTage[:LEVel] <nrf+> {,<nrf+>} 0 through MAX MINimum MAXimum V (volts)</nrf+></nrf+>
Examples	LIST:VOLT 2.5,3.0,3.5 LIST:VOLT MAX,3.5,2.5,MIN
Query Syntax	[SOURce:]LIST:VOLTage[:LEVel]? [SOURce:]LIST:VOLTage:POINts?
Returned Parameters Related Commands	<nr3> {,<nr3>} VOLT</nr3></nr3>

[SOURce:]LIST:VOLTage:RANGe [SOURce:]LIST:VOLTage:RANGe:POINTs?

Channel Specific

This command sets the voltage range for each list step. There are two voltage ranges.High Range:model dependent, see Table 4-1Low Range:model dependent, see Table 4-1

When you program a range value, the load automatically selects the range that corresponds to the value that you program. If the value falls in a region where ranges overlap, the load selects the range with the highest resolution. LIST:VOLTage:RANGe:POINts? returns the number of points programmed.

NOTE: If the existing IMMediate, TRANsient, and TRIGgered voltage list settings are outside the new range, a list error is generated when the list is initiated and the list does not execute.

Command Syntax	[SOURce:]LIST:VOLTage:RANGe <nrf+> {,<nrf+>}</nrf+></nrf+>
Parameters	0 through MAX MINimum MAXimum
Unit	V (volts)
*RST Value	MAX (high range)
Examples	LIST:VOLT:RANGE MIN
Query Syntax	[SOURce:]LIST:VOLTage:RANGe?
	[SOURce:]LIST:VOLTage:RANGe:POINTs?
Returned Parameters	<nr3> {,<nr3>}</nr3></nr3>
Related Commands	VOLT:RANG

[SOURce:]LIST:VOLTage:SLEW [SOURce:]LIST:VOLTage:SLEW:POINts?

Channel Specific

This command sets the voltage slew rate for each step. This command programs both positive and negative going slew rates. MAXimum sets the slew to its fastest possible rate. MINimum sets the slew to its slowest rate. LIST:VOLTage:SLEW:POINts? returns the number of points programmed.

Command Syntax	[SOURce:]LIST:VOLTage:SLEW[:BOTH] <nrf+> {,<nrf+>}</nrf+></nrf+>					
Parameters	0 to 9.9E37 MAXimum MINimum					
Unit	V (volts per second)					
*RST Value	MAXimum					
Examples	LIST:VOLT:SLEW 50 LIST:VOLT:SLEW MAX					
Query Syntax	[SOURce:]LIST:VOLTage:SLEW[:BOTH]?					
	[SOURce:]LIST:VOLTage:SLEW:POINts?					
Returned Parameters	<nr3> {,<nr3>}</nr3></nr3>					
Related Commands	VOLT:SLEW					

[SOURce:]LIST:VOLTage:SLEW:NEGative

Channel Specific

This command sets the negative voltage slew rate for each step. MAXimum sets the slew to its fastest possible rate. MINimum sets the slew to its slowest rate.

Command Syntax	[SOURce:]LIST:VOLTage:SLEW:	[SOURce:]LIST:VOLTage:SLEW:NEGative <nrf+> {,<nrf+>}</nrf+></nrf+>					
Parameters	0 to 9.9E37 MAXimum MINimur	n					
Unit	V (volts per second)						
*RST Value	MAXimum						
Examples	LIST:VOLT:SLEW:NEG 50	LIST:VOLT:SLEW:NEG MAX					
Query Syntax	[SOURce:]LIST:VOLTage:SLEW:	NEGative?					
Returned Parameters	<nr3> {,<nr3>}</nr3></nr3>						
Related Commands	VOLT:SLEW:NEG						

[SOURce:]LIST:VOLTage:SLEW:POSitive

Channel Specific

This command sets the positive voltage slew rate for each step. MAXimum sets the slew to its fastest possible rate. MINimum sets the slew to its slowest rate.

-	[SOURce:]LIST:VOLTage:SLEW:POSitive <nrf+> {,<nrf+>} 0 to 9.9E37 MAXimum MINimum</nrf+></nrf+>						
Unit	V (volts per second)	(volts per second)					
*RST Value							
Examples	LIST:VOLT:SLEW:POS 50	LIST:VOLT:SLEW:POS MAX					
Query Syntax	[SOURce:]LIST:VOLTage:SLEW:	POSitive?					
Returned Parameters	<nr3> {,<nr3>}</nr3></nr3>						
Related Commands	VOLT:SLEW:POS						

[SOURce:]LIST:VOLTage:TLEVel [SOURce:]LIST:VOLTage:TLEVel:POINts?

Channel Specific

This command specifies the transient voltage level for each step. The transient function switches between the immediate setting and the transient level. LIST:VOLTage:TLEVel:POINts? returns the number of points programmed.

Parameters	[SOURce:]LIST:VOLTage:TLEVel <nrf+> {,<nrf+>} refer to Table 4-1</nrf+></nrf+>					
Unit	V (volts)					
*RST Value	MAXimum					
Examples	LIST:VOLT:TLEV 5 LIST:VOLT:TLEV .5					
Query Syntax	[SOURce:]LIST:VOLTage:TLEVel?					
	[SOURce:]LIST:VOLTage:TLEVel:POINts?					
Returned Parameters	<nr3> {,<nr3>}</nr3></nr3>					
Related Commands	VOLT:TLEV					

Transient Commands

These commands program the transient generator of the electronic load. The transient generator programs a second (transient) level at which the electronic load can operate without changing the original programmed settings.

See also [SOURce:]CURRent:TLEVel, [SOURce:]RESistance:TLEVel, and [SOURce:]VOLTage:TLEVel in the Input Commands section.

[SOURce:]TRANsient

Channel Specific

This command turns the transient generator on or off.

[SOURce:]TRANsient[:STATe] <bool></bool>					
0 1 OFF ON					
OFF					
TRAN 1 TRAN 0					
[SOURce:]TRANsient[:STATe]?					
<nr3></nr3>					
TRAN:MODE TRAN:FREQ					

[SOURce:]TRANsient:DCYCle

Channel Specific

This command sets the duty cycle of each of the transients when the generator is in CONTinuous mode.

Command Syntax Parameters *RST Value	[SOURce:]TRANsient:DCYCle <nrf+> 1.8% - 98.2% MAXimum MINimum 50%</nrf+>					
Unit	percent					
Examples	TRAN:DCYC 10.5	TRAN:DCYC 50				
Query Syntax	[SOURce:]TRANsient:DCYCle?					
Returned Parameters	<nr3></nr3>					
Related Commands	TRAN:MODE TR	AN:FREQ				

[SOURce:]TRANsient:FREQuency

Channel Specific

This command sets the frequency of the transients when the generator is in CONTinuous mode.

Command Syntax	[SOURce:]TRANsient:FREQuency <nrf+></nrf+>						
Parameters	0.25Hz - 10kHz MAXimum MINimum						
Unit	Hertz						
*RST Value	MAXimum						
Examples	TRAN:FREQ 50 TRAN:FREQ 5						
Query Syntax	[SOURce:]TRANsient:FREQuency?						
Returned Parameters	<nr3></nr3>						
Related Commands	TRAN:DCYC TRAN						

4 - Language Dictionary

[SOURce:]TRANsient:MODE

Channel Specific

This command selects the operating mode of the transient generator as follows.

CONTinuousThe transient generator puts out a continuous pulse stream.PULSeThe transient generator puts out a single pulse upon receipt of a trigger.TOGGIeThe transient generator toggles between two levels upon receipt of a trigger.

Command Syntax	[SOURce:]TRANsient:MODE <mode></mode>					
Parameters	CONTinuous PULSe TOGGle					
*RST Value	CONTinuous					
Examples	TRAN:MODE FIX					
Query Syntax	[SOURce:]TRANsient:MODE?					
Returned Parameters	<crd></crd>					
Related Commands	TRAN:DCYC TRAN					

[SOURce:]TRANsient:LMODE

Channel Specific

This command selects whether the transient generator uses immediate or list values for the transient settings.

FIXed	The transient generator uses the fixed or immediate values (set by the
	TRANsient function commands)
LIST	The transient generator uses the transient values programmed by the list.

Command Syntax	[SOURce:]TRANsient:LMODE <mode></mode>					
Parameters	FIXed LIST					
*RST Value	FIXed					
Examples	TRAN:LMODE FIX					
Query Syntax	[SOURce:]TRANsient:LMODE?					
Returned Parameters	<crd></crd>					
Related Commands	TRAN:MODE TRAN					

[SOURce:]TRANsient:TWIDth

Channel Specific

This command sets the pulse width of the transients when the generator is in PULSe mode.

	[SOURce:]TRANsient:TWIDth <nrf+></nrf+>						
Parameters	0.00005s - 4s MAXimum MINimum						
Unit	seconds						
*RST Value	0.0005s						
Examples	TRAN:TWID .005 TRAN:TWID 5E-4						
Query Syntax	[SOURce:]TRANsient:TWIDth?						
Returned Parameters	<nr3></nr3>						
Related Commands	TRAN:DCYC TRAN						

Status Commands

These commands program the electronic load status registers. The electronic load has five groups of status registers; Channel Status, Channel Summary, Questionable Status, Standard Event Status, and Operation Status. Refer to chapter 3 under "Programming the Status Registers" for more information.

Bit Configuration of Channel Status Registers

Bit Position	15-14	13	12	11	10	9)	8	7–5	4	3	2	1	0

STATus:CHANnel?

Channel Specific

This query returns the value of the Channel Event register. The Event register is a read-only register which holds (latches) all events that are passed into it. Reading the Channel Event register clears it.

Query Syntax	sTATus:CHANnel[:EVENt]		
Parameters	None		
Examples	STAT: CHAN: EVEN?		
Returned Parameters	<nr1> (register value)</nr1>		
Related Commands	*CLS		

STATus:CHANnel:CONDition?

Channel Specific

This query returns the value of the Channel Condition register. The particular channel must first be selected by the CHAN command.

Query SyntaxSTATus:CHANnel:CONDition?ParametersNoneExamplesSTAT:CHAN:COND?Returned Parameters<NR1> (register value)Related CommandsSTAT:CHAN?

STATus:CHANnel:ENABle

Channel Specific

This command sets or reads the value of the Channel Enable register for a specific channel. The particular channel must first be selected by the CHAN command.

Command SyntaxSTATus:CHANnel:ENABle <NRf+>Parameterschannel numberExamplesSTAT:CHAN:ENAB 3Query SyntaxSTATus:CHANnel:ENABle?Returned Parameters<NR1> (register value)Related Commands*CLS

4 - Language Dictionary

STATus:CSUM?

This query returns the value of the Channel Event summary register. The bits in this register correspond to a summary of the channel register for each input channel. Reading the Channel Event summary register clears it. This command is not channel specific, it applies to the entire mainframe.

Query SyntaxSTATus:CSUMmary[:EVENt]?ParametersNoneExamplesSTAT:CSUM:EVEN?Returned Parameters<NR1> (register value)Related Commands*CLS

STATus:CSUMmary:ENABle

This command sets or reads the value of the Channel Enable summary register. This command is not channel specific, it applies to the entire mainframe.

Command Syntax	STATus:CSUMmary:ENABle <nrf+></nrf+>
	channel number
Examples	STAT:CSUM:ENAB 3
Query Syntax	STATus:CSUMmary:ENABle?
Returned Parameters	<nr1> (register value)</nr1>

Bit Configuration of Operation Status Registers

Bit Position	15–5	5	4–1	0
Bit Name	not used	WTG	not used	CAL
Bit Weight		32		1
CAL = Interface is co	mputing new calibrati	on constants WTG	= Interface is waitir	ng for a trigger.

STATus:OPERation?

This query returns the value of the Operation Event register. The Event register is a read-only register that holds (latches) all events that are passed by the Operation NTR and/or PTR filter. Reading the Operation Event register clears it. This command is not channel specific, it applies to the entire mainframe.

Query Syntax	STATus:OPERation[:EVENt]?			
Parameters	None			
Examples	STAT: OPER: EVEN?			
Returned Parameters	<nr1> (register value)</nr1>			
Related Commands	*CLS	STAT:OPER:NTR	STAT:OPER:PTR	

STATus:OPERation:CONDition?

This query returns the value of the Operation Condition register. That is a read-only register that holds the real-time (unlatched) operational status of the electronic load. This command is not channel specific, it applies to the entire mainframe.

Query SyntaxSTATus:OPERation:CONDition?ParametersNoneExamplesSTAT:OPER:COND?Returned Parameters<NR1> (register value)Related CommandsSTAT:QUES:COND?

STATus:OPERation:ENABle

This command and its query set and read the value of the Operation Enable register. This register is a mask for enabling specific bits from the Operation Event register to set the operation summary bit (OPER) of the Status Byte register. The operation summary bit is the logical OR of all enabled Operation Event register bits. This command is not channel specific, it applies to the entire mainframe.

Command SyntaxSTATus:OPERation:ENABle <NRf+>Parameters0 to 32767 | MAXimum | MINimumDefault Value0ExamplesSTAT:OPER:ENAB 32Query SyntaxSTATus:OPERation:ENABle?Returned Parameters<NR1> (register value)Related CommandsSTAT:OPER?

STATus:OPERation:NTRansition STATus:OPERation:PTRansition

These commands set or read the value of the Operation NTR (Negative-Transition) and PTR (Positive-Transition) registers. These registers serve as polarity filters between the Operation Enable and Operation Event registers to cause the following actions. This command is not channel specific, it applies to the entire mainframe.

- When a bit in the Operation NTR register is set to 1, then a 1-to-0 transition of the corresponding bit in the Operation Condition register causes that bit in the Operation Event register to be set.
- When a bit of the Operation PTR register is set to 1, then a 0-to-1 transition of the corresponding bit in the Operation Condition register causes that bit in the Operation Event register to be set.
- If the same bits in both NTR and PTR registers are set to 1, then any transition of that bit at the Operation Condition register sets the corresponding bit in the Operation Event register.
- If the same bits in both NTR and PTR registers are set to 0, then no transition of that bit at the Operation Condition register can set the corresponding bit in the Operation Event register.

NOTE: Setting a bit in the PTR or NTR filter can of itself generate positive or negative events in the corresponding Operation Event register.

Command Syntax	STATus:OPERation:NTRansition <nrf+> STATus:OPERation:PTRansition <nrf+></nrf+></nrf+>			
Parameters	0 to 32767 MAXimum MINimum			
Default Value	0

Bit Configuration of Questionable Status Registers

STATus:QUEStionable?

This query returns the value of the Questionable Event register. The Event register is a read-only register that holds (latches) all events that pass into it. Reading the Questionable Event register clears it. This command is not channel specific, it applies to the entire mainframe.

Query Syntax	STATus:QUEStionable[:EVENt]?
Parameters	
Examples	STAT:QUES:EVEN?
Returned Parameters	<nr1> (register value)</nr1>
Related Commands	*CLS

STATus:QUEStionable:CONDition?

This query returns the value of the Questionable Condition register. That is a read-only register that holds the real-time (unlatched) questionable status of the electronic load. This command is not channel specific, it applies to the entire mainframe.

STATus:QUEStionable:CONDition?
None
STAT:QUES:COND?
<nr1> (register value)</nr1>
STAT:OPER:COND?

STATus:QUEStionable:ENABle

This command sets or reads the value of the Questionable Enable register. This register is a mask for enabling specific bits from the Questionable Event register to set the questionable summary (QUES) bit of the Status Byte register. This bit (bit 3) is the logical OR of all the Questionable Event register bits that are enabled by the Questionable Status Enable register. This command is not channel specific, it applies to the entire mainframe.

•	STATus:QUEStionable:ENABle <nrf+> 0 to 32767 MAXimum MINimum</nrf+>			
	0

Related Commands	STAT:QUES?			

System Commands

System commands control the system-level functions of the electronic load that are not directly related to input control or measurement functions.

SYSTem:ERRor?

This query returns the next error number followed by its corresponding error message string from the remote programming error queue. The queue is a FIFO (first-in, first-out) buffer that stores errors as they occur. As it is read, each error is removed from the queue. When all errors have been read, the query returns "0, No Error". If more errors are accumulated than the queue can hold, the last error in the queue is "-350, Too Many Errors".

Query Syntax	SYSTem:ERRor?
Parameters	None
Returned Parameters	<nr1>, <srd></srd></nr1>
Examples	SYST:ERR?

SYSTem:LOCal

This command places the electronic load in local mode during RS-232 operation. The front panel keys are functional.

Command Syntax	SYSTem:LOCal		
Parameters	None		
Example	SYST:LOC		
Related Commands	SYST:REM	SYST:RWL	

SYSTem:REMote

This command places the electronic load in remote mode during RS-232 operation. This disables all front panel keys except the Local key. Pressing the Local key while in the remote state returns the front panel to the local state.

SYSTem:REMote		
None		
SYST:REM		
SYST:LOC	SYST:RWL	
	None SYST:REM	

SYSTem:RWLock

This command places the electronic load in remote mode during RS-232 operation. All front panel keys including the Local key are disabled. Use SYSTem:LOCal to return the front panel to the local state.

Command Syntax	SYSTem:RW	Lock
Parameters	None	
Example	SYST:RWL	
Related Commands	SYST:REM	SYST:LOC

SYSTem:VERSion?

This query returns the SCPI version number to which the electronic load complies. The value is of the form YYYY.V, where YYYY is the year and V is the revision number for that year.

Query SyntaxSYSTem:VERSion?ParametersNoneExamplesSYST:VERS?Returned Parameters<NR2>

Trigger Commands

Trigger commands controls the triggering of the electronic load. Chapter 3 under "Triggering Changes" provides an explanation of the Trigger System.

See also [SOURce:]CURRent:TRIGgered, [SOURce:]RESistance:TRIGgered, and [SOURce:]VOLTage:TRIGgered in the Input Commands section.

NOTE: The list and measurement commands must first be enabled using the INITiate commands or no action due to triggering will occur. This does not apply to transient triggers.

ABORt

This command resets the list and measurement trigger systems to the Idle state. Any list or measurement that is in progress is immediately aborted. ABORt also resets the WTG bit in the Operation Condition Status register (see chapter 3 under "Programming the Status Registers"). ABORt is executed at power turn-on and upon execution of *RCL, RST, or any implied abort command (see List Commands).

NOTE: If INITiate:CONTinuous ON has been programmed, the trigger system initiates itself immediately after ABORt, thereby setting the WTG bit.

Command SyntaxABORtParametersNoneExamplesABORRelated CommandsINIT*RST*TRGTRIG

INITiate:SEQuence INITiate:NAME

These equivalent commands prepare the list for the execution of the next trigger. These commands are not channel specific, they apply to the entire mainframe. If the trigger system is not in the Idle state, they are ignored. INITiate:SEQuence references the list sequence by a number, while INITiate:NAME references the list sequence by the name LIST.

Sequence Number 1 (the default)	Sequen LIST	ce Name		ription	quence
Command	Syntax		[:IMMediate]:S [:IMMediate]:N		
Para	meters	For INIT	NAME: LIST		
Ex	amples	INIT:S	EQ1 IN	IT:NAME	LIST
Related Corr	mands	ABOR	INIT:CONT	TRIG	*TRG

INITiate:SEQuence2 INITiate:NAME

These equivalent commands prepare the measurement system to take a measurement on the next trigger. These commands are not channel specific, they apply to the entire mainframe. If the trigger system is not in the Idle state, they are ignored. INITiate:SEQuence references the measurement sequence by a number, while INITiate:NAME references the measurement sequence by the name ACQuire.

Sequence Number	Sequence Name	Description
2	ACQuire	Measurement acquire trigger sequence

Command Syntax	INITiate[:IMMediate]:SEQuence2 INITiate[:IMMediate]:NAME ACQuire					
Parameters	For INIT	:NAME: AC	Quire			
Examples	INIT:S	EQ2 II	NIT:NAME	ACQ		
Related Commands	ABOR	INIT:CONT	TRIG	*TRG		

INITiate:CONTinuous:SEQuence INITiate:CONTinuous:NAME

These equivalent commands prepare the list to respond to trigger commands. ON or 1 continuously initiates the list. OFF or 0 turns off continuous initiation. Upon the receipt of a trigger with continuous initiation on, one of the following actions occur:

- If LIST:STEP is set to ONCe, the list will progress to the next step in the sequence.
- If LIST:STEP is AUTO, each trigger will start the list again.

These commands are not channel specific, they apply to the entire mainframe. If the trigger system is not in the Idle state and therefore already initiated, the initiate commands are ignored.

Command Syntax	INITiate:CONTinuous:SEQuence[1] <bool> INITiate:CONTinuous:NAME LIST, <bool></bool></bool>
Parameters	0 1 OFF ON
Examples	INIT:CONT:SEQ1 ON INIT:CONT:NAME LIST, 1
Related Commands	ABOR INIT:CONT TRIG *TRG

TRIGger

When the trigger system has been initiated, this command generates a trigger signal regardless of the selected trigger source. This command is not channel specific, it applies to the entire mainframe.

Command Syntax	TRIGge	r[:IMMediate]		
Parameters	None			
Examples	TRIG			
Related Commands	ABOR	TRIG:SOUR	TRIG:DEL	TRIG:TIM

TRIGger:DELay

Channel Specific

This command sets the time delay between the detection of a trigger signal and the start of any corresponding trigger action. After the time delay has elapsed, the trigger is implemented. This command only applies to the selected channel.

Command Syntax	TRIGger:DELay <nrf+></nrf+>						
Parameters	0 - 0.032	2s MINi	mum MAXimur	n			
Unit	seconds	;					
*RST Value	0						
Examples	TRIG:D	EL .02	5 TRIG:DE	L MAX			
Query Syntax	TRIGge	r:DELay	2				
Returned Parameters	<nr3></nr3>						
Related Commands	ABOR	TRIG	TRIG:SOUR	TRIG:TIM			

4 - Language Dictionary

TRIGger:SEQuence2:COUNt

This command sets up a successive number of triggers for measuring data. With this command, the trigger system needs to be initialized only once at the start of the acquisition period. After each completed measurement, the instrument waits for the next valid trigger condition to start another measurement. This continues until the count has completed.

		:SEQuence2:COUNt <nrf+></nrf+>
Parameters	1 to 100	
*RST Value	1	
Examples	TRIG:SH	EQ2:COUN 5
Query Syntax	TRIGger	:SEQuence2:COUNt?
Returned Parameters	<nr3></nr3>	
Related Commands	TRIG	INIT:SEQ

TRIGger:SOURce

This command selects the trigger source. This command is not channel specific, it applies to the entire mainframe.

BUS			command as the trigger source. This selection re complete before the trigger occurs.	
EXTernal	Selects the electron as soon as it is re		as the trigger source. This trigger is processed	
HOLD	Only the TRIG:IM commands are ig		te a trigger in HOLD mode. All other trigger	
LINE	This generates tri	ggers that are in synchr	onization with the ac line frequency.	
TIMer	This generates triggers that are in synchronization with the electronic load's internal oscillator as the trigger source. The internal oscillator begins running as soon as this command is executed. Use TRIG:TIM to program the oscillator period.			
c	command Syntax	TRIGger:SOURce <cf< th=""><th>RD></th></cf<>	RD>

	TRIGgei <nr3></nr3>	r:TIMer?	TRIG:SOUR	TRIG:DEL		

Common Commands

Common commands begin with an * and consist of three letters (command) IEEE 488.2 standard to perform some common interface functions. The electronic loads respond to the required common commands that control status reporting, synchronization, and internal operations. The electronic loads also respond to optional common commands that control triggers, power-on conditions, and stored operating parameters.

Common commands and queries are listed alphabetically. If a command has a corresponding query that simply returns the data or status specified by the command, then both command and query are included under the explanation for the command. If a query does not have a corresponding command or is functionally different from the command, then the query is listed separately. The description for each common command or query specifies any status registers affected. Refer to chapter 3 under "Programming the Status Registers", which explains how to read specific register bits and use the information that they return.

*CLS

This command clears the following registers (see chapter 3 under "Programming the Status Registers" for descriptions of all registers):

- Standard Event Status
- Operation Status Event
- Questionable Status Event
- Status Byte
- Error Queue

Command Syntax *CLS Parameters None

*ESE

This command programs the Standard Event Status Enable register bits. The programming determines which events of the Standard Event Status Event register (see *ESR?) are allowed to set the ESB (Event Summary Bit) of the Status Byte register. A "1" in the bit position enables the corresponding event. All of the enabled events of the Standard Event Status Event Register are logically ORed to cause the Event Summary Bit (ESB) of the Status Byte Register to be set. See chapter 3 under "Programming the Status Registers" for descriptions of the Standard Event Status registers.

The query reads the Standard Event Status Enable register.

Command Syntax	*ESE <nrf></nrf>	
Parameters	0 to 255	
Power-On Value	see *PSC	
Examples	*ESE 129	
Query Syntax	*ESE?	
Returned Parameters	<nr1></nr1>	
Related Commands	*ESR? *PSC *STB	?

Bit Configuration of Standard Event Status Enable Register

Bit Positio	on	7	6	5	4	3	2	1	0
Bit Name		PON	not used	CME	EXE	DDE	QYE	not used	OPC
Bit Weigh	nt	128		32	16	8	4		1
PON	Power-on	1			DDE	Devic	e-depend	dent error	
CME	Comman	d error			QYE	Query	error		
EXE	Execution	n error			OPC	Opera	ation com	nplete	

*ESR?

This query reads the Standard Event Status Event register. Reading the register clears it. The bit configuration of this register is the same as the Standard Event Status Enable register (see *ESE). See chapter 3 under "Programming the Status Registers" for a detailed explanation of this register.

Query Syntax	*ESR?			
Parameters	None			
Returned Parameters	<nr1></nr1>	· (registe	r value)	
Related Commands	*CLS	*ESE	*ESE?	*OPC

*IDN?

This query requests the electronic load to identify itself. It returns the data in four fields separated by commas.

Query Syntax			
Parameters	None		
Returned Parameters	<aard></aard>	Field	Information
		Agilent Technologies	manufacturer
		xxxxA	model number
		nnnnA-nnnnn	serial number or 0
		<r>.xx.xx</r>	firmware revision
Example	Agilent	Technologies, N3300A	, 0, A.00.01

*OPC

This command causes the interface to set the OPC bit (bit 0) of the Standard Event Status register when the electronic load has completed all pending operations. (See *ESE for the bit configuration of the Standard Event Status registers.) Pending operations are complete when:

- All commands sent before *OPC have been executed. This includes overlapped commands. Most commands are sequential and are completed before the next command is executed. Overlapped commands are executed in parallel with other commands. Commands that affect trigger actions are overlapped with subsequent commands sent to the electronic load. The *OPC command provides notification that all overlapped commands have been completed.
- All triggered actions are completed and the trigger system returns to the Idle state.

*OPC does not prevent processing of subsequent commands but Bit 0 will not be set until all pending operations are completed. The query causes the interface to place an ASCII "1" in the Output Queue when all pending operations are completed.

Command Syntax	*OPC	
Parameters	None	
Query Syntax	*OPC?	
Returned Parameters	<nr1></nr1>	
Related Commands	*TRIG	*WAI

*OPT?

This query requests the electronic load to identify any options that are installed. Options are identified by number. A 0 indicates no options are installed.

Query Syntax *OPT? Returned Parameters <AARD>

*PSC

This command controls the automatic clearing at power-on of the Service Request Enable and the Standard Event Status enable registers as follows (see chapter 3 under "Programming the Status Registers" for register details):

- **1** or **ON** Prevents the register contents from being saved, causing them to be cleared at power-on. This prevents a PON event from clearing SRQ at power-on.
- **0** or **OFF** Saves the contents of the Service Request Enable and the Standard Event Status enable registers in non-volatile memory and recalls them at power-on. This allows a PON event to generate SRQ at power-on.

The query returns the current state of *PSC.

Command Syntax	*PSC <bool></bool>
Parameters	0 1 OFF ON
Example	*PSC 0 *PSC 1
Query Syntax	*PSC?
Returned Parameters	0 1
Related Commands	*ESE *SRE

*RCL

This command restores the electronic load to a state that was previously stored in memory with a *SAV command to the specified location. All states are recalled with the following exceptions:

- CAL:STATe is set to OFF
- The trigger system is set to the Idle state by an implied ABORt command (this cancels any uncompleted trigger actions)

NOTE: The device state stored in location 0 is automatically recalled at power turn-on. Lists are only restored if they have been saved in non-volatile memory locations 0, 7, 8, and 9.

Command Syntax*RCL <NRf>Parameters0 to 9Example*RCL 3Related Commands*PSC*RST*SAV

4 - Language Dictionary

*RDT?

This query reads the model numbers of the modules installed in the mainframe. It returns the data in comma-separated fields.

Query Syntax*RDT?ParametersNoneReturned Parametersmodel numbers separated by commasExampleCHAN1:N3302A; CHAN2:N3302A; CHAN3:N3304A

*RST

This command resets ALL channels of the electronic load to the following factory-defined states:

CAL:STAT CHAN INP INP:SHOR PORT0 PORT1 SENS:CURR:RANG SENS:SWE:POIN SENS:SWE:OFFS SENS:SWE:OFFS SENS:SWE:TINT SENS:VOLT:RANG SENS:WIND [SOUR:]CURR:MODE [SOUR:]CURR:PROT [SOUR:]CURR:PROT:DEL [SOUR:]CURR:PROT:DEL [SOUR:]CURR:PROT:STAT [SOUR:]CURR:PROT:STAT [SOUR:]CURR:SLEW [SOUR:]CURR:SLEW:NEG [SOUR:]CURR:SLEW:POS [SOUR:]CURR:TLEV [SOUR:]CURR:TLEV [SOUR:]CURR:TRIG [SOUR:]FUNC [SOUR:]LIST:COUN [SOUR:]LIST:STEP	OFF 1 ON OFF OFF 0 MAX 1 0 0.00001 MAX RECT MIN FIX MAX 15 s OFF MAX MAX MAX MAX MAX MAX MAX MAX	[SOUR:]RES [SOUR:]RES:MODE [SOUR:]RES:RANG [SOUR:]RES:SLEW [SOUR:]RES:SLEW:NEG [SOUR:]RES:SLEW:POS [SOUR:]RES:TLEV [SOUR:]RES:TLEV [SOUR:]TRAN [SOUR:]TRAN:DCYC [SOUR:]TRAN:FREQ [SOUR:]TRAN:FREC	MAX FIX MAX MAX MAX MAX MAX MAX MAX MAX MAX MA
---	--	--	---

NOTE:

 *RST does not clear any of the status registers or the error queue, and does not affect any interface error conditions.

- ◆ *RST sets the trigger system to the Idle state.
- ◆ *RST clears the presently active list.

Command Syntax	*RST	
Parameters	None	
Related Commands	*PSC	*SAV

*SAV

This command stores the present state of the electronic load to a specified location in memory. Up to 10 states can be stored. States in saved in locations 1-6 are volatile, the data will be lost when power is turned off. States in locations 0, 7, 8, and 9 are nonvolatile, the data will be saved when power is removed. If a particular state is desired at power-on, it should be stored in location 0. It then will be recalled at power-on if the power-on state is set to RCL0. Use *RCL to retrieve instrument states. Any lists associated with a device state are also saved if they are stored in locations 0, 7, 8, or 9.

NOTE: *SAV does not save the programmed trigger values ([SOURce:]CURRent:TRIGGer, [SOURce:]RESistance:TRIGGer, [SOURce:]VOLTage:TRIGGer). Programming an *RCL or a *RST command causes the triggered settings to revert to their [IMMediate] settings.

Command Syntax*SAV <NRf>Parameters0 to 9Example*SAV 3Related Commands*PSC*RST*RCL

*SRE

This command sets the condition of the Service Request Enable Register. This register determines which bits from the Status Byte Register (see *STB for its bit configuration) are allowed to set the Master Status Summary (MSS) bit and the Request for Service (RQS) summary bit. A 1 in any Service Request Enable Register bit position enables the corresponding Status Byte Register bit and all such enabled bits then are logically ORed to cause Bit 6 of the Status Byte Register to be set.

When the controller conducts a serial poll in response to SRQ, the RQS bit is cleared, but the MSS bit is not. When *SRE is cleared (by programming it with 0), the electronic load cannot generate an SRQ to the controller. The query returns the current state of *SRE.

Command Syntax	*SRE <nrf></nrf>
Parameters	0 to 255
Default Value	see *PSC
Example	*SRE 128
Query Syntax	*SRE?
Returned Parameters	<nr1> (register binary value)</nr1>
Related Commands	*ESE *ESR *PSC

*STB?

This query reads the Status Byte register, which contains the status summary bits and the Output Queue MAV bit. Reading the Status Byte register does not clear it. The input summary bits are cleared when the appropriate event registers are read (see chapter 3 under "Programming the Status Registers" for more information). A serial poll also returns the value of the Status Byte register, except that bit 6 returns Request for Service (RQS) instead of Master Status Summary (MSS). A serial poll clears RQS, but not MSS. When MSS is set, it indicates that the electronic load has one or more reasons for requesting service.

Query Syntax*STB?ParametersNoneReturned Parameters<NR1> (register value)Related Commands*SRE*ESR

*TRG

This command generates a trigger to any system that has BUS selected as its source (for example, TRIG:SOUR BUS). The command has the same affect as the Group Execute Trigger (<GET>) command.

Command Syntax*TRGParametersNoneRelated CommandsABORINITTRIG:IMM

*TST?

This query causes the electronic load to do a self-test and report any errors.

Query Syntax	TST?	
Parameters	None	
Returned Parameters	<nr1></nr1>	0 indicates the electronic load has passed selftest.
		Non-zero indicates an error code (see appendix C)

*WAI

This command instructs the electronic load not to process any further commands until all pending operations are completed. Pending operations are complete when:

- All commands sent before *WAI have been executed. This includes overlapped commands. Most commands are sequential and are completed before the next command is executed. Overlapped commands are executed in parallel with other commands. Commands that affect input voltage or state, relays, and trigger actions are overlapped with subsequent commands sent to the electronic load. The *WAI command prevents subsequent commands from being executed before any overlapped commands have been completed.
- All triggered actions are completed and the trigger system returns to the Idle state.

*WAI can be aborted only by sending the electronic load a GPIB DCL (Device Clear) command.

Command Syntax WAI? Parameters None Related Commands *OPC

SCPI Command Tree

Command Syntax

ABORt	Resets the trigger system to the Idle state
CALibrate	
:DATA <n> {,<n>,<n>}</n></n></n>	Enters the calibration data
:IMON:LEVel <points></points>	Set cal points for current monitor offset (P1 P2)
:IPRog:LEVel <points></points>	Set cal points for current monitor & programming (P1 P2 P3 P4)
:LEVel <points></points>	Set cal points for the selected function (P1 P2)
:PASSword <n></n>	Set calibration password
:SAVE	Save new cal constants in non-volatile memory
:STATE <bool> [,<n>]</n></bool>	Enable or disable calibration mode
CHANnel INSTrument	
[:LOAD]	Selects a channel in the mainframe
INITiate	
[:IMMediate]	
:SEQuence[1] :SEQuence2	Initiates a specific numbered sequence
:NAME LIST ACQuire	Initiates a specific named sequence
CONTinuous	
:SEQuence[1] <bool></bool>	Sets continuous initialization
:NAME LIST <bool></bool>	Sets continuous initialization
INPut OUTput	
[:STATe] <bool></bool>	Enables/disables the input
:PROTection	
:CLEar	Reset latched protection
:SHORt	
[:STATe] <bool></bool>	Enables/disables the input short
MEASure FETCh	
:ARRay	
:CURRent[:DC]?	Returns the digitized instantaneous current
:POWer[:DC]?	Returns the digitized instantaneous power
:VOLTage[:DC]?	Returns the digitized instantaneous voltage
[:SCALar]	
:CURRent[:DC]?	Returns the input current
:ACDC?	Returns the total rms current (ac+dc)
:MAX?	Returns maximum current
:MIN?	Returns minimum current
:POWer[:DC]?	Returns the input power measurement
:MAX?	Returns the maximum input power measurement
:MIN?	Returns the minimum input power measurement
:VOLTage[:DC]?	Returns the input voltage
:ACDC?	Returns the total rms voltage (ac+dc)
:MAX?	Returns maximum voltage
:MIN?	Returns minimum voltage
PORT0 [:STATe] <bool></bool>	Enables/disables the general purpose digital port
PORT1 [:LEVel] <n></n>	Programs the general purpose digital port

SENSe	
:CURRent	
:RANGe <n></n>	Selects the current measurement range
:SWEep	
:OFFSet	Defines the data offset in the measurement
:POINts <n></n>	Define the number of data points in the measurement
:TINTerval <n></n>	Sets the digitizer sample spacing
:WINDow [:TYPE] <type></type>	Sets the measurement window function (HANN RECT)
:VOLTage	, , , , , , , , , , , , , , , , , , ,
:RANGe <n></n>	Selects the voltage measurement range

:TLEVel <n></n>	Sets the transient input voltage
STATus	
:CHANnel	
[:EVENt]?	Returns the value of the channel event register
CONDition?	Returns the value of the channel condition register
:ENABle <n></n>	Enables specific bits in the channel event register
:CSUMmary	
[:EVENt]?	Returns the value of the channel summary event register
:ENABle <n></n>	Enables specific bits in the channel summary event register
:OPERation	, , , ,
[:EVENt]?	Returns the value of the operation event register
:CONDition?	Returns the value of the operation condition register
:ENABle <n></n>	Enables specific bits in the operation event register
:NTRansition <n></n>	Sets the negative transition filter
:PTRansition <n></n>	Sets the positive transition filter
:QUEStionable	
[:EVENt]?	Returns the value of the event register
:CONDition?	Returns the value of the condition register
:ENABle <n></n>	Enables specific bits in the Event register
SYSTem	-
:ERRor?	Returns the error number and error string
:VERSion?	Returns the SCPI version number
:LOCal	Go to local mode (for RS-232 operation)
REMote	Go to remote mode (for RS-232 operation)
:RWLock	Go to remote with local lockout (for RS-232 operation)
TRIGger	
[:IMMediate]	Sends a trigger immediately
:DELay	Sets the trigger delay
:SOURce <source/>	Sets the trigger source (BUS EXT HOLD LINE TIM)
:TIMer	Sets the period of the trigger generator.
:SEQuence2	
:COUNt	Specifies the number of triggers that will cause the specified
	measurement after an INIT command.

Error Messages

Error Number List

This appendix gives the error numbers and descriptions that are returned by the electronic load. Error numbers are returned in two ways:

- Error numbers are displayed on the front panel
- Error numbers and messages are read back with the SYSTem:ERRor? query. SYSTem:ERRor? returns the error number into a variable and returns two parameters, an NR1 and a string.

The following table lists the errors that are associated with SCPI syntax errors and interface problems. It also lists the device dependent errors. Information inside the brackets is not part of the standard error message, but is included for clarification. When errors occur, the Standard Event Status register records them in bit 2, 3, 4, or 5:

Table B-1. Error Numbers

Error #	Error String [Description/Explanation/Examples]
	Command Errors –100 through –199 (sets Standard Event Status Register bit #5)
-100	Command error [generic]
-101	Invalid character
-102	Syntax error [unrecognized command or data type]
-103	Invalid separator
-104	Data type error [e.g., "numeric or string expected, got block data"]
-105	GET not allowed
-108	Parameter not allowed [too many parameters]
-109	Missing parameter [too few parameters]
-112	Program mnemonic too long [maximum 12 characters]
–113	Undefined header [operation not allowed for this device]
-121	Invalid character in number [includes "9" in octal data, etc.]
-123	Numeric overflow [exponent too large; exponent magnitude >32 k]
-124	Too many digits [number too long; more than 255 digits received]
–128	Numeric data not allowed
–131	Invalid suffix [unrecognized units, or units not appropriate]
–138	Suffix not allowed
-141	Invalid character data [bad character, or unrecognized]
-144	Character data too long
-148	Character data not allowed
-150	String data error
-151	Invalid string data [e.g., END received before close quote]
-158	String data not allowed
-160	Block data error
-161	Invalid block data [e.g., END received before length satisfied]

-168 Block data not allowed –170 Expression error -171 Invalid expression -178 Expression data not allowed Execution Errors -200 through -299 (sets Standard Event Status Register bit #4) -200 Execution error [generic] -221 Settings conflict [check current device state] -222 Data out of range [e.g., too large for this device] -223 Too much data [out of memory; block, string, or expression too long] -224 Illegal parameter value [device-specific] -225 Out of memory -270 Macro error -272 Macro execution error -273 Illegal macro label -276 Macro recursion error -277 Macro redefinition not allowed System Errors -300 through -399 (sets Standard Event Status Register bit #3) -310 System error [generic] -350 Too many errors [errors beyond 9 lost due to queue overflow] Query Errors -400 through -499 (sets Standard Event Status Register bit #2) -400 Query error [generic] -410 Query INTERRUPTED [query followed by DAB or GET before response complete] -420 Query UNTERMINATED [addressed to talk, incomplete programming message received] -430 Query DEADLOCKED [too many queries in command string] -440 Query UNTERMINATED [after indefinite response] Selftest Errors 0 through 99 (sets Standard Event Status Register bit #3) 0 No error 1 Module Initialization Lost 2 Mainframe Initialization Lost 3 Module Calibration Lost 4 Non-volatile RAM STATE section checksum failed 5 Non-volatile RAM RST section checksum failed 10 RAM selftest 11 CVDAC selftest 1 12 CVDAC selftest 2 13 CCDAC selftest 1 14 CCDAC selftest 2 15 **CRDAC selftest 1** 16 CRDAC selftest 2 20 Input Down 40 Flash write failed 41 Flash erase failed 80 Digital I/O selftest error Device-Dependent Errors 100 through 32767 (sets Standard Event Status Register bit #3)

- 213 RS-232 buffer overrun error
- 216 RS-232 receiver framing error
- 217 RS-232 receiver parity error
- 218 RS-232 receiver overrun error
- 220 Front panel uart overrun
- 221 Front panel uart framing
- 222 Front panel uart parity
- 223 Front panel buffer overrun
- 224 Front panel timeout
- 401 CAL switch prevents calibration
- 402 CAL password is incorrect
- 403 CAL not enabled
- 404 Computed readback cal constants are incorrect
- 405 Computed programming cal constants are incorrect
- 406 Incorrect sequence of calibration commands
- 407 CV or CC status is incorrect for this command
- 408 Output mode switch must be in NORMAL position
- 600 Lists inconsistent [lists have different list lengths]
- 601 Too many sweep points
- 602 Command only applies to RS-232 interface
- 603 FETCH of data that was not acquired
- 604 Measurement overrange
- 605 Command not allowed while list initiated
- 610 Corrupt update data
- 611 Not Updating

Comparing N3300A Series Electronic Loads with Earlier Models

Introduction

The Agilent N3300A Series Electronic Loads covered by this manual are compatible in many ways with the previous HP/Agilent 6050B, 6051B, 60501B, 60502B, 60503B, 60504B, 60507B Electronic Loads. This means that in most cases, programs written for earlier electronic loads will run on the N3300A Series Electronic Loads. However, be aware that there are also many differences between the previous version and the N3300A Series loads that will require you to modify previous electronic load programs.

If you are using Agilent N3300A Series Electronic Loads in test systems or with software designed for 6050B, 6051B, 60501B, 60502B, 60503B, 60504B, 60507B Electronic Loads, you may experience some of the differences documented in Table C-1. If so, refer to the possible reason for the difference in Table C-2 for suggestions on what to do about the difference.

It is not the intent of Table C-2 to provide an exhaustive list of all the differences between previous version electronic loadss and the N3300A Series loads or all possible solutions to problems with previously written software. This table only highlights the areas that affect the behavior of the instrument in normal use.

NOTE: For additional information, please contact your Agilent Sales and Support Office listed at the back of the User's Guide.

Difference Noticed	Possible Reason (see table C-2)	
Values read back on the display and over the bus are slightly different than on previous electronic load units.	#1, #2, #3, #4	
Values read back on the display and over the bus are significantly different than on previous electronic load units.	#1, #4, #7, #9	
Values on front panel display fluctuate more than on previous electronic load units.	#2, #3, #4	
Unit unexpectedly turns off; Prot annunciator is on.	#11, #19	
Response to analog programming input is different than on previous electronic load units.	#15, #16	
Err annunciator comes on when program is run.	#8, #9, #10, #13	
Unit under test occasionally behaves unexpectedly.	#1, #7	

Table C-1. Examples of Operating Differences

	0-240 volts	0-24, 0-240 volts	
	The addition of voltage programmin	g and readback ranges provides 16-bit	
	accuracy with the N3300A Series loads. Existing programs may need to be		
	modified to take advantage of the in	nproved accuracy provided with the	
	additional ranges.		
3. Current Readback	1 range (model dependent):	2 ranges (model dependent):	
Range	0-10 amps or	0-1, 0-10 amps or	
	0-30 amps or	0-3, 0-30 amps or	
	0-60 amps or	0-6, 0-60 amps or	
	0-120 amps0-12, 0-120 ampsThe addition of current readback ranges provides greater accuracy with the		
	N3300A Series loads. Existing programs may need to be modified to take advantage of the improved accuracy provided with the additional ranges.		
4. Measurement Mode	Single measurement occurs at Multiple measurements at command		
4. Measurement Mode	command execution.	execution. Average value is returned.	
		Number of samples and time interval	
		between samples is programmable.	
	This feature provides greater accuracy and noise immunity when making		
	measurements. The time required to make measurements with the N3300A		
	Series loads may vary considerably, depending on the type of measurement		
	specified. The default measurement settings on the N3300A Series loads are		
	faster than measurements on previo	ous electronic loads.	
5. Programming	Voltage (60V) = 0.1% +50mV	Voltage (60V) = 0.1% +8mV	
Accuracy	Current (60A) = 0.1% +75mA	Current (60A) = 0.1% +15mA	
(300W model shown)	Resistance $(1\Omega) = 0.8\% + 8m\Omega$	Resistance (2 Ω) = 0.4% +12m Ω	
	Resistance $(100\Omega) = 0.3\% + 8mS$	Resistance $(20\Omega) = 3\% + 40m\Omega$	
	Resistance $(10k\Omega) = 0.03\% + 8mS$	Resistance (200 Ω) = 20% +120m Ω	
		Resistance $(2k\Omega) = -50\% + 2000\%$	
	This feature provides greater accuracy with the N3300A Series loads.		
	Existing programs may need to be modified to take advantage of the		
	improved programming accuracy provided with the additional ranges.		
6. Programming	Voltage $(60V) = 16mV$	Voltage $(60V) = 1mV$	
Resolution	Current $(60A) = 16mA$	Current $(60A) = 1mA$	
(300W model shown)	Resistance $(1\Omega) = 0.27m\Omega$	Resistance $(2\Omega) = 0.035m\Omega$	
	Resistance $(100\Omega) = 0.27$ mS	Resistance $(20\Omega) = 0.35m\Omega$	
	Resistance $(10k\Omega) = 0.027mS$	Resistance $(200\Omega) = 3.5m\Omega$	
	This facture provides prestores	Resistance $(2k\Omega) = 35m\Omega$	
	This feature provides greater accura		
	Existing programs may need to be r	noumed to take advantage of the	
improved programming resolution.			

Table C-2. Reasons for Differences

	Table C-2.	Differences	(continued)	
--	------------	-------------	-------------	--

14	Table C-2. Differences (continued)			
ltem	HP/Agilent Series 6050x	Agilent Series N3300A		
7. Mode/Range	Firmware turns the input off	Firmware does not turn the input off		
Change Performance	between mode and range changes.	between mode and range changes.		
	The input is no longer programmed o			
		ed current or voltage dropouts may still		
	occur. In general, these dropouts may			
	was the case with previous electronic			
8. Calibration	Calibration procedure for previous	Refer to the calibration procedure in		
	loads is documented in the	the N3300A Series User's Guide.		
	Operating manual.			
	Existing programs must be modified to correctly calibrate the N3300A Series loads.			
9. Resistance Ranges	3 ranges: 0-1Ω, 1-1kΩ, 10-10kΩ	4 ranges: 0-2Ω, 1.8-20Ω, 18-200Ω,		
(300W model shown)	5 Taliges. 0-152, 1-1852, 10-10852	4 ranges: 0-232, 1.8-2032, 18-2032, 18-2032, 18-2032, 180-2kΩ, $(1.8-2)^{-1}$		
	Popietaneo transiento mov net work ir	n some cases. For example if you are		
		ous electronic loads), the command will		
	not work with the resistance ranges in the N3300A Series loads. You can only transition within a specific resistance range (180Ω to $2k\Omega$ for example).			
10. Resistance Slew		Slew rates are programmed in ohms/		
Rate	1Ω range slew rate uses the value programmed for the voltage slew.	second. Each resistance range has its		
Rale		own slew rate. Refer to Appendix A in		
	1kΩ and 10kΩ range slew rate uses the values programmed for the	the N3300A Series User's Guide.		
	the values programmed for the current slew.			
	The addition of resistance slew rates provides greater capability when			
	programming input resistance. Existing programs must be modified to			
	correctly program resistance slew rates.			
11. UNR Status	Applied in constant current mode	Applies in all operating modes and		
Reporting	and in $1k\Omega$ and the $10k\Omega$ resistance	ranges.		
	mode.			
	This feature provides more comprehensive status reporting. Programs that			
	use the UNR status reporting to generate service requests may need to be			
	modified to account for the additional operating modes and ranges that may			
	cause an unregulated status condition to be reported.			
12. *SAV 0 Storage	Module settings are saved in	All module settings are saved in the		
Location	individual modules.	mainframe.		
	This feature saves all power up settings in the mainframe, not the module.			
	This will cause the modules to behave according to the settings stored in			
	each mainframe when swapped. Previous load modules cannot be installed			
	in N3300A Series mainframes. N3300A Series modules cannot be installed			
	in previous mainframes.			
13. Error Messages	Error messages for previous loads	Refer to the error message table in		
	are documented in the Operating	the N3300A Series User's Guide.		
	manual.			
	This feature adds more error messages. Existing programs need to be			
	modified to trap the additional error m			
14. Query Response	*IDN? and *RDT? = Hewlett-	*IDN? and *RDT? = Agilent		
	Packard and earlier model	Technologies and N3300A Series		
	numbers.	model numbers; query number		
	This shapped the company nerve are	formats may also be different.		
	This changes the company name and model numbers. Existing programs			
may need to be modified if the *IDN? and *RDT? queries are used.				

ltem	HP/Agilent Series 6050x Agilent Series N3300A		
15. CC and CV Analog	Current (60A) = 4.5% +75mA	Refer to Appendix A in the N3300A	
Programming	Voltage $(60V) = 0.8\% + 200mV$	Series User's Guide.	
Accuracy		amming accuracy in both constant current	
(300W model shown)		ing programs may need to be modified to	
	take advantage of the improved ana		
16. CR Analog	Not available	A 0-to-10V signal at the analog	
Programming	programming input corresponds to the		
5 5	minimum to full scale input resistance		
	of the selected resistance range.		
	This feature adds analog programming in constant resistance mode. Existing programs will need to be modified to use the analog programming available		
	in constant resistance mode.		
17. List Programming	Not available	Lists containing up to 100 steps can be	
		programmed and downloaded to each	
	electronic load module. They can be		
	run simultaneously in response to an		
	external trigger. This feature adds list programming to the current, voltage, resistance,		
	transient, and port functions. Existing programs will need to be modified to		
	use lists. Refer to the N3300A Series User's Guide for details.		
18. Front Panel	Deleted keys Added keys		
	Range Short on/off	Ident Sense	
	Tran Level Tran on/off	Channel Protect	
	Slew Freq	▲ ▼ Step ▲ ▼	
	Dcycl Mode	List Trigger	
		Func Trigger Control	
		d menus to the front panel. This results	
	in significant differences in front pan		
	N3300A Series loads. Refer to the N3300A Series User's Guide for more information.		
19. Reverse Voltage	Available on input terminals	Available on input and sense terminals	
Protection		dds reverse voltage protection on the sense terminals. Load	
Frotection	modules will shut down with reverse voltage on remote sense terminals.		
20. Mainframe RS-232	Not available	An RS-232 connector is available on	
Connector		the 2-pin user-programmable digital	
		output port is available on the back of	
		the mainframe.	
	Existing programs must be modified to use the digital port on the mainframe.		
21. Mainframe Digital	Not available	A 2-pin user-programmable digital	
Port		output port is available on the back of	
		the mainframe.	
	Existing programs must be modified to use the digital port on the mainframe.		
22. Module	3 ribbon cables including ac line	1 ribbon cable with no ac line	
Interconnections	distribution. distribution.		
	Previous load modules cannot be installed in N3300A Series mainframes. N3300A Series modules cannot be installed in previous mainframes.

Manual Updates

The following updates have been made to this manual since its publication.

3/01/02

Model N3307A has been added.

Additions have been made to Table 4-1 in chapter 4
