

ROHDE & SCHWARZ

SPN

GENERATOR SPN

CHARACTERISTICS

- Compact, attractively priced generator with wide frequency range from 1 Hz to 1.3 MHz
- High frequency stability
- Extremely low distortion
- Wide output-voltage range
- High spectral purity
- Flat frequency response
- Sinewave and squarewave outputs
- Switch-selected output impedance
- Input for external sweep voltage (lin/log)
- Output voltage proportional to frequency
- Standardized octave and third-octave sequences selectable
- Easy to operate through microprocessor
- Options: IEC bus and balun

Characteristics

The **Generator SPN** is a programmable synthesizer whose sinewave output signal features a wide level range and low distortion. It is suitable both for use in computer-controlled test assemblies (photo below) and for manual operation. Due to its attractive price and remote-control capability via the IEC bus, the SPN finds a wide field of use in production, service, research and development. Since the SPN combines latest technology and modern circuit design, it is able to comply with the most exacting requirements in measurements, e.g. in acoustics and hifi technology. There is also a large number of other fields in which accurate frequencies are required, for instance in telemetry and physics or in mechanical control processes. In addition, the outputs of two SPN generators can be connected in parallel for measuring non-linear distortions.

Frequency. Modern synthesizer technology ensures highly accurate, crystal-referenced output frequencies from 1 Hz to 1.3 MHz with a frequency setting time of only 15 ms. The short setting time is important in computer-controlled test systems with a high measuring rate or for the generation of tone sequences such as those required for measurements on selective calling equipment. The frequency entered via the keyboard is read out on the display in five digits (smallest resolution: 0.1 Hz) with a floating decimal point. The frequency can be varied quasi-continuously using a rotary knob. The SPN offers another

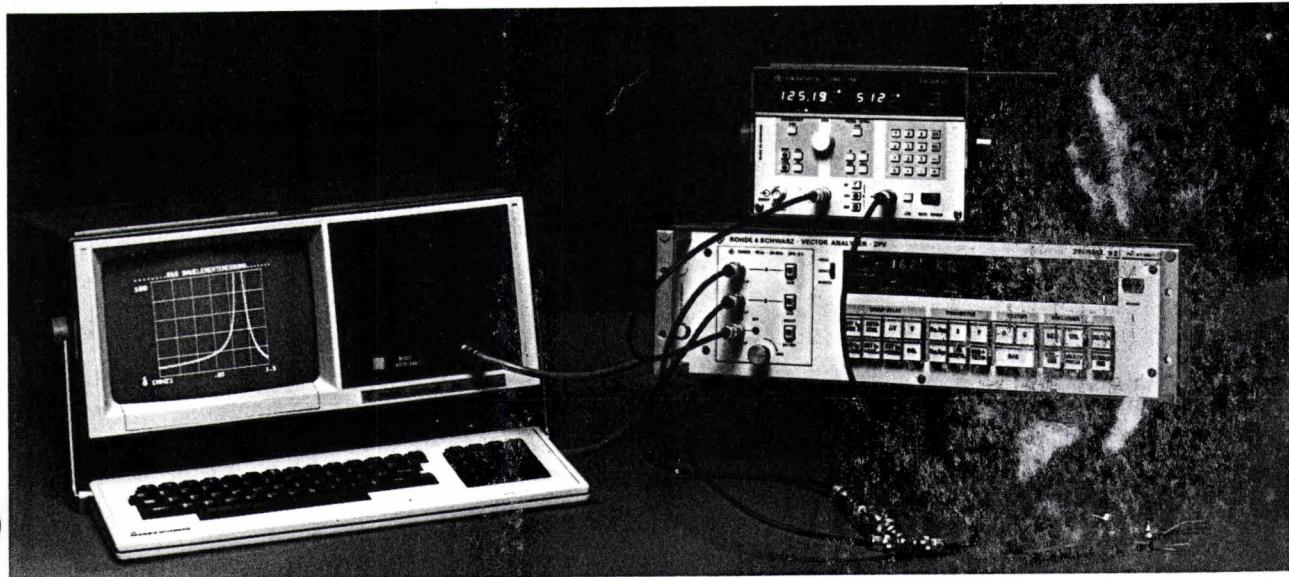

convenient way of frequency variation by frequency jumps with selectable step size and by calling up the standard octave and third-octave sequences. Logarithmic frequency variation is possible by entering a multiplication or division factor between 1.00 and 2.00.

Output level (sinewave output). Adjustable between 0.1 mV and 10 V with smallest resolution of 0.01 mV (depending on output impedance selected). The output level is read out in three digits with a floating decimal point on the level display (in mV, dBV or dBm). The output level entered can also be varied quasi-continuously or in steps and it can be converted from one unit into another simply at the push of a button. The maximum output EMF is 10 V_{rms}.

Distortion is as low as 0.03% in the frequency range from 50 Hz to 100 kHz, so that the SPN fulfills the most demanding requirements of the audio-frequency range.

Output impedance. The output impedance of the sine-wave output can be selected between 600, 50 and approximately 5 Ω at the push of a button and thus be matched to the standard system impedances. The output impedance is linear and real, allowing the sinewave outputs of two SPN generators to be connected in parallel. The output level can be switched off at another push of the impedance button.

Squarewave output. In addition to the sinewave output, an output with a squarewave signal of the same frequency is available for driving digital circuits as well as for other measuring tasks; output level: TTL, positive.

Automatic test assembly with Generator SPN, Vector Analyzer ZPV and Process Controller PUC

External sweeping. The generator frequency can be swept in a linear or logarithmic mode over the entire frequency range or certain subranges – required sweep voltage 0 to 1.3 V. The logarithmic conversion is done internally. The sweep range is from 1 Hz up to the upper range limit which can be selected and is indicated on the display.

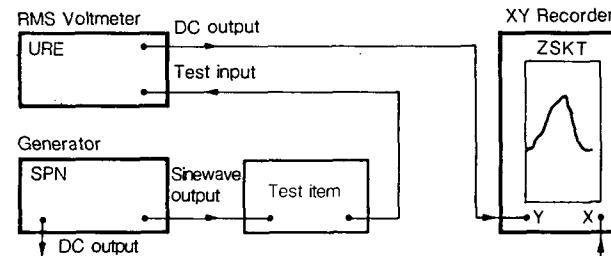

Range 1	1 Hz to 1.3000 kHz
2	1 Hz to 13.000 kHz
3	1 Hz to 130.00 kHz
4	1 Hz to 1300.0 kHz

Setting example: sweep range from 1 Hz to 130 kHz

Frequency-proportional output voltage. In the manual and remote control mode the SPN provides at the SWEEP socket a DC output voltage proportional to the frequency (0 to 1.3 V), the value of 1.3 V corresponding to the selected upper frequency limit (as in sweep mode). This output voltage can be used for plotting the measured curves, e.g. frequency responses, on XY recorders.

With logarithmic frequency variation the DC output voltage also varies logarithmically.

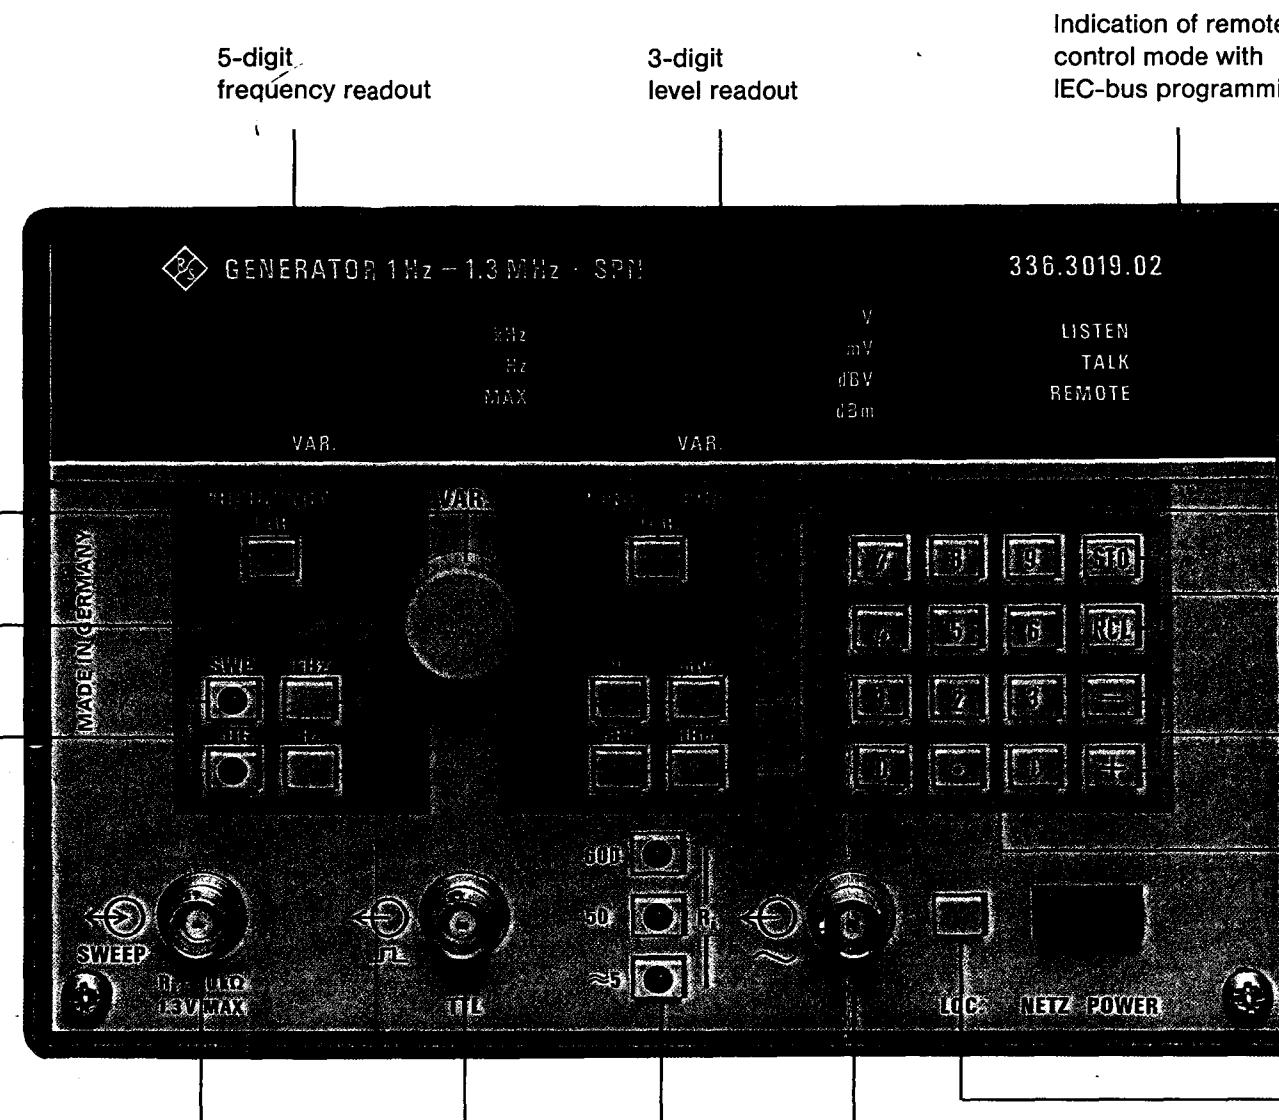

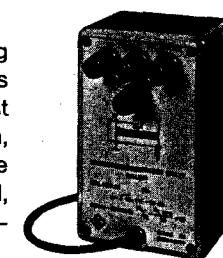

Test setup for frequency response recording using the generator's frequency-proportional DC voltage at the X input of the recorder

Options

For special applications the performance of the SPN Generator can be extended simply and at low cost.

Remote control. All settings of the Generator SPN can be made remotely using the IEC Bus option SPN-B4 which can easily be retrofitted. The short programming time makes the SPN suitable for use in automatic measuring assemblies and test systems.

Balun SPN-Z1. Used for feeding balanced line systems or amplifiers and for eliminating hum pickup in test setups; stepdown transformation, therefore low internal impedance (approx. 15Ω); mumetal-shielded, therefore immune to external interference fields.

OPERATION, PROGRAMMING

Operation

High operating convenience. Thanks to the microprocessor control the SPN is easy to operate. Data entry is made via keys, the numerical value being entered first, then the unit. Quasi-analog settings are possible using the rotary knob.

Frequency setting

1.1303 kHz	
5 Hz	
Step-up by 1 kHz	
Step-down by 100 Hz	
Variation with 100 Hz step size	
Logarithmic variation (10%)	

Level setting

9.85 V	
122 mV	
18.2 dBV	
6 dBm	
Variation with 10 mV step size	

Output impedance

50 Ω	
------	--

Storage facility. The SPN can store five complete instrument settings (memory addresses: 1 to 5). RCL recalls either complete settings or individual frequency or level settings.

Storage: complete setting	
Recall: complete setting	
level value only	
frequency value only	

Special functions. The frequency steps commonly used in acoustics (DIN 45401, ISO 266) are possible by calling up special functions:

	for 1st octave sequence (16/31.5/63/125/...Hz)
	for 2nd octave sequence 22.4/45/90/180/...Hz)
	for 1st third-octave sequence (16/20/25/31.5/...Hz)
	for 2nd third-octave sequence (18/22.4/28/35.5/...Hz)

The VAR knob allows the selected sequence to be stepped up or down.

Programming

Programming examples for the Process Controller PUC from Rohde & Schwarz for setting the level, output impedance and frequency on the Generator SPN (address 11).

Setting of

2. Operating Instructions

The values mentioned in this section are not guaranteed; only the specifications in the Data Sheet or Technical Information are binding.

For the designation and number of the panel controls refer to Figs. 2-7 and 2-8.

2.1 Legend for Figs. 2-7 and 2-8

No.	Marking	Function
1		5-digit readout indicating the frequency setting.
2	kHz Hz MAX	3 LEDs indicating the unity and the maximum sweep range.
3		3-digit readout indicating the output level
4	V mV dBV dBm	4 LEDs indicating the unit of the output level
5	LISTEN TALK REMOTE	3 LEDs indicating the remote-controlled mode in the case of IEC-bus programming.
6	7 8 9 STO 4 5 6 RCL 1 2 3 - 0 . C +	Keyboard for data entry: frequency with keys <u>13</u> ; level with keys <u>10</u> . C clears the entry or a blinking readout; STO stores, RCL recalls 5 complete instrument settings or 5 frequency and 5 level settings as well as 5 special functions.
7	POWER (OFF)	Power switch.
8	LOC.	Key for switching over from the IEC-bus to the manual mode.
9		Sinewave output; BNC female connector.

No.	Marking	Function
10	V mV dBV dBm	4 keys for level entry. They define the desired unity of the preceding level-value entry (keyboard <u>6</u>)
11	600 Ω 50 Ω ≈ 5 Ω Ri	3 keys for entering the output impedance. LED incorporated in the key lights up to indicate the impedance selected.
12	 TTL	Squarewave output; BNC female connector.
13	kHz Hz	2 keys for entering the frequency unit after having entered the frequency value on keyboard <u>6</u> .
14	 SWEEP $R_i = 10 \text{ k}\Omega$ 1.3 V MAX.	Input and output for the sweep voltage; BNC female connector.
15	LOG.	Key for selecting the logarithmic sweep. Indicated by built-in LED.
16	SWP	Key for switching the sweep on and off. With the sweep on, the built-in LED lights up.
17	VAR.	Knob for quasi-continuous variation of frequency or level after entry with key <u>18</u> ; variation either in steps or logarithmic after entry on keyboard <u>6</u> .
18	VAR	2 keys for entering the frequency or level variation. The associated VAR indicator below readout <u>1</u> or <u>3</u> lights up.

No.	Marking	Function
19	ADDRESS	6-pole switch for setting the IEC-bus address.
20	IEC 625 BUS	IEC-bus connector.
21		Opening provided for bringing the sinewave output out on the rear panel.
22	 47-63 Hz	AC supply connector
23	100 V/120 V M1C 220 V/240 V MO.5C	Fuse holder and AC supply voltage selector.
24	1 MHz REF. TTL 0.2 to 2 V $R_i > 500 \Omega$	Socket for the output of the internal crystal reference frequency. The connection can be changed for the input of an external reference frequency.

2.2 Preparation for Use

The Generator SPN is designed for operation from 100-V, 120-V, 220-V and 240-V AC supplies. The instrument is factory-set for operation from 220 V. To change over to a different supply voltage, withdraw the cover of the voltage selector 23 (Fig. 2-8) and reinsert it with the fuse holder such that the desired voltage is below the triangular marking. The instrument is then ready to be operated from the new AC supply voltage. Use a MO.5C (0.5 A) fuse for 220 V and 240 V and a M1.0C (1.0 A) fuse for 100 V and 120 V.

The Generator SPN has half the width of a 19" case. It is also suitable for use in 19" racks. For this purpose a rack adapter is available (see under "recommended extras"). For rack incorporation, remove the lateral screws, withdraw the two hoods, the lateral bars and the carrying handle. The threaded openings for fixing the rack adapter are provided on the instrument. The opening for changing over the output from the front panel to the rear panel is provided on the rear panel.

Make sure that ventilation is not obstructed.

2.3 Manual Mode

Various keys and a knob are provided for manual operation of the Generator. The entry keys and the digital readouts are conveniently arranged in three groups. The lefthand section contains the frequency readout, the frequency variation key and the sweep setting keys. This section also comprises the sweep input and output BNC connectors. The section in the centre includes the level readout, the keys for entering the level and the output impedance, the level variation key and the squarewave output. The righthand section includes the keyboard for entering data for all parameters, the LISTEN, TALK and REMOTE indicators, the power switch, the go-to-local key and the sine-wave output. Setting with the aid of the keys is performed in the following order: numerical value, unit or function. Quasi-continuous adjustment is possible by means of the rotary knob. Unpermissible settings will not be accepted. The readout in which the value should have appeared blinks until the entry has been cleared by pressing the C key or a new valid entry has been made. A blinking readout then always signals that the desired setting cannot be accepted.

2.3.1 ON Status

After the instrument has been switched on with the power switch 7, the SPN performs a display test and displays the IEC-bus address selected. After a warmup of about 15 s indicated by a count down in the display, the instrument is ready for operation. When the count down readout is extinguished, the frequency of 10.000 kHz is set. The output voltage is fixed at 1 mV in order to protect sensitive test items.

2.3.2 Setting the Frequency

The frequency range of the SPN is 1 Hz to 1.3 MHz. The frequency is set by entering the desired value on keyboard 6 (Fig. 2-7) and pressing one of keys 13 for the unit (kHz or Hz). Zeros at the end of the value to be entered after the decimal point need not be filled up. Entries after the decimal point which exceed the acceptable number of digits are ignored. The frequency is displayed in readout 1 in kHz or Hz with the decimal point.

Examples:

Keyboard 6

1	.	0	3
---	---	---	---

Keys 13

kHz

--

Readout 1

1.	0	3	0	0
----	---	---	---	---

kHz

VAR.

Hz

--

2	4.	6
---	----	---

Hz

VAR.

If the value entered exceeds the limits of the frequency range, the readout starts to blink.

The blinking can be eliminated by pressing key C (keyboard 6) - the old setting being retained - or by performing a new, valid entry.

2.3.2.1 Frequency Variation

A frequency entered via the keyboard 6 (Fig. 2-7) can be varied either with knob 17 in four different ways (a to d) or with the + and -keys 6 in freely selectable steps.

a) Single-step variation

After switching the set on or pressing key 18, use knob 17 to increment the last frequency digit displayed.

Example:

Readout 1

1.	0	2	0	5
----	---	---	---	---

Key 18

kHz

VAR.

Knob 17

VAR.

Readout 1

1.	0	2	0	6
----	---	---	---	---

kHz

VAR.

kHz

1.	0	2	0	5
----	---	---	---	---

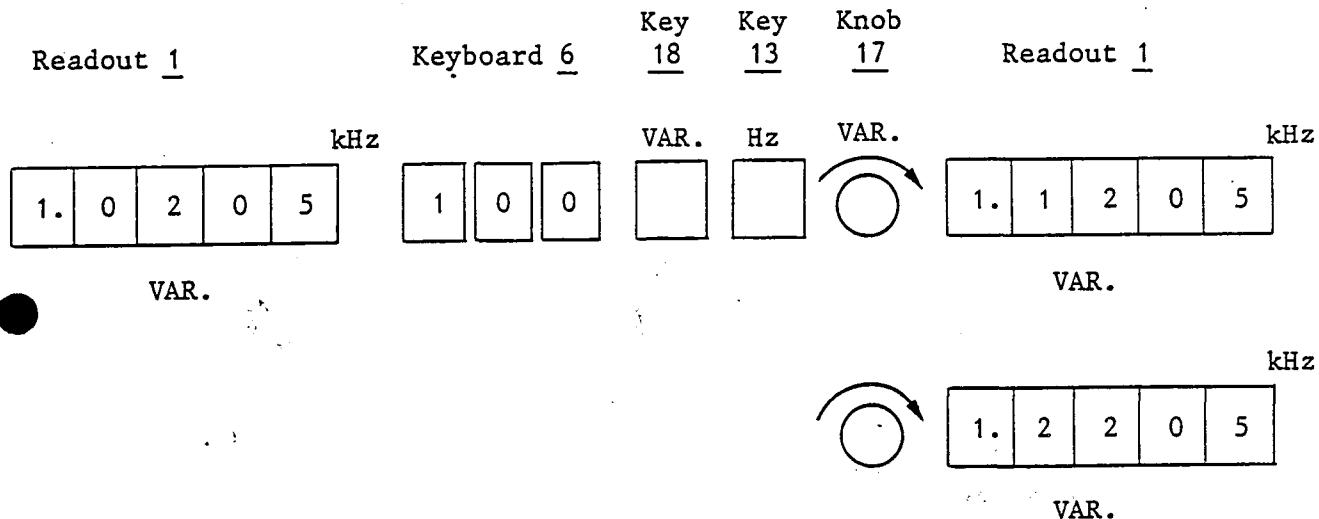

VAR.

b) Variation in random steps

The frequency set can be varied in random steps with knob 17.

For this purpose, first enter the numerical value on keyboard 6, and then the variation step with key 18 and the unit with key 13.

Example: 100-Hz variation

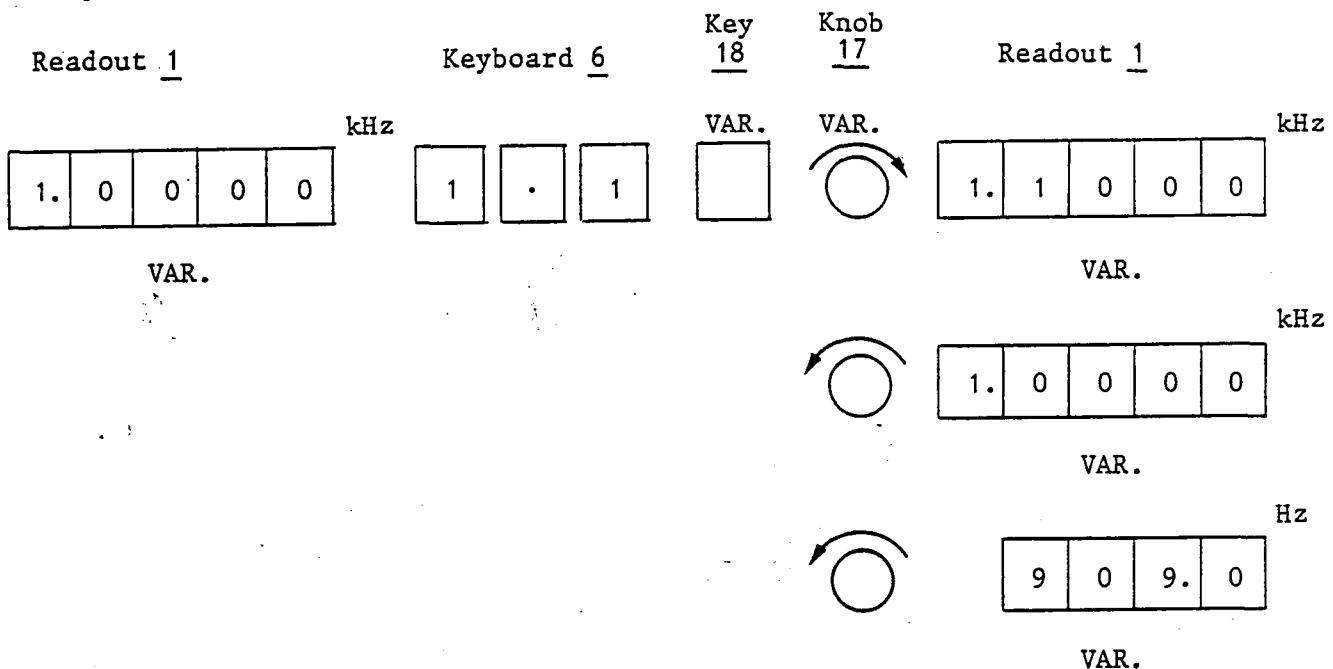

If the frequency variation entered cannot be executed because of the insufficient frequency resolution, LED 18 is blinking and the frequency value is no longer increased. This may also happen if, with a continuous variation, the frequency range is automatically changed and thus also the resolution of the readout.

c) Logarithmic variation

The frequency can also be varied logarithmically by entering a multiplication or division factor of the variation, this factor lying between 1.00 and 2.00. The displayed frequency is then increased or decreased with each step by the factor entered depending on the sense of rotation of the variation knob.

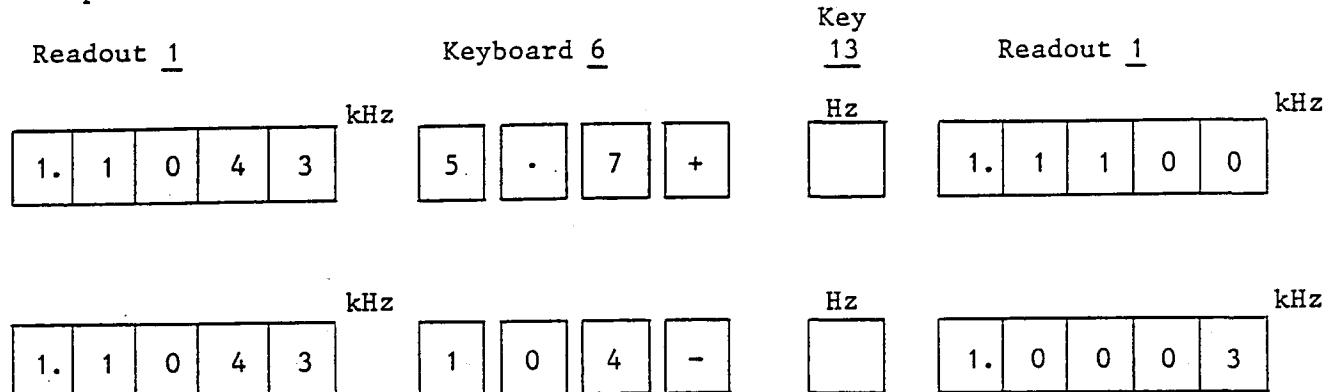

Example: Factor 1.1

d) For setting and varying the standardized octave and one-third-octave sequences see Section 2.3.6.1.

A frequency step can be added to or subtracted from the frequency set. For this purpose, first enter the numerical value, then the sign and finally the unit.

Example:

2.3.3 Setting the Output Level

2.3.3.1 Level Entry

The output level is set by entering the desired numerical value via keyboard 6 (Fig. 2-7). Next, press one of keys 10 (V, mV, dBV or dBm) which then defines that the entered value is a level value designating the unit selected. In the case of negative dBV or dBm values, the negative sign has to be entered prior to the numerical value. Zeros at the end of the numerical value need not be filled up after the decimal point.

The entered unit lights up in the readout.

Permissible ranges for level entries:

-60 dBV to 20 dBV or 1 mV to 10 V for $R_i = 600$ and 50Ω

-80 dBV to 0 dBV or 0.1 mV to 1 V for $R_i = 5 \Omega$

The microprocessor selects the unit suitable for the readout (example: 1000 mV yield the display 1.00 V).

If keys 10 are pressed, the displayed level can be converted into mV, V, dBV or dBm without requiring any previous entry of a numerical value.

Example:

Keyboard <u>6</u>	Key <u>10</u>	Readout <u>3</u>					
<table border="1"><tr><td>1</td><td>0</td></tr></table>	1	0	V	<table border="1"><tr><td>1</td><td>0.</td><td>0</td></tr></table>	1	0.	0
1	0						
1	0.	0					
		V					
	dBV	<table border="1"><tr><td>2</td><td>0.</td><td>0</td></tr></table>	2	0.	0		
2	0.	0					
		dBV					
Key <u>11</u>	Keyboard <u>6</u>	Key <u>10</u>					
50Ω	<table border="1"><tr><td>o</td></tr></table>	o	<table border="1"><tr><td></td></tr></table>				
o							
	<table border="1"><tr><td>1</td><td>6</td></tr></table>	1	6	<table border="1"><tr><td>1</td><td>6.</td><td>0</td></tr></table>	1	6.	0
1	6						
1	6.	0					
		dBM					
$= 5 \Omega$	<table border="1"><tr><td>o</td></tr></table>	o	<table border="1"><tr><td>1</td><td>6.</td><td>0</td></tr></table>	1	6.	0	
o							
1	6.	0					
		dBM					

If the output impedance is switched over, the EMF - if level is shown in dBm - is changed automatically so that the indicated level supplied at Bu 9 is made available at the correct impedance matching.

If the unit is mV, V or dBV, readout 3 displays the open-circuit voltage. In the dBm indication mode, the power referred to 1 mW into a load corresponding to the output impedance of the SPN is displayed. With a finite load, the voltage across the load can be calculated. It depends on the output impedance selected.

Thus

$$V_{load} = V_C \frac{Z_{load}}{Z_{out} + Z_{load}}$$

where V_C = the open-circuit voltage
and V_{load} = the voltage across Z_{load} .

On the other hand, the open-circuit voltage required for a given voltage V_{load}

$$V_C = V_{load} \frac{Z_{out} + Z_{load}}{Z_{load}}$$

If the load impedance is equal to the output impedance, the systems are matched and the voltage occurring across the load is half the value of the open-circuit voltage or the output level is 6 dB less than the open-circuit level.

In addition to levels indicated in terms of dBV, values in dB referred to 0.775 V and dB μ V are commonly used. Open-circuit voltage read on the SPN can easily be converted to these levels.

Value in corresponds to	Value in		
	dB μ V	dB referred to 0.775 V	dBV
dB μ V		+117.8	+120
dB referred to 0.775 V	-117.8		+2.2
dBV	-120	-2.2	

2.3.3.1.1 Switching the Level Off

Press the illuminated key 11 (output impedance); the level is switched off without affecting the settings and readouts of frequency or level.

This status is indicated by the fact that all the LEDs in keys 11 are off. When the level is switched off, the output impedance is = 5Ω .

Press one of keys 11 again to switch the level and the output impedance on.

2.3.3.2 Varying the Output Level

Press the righthand key 18, a quasi-continuous level variation is possible with the aid of knob 17 (Fig. 2-7). This variation is logarithmic for dBV and dBm or linear for V and mV (indicated by LEDs 4).

After pressing the LEVEL VAR key 18, use knob 17 to step the last digit of the displayed level up or down.

Example:

----	---	---

VAR.

The level set can also be varied in random steps with the aid of the rotary knob. For this purpose, first enter the numerical value on keyboard 6, next the variation with key 18 and the unit with one of keys 10.

Example: 100-mV variation

A level step can be added to or subtracted from the level set. This step can be entered in mV, V or dB. The result is displayed in terms of the unit of the previously set level. To perform this step, first enter the numerical value on keyboard 6 (Fig. 2-7), then the sign and finally the unit. To enter a step in dB, one of the dBV or dBm keys must be pressed.

Exemple: 1.5-dBm step down in level

The level limits cannot be exceeded by turning the variation knob. If the knob is turned further, the minimum or maximum value remains unchanged.

2.3.3.3 Setting an Extremely Small Voltage

If extremely small voltages are to be applied to a load, the connection of the SPN to the load should be made with the utmost care. An improper connection between generator and load or insufficient earthing of these units may cause an unwanted voltage at the input of the load; this voltage may be higher than the wanted signal itself. Fig. 2-1 shows the generation of an unwanted voltage.

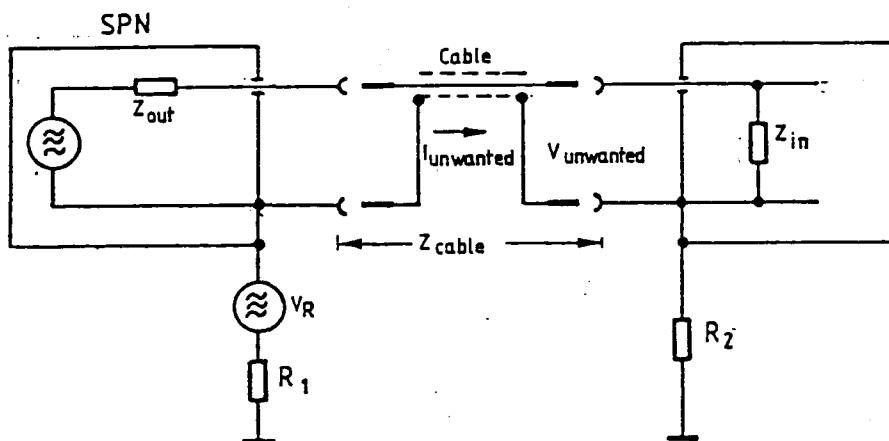

Fig. 2-1 Unwanted voltage produced by ground loops

This voltage becomes effective at the load input whenever an unwanted current $I_{unwanted}$ flows through the outer conductor of the coaxial connecting cable and thus a voltage drop of $V_{unwanted} = I_{unwanted} \cdot Z_{cable}$ occurs across Z_{cable} of this outer conductor. The source (V_{source}) of this current may be in one of the two lines used for grounding the units. In this way a circuit is constituted via R_1 , Z_{cable} , R_2 . The unwanted voltage produced across the load

$$V_{unwanted} = I_{unwanted} Z_{cable} = V_{source} \frac{Z_{cable}}{R_1 + R_2 + Z_{cable}}$$

becomes the smaller, the smaller the cable impedance and the greater the two ground impedances are.

The source of this unwanted signal is frequently the voltage drop shown in Fig. 2-2 occurring between the earthed-wire contacts A and B of the two power cables.

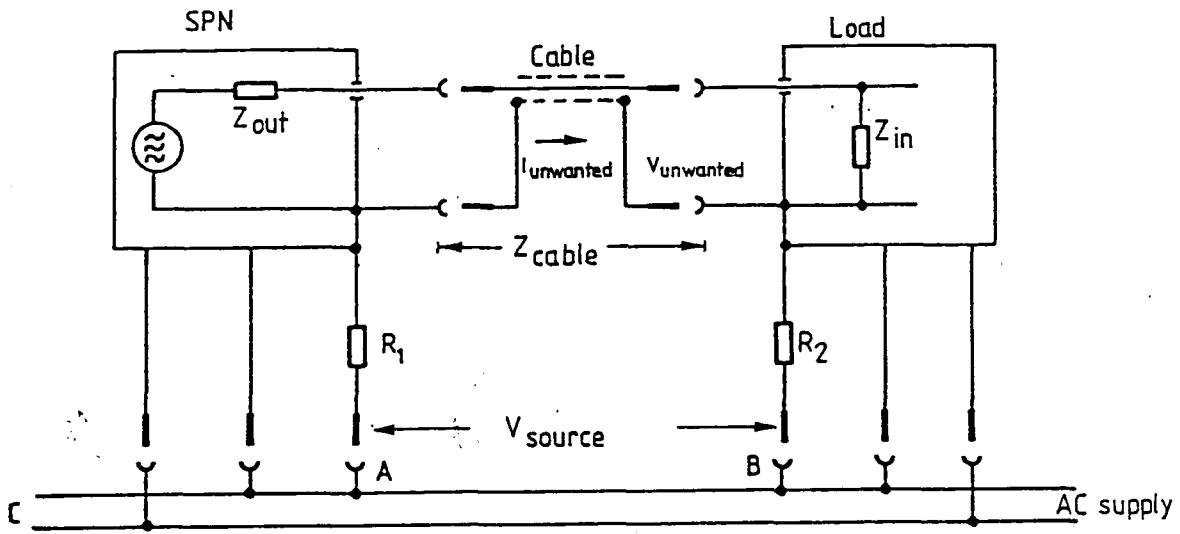

Fig. 2-2 Cause of ground loops

The voltage drop V_{source} occurring between the earthed-wire contacts A and B may be caused by other loads in addition to the consumption of the SPN, these loads being connected to the same line C.

The interference picked up from the AC supply can be reduced best by plugging the power connector of the generator and of the load into a double power outlet as is shown in Fig. 2-3; in this way, the line impedance between A and B is reduced such that $V_{source} \approx 0$ and thus also $V_{unwanted} \approx 0$.

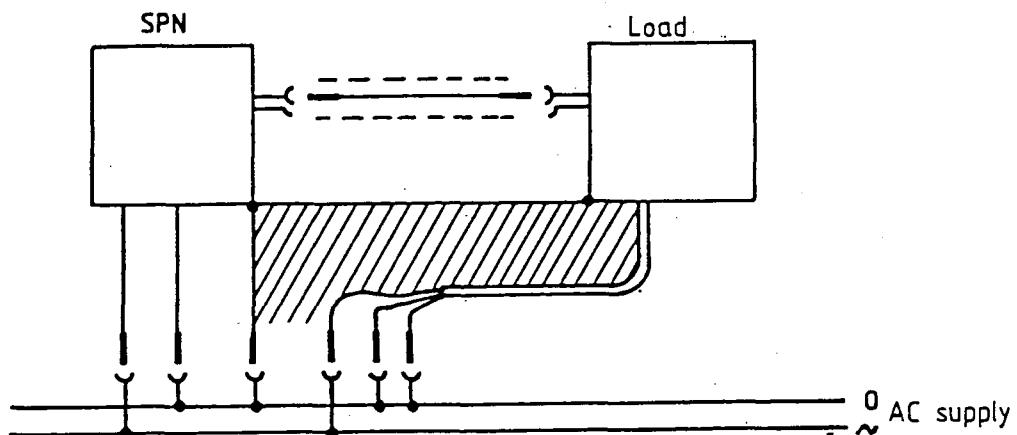

Fig. 2-3 Elimination of ground loops

2.3.3.4 Units of Level Indication

1 the entries for the output level refer to the EMF or maximum power into an ohmic termination of 600, 50 or $\approx 5 \Omega$.

dBV is a logarithmic unit of the output voltage referred to 1 V. It is calculated based on the output voltage:

$$V_{dBV} = 20 \log \frac{V_{out} (V)}{1 (V)}$$

Thus an output voltage of precisely 1 V corresponds to 0 dBV. Voltages higher than 1 V yield positive, those smaller than 1 V negative values in dBV.

The unit dBm is the logarithmic measure of the output power which an ohmic termination would handle referred to 1 mW.

It is calculated based on the power: $P_{dBm} = 10 \log \frac{P (mW)}{1 (mW)}$

or based on the voltage $P_{dBm} = 10 \log \frac{V_{out}^2 (V) \cdot 20}{1 (mW)}$

If the test item or the load is mismatched, the remaining power is reduced due to reflection. Depending on the VSWR, the output power is:

$$P_{(load)} = P_{(readout)} \frac{4 \text{ VSWR}}{(1 + s)^2}$$

2.3.4 Setting the Output Impedance

Key 11 (Fig. 2-7) permits the impedance of output 9 to be selected:

600, 50 and $\approx 5 \Omega$. In this way, matched measurements are possible in different impedance systems. The accuracy of the 600- Ω and 50- Ω output impedance is $\pm 1\%$.

NOTE: The 600- Ω impedance of output 9 can be matched to a different system by exchanging resistor R13 (drawing No. 392.7522). The newly inserted resistor R13 must be 50 Ω smaller than the desired output impedance.
The new output impedance is selected by pressing the 600- Ω key.
The 50- Ω and the ≈ 5 - Ω output impedance remain unchanged.

Attention: The dBm indication must be converted by the corresponding factor.

The EMF indication remains correct.

Example:

A balanced 600- Ω output is required. For this purpose, the Balun SPN-Z1 (see Section 2.5) is used.

The required new resistor R13 is calculated as follows:

$$Z_{out} = \frac{Z_{out \text{ SPN}} + 15 \Omega}{10} \text{ (balun)}$$

$$Z_{out} = 600 \Omega$$

$$Z_{out \text{ SPN}} = (Z_{out} - 15) \Omega \times 10 = (600 - 15) \Omega \times 10 = 5850 \Omega$$

$$R_{13} = Z_{out \text{ SPN}} - 50 \Omega = 5850 \Omega - 50 \Omega = 5800 \Omega.$$

2.3.5 Sweep Mode

The output frequency of the SPN can be swept by an external signal in the linear or logarithmic mode over the entire or certain subranges.

To select the mode, press key 16 (Fig. 2-7) for linear or key 15 for logarithmic operation. The level control is switched off in sweep operation.

2.3.5.1 Sweep Range

The sweep range always extends from the lower frequency limit of the SPN (≈ 1 Hz) to an upper frequency limit which can be set depending on the range. This maximum frequency obtained by an external 1.3-V signal applied to input 14 (Fig. 2-7) appears in readout 1. This is indicated by the MAX LED 2. The level control is switched off in sweep operation.

Table 2-1

Entry	Sweep range	Frequency displayed in readout <u>1</u>						
<table><tr><td><input type="checkbox"/> 1</td><td><input type="checkbox"/> SWP</td></tr><tr><td colspan="2">or</td></tr><tr><td><input type="checkbox"/> 1</td><td><input type="checkbox"/> LOG</td></tr></table>	<input type="checkbox"/> 1	<input type="checkbox"/> SWP	or		<input type="checkbox"/> 1	<input type="checkbox"/> LOG	Range 1 ≈ 1 Hz to 1,3 kHz	1,3 kHz
<input type="checkbox"/> 1	<input type="checkbox"/> SWP							
or								
<input type="checkbox"/> 1	<input type="checkbox"/> LOG							
<table><tr><td><input type="checkbox"/> 2</td><td><input type="checkbox"/> SWP</td></tr><tr><td colspan="2">or</td></tr><tr><td><input type="checkbox"/> 2</td><td><input type="checkbox"/> LOG</td></tr></table>	<input type="checkbox"/> 2	<input type="checkbox"/> SWP	or		<input type="checkbox"/> 2	<input type="checkbox"/> LOG	Range 2 ≈ 1 Hz to 13 kHz	13 kHz
<input type="checkbox"/> 2	<input type="checkbox"/> SWP							
or								
<input type="checkbox"/> 2	<input type="checkbox"/> LOG							
<table><tr><td><input type="checkbox"/> 3</td><td><input type="checkbox"/> SWP</td></tr><tr><td colspan="2">or</td></tr><tr><td><input type="checkbox"/> 3</td><td><input type="checkbox"/> LOG</td></tr></table>	<input type="checkbox"/> 3	<input type="checkbox"/> SWP	or		<input type="checkbox"/> 3	<input type="checkbox"/> LOG	Range 3 ≈ 1 Hz to 130 kHz	130 kHz

<input type="checkbox"/> 3	<input type="checkbox"/> LOG							
<table><tr><td><input type="checkbox"/> 4</td><td><input type="checkbox"/> SWP</td></tr><tr><td colspan="2">or</td></tr><tr><td><input type="checkbox"/> 4</td><td><input type="checkbox"/> LOG</td></tr></table>	<input type="checkbox"/> 4	<input type="checkbox"/> SWP	or		<input type="checkbox"/> 4	<input type="checkbox"/> LOG	Range 4 ≈ 1 Hz to 1300 kHz	1300 kHz
<input type="checkbox"/> 4	<input type="checkbox"/> SWP							
or								
<input type="checkbox"/> 4	<input type="checkbox"/> LOG							

Example:

Keyboard 6

Key 16 (15)

Readout 1

	SWP		kHz
3	o	1 3 0 0 0	MAX
	LOG.		kHz
1	o	1. 3 0 0 0	MAX

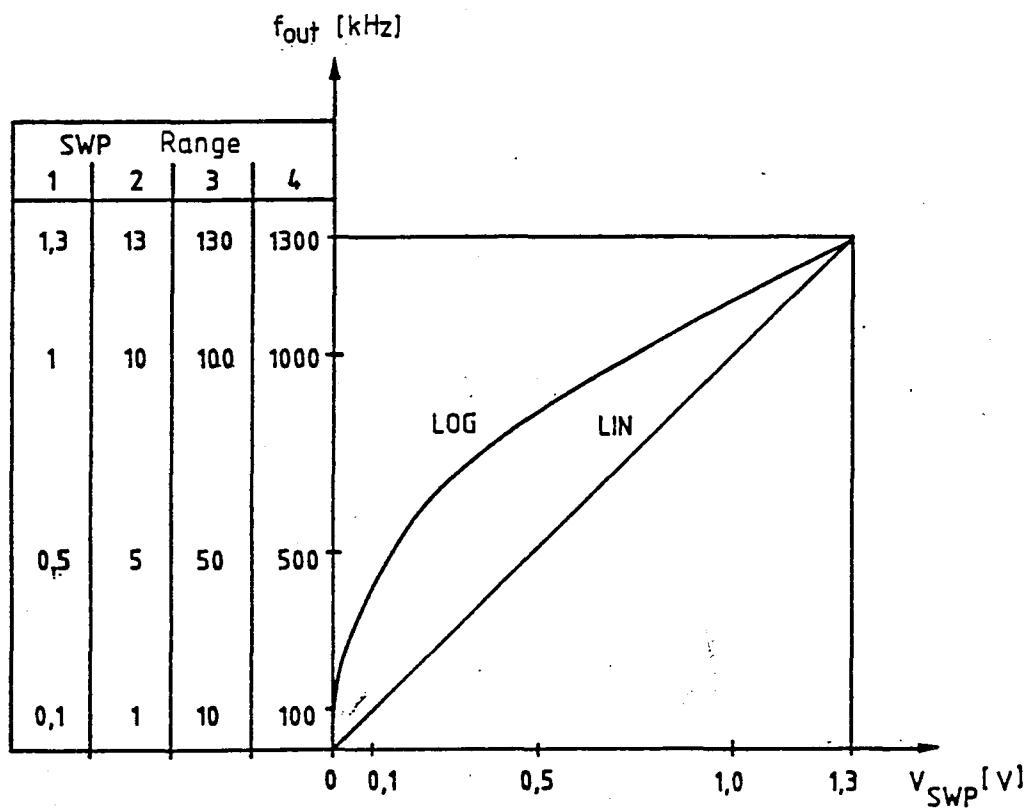

Fig. 2-4 Sweep range limits, depending on control voltage.
LOG / LIN diagram

To switch the sweep mode off, press the SWP key 16 again; the previously selected frequency appears again in readout 1. With the sweep mode enabled, the entry of a new frequency is not accepted and signalled as a wrong entry.

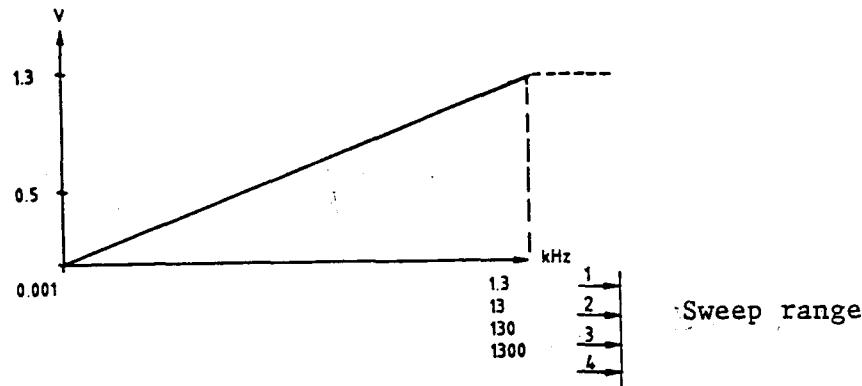

2.3.5.2 DC Output Voltage Proportional to Frequency

Connector 14 delivers a DC voltage proportional to the frequency. The voltage range always covers 0 V at 1 Hz to 1.3 V at the maximum frequency of each sweep range.

After the SPN has been switched on, sweep range 4 (1 Hz to 1300 kHz) is selected.

a) Linear frequency variation

With linear frequency variation (see Section 2.3.2.1 a, b, d) the frequency-proportional DC output voltage is a linear function of the output frequency. Select the maximum frequency to cover the full sweep range in accordance with the following diagram:

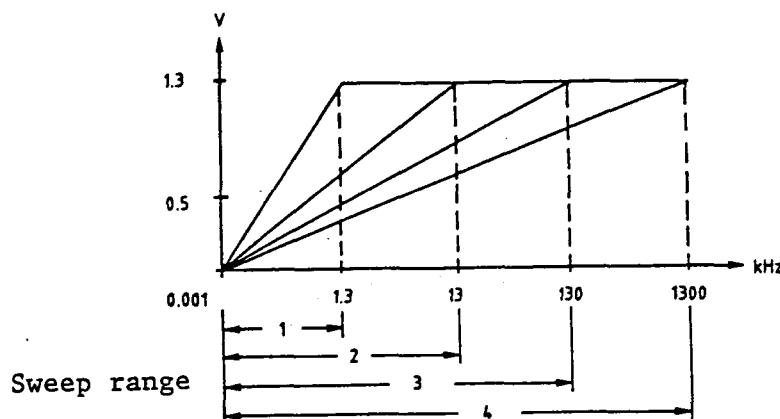

Example: Maximum DC output voltage at 13 kHz

	Keyboard 6	Key 16	Readout 1	kHz
Range selection	2	o	1 3. 0 0 0	MAX
		SWP		The previously set frequency appears in readout 1.

b) Logarithmic frequency variation

With logarithmic frequency variation (see Section 2.3.2.1 c) there is a logarithmic relation between the frequency-proportional DC output voltage and the output frequency. Select the maximum frequency to cover the full sweep range in accordance with the following diagram:

Example: Maximum DC output voltage at 13 kHz

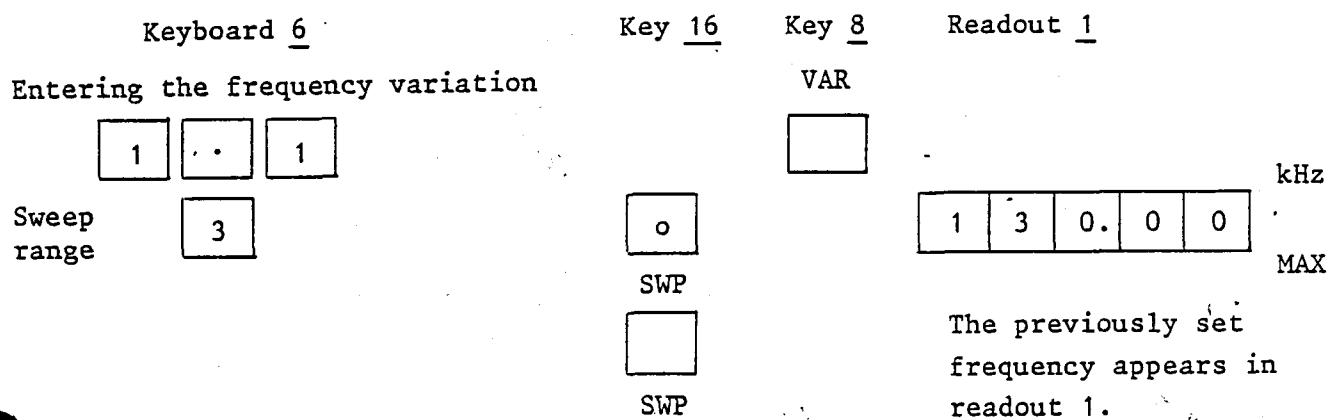

2.3.5.2.1 Recording Frequency Responses with the aid of an XY Recorder

To record frequency responses with the aid of an XY recorder, proceed as follows:

1. Select the linear or the logarithmic frequency variation mode (see Section 2.3.2.1).
2. Select the limit frequency in accordance with the diagram under 2.3.5.2 a) or 2.3.5.2 b).

Example: Frequency range from 1 Hz to 130 kHz,
10% frequency variation

The frequency displayed in readout 1 can be varied with knob 17.

3. Calibrate the X axis of the recorder with the pen lifted.

To calibrate the Y axis, use knob 17 to vary the frequency (for instance to find a maximum). The X deflection voltage is following the frequency and stops at the corresponding upper sweep limit.

4. Use knob 17 or enter a frequency value to set the lower frequency limit; lower the pen and vary the frequency with knob 17.
5. Lift the pen at the end of the sweep.

Prior to a new sweep, use knob 17 or enter a frequency value to set the lower frequency limit.

2.3.6 Storing Facility

All the settings made on the instrument can be stored and called up if required.

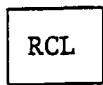

The instrument permits five complete instrument setups to be stored in parallel. For this purpose, press the STO key and one of the numbers 1 to 5 on keyboard 6 (Fig. 2-7).

The RCL of keyboard 6 permits all the values stored to be recalled.

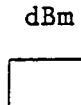

The syntax is the same as that of the STO instruction, the RCL key replacing the STO key. In addition to the recall of complete instrument setups, five separate frequency and five level settings out of the complete instrument setup can be fetched. For this purpose, press the number number of the desired memory on keyboard 6 after the RCL key and one of keys 10 or 13.

Examples:

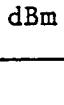

Keyboard 6

Key 10

Keyboard 6

1

1

All the data recalled are checked for correct syntax so that unpermissible settings do not occur due to errors in storing. Should such an error occur, the frequency readout 1 signals "error" for half a second and then the smallest value of the setting is output (e.g. frequency: 1 Hz; level: 1 mV).

After the instrument has been switched on, the values of 10 kHz and 1 mV are stored as the basic settings in all the five memories. These values are overwritten only if new values are entered.

2.3.6.1 Special Functions

By pressing the keys RCL, Ø and a further number (1 to 4) on keyboard 6 (Fig. 2-7), the standardized octave and one-third-octave sequences can be set as special functions Ø1 to Ø4.

RCL Ø1	first octave sequence
RCL Ø2	second octave sequence
RCL Ø3	first one-third-octave sequence
RCL Ø4	second one-third-octave sequence

The lowest frequency of the selected sequence appears in readout 1.

Knob 17 permits the frequency to be stepped up or down in accordance with the standardized sequence. Switching-off is possible by pressing the VAR. frequency key again.

When the keys RCL, Ø and 5 are pressed, switchover at 1.3 kHz does not take place and the output frequency of the SPN in the frequency range 1 Hz to 13 kHz is read out with a resolution of 1 Hz. The special function RCL Ø5 can be switched off by pressing the keys RCL and twice Ø.

Table 2-2 Octave and one-third-octave sequences to DIN 45401

1st octave sequence	1st one-third-octave-sequence	2nd one-third-octave-sequence
1.0 Hz	1.0 Hz	1.1 Hz
2.0 Hz	1.2 Hz	1.4 Hz
4.0 Hz	1.6 Hz	1.8 Hz
8.0 Hz	2.0 Hz	2.2 Hz
16.0 Hz	2.5 Hz	2.8 Hz
31.5 Hz	3.1 Hz	3.5 Hz
63.0 Hz	4.0 Hz	4.5 Hz
125.0 Hz	5.0 Hz	5.6 Hz
250.0 Hz	6.3 Hz	7.1 Hz
500.0 Hz	8.0 Hz	9.0 Hz
1.0 kHz	10.0 Hz	11.2 Hz
2.0 kHz	12.5 Hz	14.0 Hz
4.0 kHz	16.0 Hz	18.0 Hz
8.0 kHz	20.0 Hz	22.4 Hz
16.0 kHz	25.0 Hz	28.0 Hz
31.5 kHz	31.5 Hz	35.5 Hz
63.0 kHz	40.0 Hz	45.0 Hz
125.0 kHz	50.0 Hz	56.0 Hz
250.0 kHz	63.0 Hz	71.0 Hz
500.0 kHz	80.0 Hz	90.0 Hz
1000.0 kHz	100.0 Hz	112.0 Hz
	125.0 Hz	140.0 Hz
	160.0 Hz	180.0 Hz
	200.0 Hz	224.0 Hz
	250.0 Hz	280.0 Hz
	315.0 Hz	355.0 Hz
	400.0 Hz	450.0 Hz
	500.0 Hz	560.0 Hz
2nd octave sequence	630.0 Hz	710.0 Hz
	800.0 Hz	900.0 Hz
1.4 Hz	1.0 kHz	1.12 kHz
2.8 Hz	1.25 kHz	1.4 kHz
5.6 Hz	1.6 kHz	1.8 kHz
11.2 Hz	2.0 kHz	2.24 kHz
22.4 Hz	2.5 kHz	2.8 kHz
45.0 Hz	3.15 kHz	3.55 kHz
90.0 Hz	4.0 kHz	4.5 kHz
180.0 Hz	5.0 kHz	5.6 kHz
355.0 Hz	6.3 kHz	7.1 kHz
710.0 Hz	8.0 kHz	9.0 kHz
1.4 kHz	10.0 kHz	11.2 kHz
2.8 kHz	12.5 kHz	14.0 kHz
5.6 kHz	16.0 kHz	18.0 kHz
11.2 kHz	20.0 kHz	22.4 kHz
22.4 kHz	.	.
45.0 kHz	.	.
90.0 kHz	.	.
180.0 kHz	.	.
355.0 kHz	400.0 kHz	355.0 kHz
710.0 kHz	500.0 kHz	450.0 kHz
	630.0 kHz	560.0 kHz
	800.0 kHz	710.0 kHz
	1000.0 kHz	900.0 kHz
	1250.0 kHz	1120.0 kHz

2.3.7 Squarewave Output

The squarewave output 12 (BNC female connector) (Fig. 2-7) is available simultaneously with the sinewave output 9. The squarewave output delivers a constant TTL level suitable for driving TTL circuits. The output is short-circuit-proof and has a fan-out of 10.

2.3.8 Reference Frequency

The reference frequency of 1 MHz with TTL level is available at BNC socket 24 for external controls.

It is also possible to apply an external reference frequency of 1 MHz 0.2 to 2 V if the SPN, for example, is to be operated from another unit or at a standard frequency. For this purpose, the BNC socket 24 must be connected in such a manner that it can be used as an input.

The SPN is supplied with the BNC socket 24 connected as an output. When the socket is to serve as a reference input, the link BR1 and the cable K7 must be changed over from ST3 to ST2 on the frequency processor board 392.7580.

2.4 Remote-controlled Operation

The Generator SPN can also be remote-controlled. The setting data are transmitted via a byte-serial bussed system using an interface which corresponds to IEC 625-1 (formerly IEC 66.22), IEEE 488-1975 and DIN 66.22. The IEC-625 Bus connector 20 on the rear panel (Fig. 2-8) is used for this purpose.

2.4.1 Interface

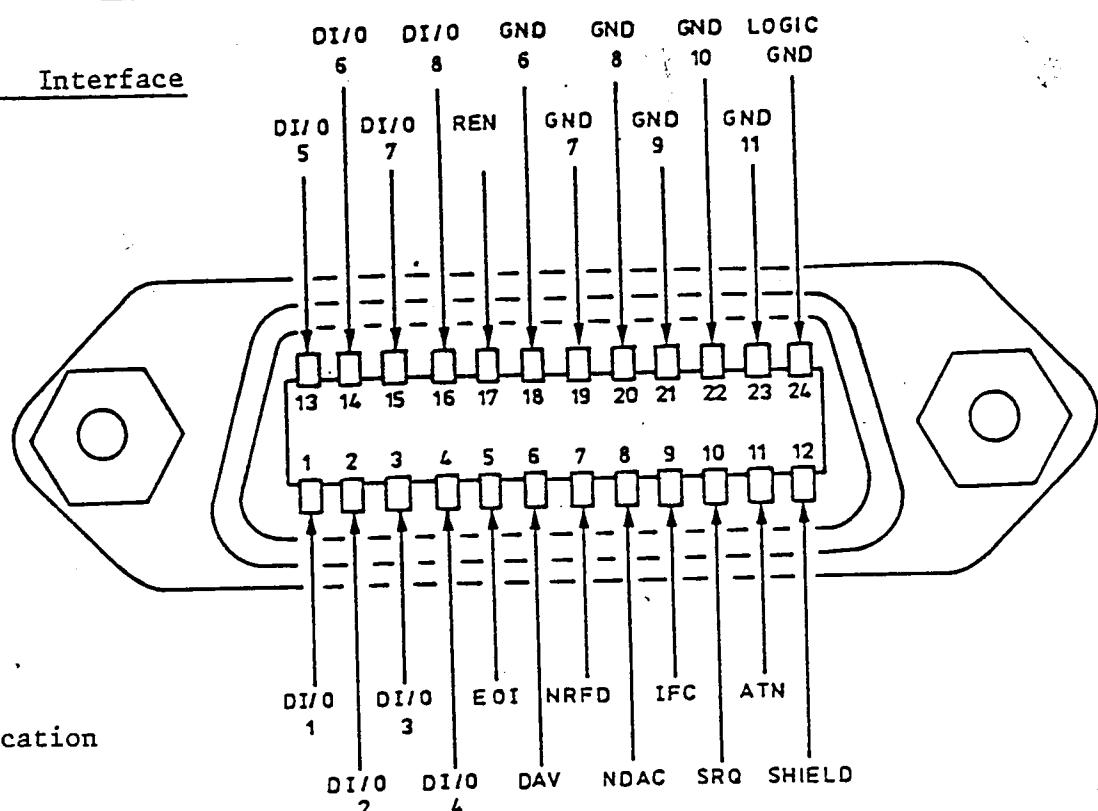

Fig. 2-5

Pin allocation

The IEEE 488-1975 standard provides for a different connector than the international IEC standard. The SPN is fitted with the most commonly used 24-way female connector to IEEE 488-1975. By using an adapter, devices fitted with a 25-way female connector to IEC can easily be connected to the SPN. The control function and data transfer are the same.

The standardized interface has three groups of bus lines.

1. Data bus, 8 lines DI/0 to DI/0 8

Data transfer is bit-parallel and byte-serial, the characters of the ISO 7-bit code (also ASCII code) being transmitted.

DI/0 1 represents the lowest-order and DI/0 8 the highest-order bit.

2. Control bus, 5 lines

These lines are used for transferring control functions.

ATN (attention) goes active LOW while an address is transferred to the devices connected.

REN (remote enable) is used for switching the Generator to the remote-controlled mode.

SRQ (service request) enables a device - by activating this line - to request a service from the controller.

IFC (interface clear) is activated to bring the devices connected to a defined initial status.

EOI (end or identify) can be used to mark the end of a data transfer and is also used for polling after a service request.

3. Handshake bus, 3 lines

It is used to control the timing of the data transfer.

NRFD (not ready for data) Active LOW on this line signals to the controller that one of the devices connected is not ready to accept data.

DVD (data valid) is activated by the controller shortly after a new data byte has been applied to the data bus.

NDAC (not data accepted) is kept active LOW by the device connected until it has accepted the data transferred on the data bus.

2.4.2 Setting the Address

Table 2-3 gives the setting of the address switches. The decimal address 11 is factory-set on the SPN.

The address is transferred only when the SPN is switched on and in the case of DCL (device clear).

Table 2-3 Setting the device address

ASCII character		Binary address					Decimal equivalent
Listen address	Talk address	Address switches A5 A4 A3 A2 A1					
(SPACE)		0	0	0	0	0	0
!	A	0	0	0	0	1	1
"	B	0	0	0	1	0	2

]	1	1	1	0	1	28
		1	1	1	1	0	29
							30

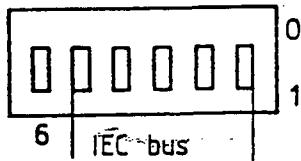

Fig. 2-6 Address switch 19 on the rear panel (see Fig. 2-8)

2.4.3 REMOTE/LOCAL/DEVICE CLEAR

When driven by a controller, the SPN automatically goes to the REMOTE mode and stays in this state even when the output is terminated. LED 5 (Fig. 2-7) indicates this status. In this case, all the front-panel controls are disabled. If a manual setting is to be made, first stop the program run of the controller. Next press the LOC key 8 to switch the SPN over to manual operation. Now the desired setting can be made.

The controller can bring the instrument to the LOCAL mode by the GTL (go-to-local) control instruction.

Switchover to the REMOTE mode is automatically performed with the next setting instruction.

The switchover to the LOCAL mode by pressing key 8 can be inhibited by sending once - if possible at the beginning of the program - the LLO (local-lockout) instruction via the IEC bus.

The instrument is brought to its basic state (frequency 10.000 kHz, output level 1 mV, output impedance 50 Ω) by a DCL (device-clear) instruction which should be entered at the beginning of a program every time the IEC bus is restarted.

Table 2-4 gives examples for outputting the above-mentioned instructions, based on the decimal address 11 of the SPN. This decimal address corresponds to the full decimal equivalent of 43 (ASCII code).

Table 2-4

	R6S PUC/PPC	Tektronix 4051/4052	hp 9825	9835/9845	Commodore PET 2001/3032/4032/8032
Go to local	IECLAD11 IECGTL IECUNL (for the device addressed)	WBYTE#43,1: 1c1711	LOCAL711 or LOCAL7	not possible	
Local lockout	IECLLO (for all devices)	WBYTE#43,17: or WBYTE#17:	1107 (for all devices)	LOCAL LOCKOUT7 (for all devices)	not possible
Remote	IECLAD11	WBYTE#43: rem711 or rem7	REMOTE711 or REMOTE7	REMOTE711 or REMOTE7	in conjunction with an output only
Selected device clear	IECLAD11 IECSDC IECUNL	WBYTE#43,4: clr711		RESET 711	not possible

2.4.4 Remote-control Instructions

2.4.4.1 Listener

Setting instructions consist of data (optional) and an easy-to-remember combination of two characters designating the unit or the function while being the delimiter at the same time.

Storage instructions and special functions are terminated by numbers. The separator can be any character with the exception of numbers, decimal points and the letters included in the instructions.

Table 2-5 Remote-control instructions of SPN

Function	Data	Instruction (delimiter)
Setting the frequency in kHz in Hz	Max. 5 decimal digits with or without decimal point	KH HZ
Setting the frequency with short transient period (time saving about 5 ms) in kHz in Hz	Max. 5 decimal digits with or without decimal point	KS HS
Setting the level in V in mV in dBV in dBm	Max. 3 decimal digits with or without decimal point	V MV DV DM
Switching the level off	None	RØ
Switching on the linear sweep: range 1 range 2 range 3 range 4	None None None None	S1 S2 S3 S4
Switching on the logarithmic sweep: range 1 range 2 range 3 range 4 Switching off	None None None None None	L1 L2 L3 L4 LØ

Function	Data	Instruction (delimiter)
Switching the sweep off	None	SØ
Output impedance 600 Ω 50 Ω ≈ 5 Ω	None None None	R 6 R 5 R 1
Storing the complete setup	n = number 1 to 5 for the last digit	ST n
Recalling the frequency	Same as for storing	RC KH n RC HZ n
Recalling the level	Same as for storing	RC V n RC MV n RC DV n RC DM n
Recalling the complete setup	Same as for storing	RC n
Switching on the special functions	n = number 0 to 5	RC Ø n
After switching on the special functions: stepping up stepping down	None None	N 1 N Ø
Enabling service request	None	SR

For data entry the limits of the setting range must be observed.
 If they are exceeded, SRQ is signalled if the controller had previously sent the SR IEC-bus instruction. If the data entered have a finer resolution than the SPN can accept, the extra digits are ignored.

2.4.4.2 Service Request

If the controller allows the service request by sending the SR instruction, the SPN signals different entry errors by activating the SRQ line.

The status byte output during the subsequent serial poll has the following meaning:

Status byte Decimal equivalent	Meaning
65	Syntax error
66	Entered frequency exceeds the range or frequency has been entered with the sweep mode on
67	Entered level exceeds the range
68	Instruction not recognized

After the instrument has been switched on, the service request is always inhibited. It is enabled by the SR instruction.

2.4.5 Programming Examples for Process Controllers PPC/PUC

Frequency setting

a) for 1.2343 kHz

Entry: IECOUT11,"1.2343 KH"

b) for 432.5 Hz

Entry: IECOUT11,"432.5 HZ"

Frequency setting for short transient periods (without display)

a) for 1.2343 kHz

Entry: IECOUT11,"1.2343 KS"

b) for 432.5 Hz

Entry: IECOUT11,"432.5 HS"

Level setting

a) for 4.32 V

Entry: IECOUT11,"4.32 V"

b) for 185 mV

Entry: IECOUT11,"185 MV"

c) for 14.2 dBm

Entry: IECOUT11,"14.2 DM"

d) for 15.2 dBV

Entry: IECOUT11,"15.2 DV"

Switch on range 1: IECOUT11,"S1"

Switch off linear sweep: IECOUT11,"S0"

Switch on logarithmic sweep range 1: IECOUT11,"L1"

Switch off logarithmic sweep only: IECOUT11,"L0"

Switch off sweep: IECOUT11,"S0"

Output impedance

a) Switch on 600 Ω: IECOUT11,"R6"

b) Switch on 50 Ω: IECOUT11,"R5"

c) Switch on ≈ 5 Ω: IECOUT11,"R1"

Store the complete setup,
for instance in memory 1 IECOUT11,"ST 1"

Recall the values stored as in the case of storing
(replace ST by RC)

Switch on the special function

- a) first octave sequence: IECOUT11,"RC Ø1"
- b) second octave sequence: IECOUT11,"RC Ø2"
- c) first one-third-octave sequence: IECOUT11,"RC Ø3"
- d) second one-third-octave sequence: IECOUT11,"RC Ø4"

After recalling the special function, the sequence selected is

- a) stepped up once IECOUT11,"N1"
- b) stepped down once IECOUT11,"NØ"

Recall the second one-third-octave sequence and step up ten times

```
1Ø IECOUT 11, "RC Ø4"  
2Ø FOR I = 1 TO 1Ø STEP 1  
3Ø IECOUT 11, "N1"  
4Ø NEXT I
```

Switch the level off and on again with 50-Ω output impedance

```
1Ø IECOUT 11, "RØ"  
2Ø IECOUT 11, "R5"
```

Frequency response measurement in the range from 16 Hz to 13.0 kHz when using the voltage proportional to frequency

SPN setting	1Ø IECOUT11,"5VRS"
Upper and lower limit frequency	2Ø IECOUT11,"S1SØ"
Frequency range and step width	3Ø FORI=16TO13000STEP1
Frequency output	4Ø IECOUT11,STRS(I)+"HZ"
	5Ø NEXT I
	6Ø END

Complete setup of instrument

Frequency:	1.2343 kHz
Level:	4.32 V
Output impedance:	50 Ω

Entry: IECOUT11,"1.2343KH4.32VR5"

For better reading, the instruction can also be provided with separators and space characters. These are ignored by the SPN.

IECOUT11,"1.2343 KH,4.32V,R5"

The instructions required for data output differ slightly for computers of different make. Examples are given in Table 2-6 for the most commonly used desktop models.

*)When using the graphic Computing System 4051, connect the bus line (pin 17) to ground (pin 18).
This can be done with a shortcircuit connector.

2.5 Balun SPN-Z1

The Balun SPN-Z1 265.4319.02 is part of the recommended extras. It permits a voltage balanced to earth to be drawn from the SPN or any other unbalanced voltage source and is used for feeding balanced line systems and amplifiers requiring a push-pull or floating input voltage. It is also suitable for transmitting stereo multiplex signals. Moreover, the use of such a balun is of advantage in many test setups to interrupt hum loops, for instance when measuring the stopband of filters. To ensure that the balun does not pick up any hum voltage, it is inserted into a μ metal shielding can.

Due to the step-down transformation, the balun, including the transformed current source, has a small output impedance (see Section 4.9.1). Thus with the usual secondary load of 600Ω , practically the full, transformed EMF of the SPN is available.

As the frequency response of the balun stays very flat over the entire frequency range at loads between 150Ω and open circuit, it is sufficient to measure the primary in order to determine the secondary voltage.

The secondary voltage is symmetrical about the centre tap. An asymmetry occurs only in the vicinity of the upper frequency limit.

Make sure that the permissible primary voltage (5 to 32 V) in the lower frequency range is not exceeded since otherwise the harmonic distortion will increase excessively.

3. Maintenance

3.1 Required Measuring Equipment and Accessories

No.	Instrument	Required specifications	R & S type	See section
1	Frequency counter	Range 1 Hz to 1.3 MHz		3.2.2 3.2.10
2	AC-DC voltmeter	Range 1 mV to 10 V	UDS 6 346.9210... URE 342.1214...	3.2.3 3.2.4 3.2.8 3.2.11
3	AF spectrum	Range 1 Hz to 1300 kHz, dynamic range > 70 dB		3.2.5 3.2.6
4	Distortion meter	Range 1 Hz to 1300 kHz		3.2.7
5	50-Ω feed-through termination	Z = 50 Ω, 0.5 W	RAD 289.8966.00	3.2.8
6	Oscilloscope			3.2.9 3.2.10
7	Controller	Interface to IEEE 488 or IEC 625.1	Process Controller PUC 344.9800...	3.2.12
8	Power meter	Range 1 Hz to 1.3 MHz Z = 50 Ω error < 0.1 dB		3.2.4
9	10-dB attenuator	Z = 50 Ω/0.5 W, 10 dB	DSF 289.8866.00	3.2.4

3.2 Checking Rated Specifications

3.2.1 Checking Readouts, Indicators and Keyboard

After the SPN has been switched on, all the LEDs should stay on for 5 seconds. During this period, readouts 1 and 3 (Fig. 2-7) display 0...0. To check the keyboard, perform the entries listed in section 2.3 and check the figures displayed in the readouts.

3.2.2 Checking Frequency Setting and Accuracy

Test setup: Connect a frequency meter to the squarewave output 12 (Fig. 2-7).

Checking: Set the following frequencies on the SPN and check with the frequency meter.

1300 kHz	63.7 Hz
130 kHz	32.8 Hz
13 kHz	1 Hz
1.3 kHz	

A relative frequency error may be due to aging or a temperature variation.

In the steady state, the relative frequency error must stay constant for all the frequencies selected. Check this error against the specifications.

3.2.2.1 Checking the Reference Frequency

Test setup: Connect a frequency meter to the reference output 24 (Fig. 2-8).

Checking: Check the 1-MHz reference frequency with the frequency meter.

A relative frequency error may occur due to aging or a temperature variation.

3.2.3 Checking Level Setting

Setting on the SPN: Frequency = 1 kHz; $Z_{out} = 50 \Omega$.

Connect a high-impedance voltmeter to the sinewave output.

Checking: Use knob 17 to reduce the level from 20 dBV to 10.1 dBV in steps of 0.1 dBV. Check the level steps on the voltmeter. At the maximum error, reduce the error by 10/20/30/40/50/60 and 70 dB and check on the voltmeter.

Example: Maximum error at 12.1 dBV

Entry: 2.1 dBV (12.1 dBV - 10 dB)

-7.9 dBV (12.1 dBV - 20 dB)

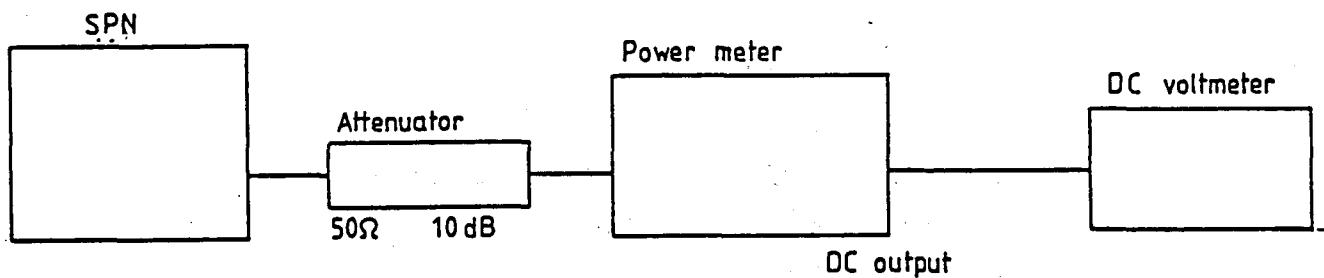

Check the error of the output voltage against the specifications.

Repeat the measurement at 50 kHz.

3.2.4 Checking Frequency Response

Setting on the SPN: Level = 10 V, frequency = 1 Hz to 1300 kHz,
output impedance = 50 Ω

Test setup:

Checking:

Vary the frequency on the SPN and check the level on the DC voltmeter. The permissible frequency response (difference between the highest and the lowest level) is to be checked against the specifications.

3.2.5 Checking Spurious Signal Rejection

Setting on the SPN: Level = 10 V, frequency = 1 Hz to 1300 kHz,
output impedance = 50 Ω

Test setup:

Connect the AF analyzer to the sinewave of the SPN.
Check the spurious signal suppression against the specifications.

3.2.6 Checking Harmonic Content

Setting on the SPN: Level = 10 V, frequency 1 Hz to 1300 kHz.

Test setup: Connect the AF analyzer to the sinewave output of the SPN. Check the harmonic content against the specifications.

3.2.7 Checking Harmonic Distortion

Setting on the SPN: Level = 10 V, frequency = 1 Hz to 1300 kHz

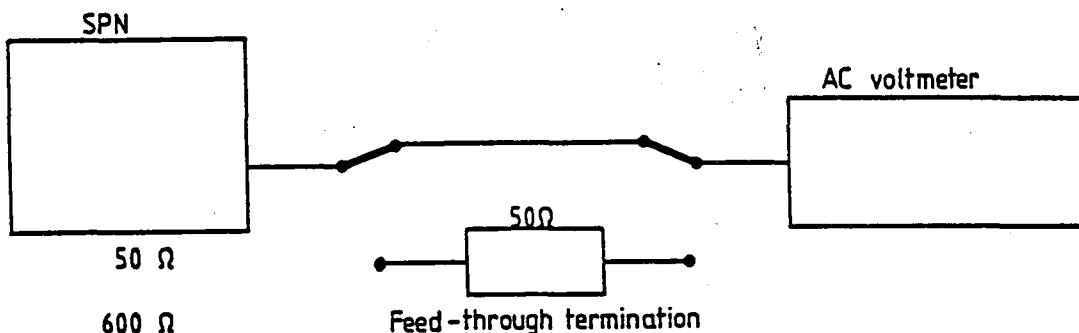

Test setup: Connect a distortion meter to the sinewave output of the SPN. Check the harmonic distortion against the specifications.

3.2.8 Checking Output Impedance

Setting on the SPN: Level = 10 V, frequency = 50 kHz,
output impedance = 50 Ω/600 Ω

Checking: Connect the AC voltmeter to the sinewave output and measure the open-circuit voltage.

Connect a 50-Ω feed-through termination to the output and measure the values for the two output impedances mentioned.

$$V_{nom} = \frac{V_{open}}{Z_{out} + 50} \quad 50$$

$$\text{Error \%} = \frac{V_{nom} - V_{act.}}{V_{nom}} \cdot 100$$

Check the maximum error against the specifications.

3.2.9 Checking Squarewave Output

Setting on the SPN: Level = 3.17 V, frequency = 1 Hz to 1300 kHz

Test setup: Connect the oscilloscope via a high-impedance probe to the squarewave output.

Checking: The duty cycle should be \approx 0.5 over the entire frequency range.

3.2.10 Checking Sweep Operation

Setting on the SPN: Level = 10 V; select SWP range 4 (max. frequency 1300 kHz)

Test setup: Connect the counter and the oscilloscope to the squarewave output.

Checking: Apply a voltage of 0 V to the sweep input.
fout should be \approx 0 Hz.

Apply a voltage of 1.3 V to the sweep input.
fout should be \approx 1300 kHz.

3.2.11 Checking DC Output Voltage Proportional to Frequency

Setting on the SPN: Select SWP range 1.

Switch off the SWP mode.

Test setup: Connect a DC voltmeter to the sweep output.

Checking: The DC voltage measured at the sweep output should be proportional to frequency:
1 Hz corresponding to 0 V
1.300 kHz corresponding to 1.3 V

3.2.12 Checking Interface Functions

Test setup: Use the controller (e.g. PUC from R&S) for remote control of the SPN. Program all the setting instructions listed in Section 2.4.4.1 and check the correct execution on the front-panel display.

3.4 Regular Maintenance Work

The only maintenance required is the adjustment of the frequency, the variation of which is caused by crystal aging.

For the adjustment see Section 4.2.2.1.

4.2 Overall Description

4.2.1 Circuit Description and Construction

(See Fig. 4-2)

(For block diagram see Fig. 4-1)

The SPN output signal is produced by mixing a 2-MHz fixed-frequency signal with the signal derived from a phase-controlled oscillator. The output of this oscillator is derived from a stable 18-MHz control frequency by frequency synthesis.

There are three frequency decades ahead of the output mixer in order to ensure high resolution and little spurious FM at low frequencies. In the first frequency decade, the divided oscillator frequency (2.13 to 3.3 MHz) is mixed with a fixed frequency of 18 MHz to obtain 20.13 to 21.3 MHz and then divided by ten. The 2.013 to 2.13 MHz signal thus produced has a resolution which is ten times finer while the spurious FM is reduced by the factor 10. Thus the first decade covers the range from 13.0 to 130 kHz, the second decade that from 1.3 to 13 kHz and the third decade from 1 Hz to 1.3 kHz.

The active high-quality output mixer which delivers a low-distortion signal ensures a small distortion factor and an excellent spurious frequency rejection for the output signal.

A preamplifier and an output amplifier boost the signal to the required high output level.

Because of the low frequency of the output, the output amplifier is DC-coupled throughout. An offset control is provided to keep the DC offset as small as possible.

Two independent control loops are provided for level control in order to obtain a short transient level response time even for low frequency outputs. The RF mixer frequency alone is regulated up to 9.999 kHz whereas between 10 kHz and 1.3 MHz control is extended to the complete output signal.

The output attenuator can be mechanically switched in 10-dB steps up to a maximum attenuation of 70 dB. The 0.1-dB steps are electronically set by a D/A converter by way of the level control.

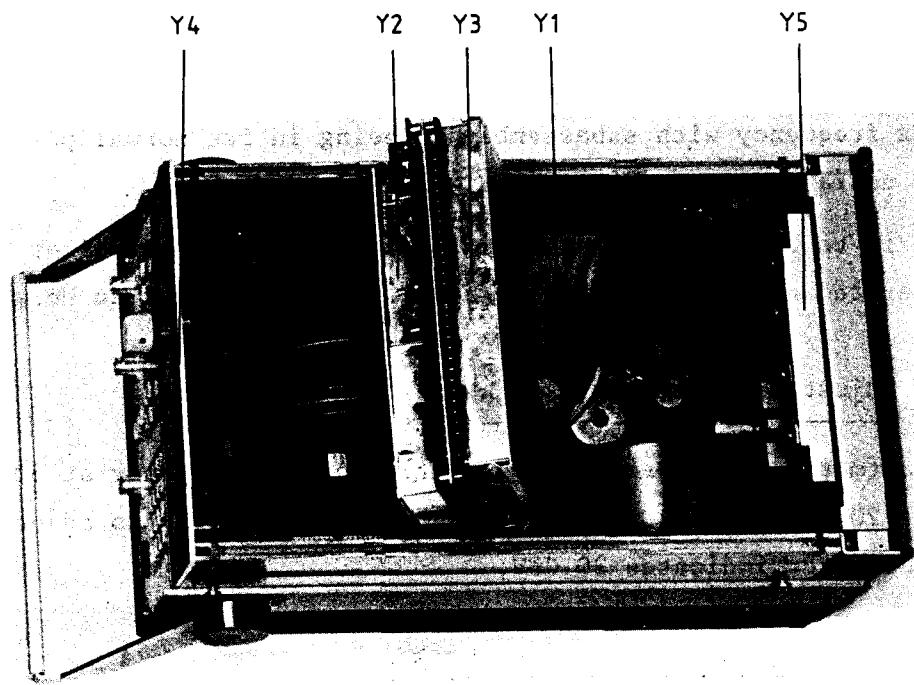

All functions are controlled by a microprocessor which continuously polls the keyboard and the IEC bus. Based on the key entries, the microprocessor calculates the required settings and performs them. Moreover, the microprocessor also drives the display.

In spite of its comprehensive circuitry, the SPN is of small size and has a clear, compact design. Extruded aluminium profiles are used for the side panels which rigidly connect the front panel to the rear junction panel. The top and bottom panelling fixed by lateral screws can be removed after undoing these screws. The front and the rear panels can be removed after undoing four screws per panel. However, the two panels should not be removed at the same time since the SPN would lose its mechanical stability.

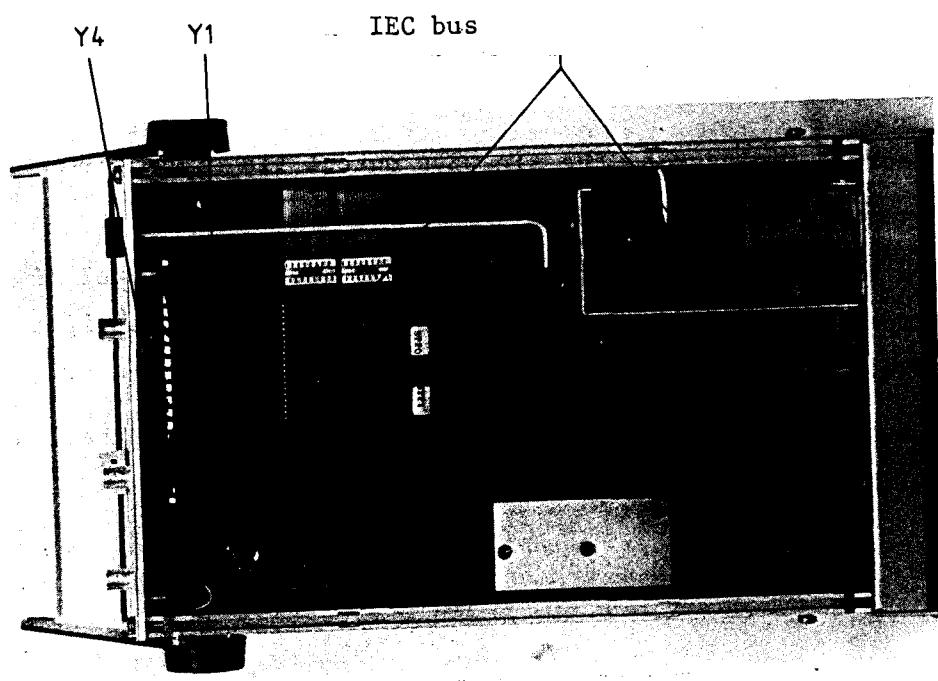

Board Y1 (control circuit and attenuator) is used as the motherboard and fixed to the bottom of the instrument.

Boards Y2 (frequency generator) and Y3 (frequency processor) are plugged together. Having undone the two front screws, the boards can easily be swung up and horizontally displaced. This ensures excellent access for servicing.

Boards Y2 and Y3 as well as part of board Y1 are designed as RF-leakage-proof subassemblies with a view to eliminating crosstalk.

Top with Y2 and Y3 swung out

Bottom

Fig. 4-2 Interior views

4.2.2.1 Reference Frequency Adjustment

Connect a frequency counter to the reference frequency output and use C4 to adjust the 1-MHz frequency with subassembly Y3 being in its normal position. The permissible deviation is $\pm 1\text{ Hz}$.

This adjustment is to be performed at normal ambient temperature after the SPN has been operated at this temperature for a period of about an hour.

4.2.2.2 Level Adjustment for $f_{\text{out}} > 10 \text{ kHz}$

Connect an AC voltmeter to the sinewave output. Set the frequency at 50 kHz and the level at 20 dBV on the SPN. Use potentiometer R99 (Y2) to adjust such that the voltmeter indicates 20 dBV.

4.2.2.3 Operating Point of 10-V Output Stage

Connect a distortion meter to the sinewave output via a $50\text{-}\Omega$ feed-through termination.

Select the output frequency of 100 kHz, the level of 1 V and the output impedance of $\approx 5 \text{ }\Omega$ on the SPN.

Turn potentiometer R21 (Y5) from the righthand stop slowly anti-clockwise until a distortion factor of 0.03% is reached.

4.2.2.4 Spurious Frequency Adjustment

Connect an AF spectrum analyzer to the sinewave output via a 20-dB/ $50\text{-}\Omega$ attenuator.

Select on the SPN the output frequency of 1300 kHz, the output level of 10 V and the output impedance of $50 \text{ }\Omega$. With these settings, a spurious signal is present at 700 kHz.

Use potentiometer R111 (Y2) to adjust this spurious frequency to the lowest value possible without affecting the distortion factor.

4.2.2.5 Level Adjustment for $f_{out} < 10$ kHz

Connect an AC voltmeter to the sinewave output. Select on the SPN the output frequency of 50 kHz and the level of 20 dBV.

Measure the output voltage. Without changing the frequency setting, set 10.1 dBV on the SPN and measure again.

Switch the frequency over to 1 kHz and the level to 20 dBV. Adjust to the same values as with an output frequency of 50 kHz using potentiometers R34 (Y2) at 20 dBV and R112 (Y2) at 10.1 dBV.

Repeat the adjustment several times since the two adjustments affect each other.

4.2.2.6 Sweep Adjustment

Connect a frequency counter and an oscilloscope in parallel to the square-wave output.

Select SWP range 4 on the SPN. 1300.0 kHz MAX appears on the display.

Connect a DC power supply to the sweep input and set the voltage to 0 V.

Use potentiometer R84 (Y2) to adjust an output frequency of \approx 0 Hz.

Increase the voltage applied to the sweep input to 1.3 V. Use potentiometer R110 (Y2) to adjust the frequency to \approx 1300 kHz.

Repeat the adjustment several times since the adjustments affect each other.

Select the LOG SWP range 4 with the same settings as above.

Adjust the voltage applied to the sweep input to 0 V. Use potentiometer R71 (Y2) to set a frequency of \approx 0 Hz. Increase the voltage at the sweep input to 1.3 V and use potentiometer R87 (Y2) to adjust the frequency to \approx 1300 kHz.

4.2.2.7 Adjustment of Frequency-proportional DC Output Voltage

Connect a DC voltmeter to the sweep output.

Enter the frequency of 1.300 kHz on the SPN.

Select sweep range 1 so that display shows 1.300 kHz MAX.

Switch off the sweep mode.

Use potentiometer R82 to adjust a DC voltage of 1.3 V.

4.2.3 Troubleshooting

4.2.3.1 General Instructions

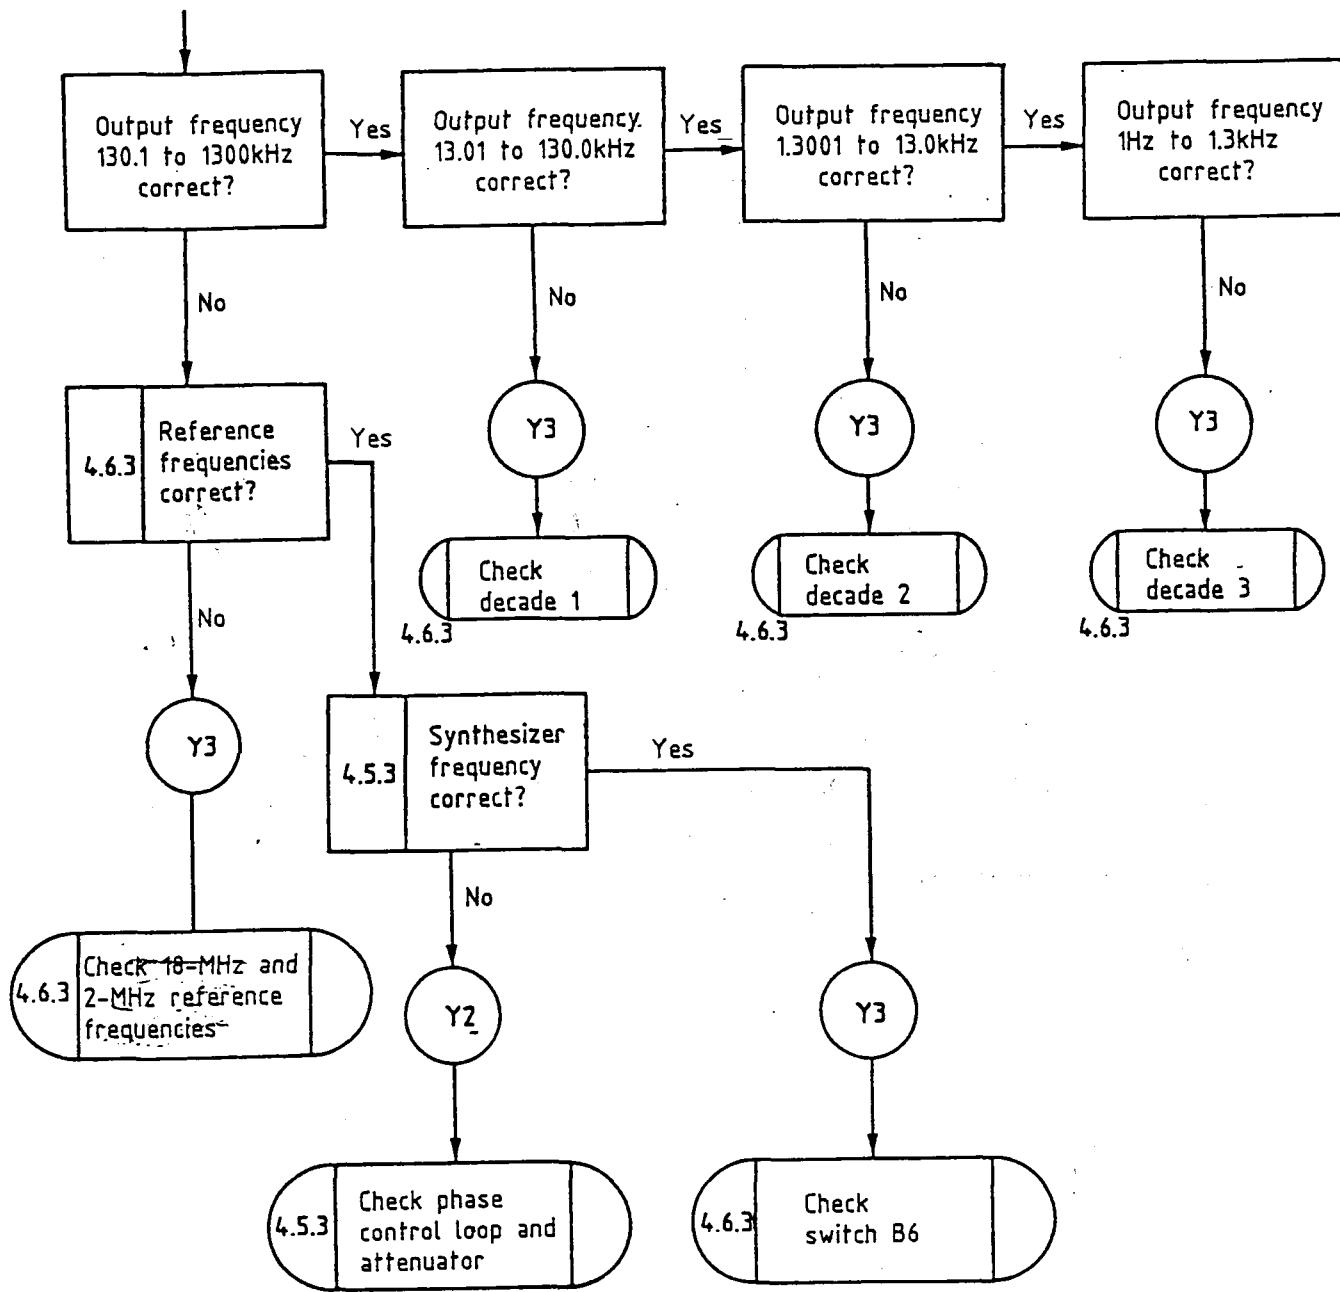

The following flow charts are to be used for determining the faulty board. The numbers to the left in the box refer to the section in which the performance test is described. The symbol in the circle gives the number of the circuit board on which the fault is to be traced. Levels and switching states are to be checked against those of relevant circuit diagrams. Prior to troubleshooting make sure that all supply voltages have the correct value (see Section 4.4).

 Make sure that the circuit boards are exchanged only when the instrument is switched off. 

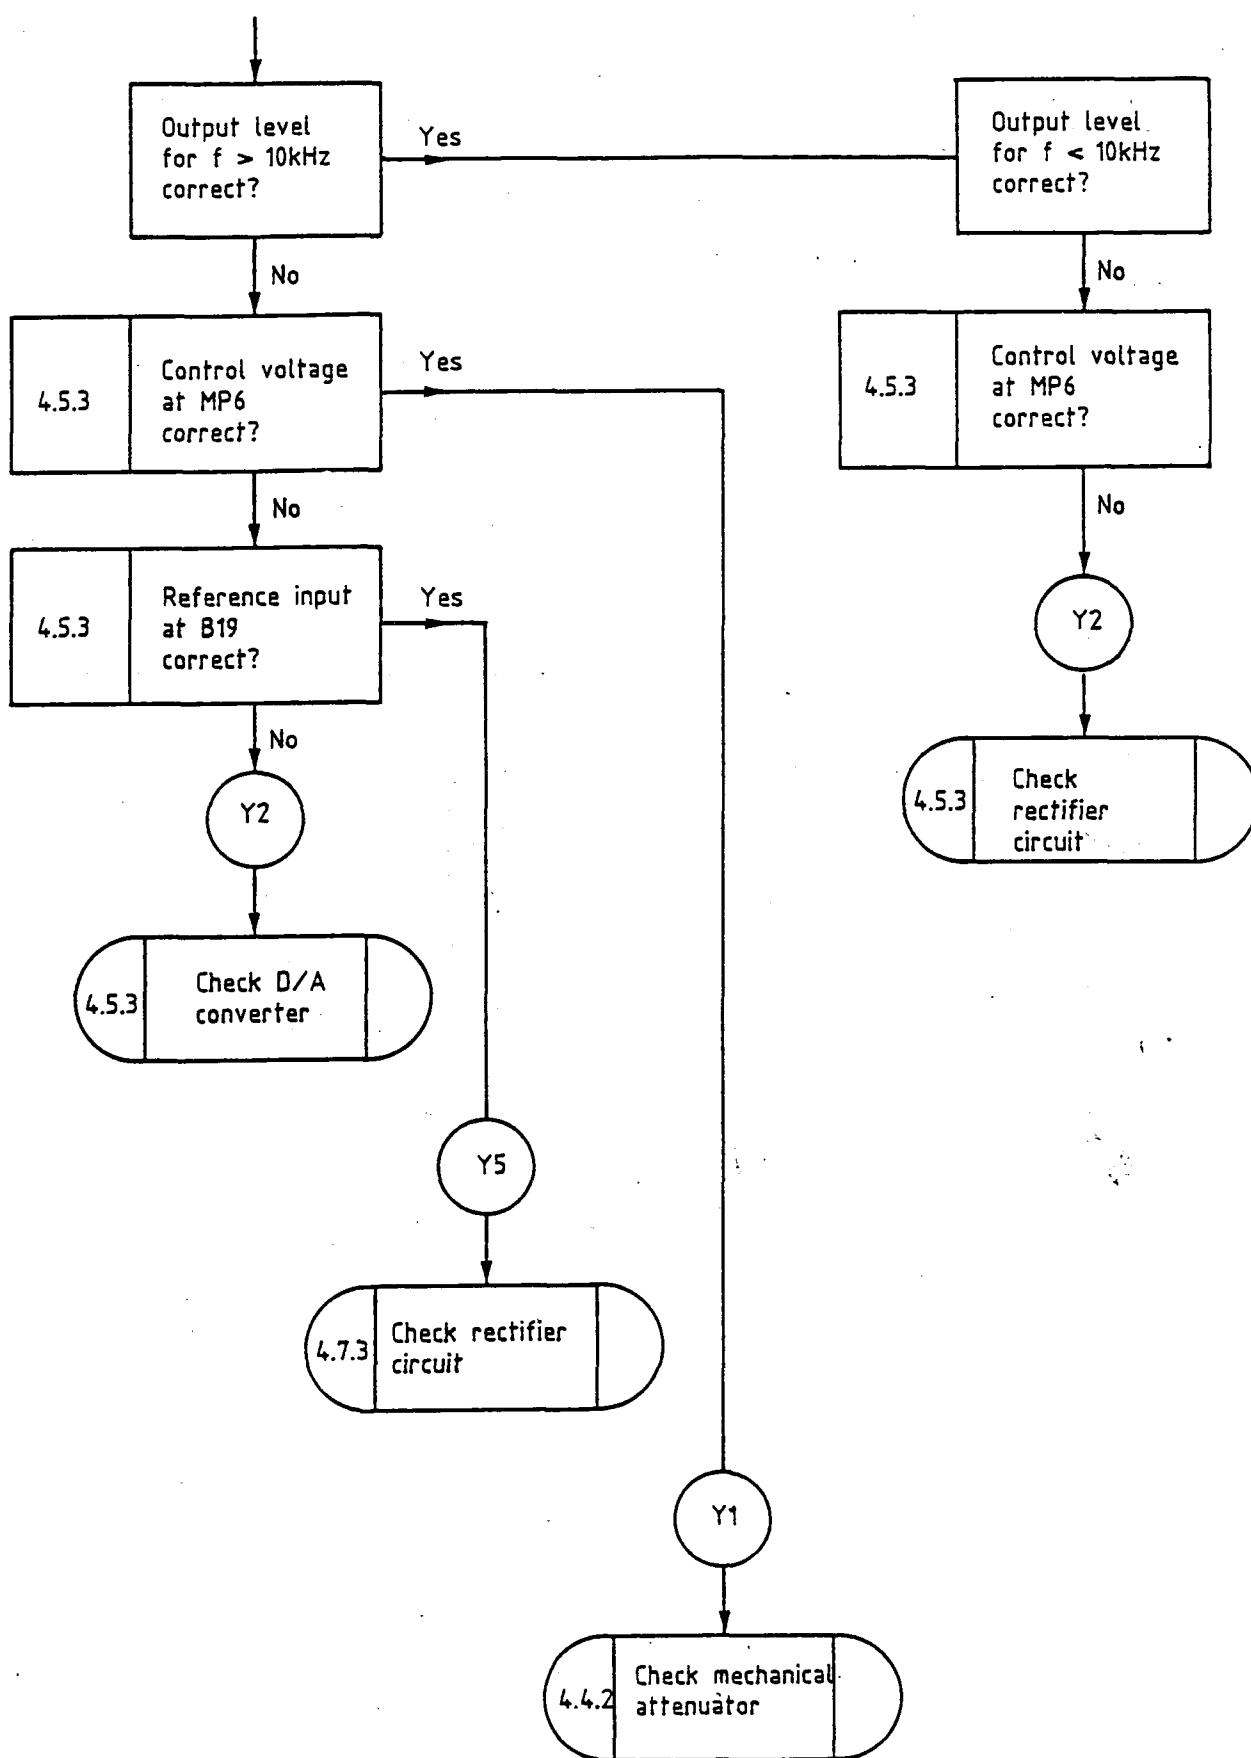

Table 4-1 Circuit boards

No.	Designation	Order No.
Y1	Control circuit and attenuator	392.7522
Y2	Frequency generator	392.7545
Y3	Frequency processor	392.7580
Y4	Display and keyboard	336.4015
Y5	10-V output stage	336.4038

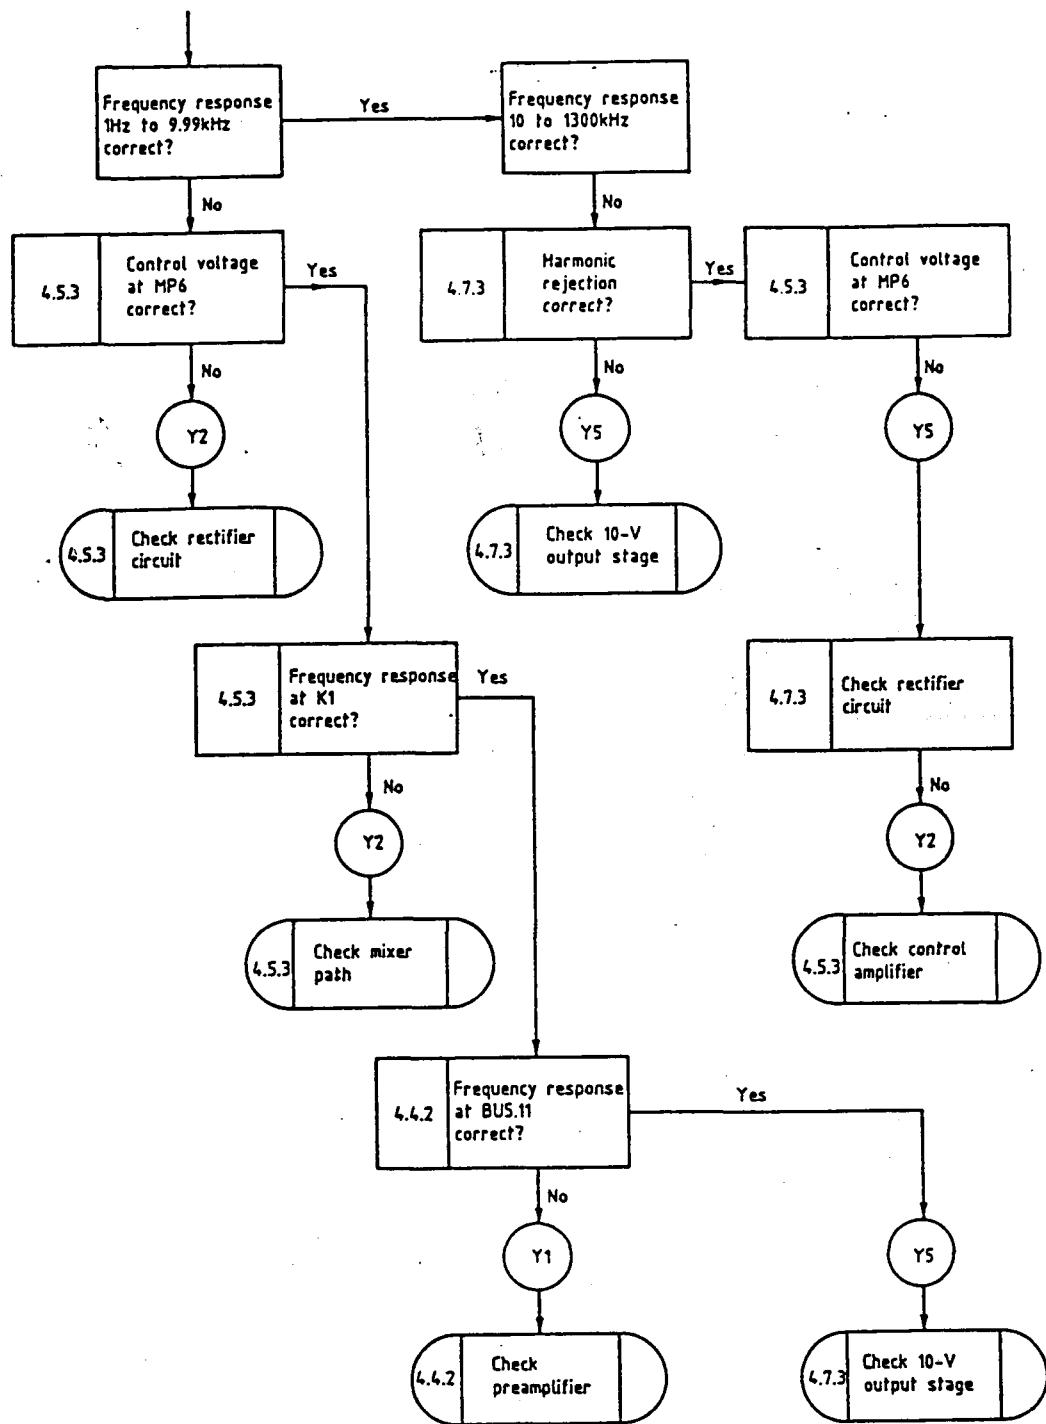

4.2.3.2 Wrong Output Frequency

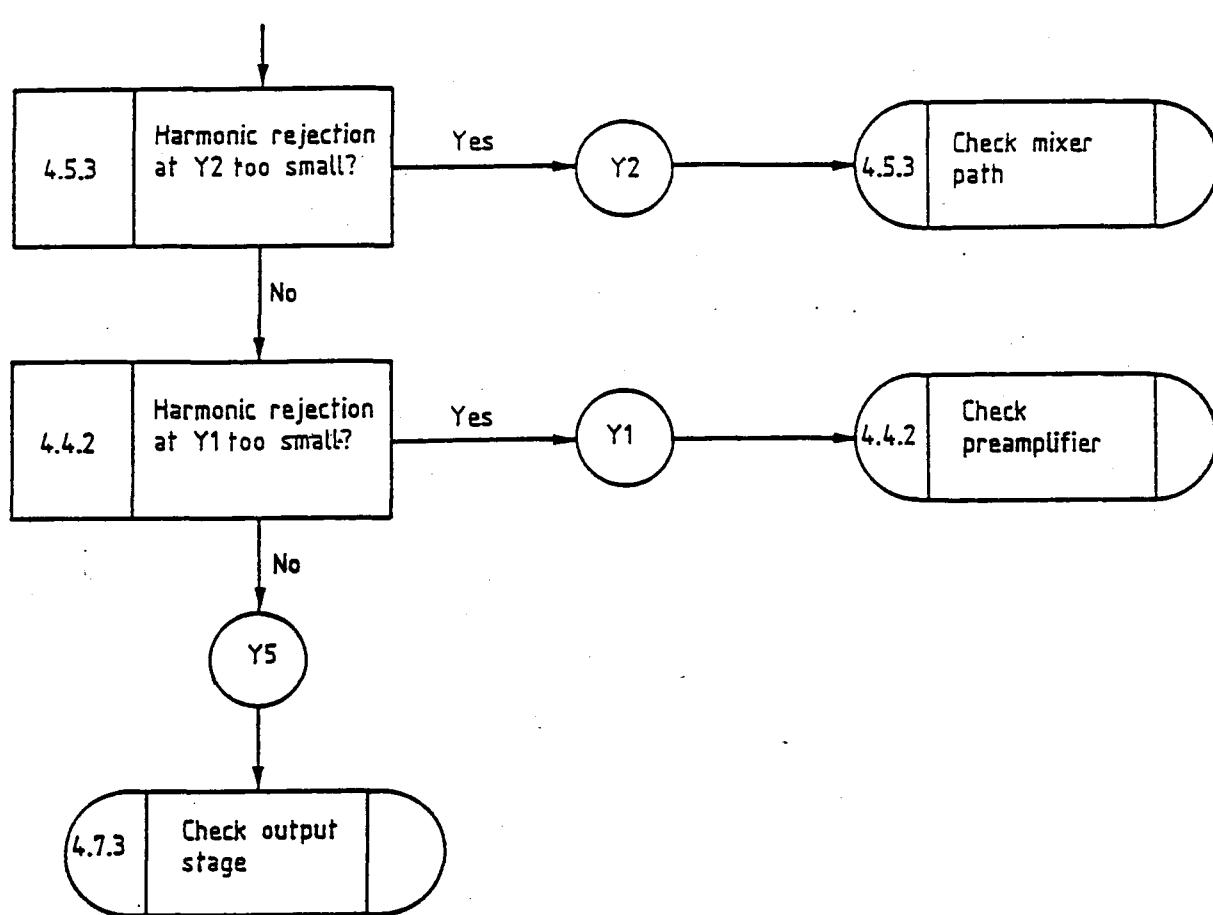

4.2.3.3 Wrong Output Level

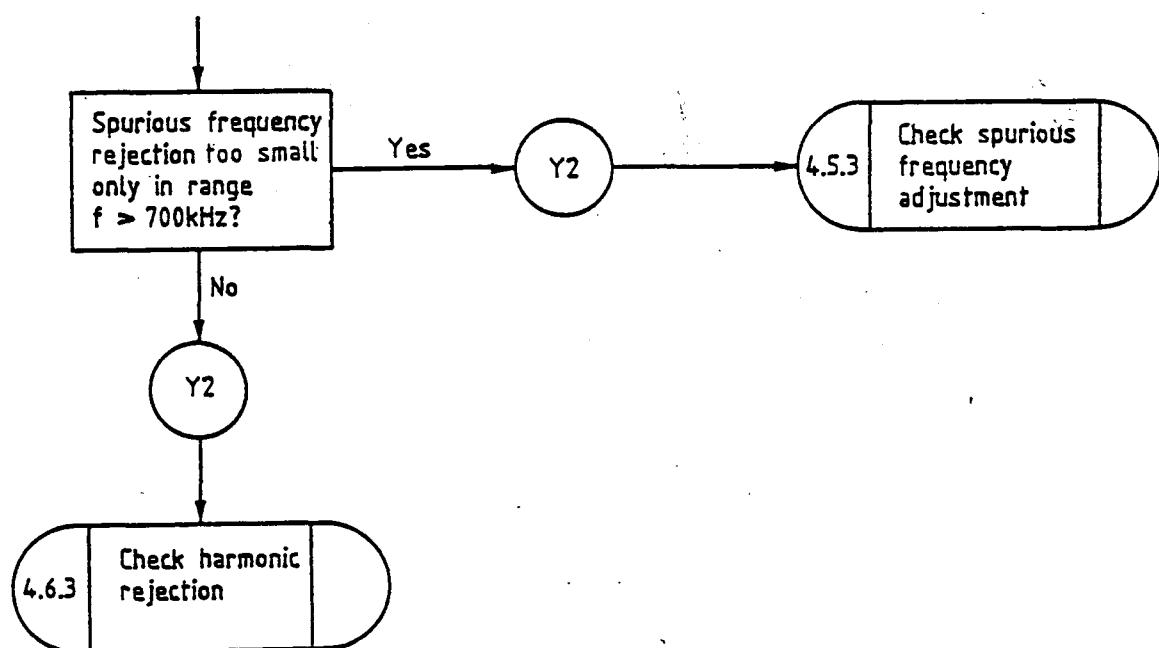

4.2.3.4 Excessive Frequency Response

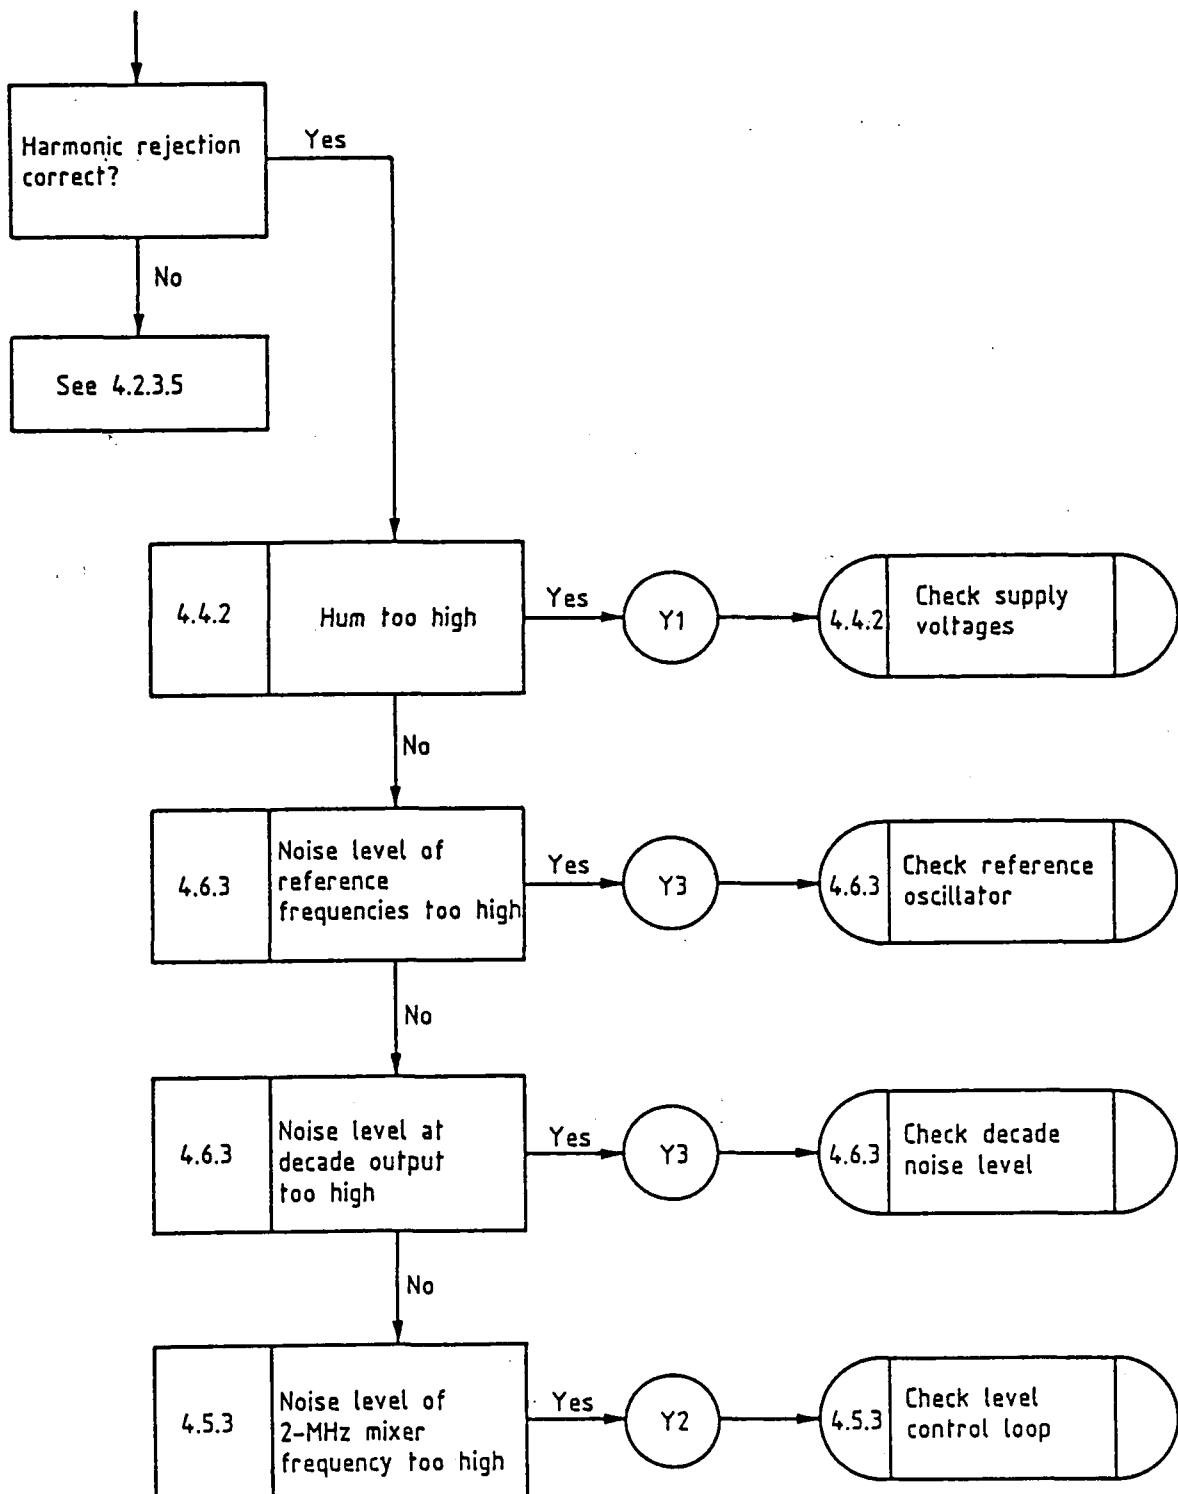

4.2.3.5 Insufficient Harmonic Rejection

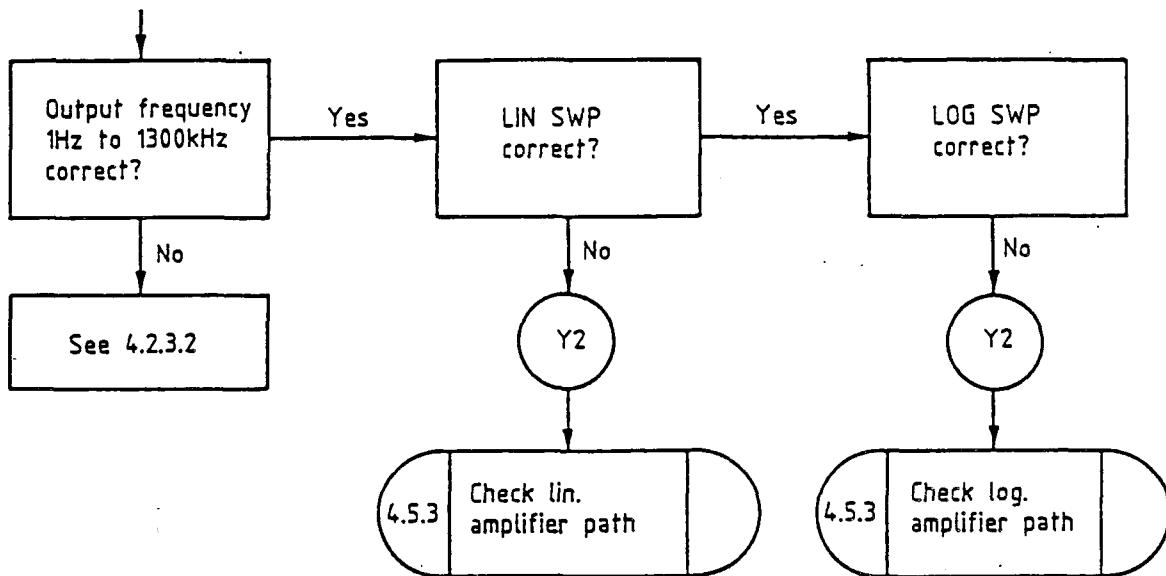

4.2.3.6 Insufficient Spurious Frequency Rejection

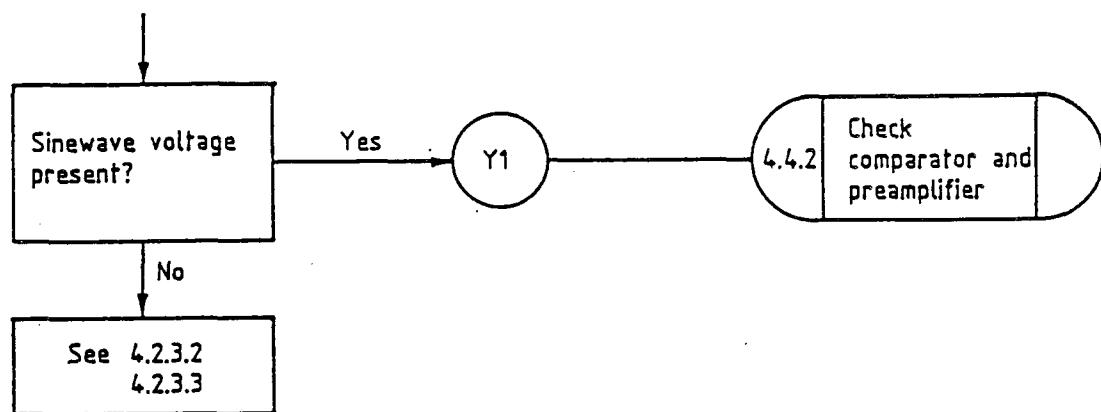

4.2.3.7 Excessive Distortion Factor

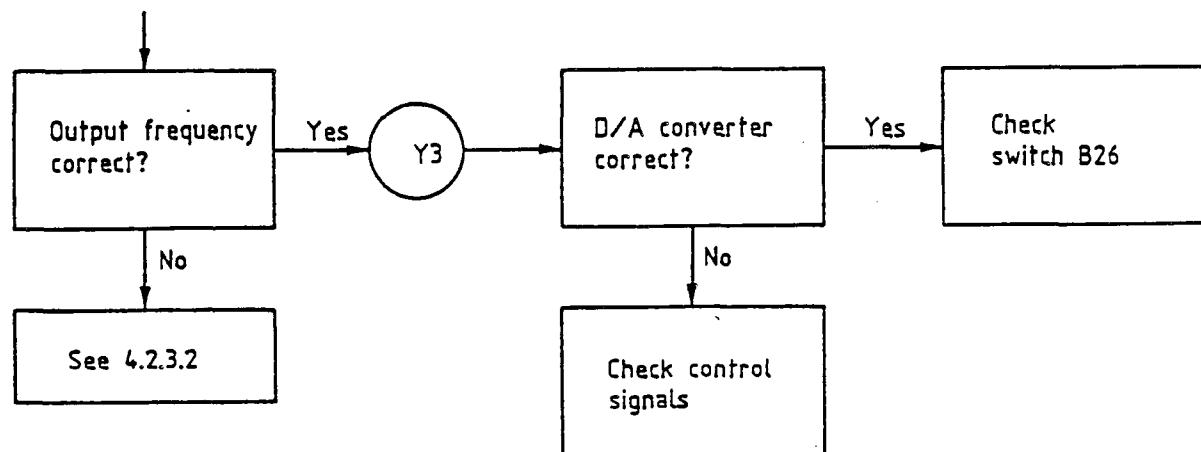

4.2.3.8 Faulty Sweep Operation

4.2.3.9 Faulty Squarewave Signal

4.2.3.10 Faulty Frequency-proportional DC Output Voltage

4.3 Display and Keyboard Y4 336.4015

4.3.1 Circuit Description

Board Y4 has the circuitry for the keys and the control knob for operation and adjustment, the associated LEDs indicating the selected mode as well as

- the 5-digit seven-segment readout indicating the selected frequency
- the 3-digit seven-segment readout indicating the selected level.

The keys and the drivers B10 and B11 as well as the transistors T1 to T9 driving the readouts and the LEDs are connected via ST1 and ST2 to the keyboard and display chip B25 on board Y1. The lines are driven and multiplexed by B25.

The quasi-continuous frequency and level adjustment is made with the aid of a control knob whose magnetic-detent disk is sampled by two Hall-effect chips (B14 and B15). The output signals are shifted 7.5° by phase and are taken via ST1 and ST2 to board Y1.

4.3.2 Troubleshooting and Checking

For checking see Section 3.2.1.

4.4 Control-circuit and Attenuator Board Y1 392.7522

4.4.1 Circuit Description

The control circuit and attenuator board Y1 accommodates the following sections:

- a) power supply
- b) sinewave preamplifier
- c) mechanical attenuator
- d) squarewave amplifier
- e) difference current sink for display and keyboard
- f) front-panel driving circuit
- g) microprocessor

a) Power supply

The power supply produces five DC voltages: three regulated voltages (+5 V, +15 V, -15 V) and two unregulated voltages (+32 V, -32 V) for the 10-V output stage Y5.

The +15-V and -15-V lines are regulated with the aid of fixed-voltage regulators, I.C.'s B7 and B8. The +5-V voltage source consists of the precision voltage regulator, IC B10, driver transistor T13 for current amplification and setting circuit T14. The voltage regulator (μ A 723) contains a reference source. The +5-V voltage is set by voltage divider R45 and R46.

All regulated voltages are protected against prolonged shortcircuit.

The fixed-voltage regulators contain a constant-current limiter and a circuit protecting against thermal overload.

b) Sinewave preamplifier

The preamplifier is designed as a DC-coupled cascode amplifier. To avoid a temperature-dependent drift in the differential amplifier, the thermally coupled FETs T3 and transistors B4I, B4II and B4III are used. In this way potential shifts which might be caused by direct coupling can be avoided. Due to variations of the drain-gate potential in T3, distortions may occur from changes in impedance. This is avoided by using a combined cascode-bootstrap circuit ensuring a constant drain-gate potential and thus distortion-free gain independent of impedance variations.

The output of the preamplifier is designed as a low-impedance push-pull class A stage using transistors T7 to T10. The output offset voltage is measured across the 10-V output stage Y5 and applied, via connector ST3a and lowpass filter R14/C4, to control amplifier B3. The control voltage obtained is superimposed onto the push-pull signal of the preamplifier and thus becomes effective at the input of the preamplifier.

c) Mechanical attenuator

The mechanical attenuator is connected between the 10-V output stage and the output of the instrument. It permits the output-stage signal to be attenuated by 70 dB in 10-dB steps.

The attenuator contains three sections 10 dB, 20 dB and 40 dB respectively, which are switched with relays RS1, RS2 and RS3. The output impedance and the level is switched at the attenuator output by means of RS4 and RS5.

The relays are driven by power driver B1.

d) Squarewave amplifier

The squarewave amplifier consists of comparator B5 coupled with high-impedance to the sinewave preamplifier output and of the output stage T11, T12. The output is shortcircuit-proof.

e) Difference current sink for display and keyboard Y4

The difference current sink B12 drives via transistor T15 the shunt transistor T16 which compensates via R50 to R55 load variations occurring by display multiplexing thus avoiding any disturbance of the +5-V supply.

f) Front-panel driving circuit

The IC B25 constitutes the interface between the microprocessor and the display and keyboard subassembly Y4. The display information is written into the RAM of B25. The interface automatically controls the output of the RAM content to the display in multiplex mode.

B26 decodes the three control outputs SLO to SL2 delivering periodical scan pulses for interrogating the keys. When a key is pressed, one of the scan pulses is through-connected on one of the return lines RL0 to 5. The data sent on the return line by the pressed key is stored in B25 as well as status data of the SL outputs. The two values stored yield the position code of the key which is read in to the microprocessor by an interrupt raised from a keystroke.

Turning the variation knob raises an interrupt. The phase-shifted pulses present at the input of B32 are evaluated in the ICs B32, B24, B33 and applied to microprocessor B14 via the output of B33. A HIGH signal at the output of B33 causes the displayed value to be increased and a LOW signal causes it to be reduced.

g) Microprocessor

The microprocessor B14 constitutes the heart of the digital control of Generator SPN. The data bus, the address bus and the control lines of the processor are buffered via ICs B15, B16, B19, B23 and B31. The reset input is connected to the +5-V supply via R63, R64 and C33 to ensure that the SPN starts from a defined state.

B18 performs the address decoding for RAM B22 and EPROMs B20, B21 and B35.

● Data transfer via the keyboard/display interface IC B25 is driven by the \overline{WR} , \overline{RD} , \overline{CS} , CD control lines. The data present at the output of B31 are transferred to subassemblies Y1, Y2 and Y3 with the strobe signals STR1 to STR7 enabled by B19. An interrupt causes microprocessor B14 to read data in via the bus. If the data are entered from the keyboard, the interrupt is sent by the keyboard/display interface IC B25. For IEC-bus data the interrupt is generated from D1 and B33.

4.4.2 Troubleshooting and Checking

a) Power supply

Measure the voltages at the test points listed under operating conditions and compare measured values to those of Table 4-2.

Table 4-2

Test point	Voltage
ST/BU 8	+5.15 V ± 0.15 V
ST/BU 7	+15 V ± 0.75 V
ST/BU 9	-15 V ± 0.75 V
ST 5.17	+32 V ± 3.0 V
ST 5.20	-32 V ± 3.0 V

● Measure the noise levels with the differential input of a floating oscilloscope or with a floating millivoltmeter and compare the values to Table 4-3.

Table 4-3

Voltage	Noise voltage (μV_{rms})
+5.15 V	≤ 3
+15 V	≤ 0.4
-15 V	≤ 0.4

b) Sinewave preamplifier

- Open link BU16.
- Apply a DC voltage to connector ST16 such that a DC voltage of 0 V is measured at ST5.11.
- Apply a 110-mV_{rms} sinewave signal of 1 Hz to 1300 kHz to input ST12.
- Measure the gain, distortion factor and harmonic rejection at ST5.11.

Gain \approx 10 dB

Distortion factor 1 Hz to 50 Hz \leq 0.045%
 50 Hz to 100 kHz \leq 0.025%
 100 kHz to 1300 kHz \leq 0.195%

Harmonic rejection 1 Hz to 100 kHz \geq 73 dB
 100 kHz to 1300 kHz \geq 57 dB

If these values are not obtained, check the DC values given in the circuit diagram.

c) Mechanical attenuator

Apply a sinewave voltage to ST5.8: $f_{out} = 1 \text{ kHz}$
 $V_{in} = 20 \text{ dBV} = 10 \text{ V}$
 $Z_{out} = 50 \Omega$

Check the attenuator with the control signals applied to port B2 in accordance with Table 4-4.

Table 4-4

Control signals at B2						Attenuation	Level at ST14
D5	D4	D3	D2	D1	D0		
X	0	1	0	0	0	0 dB	20 dBV = 10 V
X	0	1	0	0	1	-10 dB	10 dBV = 3.16 V
X	0	1	0	1	0	-20 dBV	0 dBV = 1 V
X	0	1	1	0	0	-40 dB	-20 dBV = 100 mV

Permissible error $\leq \pm 1\%$

For checking the output impedance see Section 3.2.8.

Table 4-5

Control signals at B2						Output impedance
D5	D4	D3	D2	D1	D0	
X	1	0	0	0	0	600 Ω
X	1	1	0	0	0	50 Ω
X	0	1	0	0	0	≈ 5 Ω

d) Squarewave amplifier

Setting up:

- Open link BU16.
- Apply a DC voltage to connector ST16 such that a DC voltage of 0 V is measured at ST5.11.
- Apply a 40-mV sinewave signal of 1 Hz to 1300 kHz to input ST12.

Checking: Connect an oscilloscope to ST15.

The duty cycle should be about 0.5.

Troubleshooting:
- Check the DC voltages in accordance with circuit diagram
- Check squarewave signal at pin 11 of B5.

e) Difference current sink for display and keyboard

Display on board Y4

8.888 kHz 8.88 V

$$Z_{out} = 50 \Omega$$

Measure the noise voltage at connector ST/BU10 using a floating microvoltmeter. Permissible value: ≤ 3 mV.

f) Microprocessor

When checking the microprocessor which constitutes a complex digital system, the signature analysis in the free-running mode is available as an aid for troubleshooting. In the free-running mode, the processor is made to cyclically scan its complete addressing range, the start/stop signals for the signature analyzer coming directly from the address bus.

Setting up:

- Set bridge BU31 such that contacts 1 and 2 are closed. Press any key on the keyboard. B16, B23 and B22 are inhibited. All the data lines are cyclically set to \emptyset via B17.
- Checking the CLOCK output B14, pin 37.
3-MHz clock signal with TTL level.
- Connect the signature analyzer to ST6.
- Set bridge BU32 such that contacts 1 and 2 are closed.

Setting the signature analyzer:

Compare the signatures on the address bus to those given in Table 4-6.

- Set bridge BU32 such that contacts 2 and 3 are closed.

Setting the signature analyzer:

Compare the signatures on the data bus to those given in Table 4-7.

At the end of the test, set bridge BU31 such that contacts 2 and 3 are closed.

Table 4-6

4.5 Frequency Generator Y2 392.7545

4.5.1 Circuit Description

The frequency generator board accommodates the following sections:

- a) synthesizer
- b) output mixer
- c) level control circuit with electronic attenuator
- d) LOG / LIN sweep amplifier

a) Synthesizer

The oscillator consists of transistor T102 with the tuned circuit L102, L103 and G1 101 to G1 104 plus G1 108, G1 109 and can be adjusted from 80.04 to 132 MHz. The oscillator frequency is divided in the programmable divider (B6, B7, B8, B9, B10, B11 and B12) by $M = 20010$ to 33000 and compared with the 4-kHz crystal-oscillator reference frequency (B15, B16) in the phase discriminator (B1). The derived voltage controls the oscillator, via the control amplifier (B2) and the lowpass filter, with crystal accuracy to the frequency determined by the division factor M and the reference frequency ($f_{oscill} = M \cdot f_{ref}$). The oscillator frequency is divided by 40 (B4, B5) and brought out at ST15.

b) Output mixer

The output mixer is designed as an active mixer (B21). After the lowpass filter (C41 to C45, L8 to L11), the low-distortion 2-MHz mixer frequency is applied to pin 3 of the mixer. The squarewave signal of 2.001 to 3.3 MHz is the oscillator signal for the mixer and is added at pins 2 and 9.

After the buffer amplifier (T2), the wanted signal is filtered from the mixture product and brought out at pin 8 of the lowpass filter (C60 to C73, L12 to L15); it is then taken to output K1 via buffer amplifier T3.

c) Level control circuit with electronic attenuator

Level control is performed by two independent control loops in order to obtain short transient responses even at low frequencies of output.

For output frequencies of up to 9.999 kHz, only the 2-MHz mixer frequency is controlled. A detector (R25, G1 6, C54, R26) is provided at the lowpass filter output for level measurement. The rectified voltage produced is compared

in the control amplifier (B19, B20) with a reference input (B22). The control voltage required to drive the setting circuit (B18) is thus obtained by switching B25 depending whether $f < 9.999$ kHz or $f > 10$ kHz.

For frequencies above 10 kHz the output signal is directly controlled. The detector is located at the output of the 10-V output stage Y5. After the voltage divider (R44, R45), the rectified signal is applied to the control amplifier (B19) and compared with the reference input (B22).

The reference input is the output signal of a D/A converter (B22) which permits level adjustment in 0.1-dB steps over 10 dB.

d) LOG / LIN sweep amplifier

The external sweep voltage applied to the input of the buffer amplifier (B26) is taken to switch B27 either directly for LIN SWP operation or via the LOG amplifier (B26) for LOG SWP operation and then amplified (B26).

The sweep voltage obtained controls the oscillator frequency via the varactors.

Diodes (G1 10 to G1 12) are used for logarithmic conversion of the sweep voltage.

4.5.2 Adjustment

4.5.2.1 Synthesizer

- Apply a 2-MHz TTL signal to ST16.
- Set the oscillator frequency of 80040 000 Hz (MP3) by applying the control signals to ports B13 and B14 in accordance with Table 4-8.
- Connect a DC voltmeter to ST4.
- Withdraw the core from oscillator coil L103 by rotating it.
- Rotate the core of coil L102 to adjust a DC voltage of 2.0 V at ST4.

Table 4-8

SPN setting	Port	Control byte								Division factor
		D7	D6	D5	D4	D3	D2	D1	D0	
1 Hz	B13	0	0	0	1	0	0	0	0	20010
	B14	0	1	1	1	1	1	0	1	

4.5.2.2 Output Mixer

- Open link BU5.
- Apply a 2-MHz TTL signal to ST16.
- Apply a 3.3-MHz TTL signal to ST17.
- Connect an AF spectrum analyzer and an RF voltmeter to output K1.
- By varying the DC voltage at MP5.1, adjust the level of the 2-MHz signal such that a voltage of 300 mV_{rms} is indicated on the RF voltmeter.
- Use potentiometer R111 to adjust the spurious signal at 700 kHz to minimum.

4.5.3 Troubleshooting and Checking

a) Synthesizer

- Apply a 2-MHz TTL signal to ST16.
- Connect a frequency counter to ST15 and check the frequency with the control byte applied to ports B13 and B14 in accordance with Table 4-9.

Table 4-9

SPN setting	Port	Control byte								Division factor	Frequency Hz
		D7	D6	D5	D4	D3	D2	D1	D0		
1300 kHz	B13	0	1	0	0	0	0	0	0	33000	3300000
	B14	1	1	0	0	1	1	1	0		
63.7 Hz	B13	1	1	1	1	0	1	1	1	20637	2063700
	B14	1	0	0	0	0	0	0	0		
32.8 Hz	B13	0	0	0	0	1	0	0	0	20328	2032800
	B14	0	1	1	1	1	1	1	1		
1 Hz	B13	0	0	0	1	0	0	0	0	20010	2001000
	B14	0	1	1	1	1	1	0	1		

The frequency accuracy is determined by the 2-MHz signal at ST16. If the values specified are not obtained, check DC voltages given in the circuit diagram and the division factor M of the programmable divider.

b) Output mixer

- Open link BU5.
- Apply a 2-MHz TTL signal to ST16.
- Connect an AF spectrum analyzer and an RF voltmeter to output K1.
- By varying the DC voltage at MP5.1, adjust the level of the 2-MHz signal for every frequency variation of the TTL signal such that a voltage of 300 mV is indicated on the RF voltmeter.
- Check the harmonic and spurious-frequency rejection using the AF spectrum analyzer.

Nominal values:

Harmonics 1 Hz to 100 kHz down \geq 73 dB
 100 kHz to 1300 kHz down \geq 57 dB

Spurious frequencies up to 700 kHz down \geq 70 dB
 700 kHz to 1300 kHz down \geq 65 dB

If the values specified are not obtained:

- Check the attenuation of the lowpass filter (C60 to C73, L12 to L15).
Maximum attenuation \leq 10 dB.
- Compare DC voltage values with those given in the circuit diagram.
- Check the adjustment of potentiometer R111.

c) Level control circuit with electronic attenuator

- Apply a 2-MHz TTL signal to ST16.
- Apply a 2.001-MHz TTL signal to ST17.
- Connect an RF voltmeter to output K1.
- Adjust R112 to mid-position.
- Use R99 to adjust a DC voltage of 10.2 V at MP9 using control byte at ports B23 and B24 in accordance with Table 4-10.
- With the control byte applied in accordance with Table 4-11, check the voltage at MP9 and pin 14 of B19. The two voltages must have the same value.
- Check the variation of the output level at output K1.

Table 4-10

SPN setting	Port	Control byte								Voltage at MP 9
		D7	D6	D5	D4	D3	D2	D1	D0	
10 V	B23	X	1	X	1	1	1	1	1	10.2 V
	B24	1	1	1	1	1	1	1	1	

Table 4-11

SPN setting	Port	Control byte								Voltage at MP 9 and pin 14/B19
		D7	D6	D5	D4	D3	D2	D1	D0	
3.8 mV	B23	X	1	X	0	0	1	0	0	3.88 mV
	B24	0	1	1	0	0	0	0	1	
6.2 mV	B23	X	1	X	0	1	0	1	1	6.33 mV
	B24	1	0	0	1	1	1	1	0	

d) LOG / LIN sweep amplifier

LIN

- Connect a frequency counter to ST15.
- Select LIN SWP and apply the control byte in accordance with Table 4-12 to port B23.
- Apply a signal of 0 V to ST12.13.
- Use potentiometer R84 to adjust a frequency of about 2 MHz.
- Increase voltage at ST12.13 to 1.3 V.
- Use potentiometer R110 to adjust a frequency of about 3.3 MHz.
- Repeat this adjustment several times since the adjustments affect each other.
- Vary the voltage at ST12.13 and make sure that the frequency varies linearly.
Nominal value: linearity $\pm 5\%$.

LOG

- Select LOG SWP and apply the control signal in accordance with Table 4-12 to port B23.
- Apply a signal of 0 V to ST12.13.
- Use potentiometer R71 to adjust a frequency of about 2 MHz.
- Increase the voltage at ST12.12 to 1.3 V and use potentiometer R87 to adjust a frequency of 3.3 MHz.
- Vary the voltage at ST12.13 and make sure that the frequency varies logarithmically.
Nominal value: deviation $\pm 8\%$.

Table 4-12

SPN setting	Port	Control byte								SWP mode
		D7	D6	D5	D4	D3	D2	D1	D0	
SWP LOG	B23	X	0	0	X	X	X	X	X	LIN
		X	0	1	X	X	X	X	X	LOG

If errors occur, compare DC values with those given in the circuit diagram.

4.6 Frequency Processor Y3 392.7580

4.6.1 Circuit Description

The frequency processor board accommodates the following sections:

- a) crystal oscillator
- b) frequency decades
- c) D/A converter
- d) Reference frequency

a) Crystal oscillator

The crystal oscillator (B1) operates at the frequency of 18 MHz. The accurate frequency value can be set with C4 and R99.

The reference frequencies of 18 MHz and 2 MHz are derived from the oscillator frequency.

A hex inverter (B2) used as a buffer amplifier at the output of the crystal oscillator routes the 18-MHz reference frequency to the frequency decades.

The 2-MHz reference frequency is obtained in B3 and B4 by division and is taken to BU16.

b) Frequency decades

Three practically identical frequency decades are used. These decades are switched on and off by B6, B11, B16 and B21 depending on the frequency selected and the signal is then applied via amplifier T7 to output BU17.

Depending on the decade (control line D1), the signal is divided at the output by voltage divider R80, R111. This ensures level matching of the switching voltage for the output mixer (Y2).

The frequency decades ensure a high resolution and low spurious FM.

In the first decade, the signal of 2.13 to 3.3 MHz is taken from BU15 via switch B6 and lowpass filter C14 to C17, L5 to L7 to the mixer input (B8). The 18-MHz reference frequency is applied as the local frequency via switch B7 to the second mixer input.

After the 4-section bandpass filter (C26 to C36, L8 to L11), the mixed signal of 20.13 to 21.3 MHz is boosted to TTL level by comparator (B9) and its frequency is divided by 10 (B10).

The resolution of the frequency obtained (2.013 to 2.13 MHz) is 10 times finer and the spurious FM is reduced by the factor of 10.

Depending on the frequency range, the same processing is repeated in the other two frequency decades.

c) D/A converter

The D/A converter (B24) delivers a frequency-proportional DC output voltage.

The frequency data is stored in the two latches (B22, B23) and taken to the D/A converter (B24).

The analog switch B26 disconnects the frequency-proportional voltage at the output when the sweep mode is in use.

4.6.2 Adjustment

4.6.2.1 Crystal Oscillator

The adjustment is to be made at normal ambient temperature after the oscillator has been operated at this temperature for a period of about half an hour.

Connect a DC voltmeter to BR1 INT. Adjust potentiometer R96 for a voltage of 1.8 V.

Connect a frequency counter to test point MP4 and use C4 to adjust the 18-MHz frequency with the subassembly being in its normal position.

The permissible deviation is ± 18 Hz.

4.6.3 Troubleshooting and Checking

a) Crystal oscillator

BR1 must be in position INT.

Use a frequency counter to check the reference frequencies at MP4 (18 MHz), BU16 (2 MHz) and ST3 (1 MHz).

Change BR1 to position EXT.

Feed to ST2 a 1-MHz signal with 0.2 to 2 V.

Measure the frequency at ST3 using a frequency counter.

The frequency accuracy must correspond to that of the signal applied.

Vary the frequency at ST2 by $\pm 5 \times 10^{-5}$.

The voltage at ST1 must be between 0.2 and 4.2 V.

Change BR1 over to position INT.

b) Frequency decades

- Apply a 3.3-MHz TTL signal to BU15.
- Connect a frequency counter to BU17.
- Apply the control data to port B5 in accordance with Table 4-13 and check the frequency.

Table 4-13

SPN setting	Port	Control data				Frequency kHz
		D4	D3	D2	D1	
1300 kHz	B5	0	0	0	0	3300
130 kHz		0	0	0	1	2130
13 kHz		0	0	1	1	2013
1.3 kHz		0	1	1	1	2001.3

- Apply a TTL signal in accordance with Table 4-14 to BU15.
- Apply the control data to port B5 in accordance with Table 4-14 and check the frequency.

Table 4-14

SPN setting	Port	Control data				Frequency kHz
		D4	D3	D2	D1	
130.10 kHz	B5	0	0	0	0	2130100
13.01 Hz		0	0	0	1	2130100
1.301 Hz		0	0	1	1	2130100
1 Hz		0	1	1	1	2001000

Apply an AF spectrum analyzer to output BU17.

- Apply a TTL signal of 2 to 3.3 MHz to BU15.
- Apply the control data to port B5 in accordance with Table 4-15 and check the spurious frequency rejection using the AF spectrum analyzer.
Spurious frequency rejection: down ≥ 70 dB.

Table 4-15

SPN setting	Port	Control data				Frequency kHz
		D4	D3	D2	D1	
130.1 kHz to 1300 kHz	B5	0	0	0	0	130.1 to 1300
13.01 kHz to 130 kHz		0	0	0	1	13.01 to 130
1.301 kHz to 13 kHz		0	0	1	1	1.301 to 13
1 Hz to 1.3 kHz		0	1	1	1	0.001 to 1.3

If the values given are not obtained, check switches and levels at the comparator inputs.

c) D/A converter

- Apply the control byte to ports B22 and B23 in accordance with Table 4-16.
- Connect a DC voltmeter to pins 3, 4 of B26.
- Use potentiometer R82 to adjust a voltage of 1.3 V.

Table 4-16

SPN setting	Port	D7	D6	D5	Control byte				D0	Voltage at pins 3, 4 of B26
					D4	D3	D2	D1		
1 SWP										
SWP OFF	B22	1	1	1	1	1	1	1	1	
LOG OFF										
1.300 kHz	B23	1	1	1	X	X	X	X	1	1.3 V

- With the control byte applied to ports B22 and B23 in accordance with Table 4-17 check the voltage at pins 3, 4 of B26.

Table 4-17

SPN setting at SPN	Port	D7	D6	D5	Control byte				D0	Voltage at pins 3, 4 of B26
					D4	D3	D2	D1		
1 SWP										
SWP OFF										
LOG OFF

	B23	1	1	0	X	X	X	X	0	
1 Hz	B22	0	0	0	0	0	0	0	0	0 V
	B23	0	0	0	X	X	X	X	0	

4.7 10-V Output Stage Y5 336.4038

4.7.1 Circuit Description

On the 10-V output stage board, the signal from the control circuit and attenuator is boosted by about 20 dB to the maximum level of 10 V to be made available at the SPN output. The amplifier consists of a differential pre-amplifier (B1), a current mirror (T22, T24, T25, T44, B20) for the output stage and the output stage (T40 to T43).

R21 is used to adjust the quiescent current of the VMOS transistors (T42, T43) such that the harmonic rejection is of a sufficient level (> 70 dB at 100 kHz). The power dissipation thus produced is so great that cooling via the rear junction panel is necessary. A good harmonic rejection is obtained for the output signal by the feedback loop (R6, R5) covering the entire amplifier stage. Ahead of the resistors (R24, R25, R47, R48) constituting the 50- Ω output impedance, the diode (G1 50) measures the output signal. The lowpass filter (R55; C52) is provided to determine the DC offset.

The rectified voltages produced are applied to the positive inputs of the double amplifier (B50I, B50II) and are routed to Y1 and Y2 via BU5.3 and BU5.4.

The fixed-voltage regulators (B60, B61) provide for the regulation of the +24-V and -24-V supplies for the 10-V output stage.

4.7.2 Adjustment

- Apply a low-distortion 100-kHz signal of 1 V to input BU5.11 (distortion < 0.02 %).
- Connect a distortion meter to output BU5.8.
- Starting from the righthand stop, turn potentiometer R21 slowly anticlockwise until the minimum distortion factor is obtained.

4.7.3 Troubleshooting and Checking

- Apply a 1-V signal between 1 Hz and 1300 kHz to BU5.11.
- Connect an RF millivoltmeter to BU5.8 and check the gain.
Gain = 20 dB
- Connect an AF spectrum analyzer to BU5.8 and check the harmonic rejection.
Harmonics 1 Hz to 100 kHz down \geq 70 dB
 100 kHz to 1300 kHz down \geq 54 dB
- Apply a 100-kHz signal to BU5.11 and vary the level between 300 mV and 1 V.

- Connect a DC voltmeter to BU5.4 and check whether the DC voltage follows the level of the input signal.
- Apply a DC voltage between 0 and 500 mV to BU5.11 and check with a DC voltmeter connected to BU5.3 whether the DC voltage follows the level of the input signal.

If the values specified are not obtained, compare DC values with those given in the circuit diagram.

4.8 IEC-Bus

4.8.1 Circuit Description

The SPN has the following interface functions combining with IEC 625-1/IEEE 488:

T6 talker (basic talker version with serial poll; unaddressing if MLA)
L4 listener (basic listener version; unaddressing if MTA)
RL1 remote/local
DC1 device clear
SR1 service request

The IEC interface 8291A (D1) controls all the functions via bidirectional drivers (D2 to D5).

The complex peripheral (D1) connects the microprocessor data bus to the IEC-625 interface mounted on the rear panel of the instrument. Data transfer in both directions is interrupt-controlled via the 16 internal write and read registers of the IEC-bus IC. The 8 data lines, 5 control lines and 3 handshake lines are connected by means of drivers D2 to D5 to the standard IEC-bus connector on the rear panel with the aid of cables K3 and K4.

The IEC-bus address is set with switch S20 and read in from port B22 (on Y1) when the SPN is switched on.

4.8.2 Troubleshooting and Checking

First check the functioning of the display and keyboard subassembly in accordance with 3.2.1. Set the correct device address (11).

Functioning of remote control and data output via the IEC bus:

- Connect the IEC-bus controller to the IEC-bus connector of the SPN.

Check all the functions of the instrument with the aid of the setting instruction in accordance with Table 2-5 (Section 2.4.4.).

Checking the indication of the remote mode:

LISTEN, TALK, REMOTE LEDs

Checking the LOCAL mode:

- Set the SPN to the REMOTE mode by addressing it as listener via the IEC-bus controller (without sending the instruction LLO = LOCAL LOCKOUT).

- Check that REMOTE and LISTEN LEDs light up.

After the LOCAL key has been pressed, the SPN should return to the LOCAL mode, i.e. manual operation.

- Check that the REMOTE indicator extinguishes.

- Set the SPN to the REMOTE mode by addressing it as listener via the IEC-bus controller.

- Send the LLO (LOCAL LOCKOUT) instruction.

After the LOCAL key has been pressed, the SPN must not return to the LOCAL mode.

4.9 Balun SPN-Z1 265.4319.02

4.9.1 Circuit Description

The Balun makes it possible to obtain a balanced-to-ground output voltage from the SPN. Depending on the transformation ratio, the output impedance is reduced as follows:

$$Z_{\text{out}} = \frac{Z_{\text{SPN}}}{10} + 15 \quad [\Omega]$$

The Balun is protected against stray magnetic field by a μ -metal shielding can.

All the connectors are located on the front panel.

4.9.2 Troubleshooting and Checking

Symmetry of the secondary winding:

- Apply a 0.9-V signal at 30 Hz, 1 kHz, 20 kHz, 30 kHz, 100 kHz (output impedance of Generator 50 Ω).
- Ground the centre tap (open at 100 kHz).
- Terminate the output of the balun with 150 Ω, 1 kΩ, no load in turn. At 100 kHz, $2 \times 300 \Omega \pm 0.5\%$ grounding the centre of the resistors.
- Use an AF millivoltmeter to measure the potential at both ends of the secondary with respect to ground.

Potential difference at:

30 Hz < 0.1 dB
1 kHz < 0.1 dB
20 kHz < 0.2 dB
30 kHz < 0.3 dB
100 kHz < 0.5 dB

Distortion factor:

- Apply a signal at 30 Hz, 10 V/50 Ω.
- Ground the centre tap.
- Terminate the output of the balun with 150 Ω.
- Connect a distortion meter to the output and check the distortion factor. Nominal value: < 0.2%.

Check the frequency response of the output voltage with all permissible loads, referred to 1 kHz.

Frequency response flatness up to 30 kHz < ±0.2 dB

100 kHz < ±1 dB

- Check the crosstalk of stereo multiplex signals using a stereocoder.

Crosstalk

for L or R signal < 0.5 %
at "100 Hz to 15 kHz"

for L or R signal ≈ 1 %
at "40 Hz"

Schaltteillisten
numerisch geordnet
Parts lists
in numerical order

R&S-Schlüsselliste

Die R&S-Schaltteillisten nennen in der Spalte "Benennung/Beschreibung" die technischen Daten der Bauelemente in Kurzform. Die Art des Bauelements (z. B. Schicht-, Draht-Widerstand usw.) beschreiben die 2 Kennbuchstaben vor der "Benennung" (evtl. auch vor der "Sachnummer"), die nachfolgend erklärt werden. In Ersatzteil-Bestellungen an R&S ist stets die Angabe der vollständigen Sachnummer erforderlich.

R&S key list

The R&S Parts Lists give the technical data of the components in short form in the column "Benennung/Beschreibung" (designation). The type of component (e.g. depos.-carbon resistor, wire-wound resistor etc.) is indicated by 2 identification letters before the designation, possibly also before the "Sachnummer" (order number), which are explained below. When ordering spare parts from R&S, the complete order number must always be specified.

Liste des symboles de référence R&S

La colonne «Désignation/description» des listes de pièces de R&S indique les caractéristiques des éléments sous forme abrégée. Le type d'élément (p. ex. résistance à couche, résistance bobinée etc...) est décrit par les deux lettres précédant la désignation (et éventuellement le numéro de référence), dont voici l'explication. Prière d'indiquer le numéro de référence («Sachnummer») complet dans toute commande de pièces de rechange.

Kennbuchst	Art des Bauelementes	Identif.-letter	Type of component	Symbole	Type d'élément
A	Aktive Bauelemente, Halbleiter	A	Active components, semiconductors	A	Composants actifs, semiconducteurs
AD	Universaldiode, z.B. Gleichrichter, Sperrdiode	AD	General-purpose diode, e.g. rectifier, high-resistance diode	AD	Diode d'usage général, p.ex. redresseur, diode à haute resistance
AE	Spezialdiode, z.B. Tunnel-, Kapazitäts-, Zener-Diode	AE	Diode (special), e.g. tunnel diode, varactor, Zener diode	AE	Diode spéciale, p.ex. diode tunnel, varactor, diode Zener
AF	Fotoelement, z.B. Foto-Diode, -Transistor, -Widerstand, Leuchtdiode	AF	Ligh-sensitive component, e.g. resistor, diode, transistor; LED	AF	Composant photoélectrique, p.ex. diode, transistor, resistance photoél., D.E.L.
AG	Leistungs-Gleichrichter, z.B. Thyristor, Triac, Selengleichrichter	AG	Power rectifier, e.g. thyristor, triac, selenium rectifier	AG	Redresseur de puissance, p.ex. thyristor, triac, redresseur au sélénium
AK	Kleinsignal-Transistor	AK	Low-power transistor	AK	Transistor faible puissance
AL	Leistungs-Transistor	AL	High-power transistor	AL	Transistor grande puissance
AM	Spezial-Transistor, z.B. FET, MOSFET	AM	Transistor (special), e.g. FET, MOS-FET	AM	Transistor spécial, p.ex. TEC, MOSTEC
AP	Peltier-, Hall-Element	AP	Peltier element, Hall element	AP	Element Peltier, élément Hall
AR	Röhre für Empfänger, Verstärker, Gleichrichter	AR	Valve for receiver, amplifier, rectifier	AR	Tube pour récepteur, amplificateur, redresseur
AS	Spezialröhre, z.B. Senderöhre, EW-Widerstand, Stabilisator	AS	Valve (special), e.g. for transmitter, barettter, ballast valve	AS	Tube (spécial), p.ex. pour émetteur, résistance fer-hydrogène, ballast
AT	Katodenstrahlröhre, z.B. Bildröhre, Ziffern-Anzeigeröhre	AT	Cathode ray tube, e.g. picture tube, digital indicator tube	AT	Tube à rayon cathodique, p.ex. tube à image, tube à affichage numérique
AW	Spannungs- oder temperaturabhängiger Widerstand	AW	Voltage- or temperature-dependent resistor	AW	Varistance ou thermistance
B	Bausteine	B	PC boards, chips	B	Cartes imprimées, puces
BC	Integr. Schaltkreis (Microcomp.)	BC	Integrated circuit (interface, A/D)	BC	Circuit intégré (microprocesseur)
BD	R&S-Dünnenschichtschaltung	BD	R&S thinfilm circuit	BD	Circuit à couche mince R&S
BG	Gerätebaugruppe	BG	Subassembly	BG	Sous-ensemble
BJ	Integr. Schaltkreis (Interface, A/D-Wandler)	BJ	Integrated circuit (interface, A/D converter)	BJ	Circuit intégré (interface, convertisseur A/N)
BK	Kernspeicher, Magnetspeicher	BK	Core memory, magnetic memory	BK	Mémoire à tores, mémoire magnétique
BL	Log. Schaltkreis z.B. DTL, TTL, HTL, ECL, C-MOS	BL	Logic circuit, e.g. DTL, TTL, HTL, ECL, C-MOS	BL	Circuit logique, p.ex. DTL, TTL, HTL, ECL, C-MOS
BM	Hybridbaustein, z.B. Mischer, Tuner, Modulator	BM	Hybrid chip, e.g. mixer, tuner, modulator	BM	Puce hybride, p.ex. mélangeur, tuner, modulateur
BO	Anologschaltkreis, z.B. Operationsverstärker	BO	Analog circuit, e.g. operational amplifier	BO	Circuit analogique, p.ex. amplificateur opérationnel
BP	Optobausstein, z.B. Anzeigeeinheit, Koppler	BP	Optoelement, e.g. display, coupler	BP	Elément optique, p.ex. afficheur, coupleur
BS	Schalt- und Steuerbaustein, elektronischer Sensor	BS	Switching and control modul, electronic sensor	BS	Modul de commutation et de commande, sonde électronique
BV	Stromversorgung, Übersp.-Schutz	BV	Power pack, protective circuit	BV	Alimentation, protection surcharge

Kennbuchst.	Art des Bauelementes	Identif.-letter	Type of component	Symbole	Type d'élément
C	Kondensatoren	C	Capacitors	C	Condensateurs
	Bypass-, Durchf.-Kondensator	CB	Bypass capacitor, feed-through capacitor	CB	Condensateur bypass, condensateur de traversée
CC	Keramischer Kondensator	CC	Ceramic capacitor	CC	Condensateur céramique
CD	Drehkondensator	CD	Variable capacitor	CD	Condensateur variable
CE	Elektrolytkondensator	CE	Electrolytic capacitor	CE	Condensateur électrolytique
CG	Glimmerkondensator	CG	Mica capacitor	CG	Condensateur au mica
CH	Sperrsichtkondensator	CH	Semiconductor capacitor	CH	Condensateur semiconducteur
CK	Kunstfolienkondensator	CK	Synthetic-foil capacitor	CK	Condensateur à feuille synthétique
CL	Ker. Hochsp.-Kondensator	CL	HV capacitor (ceramic)	CL	Condensateur HT céramique
CM	Metallpapier-Kondensator	CM	MP capacitor	CM	Condensateur à papier métallisé
CN	Kondensatornetzwerk	CN	Capacitor network	CN	Réseau capacitif
CP	Papierkondensator	CP	Paper capacitor	CP	Condensateur au papier
CS	Störschutzkondensator	CS	Interference-suppression capacitor	CS	Condensateur anti-parasite
CT	Trimmkondensator	CT	Trimmer capacitor	CT	Condensateur ajustable
CV	Vakuum-Kondensator	CV	Vacuum capacitor	CV	Condensateur à vide
D	Drähte, Leitungen	D	Wires, lines	D	Fils, lignes
DD	Schalt- und Wickeldraht	DD	Hook-up or winding wire	DD	Fil de câblage, fil de bobinage
DF	Flachleitung, Litze	DF	Flat multiple line, stranded wire	DF	Ligne plate, ligne torsadée
DG	Abgeschirmte Leitung	DG	Shielded line	DG	Ligne blindé
DH	Koaxialkabel	DH	Coaxial line	DH	Ligne coaxiale
DN	Antenne	DN	Antenna	DN	Antenne
DS	Anschlußkabel (mehradrig)	DS	Connecting cable, multicore	DS	Câble de connexion (multiconducteur)
E	Elektrische Teile	E	Electric parts	E	Organes électriques
EB	Blei-, NC-Akku, Batterie	EB	Lead or alkaline accumulator, battery	EB	Accumulateur Pb/NC, batterie
EF	Glühlampe, Leuchte	EF	Incandescent lamp, pilot lamp	EF	Lampe à incandescence, voyant
EG	Glimmlampe, Entladungslampe	EG	Glow lamp, discharge lamp	EG	Lampe à luminescence, lampe à décharge
EK	Kontakt-Streifen, -Feder	FK	Contact clip, contact spring	EK	Lame de contact, ressort de contact
EL	Lautspr., Kopfhörer, Mikrofon	EL	Loudspeaker, headphones, microphone	EL	Haut-parleur, casque, microphone
EM	Motor, Hubmagnet, Drehfeldsystem	EM	Motor, lifting magnet, synchro system	EM	Moteur, électro- aimant de levage, système synchro
EO	Oszillator, z.B. Quarzoszillator	EO	Oscillator, e.g. crystal oscillator	EO	Oscillateur, p.ex. oscillateur à quartz
EP	Tief-, Band-, Hochpaß, Bandsperre, Diskriminator	EP	Lowpass, bandpass, highpass filter, band-stop filter, discriminator	EP	Filtre passe-bas, passe-bande, passe-haut, suppression de bande, discriminateur
EQ	Schwing-, Filter-Quarz	EQ	Oscillator or filter crystal	EQ	Quartz oscillateur, quartz de filtre
ER	Resonator, piezoelektr./ magnetostriktiv	ER	Resonator, piezoelectric/ magnetostrictive	ER	Résonateur piézo-électrique/ magneto-stricatif
ES	Passive SHF-Bauteile	ES	Passive SHF-components	ES	Composant SHF passif
ET	Thermostat	ET	Thermostat	ET	Thermostat

LV	Variometer	LV	Variometer	LV	Variomètre
R	Widerstände	R	Resistors	R	Résistances
RD	Drahtwiderstand	RD	Wire-wound resistor	RD	Résistance bobinée
RF	Kohleschicht-Widerstand	RF	Carbon-film resistor	RF	Résistance à couche de carbone
RG	Metallglasur-Widerstand	RG	Metal-coated resistor	RG	Résistance à couche métallique
RJ	Metalloxyd-Widerstand	RJ	Metal-oxide resistor	RJ	Résistance à oxyde métallique
RL	Metallfilm-Widerstand	RL	Metal-film resistor	RL	Résistance à film métallique
RM	Widerstandsdräht	RM	Resistance wire	RM	Fil de résistance
RN	Widerstandsnetzwerk	RN	Resistor network	RN	Réseau de résistance
RR	Draht-Potentiometer	RR	Wire-wound potentiometer	RR	Potentiomètre bobiné
RS	Schicht-Potentiometer	RS	Carbon-film potentiometer	RS	Potentiomètre à couche

Kennbuchst.	Art des Bauelementes	Identif.-letter	Type of component	Symbole	Type d'élément
BT	Dämpfungsglied, Abschlußwiderstand	RT	Attenuator, termination	RT	Atténuateur, charge
RV	Drahtwiderstand mit Abgriff	RV	Wire-wound resistor, tapped	RV	Résistance bobinée à prise
RW	Wendelpotentiometer	RW	Helical potentiometer	RW	Potentiomètre hélicoïdal
S	Schalter, Relais, Sicherungen	S	Switches, relays, fuses	S	Commutateurs, relais, fusibles
SB	Drucktastenschalter	SB	Pushbutton switch	SB	Commutateur à touche
SD	Drehschalter	SD	Rotary switch	SD	Commutateur rotatif
SF	Kontaktfedersatz	SF	Spring contact assembly	SF	Jeu de ressorts de contact
SH	HF-Koaxialschalter, -Relais, -Teiler	SH	Coaxial RF switch, RF relay, RF attenuator	SH	Commutateur RF coaxial, relais RF, atténuateur RF
SK	Kipp-, Wipp- und Schiebeschalter	SK	Toggle switch, slide switch	SK	Commutateur à bascule, à glissière
SL	Leistungsschalter Netz/HF	SL	AC supply switch, high-power RF switch	SL	Commutateur secteur, de puissance RF
SM	Mikroschalter	SM	Microswitch	SM	Microrupteur
SN	Elektromagnet, Relais	SN	Electromagnetic relay	SN	Relais électromagnétique
SP	Leistungsrelais, Luftschütz	SP	Power relay, air-type contactor	SP	Relais de puissance, contacteur à air
	Reedrelais	SR	Reed relay	SR	Relais reed
SS	Sicherung, Schutzschalter	SS	Fuse, automatic cut-out	SS	Fusible, coupe-circuit automatique
ST	Thermoschalter	ST	Thermal circuit breaker	ST	Disjoncteur thermique
SU	Überspannungs-Ableiter	SU	Arrester	SU	Eclateur
SW	Wechselrichter, Näherungsschalter	SW	Inverter (DC-AC), proximity switch	SW	Inverseur (DC-AC), commutateur de proximité
SZ	Zeitschalter	SZ	Time switch	SZ	Interrupteur horaire
V	Verbindungselemente	V	Connecting elements	V	Éléments de raccordement
VK	Klemme, Klemmleiste	VK	Clamp, terminal strip	VK	Pince, réglette à bornes
VL	Lötose, Stützpunkt	VL	Soldering lug	VL	Cosse à souder
VS	Schraube, Mutter, Scheibe	VS	Screw, nut, washer	VS	Vis, écrou, disque

Farbcodierung für Widerstände und Kondensatoren / Colour code for resistors and capacitors / Code couleur pour résistances et condensateurs

Anmerkung:

Die Wertangabe der weitgehend miniaturisierten Bauelemente erfolgt überwiegend durch Farbkennzeichnungen, deren Bedeutung der nachfolgenden Tabelle entnommen werden kann.

Note:

The electrical values of the largely miniaturized components are mainly identified by a colour code, the meaning of which can be taken from the table below.

Remarque:

Les valeurs électriques des composants fort miniaturisés sont indiquées dans la plupart des cas par un code couleur dont voici l'explication.

HINWEIS:

Im Zuge des technischen Fortschrittes setzt R&S zunehmend Metallschichtwiderstände mit 1% Toleranz anstelle von Kohleschichtwiderständen mit 5% Toleranz ein. Metallschichtwiderstände können sich dabei an Stellen befinden, an denen gemäß Schaltelemente Kohleschichtwiderstände vorgesehen sind. Etwaige geringfügige Differenzen der Nennwerte zwischen Stromlaufplan, Schaltteilliste und Gerät liegen im zulässigen Toleranzbereich.

N. B.:

Following the state of the art R&S makes increasing use of metal-film resistors (1% tolerance) instead of carbon-film resistors (5% tolerance). Metal-film resistors may have been employed where carbon-film resistors are specified in the parts list. Any slight differences of nominal values between circuit diagram, parts list and equipment are within tolerance.

N. B.:

Suivant le progrès technique R&S utilise de plus en plus des résistances à film métallique (tolérance 1%) au lieu des résistances à couche de carbone (tolérance 5%). Des résistances à film métallique peuvent se trouver en des points où des types à couche de carbone figurent dans la liste des composants. Les différences minimales des valeurs nominales existant éventuellement entre le schéma de circuit, la liste des composants et l'appareil sont dans la marge de tolérance.

Farbe/Colour/Couleur	A	B	C	D	Anordnungsbeispiele für Examples for Exemple pour	Definition* / Définition*	
						(1)	(2)
Schwarz/Black/Noir	-	0			Widerstände (R) Resistors (R) Résistance (R)	Kennzeichen A Marking A Repérage A	(Bauteilfarbe/1. Farbring) = 1. Zahl: (body colour or first coloured ring) = 1st digit: (couleur du corps ou 1er anneau) = 1er chiffre:

Grau/Gray/Gris	8	8	-				
Weiß/White/Blanc	9	9	-				
Gold/Doré	-	-	-	± 5%			
Silber/Silver/Argenté	-	-	-	± 10%			
Ohne Farbe/No colour/ Pas de couleur	-	-	-	± 20%			

1) Toleranzring, hier nicht spezifiziert.

1) Tolerance ring, here not specified.

1) Anneau de tolérance, ne pas spécifié ici.

Das Fehlen eines Kennzeichens bedeutet, daß die Farbe des Bauteilkörpers die Wertangabe darstellt.
The absence of a marking signifies that the body colour gives the corresponding information.
L'absence de tout repérage signifie que la couleur du corps du composant représente la valeur correspondante.
