#### **INSTRUMENT SERIAL NUMBERS**

Each instrument has a serial number on a panel insert, tag, or stamped on the chassis. The first number or letter designates the country of manufacture. The last five digits of the serial number are assigned sequentially and are unique to each instrument. Those manufactured in the United States have six unique digits. The country of manufacture is identified as follows:

B000000	Tektronix, Inc., Beaverton, Oregon, USA
100000	Tektronix Guernsey, Ltd., Channel Islands
200000	Tektronix United Kingdom, Ltd., London
300000	Sony/Tektronix, Japan
700000	Tektronix Holland, NV, Heerenveen, The Netherlands

# SAFETY INFORMATION

The following general safety information applies to all operators and service personnel. Specific warnings appear throughout the manual where they apply and should be followed in each instance.

**WARNING** statements identify conditions or practices which could result in personal injury or loss of life.

**CAUTION** statements identify conditions or practices which could result in damage to the equipment or other property.

The word **DANGER** on the equipment identifies areas of immediate hazard which could result in personal injury or loss of life.

The following safety symbols may appear on the equipment:

— Refer to the manual

— High voltage

Protective ground terminal

— A terminal which must be connected to earth ground prior to making any other connections to the equipment.

## Ground the Power Module

To avoid electric shock, the power module must be properly grounded. Refer to the power module manual for grounding instructions.

Do not use the power module power cord grounding conductor as the sole signal-return current conductor.

## Use the Proper Power Cord

To avoid electric shock and fire, use only the power cord and plug specified for your power module. Use only a power cord that is in good condition.

For detailed information on power plugs see the power module manual.

## Use the Proper Fuse

To avoid electric shock and fire, use only the fuses specified in your power module and plug-in manuals and which are identical in the following aspects:

- a. Physical Size—3AG, etc.
- b. Type—Slow Blow, Fast Blow, etc.
- c. Voltage Rating
- d. Current Rating

## Do Not Operate in an Explosive Atmosphere

To avoid explosion, do not operate this instrument in an area where flammable gas or fumes are present. Such operation could cause an explosion.

## Exercise Care When Handling the Crt

Breaking the crt may cause an implosion. Wear protective clothing and safety glasses when handling the crt. When storing the crt, put it in a protective carton or set it face down in a protected location on a smooth surface with a soft mat under the faceplate.

## Avoid Excessive Moisture

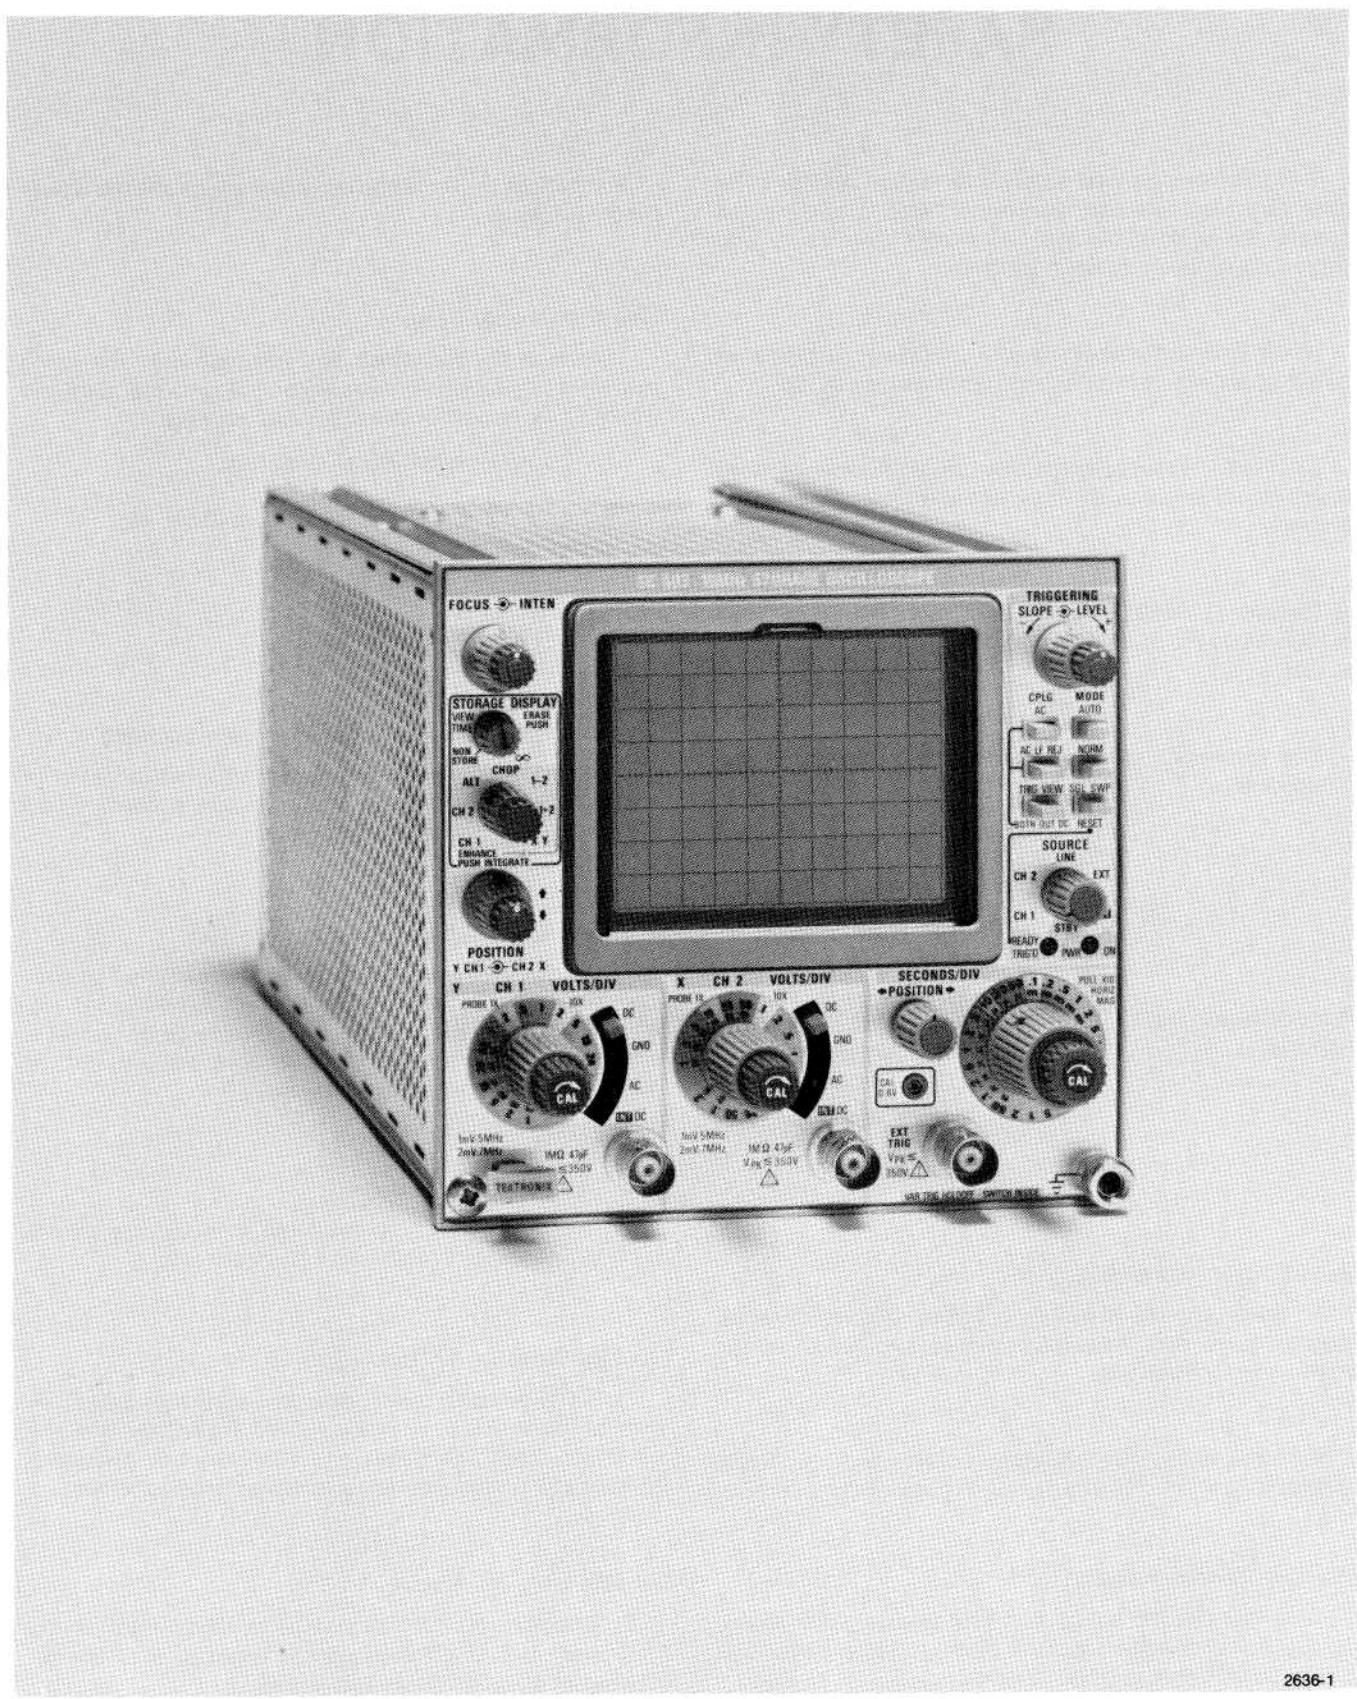

Circuit boards and components must be dry before applying power to prevent damage from arcing.

## Do Not Operate Without Covers

To avoid personal injury, do not operate the instrument without the panels or covers installed. Do not perform any servicing other than that described in the operating instructions unless you are a qualified serviceperson.

## Do Not Service Alone

Do not perform internal service or adjustment of this instrument unless another person capable of rendering first aid and resuscitation is present.

2636-1

SC 503 STORAGE OSCILLOSCOPE.

# OPERATING INSTRUCTIONS

## Introduction

The SC 503 Oscilloscope is a dual-trace, bi-stable storage oscilloscope designed to operate in two compartments of a TM 500 series power module. It features variable enhance and integrate display modes to increase the writing speed. The SC 503 has bi-stable storage, including auto-erase, a wide range of deflection factors, and versatile triggering including auto triggering and trigger view.

Recommended probes for use with the SC 503 are the P6062B, P6105, and P6060. The P6062B probe has a selectable 1X or 10X attenuation while the attenuation of the P6105 is 10X.

## Installation

### CAUTION

*Turn the power module off before inserting the plug-in; otherwise, damage may occur to the plug-in circuitry.*

The SC 503 is calibrated and ready to use when received. Referring to Fig. 1-1, install the SC 503 in the power module and turn the TRIGGERING SOURCE control to CH 1 to apply power. Check that the PWR ON indicator on the front panel illuminates.

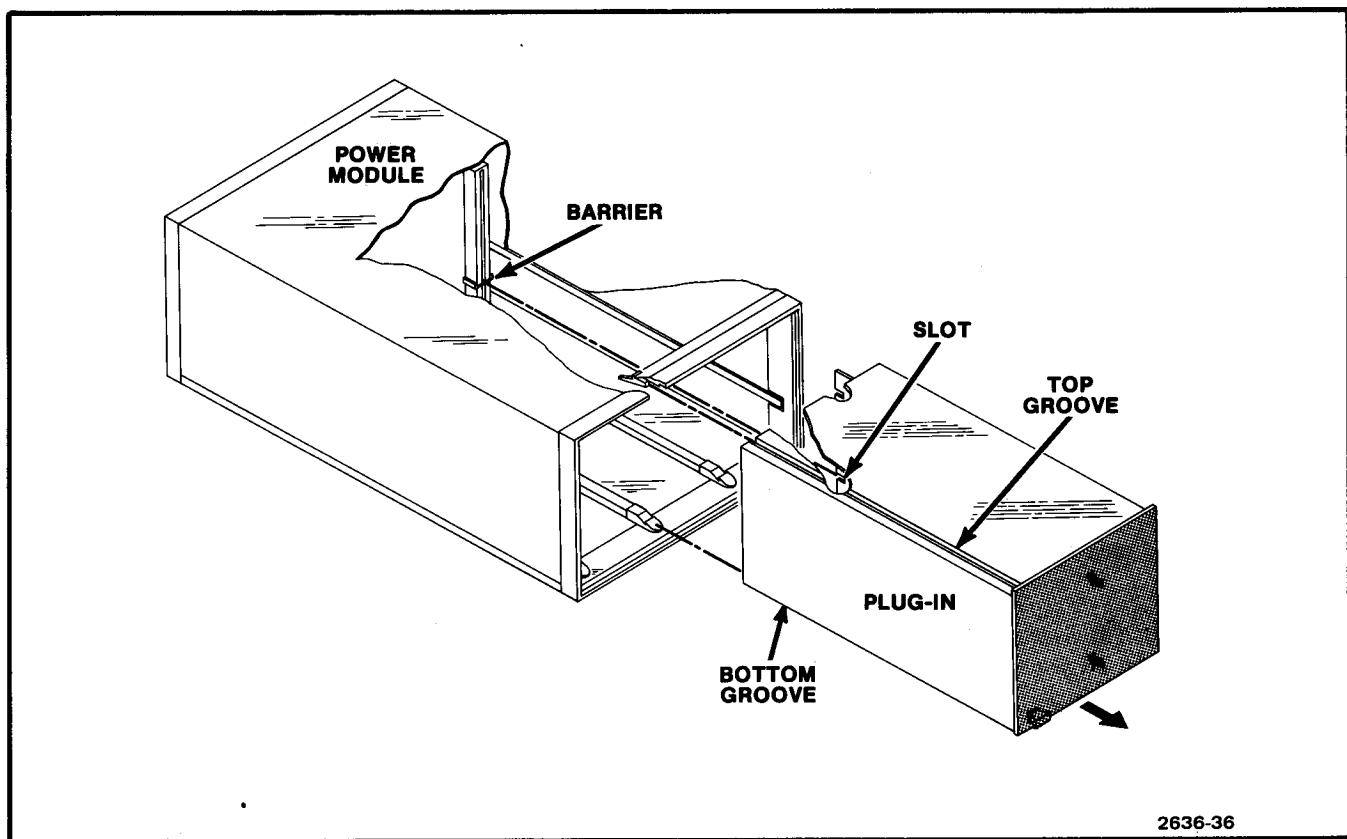

Fig. 1-1. Plug-in installation and removal.

## CONTROLS AND CONNECTORS

The SC 503 is fully calibrated and ready for use when received. Review the functions of the controls and connectors before use.

Refer to Fig. 1-2.

1. TRIGGERING SLOPE: This switch selects the polarity of the triggering signal that starts the sweep.

2. TRIGGERING LEVEL: This control selects the amplitude point on the triggering signal at which the sweep is triggered.

3. MODE AUTO: When depressed, the sweep is started by the applied trigger signal. In the absence of an adequate triggering signal, the sweep free runs and provides a bright reference trace.

4. MODE NORM: When this pushbutton is depressed, the sweep is initiated by the applied triggering signal. In the absence of an adequate triggering signal, there is no trace.

5. MODE SGL SWP—RESET: Pressing this pushbutton (momentary contact switch) re-arms the sweep. The sweep triggers only once in the single sweep mode. After the sweep is displayed, further sweeps cannot be presented until the button is pressed again to re-arm the sweep.

6. CPLG AC: Triggering signals are capacitively coupled to the input of the trigger generator circuit when this button is depressed. The dc component is rejected and the signals below approximately 50 Hz are attenuated.

7. CPLG AC LF REJ: When depressed, this pushbutton capacitively couples the signals to the input of the trigger circuit. The dc component is rejected and the signals below approximately 10 kHz are attenuated.

8. TRIG VIEW: This switch, when depressed, displays the triggering signal on the crt.

9. SOURCE: This switch selects the source of the trigger signal, coupled to the input of the trigger circuit.

STBY—This position turns off the internal regulated power supply voltages.

CH 1—In this position a sample of the channel 1 signal is used as a trigger signal.

CH 2—This position samples and uses the channel 2 signal for a trigger signal.

LINE—In this position, a sample of the power line frequency is used as a trigger signal.

EXT—This position selects the signal connected to the EXT TRIG connector for triggering.

INT—In this position, the signal connected through the rear interface connector and the power module is used as the triggering signal.

10. PWR ON: This light indicates when the SC 503 regulated power supplies are on.

11. READY TRIG'D: This light indicates the single sweep is armed or that the sweep is properly triggered.

12. PULL X10 HORIZ MAG: When the seconds/div CAL knob is pulled out (blue band exposed), the displayed sweep rate increases by a factor of 10. This magnification is also present in the XY mode.

CAL: This control, through an internal switch, controls the variable sweep rate or the variable trigger holdoff.

Variable sweep rate—The control provides for continuously variable sweep rates between the calibrated settings of the SECONDS/DIV switch.

Variable trigger holdoff—The control provides continuously variable trigger holdoff.

13. SECONDS/DIV: This switch selects the sweep rate. The CAL control must be turned fully clockwise for calibrated sweep rates.

14. Ground connection.

15. POSITION: This control positions the display horizontally on the crt, except in the XY mode.

## Operating Instructions—SC 503

16. CAL 0.6V: This jack provides a positive-going 0.6 V square wave at approximately 1 kHz for calibration and probe compensation.
17. EXT TRIG: This bnc connector is the input for external triggering signals.
18. Input connectors: These bnc connectors accept the vertical signal input.
19. DC-GND-AC-INT DC: This switch selects the type of input coupling and applies the signal to the vertical amplifier.
- DC—In this position, the front panel input connector to the input amplifier is dc coupled.
- GND—This position disconnects and grounds the input of the vertical amplifier.
- AC—In this position, signals from the front-panel bnc connector are capacitively coupled to the vertical amplifier, blocking the dc component of the input signal.
- INT DC—This position applies a dc-coupled signal to the input amplifier through the rear interface connector and the power module.
20. CAL: This control provides continuously variable deflection factors between the calibrated settings of the VOLTS/DIV switch.
21. VOLTS/DIV: This switch selects the vertical deflection factor in a 1-2-5 sequence (CAL control must be rotated fully clockwise for the indicated deflection factor).
- When using a 1X probe or no probe, read the deflection factor through the knob skirt window labeled 1X; however, when a 10X probe is used on the input, read the knob skirt window labeled 10X.
22. CH 2 POSITION: This control positions the display vertically. In the XY mode of operation this control positions the display horizontally.
23. CH 1 POSITION: This control positions the display vertically.
24. ENHANCE: When this switch is rotated clockwise, the writing speed is increased.
- INTEGRATE: This is a momentary contact button. On repetitive signals too fast to store normally, depressing the button permits a charge to build up on the crt screen (target) before the signal is stored.
25. STORAGE DISPLAY: This switch selects the mode of operation for the vertical amplifier system.
- CH 1—Displays channel 1 only.
- CH 2—Displays channel 2 only.
- ALT—This position produces a display that alternates between channel 1 and channel 2 and is switched after each trace passes across the crt.
- CHOP—This position produces a display that is switched between channels at a 250 kHz rate. This position provides the best display at sweep rates slower than approximately 0.5 ms/division.
- 1-2 —In this position, the input to channel 2 is inverted and algebraically added to channel 1.
- 1+2 —In this position, the channel 2 signal is algebraically added to channel 1.
- XY—In this position, the channel 1 signal is displayed vertically and the channel 2 signal is displayed horizontally.
26. VIEW TIME: This control adjusts the viewing time through a range from about 0.5 second to 5 seconds after the end of the sweep.
- NON STORE: When the VIEW TIME control is in the detent position (fully counterclockwise).
- STORE: When the VIEW TIME control is out of the detent position.
- ERASE PUSH: When pressed, this momentary contact switch erases the stored display.
27. INTEN: This control varies the display brightness.
28. FOCUS: This control adjusts for a well-defined crt display.

# GENERAL OPERATING INFORMATION

## Graticule

The graticule of the SC 503 is internally marked on the faceplate of the crt to provide accurate, parallax-free measurement. The graticule is divided into eight vertical and ten horizontal divisions. Each division is 0.25 inch. In addition, each major division is divided into five minor divisions. The vertical gain and horizontal timing are calibrated to the graticule, so accurate measurements can be made from the graticule.

## Intensity Control

The INTEN control is normally adjusted so the display is easily visible but not overly bright. Readjustment may be required for different displays or sweep rates. The SC 503 automatically reduces the display intensity level when sweep speeds of 10 ms and slower are selected. This reduces the possibility of accidentally burning the sensitive storage crt phosphor at slower sweep speeds.

### CAUTION

*Particular care should be exercised when a bright spot is displayed. A high-intensity spot may burn the crt phosphor and cause permanent damage to the crt.*

## Display Focus

The FOCUS control works in conjunction with the astigmatism adjustment to give a fine trace or well-focused spot.

To check for proper setting of the Astig adjustment, slowly turn the FOCUS control through the optimum setting viewing the signal displayed on the crt screen. If the Astig adjustment is correctly set, the vertical and horizontal portions of the trace will come into sharpest focus at the optimum position of the FOCUS control.

## Calibrator

The internal calibrator of the SC 503 provides a convenient signal source for checking vertical gain. The output square-wave voltage is 0.6 V, within  $\pm 1\%$  at approximately 1 kHz. This signal is very useful as a probe calibrator signal as described in the probe instruction manual.

## Vertical Displays

**Single-Trace Displays.** Either of the input channels can be used for single-trace displays. Apply the signal to the desired input connector and set the STORAGE DISPLAY switch to display the channel used. The TRIGGERING SOURCE switch selects either vertical channel as a trigger signal source.

**Dual-Trace Operation (Alternate Mode).** The ALT position of the STORAGE DISPLAY switch produces a display that alternates between channel 1 and channel 2 after each trace across the crt. Although the ALT mode can be used at all sweep rates, the CHOP mode may provide a more satisfactory display at sweep rates slower than 0.5 ms/div. At these slower sweep rates, alternate mode switching becomes visually perceptible.

**Dual-Trace Operation (Chopped Mode).** The CHOP position of the STORAGE DISPLAY switch produces a display that is electronically switched between channels. Generally, the CHOP mode provides the best display at sweep rates slower than approximately 0.5 ms/div, or whenever dual-trace, single-shot phenomena are to be displayed. At faster sweep rates, the chopped switching becomes apparent and may interfere with the display.

Proper external triggering for the chopped mode of operation is obtained when using external triggering from a signal that is time-related to either signal. This provides the same result as triggering internally from channel 1 or channel 2.

Two signals that are time-related can be displayed in the chopped mode, showing true time relationship. However, if the signals are not time-related, one signal displayed will appear to shift its horizontal position with consecutive sweeps.

Two single-shot, transient, or random signals that occur within the time interval determined by the SECONDS/DIV switch (ten times the displayed rate) can be compared using the chopped mode. To obtain a usable display, the sweep must be triggered from the vertical channel, displaying the event that occurs first. Since the signals show true time relationship, time difference measurements can be used.

## Operating Instructions—SC 503

**Algebraic Addition.** The 1-2 position of the STORAGE DISPLAY switch can be used to display the difference between two signals or for common-mode rejection to remove an undesired signal. The 1+2 position of the STORAGE DISPLAY switch can be used to display the sum of two signals.

The following should be observed:

1. Do not exceed the input voltage rating of the SC 503.
2. Do not apply signals that exceed an equivalent of approximately six times the VOLTS/DIV switch setting. For example, with a VOLTS/DIV switch setting of 0.5, the voltage applied to that channel should not exceed approximately 3 V. Signals larger than six divisions may distort the display.
3. Use CH 1 and CH 2 POSITION control settings that most nearly position the signal of each channel to midscreen when viewed in either the CH 1 or CH 2 positions of the STORAGE DISPLAY switch. This ensures the greatest dynamic range in the 1-2 and 1+2 mode of operation.
4. For similar response from each channel, set the CH 1 and CH 2 DC-GND-AC-INT DC switches to the same position.

### Deflection Factor

The amount of vertical deflection produced by a signal is determined by the signal amplitude, the setting of the VOLTS/DIV switches, and the setting of the VOLTS/DIV variable controls. The calibrated deflection factors indicated by the VOLTS/DIV switches apply only when the VOLTS/DIV variable controls are set to the calibrated position (detent fully clockwise).

The VOLTS/DIV variable controls provide continuously variable (uncalibrated) vertical deflection factors between the calibrated settings of the VOLTS/DIV switches. The VOLTS/DIV variable controls extend the maximum uncalibrated vertical deflection factor to at least 50 V/div.

### Grounding

Reliable signal measurements cannot be made unless both the oscilloscope and the unit under test are connected together by a common reference (ground) lead, in addition to the signal lead or probe. The ground strap on the signal probe provides the best ground. Also, a ground lead can be connected to the front panel ground post to establish a common ground with the signal source.

### Input Coupling

The DC-GND-AC-INT DC switches allow a choice of coupling for the applied signal. The type of display desired and the applied signal determines the coupling method used.

In the AC coupling position, the dc component of the signal is blocked by a capacitor in the input circuit. The low frequency -3 dB point in the AC position is approximately 10 Hz. Therefore, some low frequency attenuation can be expected near this frequency limit. Attenuation in the form of waveform tilt appears in square waves that have low frequency components. The AC coupling position provides the best display of signals with a dc component that is much larger than the ac component.

The DC coupling position can be used for most applications. This position allows measurement of the dc component of a signal and must be used to display signals below approximately 50 Hz to avoid the attenuation that occurs using ac coupling.

The GND position provides a ground reference at the input without externally grounding the input. The signal applied to the probe is internally disconnected from the input circuit and connected to ground through a resistor. The amplifier input circuit is held at ground potential.

In the GND position, the input signal connected to ground through a resistor forms a precharging network. This network allows the input coupling capacitor to charge to the average dc voltage level of the signal applied to the probe. Since this takes place in the GND position of the DC-GND-AC-INT DC switch, any large voltage transients accidentally generated will not be applied to the amplifier input.

The precharge network provides a measure of protection to the external circuit by reducing the current levels that can be drawn from the external circuitry during capacitor charging. The following procedure should be used when the probe tip is connected to a signal source having a different dc level than previously applied when using AC coupling.

1. Set the DC-GND-AC-INT DC switch to GND before connecting the probe tip to a signal source.
2. Touch the probe tip to the oscilloscope chassis ground. Wait several seconds for the input coupling capacitor to discharge.

3. Connect the probe tip to the signal source.
4. Wait several seconds for the input coupling capacitor to charge.
5. Set the DC-GND-AC-INT DC switch to AC. The display will remain on screen so that the ac component of the signal can be measured in the normal manner.

The INT DC position of the DC-GND-AC-INT DC switch selects the signal connected at the rear interface input.

### Trigger Source

**CH 1 and CH 2 Triggering.** For most applications, the sweep can be triggered internally. In the CH 1 and CH 2 positions of the TRIGGERING SOURCE switches, the trigger signal is obtained from the vertical deflection system. For dual-trace displays, special considerations must be made to provide the correct display. See discussion under Dual-Trace Operation.

**Line Triggering.** The LINE position of the TRIGGERING SOURCE switch connects a sample of the power line voltage to the input of the trigger generator. Line triggering is useful when the input signal is time-related (multiple) to the line frequency. It is also useful for providing a stable display of a line frequency component in a complex waveform.

**External Triggering.** An external signal connected to the EXT TRIG connector can be used to trigger the sweep in the EXT position of the TRIGGERING SOURCE switch. The external signal must be time-related to the displayed signal for a stable display. An external trigger signal can be used to provide a triggered display when the internal signal is too low in amplitude for correct triggering or contains signal components on which it is not desired to trigger. It is also useful when signal tracing in amplifiers, phase-shift networks, wave-shaping circuits, etc. The signal from a single point in the circuit under test can be connected to the external trigger input connector through a cable or signal probe. The sweep is then triggered by the same signal at all times. This allows examination of amplitude, time relationship, or waveshape changes of signals at various points in the circuit without resetting the trigger controls.

The rear interface INT DC triggering is similar to the external triggering except the signal sources are at the rear interface connector.

### Trigger Coupling

Three methods of coupling the trigger signal to the trigger circuits can be selected with the TRIGGERING CPLG switches. Each method permits selection or rejection of certain frequency components of the trigger signal to obtain selective triggering.

**AC Coupling.** The AC position blocks the dc component of the trigger signal. Signals with low-frequency components below approximately 50 Hz are attenuated. In general, ac coupling can be used for most applications.

**AC Low-Frequency Reject.** The AC LF REJ position passes all high-frequency signals above approximately 10 kHz. Dc is rejected and signals below approximately 10 kHz are attenuated. When triggering from complex waveforms, this position is useful for providing a stable display of the high-frequency components.

**DC Coupling.** The dc coupling method passes all trigger signals between dc and 10 MHz.

### Triggering Slope

The TRIGGERING SLOPE switch determines whether the trigger circuit responds on the positive-going or negative-going portion of the trigger signal. When the SLOPE switch is in the + (positive-going) position, the display starts with the + (positive-going) portion of the waveform. In the - (negative-going) position, the display starts with the - (negative-going) portion of the waveform. When several cycles of a signal appear in the display, the setting of the TRIGGERING SLOPE switch is often unimportant. However, if only a certain portion of a cycle is to be displayed, correct setting of the SLOPE switch is important to provide a display that starts on the desired slope of the input signal.

### Trigger Level

The TRIGGERING LEVEL control determines the voltage level on the triggering waveform at which the sweep is triggered. When the LEVEL control is set in the + region, the trigger circuit responds as the triggering waveform shifts in a positive-going direction. When the LEVEL control is set in the - region, the trigger circuit responds as the triggering signal changes level in a negative-going direction. To set the LEVEL control, first select the trigger SOURCE, CPLG, and SLOPE. Then set the LEVEL control fully clockwise and rotate it counterclockwise until the display starts at the desired point.

### Trigger Mode

**Automatic Triggering.** The AUTO position (AUTO button pushed in) of the TRIGGERING MODE switch provides a stable display when the LEVEL control is correctly set and an adequate trigger signal is present. When the trigger repetition rate is less than approximately 20 Hz, or in the absence of an adequate trigger signal, the sweep generator free runs to produce a reference trace. The READY TRIG'D light indicates when the sweep generator is triggered.

When an adequate trigger signal is applied, the free-running condition ends and the sweep generator is triggered to produce a stable display (with the correct LEVEL control setting). The TRIGGERING LEVEL range is reduced to approximately the peak-to-peak range of the triggering signal. Internal and external trigger sensitivity is reduced below approximately 100 Hz.

**Normal Triggering.** Operation in the normal position (NORM button pushed in) of the TRIGGERING MODE switch is the same as in the AUTO position when a trigger signal is applied. However, when a trigger signal is not present, the sweep generator remains off and there is no display. The READY TRIG'D indicator light illuminates when the sweep generator is triggered and is off when the sweep is not correctly triggered.

**Single Sweep.** When the signal to be displayed is not repetitive, use the single-sweep feature. To use this mode, first make sure the trigger circuit will respond to the event to be displayed. Depress the NORM button and obtain the best possible display in the normal manner (for random signals, set the trigger circuit to trigger on a signal which is approximately the same amplitude and frequency as the random signal). Then, press and release the SGL SWP button. The next trigger pulse will initiate the sweep and a single trace will be presented on the screen. After this sweep is complete, the sweep generator is locked out until reset. The READY TRIG'D indicator lights when the sweep generator circuit has been reset and is ready to produce a sweep. The light goes out after the sweep is completed. To prepare the circuit for another single-sweep display, press and release the SGL SWP button.

**Trigger Holdoff.** By placing the internal Swp-Var-HO switch (see the bottom right corner of the front panel for switch location) in the HO position, the variable sweep control (CAL) is connected as a variable trigger holdoff control. In this configuration, the control provides for stable triggering on aperiodic or irregular signals such as complex digital words.

To use the control, first obtain the most stable presentation possible by adjusting the triggering controls in the normal manner. Now, rotate the trigger holdoff variable control counterclockwise until any remaining instability is eliminated.

### Horizontal Sweep Rates

The SECONDS/DIV switch selects calibrated sweep rates for the sweep generator. The variable control provides continuously variable sweep rates between the settings of the SECONDS/DIV switch. Only when the variable control is in its fully clockwise position are the sweep rates calibrated.

### Sweep Magnification

The sweep magnifier expands the sweep by a factor of ten. The center division of the unmagnified display is the portion visible on the screen in magnified form. The equivalent length of the magnified sweep is more than 100 divisions. Any 10-division portion of the magnified sweep can be viewed by adjusting the horizontal POSITION control to bring the desired portion into the viewing area.

To use the magnified sweep, first move the portion of the display to be expanded to the center of the graticule. Then switch the PULL X10 HORIZ MAG control to the out position. Use the horizontal POSITION control to move the magnified portion to the desired position.

When the PULL X10 HORIZ MAG control is on, the sweep rate is determined by reading the number shown against the blue background.

### XY Operation

In some applications, it is desirable to display one signal versus another (XY) rather than against the internal time base. The XY position of the DISPLAY switch provides a means for applying an external signal to the amplifier. By connecting different signal sources to the CH 1 and CH 2 input connectors simultaneously, the vertical POSITION control positions the vertical display with the CH 1-Y and the horizontal display with the CH 2-X.

#### NOTE

*Do not exceed the horizontal scan area of the graticule in the XY mode of operation. This mode can be used to measure phase differences of signals up to approximately 50 kHz in frequency. Above this frequency, the inherent phase shift in the system makes phase measurement difficult.*

### Storage

VIEW TIME. When the VIEW TIME control is rotated fully counterclockwise (detent position), the instrument is in the non-store mode. When this control is rotated out of this detent position, the viewing time of the stored display adjusts from about 0.5 to 5 seconds. In the fully clockwise position, the display is stored until erased or the instrument is turned off. When the VIEW TIME control is positioned within the range from about 0.5 to 5 seconds, an erase occurs automatically after each sweep.

### NOTE

*It is recommended that the view time be limited to four hours or less to prevent residual image formation.*

ERASE PUSH. Pushing this momentary contact button erases the stored display.

ENHANCE. This control adjusts the stored writing speed. Rotating this control in the clockwise direction increases the writing speed. In the fully counterclockwise position, the writing speed is not increased.

PUSH INTEGRATE. Pushing the ENHANCE button in (a momentary pushbutton) permits a very fast repetitive signal to build up a charge on the target before the signal is stored.

# SPECIFICATION AND PERFORMANCE CHECK

## SPECIFICATION

### Performance Conditions

The electrical characteristics are valid only if the SC 503 has been calibrated at an ambient temperature between +20°C and +30°C and is operating at an ambient temperature between 0°C and +50°C unless otherwise noted.

Items listed in the Performance Requirements column of the Electrical Characteristics are verified by completing the Performance Check in this manual. Items listed in the Supplemental Information column are not verified in this manual; they are either explanatory notes or performance characteristics for which no limits are specified.

### ELECTRICAL CHARACTERISTICS

Table 2-1

#### VERTICAL DEFLECTION SYSTEM

Characteristics	Performance Requirements	Supplemental Information
Deflection Factor		
Calibrated Range	1 mV/div to 20 V/div in 14 steps in a 1-2-5 sequence.	
Variable Range	At least 2.5 to 1.	Continuously variable between calibrated steps and extends maximum uncalibrated deflection factor to at least 50 V/div.
DC Balance (+15°C to +35°C)	0.5 div +1 mV.	
Accuracy +15°C to +35°C		
5 mV/div to 20 V/div	±3%.	
1 mV/div to 2 mV/div	±5%.	
0°C to +50°C	Derate accuracy by an additional 1%.	
Linearity	0.1 div or less of compression or expansion as a 2 div signal is positioned between the graticule limits.	
HF Bandwidth		
5 mV/div to 20 V/div	At least 10 MHz.	
Risetime (calculated)		Less than 35 ns.
Typical step response aberrations		±2%, 3% peak-to-peak or less Signal limited to 5 major divisions.
2 mV/div	At least 7 MHz.	
1 mV/div	At least 5 MHz.	

**Specification and Performance Check—SC 503**

**Table 2-1 (cont)**

<b>Characteristics</b>	<b>Performance Requirements</b>	<b>Supplemental Information</b>
AC LF Response	10 Hz or less with ac coupling.	1 Hz or less with X10 probe.
Common Mode Rejection Ratio (CH 1—CH 2 Display Mode)	At least 30 to 1 at 1 MHz or less with same deflection factor settings.	Common mode signal limited to $\pm 5$ divisions, 10 div peak-to-peak. With X10 probes CMRR above 1 kHz is limited by probe compensation matching.
Channel Isolation	2% or less display related crosstalk to 10 MHz.	Input signal related crosstalk is typically less than 0.01%.
Displayed Noise	0.2 mV or less peak-to-peak at 1 mV/div.	
Typical Trace Drift (after 1 hour warm-up, constant line voltage)		
5 mV/div to 20 V/div		Less than 0.1 div/hr. and 0.03 div/ $^{\circ}$ C.
1 mV/div to 2 mV/div		Less than 0.3 mV/hr. and 0.1 mV/ $^{\circ}$ C.
CH 1 or CH 2 Input		
Impedance	1 M $\Omega$ $\pm 1\%$ .	Paralleled nominally by 47 pF.
Maximum Input Voltage		350 V (dc + peak ac), 700 V peak-to-peak ac at 1 kHz or less. Above 1 kHz recommended peak-to-peak ac limit is 250 V to 10 kHz derating to 25 V above 100 kHz.
Position Range	At least $\pm 6$ divisions.	
Delay Line		Nominally 140 ns. Permits viewing the leading edge of the triggering waveform.
Display Modes		
CH 1 or CH 2	Selected input is displayed.	
ALT	Alternates display of Ch 1 and Ch 2 every other sweep.	
CHOP	Chops display of CH 1 and CH 2	Chop rate at least 250 kHz.
1-2	Displays algebraic difference between CH 1 and CH 2.	
1+2	Displays algebraic sum of CH 1 and CH 2.	
XY	Displays CH 1 on Y axis and CH 2 on X axis.	X10 Horizontal Magnifier is functional. X axis positioning is controlled by CH 2 position.
Trigger View	Triggering waveform is displayed instead of selected Display Mode when TRIG VIEW switch is depressed.	Triggering point on the displayed waveform is nominally at CRT vertical center.

**Table 2-2**  
**HORIZONTAL DEFLECTION SYSTEM**

Characteristics	Performance Requirements		Supplemental Information	
Sweep Rates				
Calibrated Range	2 s/div to 0.5 $\mu$ s/div in 21 steps in a 1-2-5 sequence. X10 Horizontal Magnifier extends fastest calibrated rate to 50 ns/div.			
Variable Range	At least 2.5 to 1.		Continuously variable between calibrated sweep rates and extends slowest uncalibrated rate to at least 5 s/div. The Variable control is internally selectable between the Variable Sweep Rate or Variable Holdoff functions.	
Accuracy				
+15°C to +35°C	Unmagnified 2 s/div to 0.5 s/div 0.2 s/div to 5 $\mu$ s/div 2 $\mu$ s/div to 0.5 $\mu$ s/div	Magnified X10  $\pm 4\%$ $\pm 3\%$ $\pm 4\%$	$\pm 5\%$ $\pm 4\%$ $\pm 5\%$	Measured over center 8 displayed divisions excluding the first 50 ns and magnified sweep beyond the 100th division.
0°C to +50°C	Derate accuracy by an additional 1%.			
Linearity			Typically 5% (0.1 div) or less change in timing over any 2 div interval within the center 8 divisions.	
MAG Registration	0.5 division or less.			
Sweep Length	At least 10.0 divisions.			
Position Range				
Fully CW	Start of 1 ms/div sweep positions to right of center graticule line.			
Fully CCW	10th division of 1 ms/div sweep positions to the left of center graticule line.			
XY Mode				
Horizontal Bandwidth	At least 500 kHz.		Low frequency response is determined by CH 2 coupling selection.	
Deflection Factor	Selected by CH 2 Volts/Div and X10 Horizontal Magnifier controls.		Accuracy is typically $\pm 5\%$ .	
Phase Difference	3° or less to 50 kHz.			

**Specification and Performance Check—SC 503**

**Table 2-3  
TRIGGERING**

Characteristics	Performance Requirements		Supplemental Information
Trigger Sensitivity (Minimum peak-to-peak signal required.)			REAR INTERFACE  Typically 35 mV Typically 80 mV
Below 5 MHz 5 MHz to 10 MHz	CH 1 or CH 2 0.4 div 1.0 div	EXTERNAL 60 mV 150 mV	
Coupling			Minimum signal requirements extend to dc.
DC			
AC			Minimum signal requirements increase below 50 Hz.
AC LF REJ			Minimum signal requirements increase below 10 kHz.
Modes			
Auto	Sweep free-runs in the absence of a triggering signal.		Level control range automatically varies with the triggering signal amplitude for frequencies above 100 Hz. Not recommended for frequencies below 30 Hz. Below 100 Hz minimum signal requirements increase.
Normal	Sweep will not run unless triggered.		
Single Sweep	Upon triggering, sweep runs once and will not run again unless reset by pushing Reset switch.		Single Sweep is the default mode when all switches are out.
Trigger Level Range (Normal and Single Sweep modes only)	At least $\pm 6.0$ divisions, CH 1 or CH 2, and at least $\pm 1.2$ V external.		Typically $\pm 0.6$ V or greater, rear interface.
External Trigger Input			
Impedance	$1 \text{ M}\Omega \pm 10\%$ .		Paralleled nominally by 47 pF.
Maximum Input Voltage			350 V (dc + peak ac), 350 V peak-to-peak ac at 1 kHz or less. Above 1 kHz recommended peak-to-peak ac limit is 100 V to 10 kHz derating to 10 V above 100 kHz.
Holdoff Time			Measured at rear interface pins 20B-21B. Select Auto mode and remove any trigger source so that sweep free-runs.
2 s/div to 0.2 s/div 0.1 s/div to 5 ms/div 2 ms/div to 0.5 ms/div 0.2 ms/div to 50 $\mu$ s/div 20 $\mu$ s/div to 5 $\mu$ s/div 2 $\mu$ s/div to 0.5 $\mu$ s/div			Nominally 100 ms $\pm 25\%$ . 50 ms $\pm 25\%$ . 1.2 ms $\pm 25\%$ . 600 $\mu$ s $\pm 25\%$ . 24 $\mu$ s $\pm 25\%$ . 12 $\mu$ s $\pm 25\%$ .

**Table 2-3 (cont)**

<b>Characteristics</b>	<b>Performance Requirements</b>	<b>Supplemental Information</b>
Variable Holdoff Range		At least 20 to 1 range. The Variable control is internally selectable between the Variable Sweep Rate or Variable Holdoff functions.

**Table 2-4  
STORAGE SYSTEM**

<b>Characteristics</b>	<b>Performance Requirements</b>	<b>Supplemental Information</b>
Stored Writing Speed (center 6 X 8 divisions)		
Normal	At least 80 div/ms (50 cm/ms)	Stored writing speed decreases at lower intensity levels.
Enhanced	At least 400 div/ms (250 cm/ms)	
View Time		
Range (auto erase)		Typically less than 0.5 sec to greater than 5 sec.
Control Fully CW		Up to 4 hours. It is recommended that view time be limited to 4 hours or less to prevent residual image formation.
Erase Time		400 to 600 ms.
INTEGRATE Function		Improves storage of very fast repetitive signals. The writing gun beam accumulates a charge on the target as long as INTEGRATE pushbutton is depressed.

**Table 2-5  
CATHODE RAY TUBE**

<b>Characteristics</b>	<b>Performance Requirements</b>	<b>Supplemental Information</b>
CRT Type		T3140.
Graticule		8 X 10 divisions with 0.25 inch/division (0.64 cm/division).
Phosphor		P44.
Acceleration Potential		2 kV (−1.9 kV cathode). Beam current returns through backplate connection.
Geometry and Orthogonality (exclude 4 corners)	Bowing or tilt is 0.1 division or less with respect to graticule lines.	
Intensity Control Function		When Intensity control is rotated fully clockwise and Single Sweep mode is selected, the sweep baseline spot is clearly visible.

**Table 2-6**  
**CALIBRATOR OUTPUT AND POWER SUPPLIES**

Characteristics	Performance Requirements	Supplemental Information
Voltage	0.6 V peak-to-peak, $\pm 1\%$ .	Calibrator voltage is set by adjusting +12 V supply.
Frequency		Approximately 1 kHz.
Rise and Falltimes		Less than 1 $\mu$ s.
Output Impedance		Approximately 120 $\Omega$ .
+12 V		$\pm 0.3$ V, 5 mV peak-to-peak or less ripple.
-12 V		$\pm 0.4$ V, 5 mV peak-to-peak or less ripple.
+5 V		$\pm 0.2$ V, 5 mV peak-to-peak or less ripple.
+180 V		+180 V $\pm 10$ V. 0.7 V typical peak-to-peak ripple.
+100 V		+110 V $\pm 5$ V. 0.4 V typical peak-to-peak ripple.
-100 V		-135 V $\pm 20$ V. 1.5 V typical peak-to-peak ripple.
-1.9 kV		-1.9 kV $\pm 70$ V.
Power Module Supply Currents		
+33.5 V Supply		Typically 450 mA.
-33.5 V Supply		Typically 290 mA.
+11.5 V Supply		Typically 260 mA.
25 V AC Supply		Less than 1 mA.
Fuse Data		
F8051		0.75A, 3AG, fast-blow.
F9051		0.5A, 3AG, slow-blow.
Mainframe Power Line Draw		Typically 30 watts or less operating, less than 1 watt in standby.
Recommended Adjustment Interval		1000 hours or 6 months.
Warmup Time		20 minutes, 60 minutes after exposure to or storage in high humidity (condensing) environment.

**Table 2-7**  
**REAR INTERFACE INPUT AND OUTPUT SIGNALS**

Characteristics	Performance Requirements	Supplemental Information
Z-Axis Input		Pins 24A-23A. Analog input summed with front panel INTENSITY control setting. Nominally 1.5 k $\Omega$ $\pm 5\%$ . +5 V will turn beam on with INTEN fully CCW. -5 V will turn beam off with INTEN fully CW.

Table 2-7 (cont)

Characteristics	Performance Requirements	Supplemental Information
CH 1 and CH2 Inputs		Pins 14A-15A and 16A-17A respectively. Selected by CH1 and CH 2 coupling switches in INT (interface) position. Nominally 50 $\Omega$ $\pm 2\%$ . Customer modifiable to 1 M $\Omega$ . Parallel C is typically 100 pF. Maximum input voltage is 5 V rms 40 V peak ac. Displayed noise may exceed 1 mV peak-to-peak.
Trigger Input		Pins 14B-15B, selected by SOURCE switch in INT (interface) position. Nominally 50 $\Omega$ when INT selected and 25 $\Omega$ when other source selected. Customer modifiable to 1 M $\Omega$ . parallel C is typically 60 pF. Maximum input voltage is 2.5 V rms, 40 V peak ac. Maximum input power: 1/4 W.
External Gate Input		Pins 22B-23B. ECL balanced input operating between +5 V and ground. Nominally 100 $\Omega$ . Upon transition to logical high state sweep will free-run once and reset if GATE SELECT INPUT is grounded. A transition from logical high to low state will truncate sweep if it is running.
Gate Select Input		Pin 24B. Ground (1 k $\Omega$ or less) selects the external gate as the sweep controlling signal. Open circuit causes normal operation.
Intensify Input		Pin 19B. Single-ended ECL input operating between +5 V and ground. A low logical state causes a noticeable intensification. Open circuit defaults to logical high state.
Reset Input		Pin 21A. Ground (1 k $\Omega$ or less) causes single sweep reset.
CH 1 Trigger Output		Pins 27B-28B. Analog output with source resistance of less than 50 $\Omega$ . Sensitivity is typically 50 mV/div and bandwidth is typically 4 MHz.
Triggered Gate Output		Pins 25B-26B. ECL balanced output operating between +5 V and ground. A logical high state indicates a holdoff condition and sweep can not be triggered or gated on.
Ramp Output		Pin 18A. Analog output of positive going sweep ramp. Typically 0 V to at least +10 V. Output resistance is approximately 500 $\Omega$ . Not recommended at sweep rates faster than 1 $\mu$ s/div.
Sweep Gate Output		Pin 26A. Approximately +5 V during sweep; approximately 0 V otherwise. Source impedance through 1 k $\Omega$ .

Table 2-7 (cont)

Characteristics	Performance Requirements	Supplemental Information
Light Output		Pin 20A. Less than +1.0 V through 1 kΩ when READY/TRIG light is on; typically +5 V through high impedance otherwise. Loading by more than 1 mA when output is in the high voltage state may cause erroneous READY/TRIG light indication.
Holdoff Out		Pins 20B-21B. ECL balanced output operating between +5 V and ground.
Erase		Pin 22A. Erase function, when connected to ground.

## ENVIRONMENTAL CHARACTERISTICS

Table 2-8  
ENVIRONMENTAL CHARACTERISTICS<sup>a</sup>

Characteristics	Description	
Temperature	Meets MIL-T-28800B, class 5.	
Operating	0°C to +50°C	
Non-operating	−55°C to +75°C	
Humidity	95% RH, 0°C to +30°C 75% RH, to +40°C 45% RH, to +50°C	Exceeds MIL-T-28800B, class 5.
Altitude	Exceeds MIL-T-28800B, class 5.	
Operating	4.6 Km (15,000 ft)	
Non-operating	15 km (50,000 ft)	
Vibration	0.38 mm (0.015") peak-to-peak, 5 Hz to 55 Hz, 75 minutes	Exceeds MIL-T-28800B, class 5, when installed in qualified power modules <sup>b</sup> .
Shock	30 g's (1/2 sine) 11 ms duration, 3 shocks in each direction along 3 major axes, 18 total shocks.	Meets MIL-T-28800B, class 5, when installed in qualified power modules <sup>b</sup> .
Bench Handling <sup>c</sup>		
Transportation <sup>d</sup>	Qualified under National Safe Transit Association Preshipment Test Procedures 1A-B-1 and 1A-B-2.	

## PHYSICAL CHARACTERISTICS

Table 2-9

## PHYSICAL

Characteristics	Description
Finish	Anodized aluminum front panel etch and chromate chassis.
Net Weight	5.7 lbs; (2.5 kg).
Overall Nominal Dimensions	5.29 in (134.4 mm) W X 11.85 in (300.9 mm) D X 4.96 in (126.0 mm).

<sup>a</sup> With power module.<sup>b</sup> Refer to TM 500 power module specifications.<sup>c</sup> +45°C in TM 503 and TM 504.<sup>d</sup> Without power module.

# PERFORMANCE CHECK

## Introduction

This procedure checks the electrical characteristics of the SC 503 that appear in the Specification portion of this section. If the instrument fails to meet the requirements given in this performance check, the adjustment procedure should be performed. This procedure can also be used by an incoming inspection facility to determine acceptability of performance.

Tolerances that are specified in this performance check procedure apply to the instrument under test and do not include test equipment error.

The electrical characteristics in this section are valid only if the SC 503 is calibrated at an ambient temperature of +20°C to +30°C and operated at an ambient temperature of 0°C to +50°C.

## Test Equipment Required

Below is a list of equipment required to verify operation as specified. Other equipment may be substituted when suitable.

### LIST OF TEST EQUIPMENT REQUIREMENTS

Description	Performance Requirements	Applications	Example
TM 500 power module		All steps.	TEKTRONIX TM 503, TM 504, TM 506.
Function generator	5 Hz to 5 kHz.	Frequency response.	TEKTRONIX FG 503 Function Generator <sup>a</sup> .
Time-mark generator	0.2 s to 5 ns in 1, 2, 5 sequence.	Sweep rate accuracy.	TEKTRONIX TG 501 Time Mark Generator <sup>a</sup> .
Calibration generator	Amplitude calibration, 50 mV to 5 V; accuracy, $\pm 0.25\%$ into 1 MΩ; output, squarewave at approximately 1 kHz.	Vertical deflection accuracy.	TEKTRONIX PG 506 Calibration Generator <sup>a</sup> .
Leveled sine wave generator	50 kHz to 10 MHz.	Bandwidth, trigger sensitivity & range, & X-Y phasing.	TEKTRONIX SG 503 Leveled Sine-Wave Generator <sup>a</sup> .
Input normalizer	47 pF and 1 MΩ.	Vertical amplifier input.	Tektronix part no. 067-0541-00.
Termination	Impedance, 50 Ω; accuracy, within 2%; connectors, bnc.	Output termination for signal generator.	Tektronix part no. 011-0049-01.
Coaxial cable	Impedance, 50 Ω; length, 42 inch; connectors, bnc.	Provides signal interconnection.	Tektronix part no. 012-0057-01.
Dual input cable	Bnc female to Z bnc male connectors.	X-Y phasing.	Tektronix part no. 067-0525-01.
Adapter	Bnc-to-pin jack.	Calibrator.	Tektronix part no. 013-0084-01.
Termination	Impedance, 600 Ω; accuracy, within 2%; connectors, bnc.	Low frequency response.	Tektronix part no. 011-0092-00.

<sup>a</sup> Requires TM 500-series power module.

## Specification and Performance Check—SC 503

### Preliminary Control Settings

CH 1	
VOLTS/DIV	1
CAL	cw (detent)
DC-GND-AC-INT DC	GND
CH 2	
VOLTS/DIV	1
CAL	cw (detent)
DC-GND-AC-INT DC	GND
SECONDS/DIV	.2 m
PULL X10 HORIZ MAG-	pushed in-cw
CAL	(detent)
TRIGGERING	
MODE	AUTO
CPLG	DC (all buttons out)
SOURCE	CH 1
SLOPE	+
LEVEL	≈ midrange
DISPLAY	CH 1
INTEN	normal brightness
FOCUS	sharp trace
POSITION (vertical)	
CH 1	≈ midrange
CH 2	≈ midrange
POSITION (horizontal)	≈ midrange
VIEW TIME	ccw (detent)
ENHANCE	ccw

Table 2-10

### VERTICAL DEFLECTION ACCURACY AND TOLERANCE

VOLTS/DIV	Generator Setting	Display	Tolerance
10	50 V	5	2.0%
5	20 V	4	2.0%
2	10 V	5	2.0%
1	5 V	5	2.0%
.5	2 V	4	2.0%
.2	1 V	5	2.0%
.1	.5 V	5	2.0%
50 m	.2 V	4	2.0%
20 m	.1 V	5	2.0%
10 m	50 mV	5	2.0%
5 m	20 mV	4	2.0%
2 m	10 mV	5	5.0%
1 m	5 mV	5	5.0%

e. Repeat parts a through d for CH 2.

f. Disconnect all cables and return the front-panel controls to the preliminary settings.

### 1. Check the Vertical Deflection Accuracy (+15°C To +35°C)

DC-GND-AC-INT DC	GND
VOLTS/DIV (CH 1 and CH 2)	20
PG 506	100 V

a. Connect the calibration generator to the CH 1 input connector through a 50 Ω coaxial cable.

b. Adjust the generator variable control until exactly five graticule divisions are displayed on the crt.

c. Check—that the readout error is less than 2.0%.

d. Check—readout error for the following settings listed in Table 2-10.

#### NOTE

When checking the deflection accuracy at an ambient temperature range of 0°C to +50°C, derate the accuracy by an additional 1.0%.

### 2. Check the Vertical Deflection Variable Range Accuracy

DC-GND-AC-INT DC	DC
VOLTS/DIV (CH 1 and CH 2)	10m
SECONDS/DIV	1 μ
SOURCE	EXT

a. Connect a 50 Ω coaxial cable from the calibration generator output connector to the SC 503 CH 1 input connector.

b. Adjust the generator output for five graticule divisions of display.

c. Rotate the CH 1 POSITION controls to center the displayed signal on the screen.

d. Turn the CH 1 CAL control to the fully counterclockwise position.

e. Check—that the display is less than two graticule divisions in amplitude.

- f. Connect the  $50\ \Omega$  coaxial cable to the CH 2 input connector and repeat parts b through e of this procedure.
- g. Disconnect all cables and return the front-panel controls to the preliminary settings.

### 3. Check the Vertical Bandwidth (5 mV/div to 20 V/div)

VOLTS/DIV (CH 1 and CH 2)	5m
DC-GND-AC-INT DC	DC
SECONDS/DIV	1m

- a. Connect a 50 kHz sine-wave signal from the output connector of the leveled sine-wave generator through a coaxial cable, X10 attenuator, and a  $50\ \Omega$  termination to the SC 503 CH 1 input connector.
- b. Adjust the generator for a crt display of exactly six graticule divisions.
- c. Set the generator frequency to 10 MHz and adjust the frequency variable until the displayed signal is at least 4.2 major divisions in amplitude.
- d. Check—that the frequency readout from the generator is equal to or greater than 10 MHz.

- e. Change the DISPLAY switch to CH 2.
- f. Connect the generator output to CH 2 input connector and return the generator frequency to 50 kHz and set the amplitude for six graticule divisions.
- g. Repeat parts c and d to check the CH 2 bandwidth.
- h. Leave all controls and connections for the next step.

### 4. Check the Vertical Bandwidth (2 mV/div)

VOLTS/DIV (CH 1 and CH 2)	2m
---------------------------	----

- a. Adjust the leveled sine-wave generator for a crt display of exactly six graticule divisions.

- b. Set the generator frequency to 7 MHz and adjust the frequency variable until the displayed signal is at least 4.2 divisions in amplitude.

- c. Check—that the frequency readout from the generator is equal to or greater than 7.0 MHz.

- d. Change the DISPLAY switch to CH 1.

- e. Connect the generator output to CH 2 input connector and return the generator frequency to 50 kHz and set the amplitude for six divisions.

- f. Repeat parts b and c to check the CH 1 bandwidth.

- g. Leave all controls and connections for the next step.

### 5. Check the Vertical Bandwidth (1 mV/div)

VOLTS/DIV (CH 1 and CH 2)	1m
---------------------------	----

- a. Adjust the leveled sine-wave generator for a crt display of exactly six divisions.

- b. Set the generator frequency to 5 MHz and adjust the frequency variable until the displayed signal is at least 4.2 major divisions in amplitude.

- c. Check—that the frequency readout from the generator is equal to or greater than 5.0 MHz.

- d. Change the DISPLAY switch to CH 2.

- e. Connect the generator output to CH 2 input connector and return the generator frequency to 50 kHz and set the amplitude for six divisions.

- f. Repeat parts b and c to check the CH 2 bandwidth.

- g. Disconnect the generator and signal setup.

## Specification and Performance Check—SC 503

### 6. Check the AC LF Response

DISPLAY	XY
VOLTS/DIV (CH 1 and CH 2)	.5
DC-GND-AC-INT DC	DC

- a. Connect a 10 Hz sine-wave signal from the function generator through a  $50 \Omega$  coaxial cable, with a  $600 \Omega$  termination, to the CH 1 input connector.
- b. Adjust the INTEN and FOCUS controls for two well-defined dots on the crt display.
- c. Adjust the function generator output frequency for six graticule divisions of display (one vertical line displayed).
- d. Set the DC-GND-AC-INT DC switch to AC.
- e. Check—that the displayed amplitude is greater than 4.2 divisions.
- f. Reconnect the generator to the CH 2 input connector and repeat parts b through e.
- g. Disconnect all cables and return the front-panel controls to the preliminary settings.

### 7. Check the Displayed Noise

VOLTS/DIV (CH 1 and CH 2)	1m
DISPLAY	CH 2
DC-GND-AC-INT DC	DC
SOURCE	EXT

- a. Connect a 0.2 mV standard amplitude signal from the calibration generator through a  $50 \Omega$  coaxial cable to the CH 2 input connector.
- b. Adjust the INTEN and FOCUS controls for a well-defined display.
- c. Check—to distinguish space between the two lines on the crt display.
- d. Change the DISPLAY switch to CH 1 and reconnect the generator to the CH 1 input connector and repeat parts a through c.

e. Disconnect all cables and return the front-panel controls to the preliminary settings.

### 8. Check the Step Attenuator Balance

- a. Position the trace with the horizontal and vertical POSITION controls to the center graticule line.
- b. Rotate the VOLTS/DIV switch to the 1m position (fully clockwise).
- c. Check—that the trace shifts less than one graticule division away from the graticule center.
- d. Return all front-panel controls to the preliminary settings.

### 9. Check the Position Range

SECONDS/DIV	.5m
VOLTS/DIV (CH 1 and CH 2)	10m
DC-GND-AC-INT DC	AC

- a. Connect a 0.2 V standard amplitude signal from the calibration generator through a  $50 \Omega$  coaxial cable to the CH 1 input connector.
- b. Rotate the vertical POSITION control fully clockwise and counterclockwise and note the position of the displayed waveform.
- c. Check—that the positive and negative sections of the waveform can be positioned on the crt screen.
- d. Rotate the vertical POSITION control to midrange.
- e. Set the DISPLAY switch to CH 2 and reconnect the generator to the CH 2 input connector and repeat parts b through d.
- f. Disconnect all cables and return the front-panel controls to the preliminary settings.

### 10. Check CH 1 and CH 2 Operation

SECONDS/DIV	1m

- a. Adjust the TRIGGERING LEVEL control for a visible trace.

b. Check—for one trace affected by CH 1 front-panel controls.

c. Set the DISPLAY switch to CH 2.

d. Check—for one trace affected by CH 2 front-panel controls.

e. Return the front-panel controls to the preliminary settings.

## 11. Check Alternate Operation

SECONDS/DIV	5m
DISPLAY	ALT

a. Adjust the TRIGGERING LEVEL control for a visible trace.

b. Check—for two traces on the screen.

c. Adjust CH 1 and CH 2 vertical POSITION controls for approximately one major division separation between traces.

d. Check—that the sweep alternates between CH 1 and CH 2 traces for each SECONDS/DIV setting from 5m through .5.

e. Return the front-panel controls to the preliminary settings.

## 12. Check Chopped Operation

SECONDS/DIV	5m
DISPLAY	CHOP

a. Adjust the TRIGGERING LEVEL control for a visible trace.

b. Check—that two traces move across the screen simultaneously for each SECONDS/DIV setting from 5 m through .5.

c. Return the front-panel controls to the preliminary settings.

## 13. Check 1–2 Operation

DISPLAY	1 – 2
---------	-------

a. Adjust the TRIGGERING LEVEL control for a visible display.

b. Check—that one trace is visible on the screen and that the CH 1 and CH 2 vertical POSITION controls move the trace equally in opposite directions.

c. Return the front-panel controls to the preliminary settings.

## 14. Check 1 + 2 Operation

DISPLAY	1 + 2
---------	-------

a. Adjust the TRIGGERING LEVEL control for a visible display.

b. Check—that one trace is visible on the screen and that the CH 1 and CH 2 vertical POSITION controls move the trace equally in the same direction.

c. Return the front-panel controls to the preliminary settings.

## 15. Check XY Operation

DISPLAY	XY
---------	----

a. Adjust the CH 1 vertical POSITION control from fully clockwise to fully counterclockwise.

b. Check—that the dot moves vertically off the screen in both directions.

c. Adjust the CH 2 vertical POSITION control from fully clockwise to fully counterclockwise.

d. Check—that the dot moves horizontally off the screen in both directions.

e. Return the front-panel controls to the preliminary settings.

## Specification and Performance Check—SC 503

### 16. Check the Calibrated Sweep Range

VOLTS/DIV (CH 1 and CH 2)	.5
DC-GND-AC-INT DC	DC
SECONDS/DIV	.5 $\mu$ s

a. Connect .5  $\mu$ s time marks from the time-mark generator through a 50  $\Omega$  coaxial cable, with a 50  $\Omega$  termination, to the CH 1 input connector.

b. Rotate the TRIGGERING LEVEL control for a stable display. Vertically position the display to the center of the crt viewing area.

c. Check—that one time marker per graticule division is displayed on the crt within the accuracy tolerance listed in Table 2-11.

d. Disconnect all cables.

**Table 2-11**  
**HORIZONTAL DEFLECTION ACCURACY**

SECONDS/DIV	+15°C to +35°C		0°C to +50°C	
	Unmagnified	Magnified	Unmagnified	Magnified
2 s/div to 0.5 s/div	$\pm 4\%$	$\pm 5\%$	$\pm 5\%$	$\pm 6\%$
0.2 s/div to 5 $\mu$ s/div	$\pm 3\%$	$\pm 4\%$	$\pm 4\%$	$\pm 5\%$
2 $\mu$ s/div to 0.5 $\mu$ s/div	$\pm 4\%$	$\pm 5\%$	$\pm 5\%$	$\pm 6\%$

### 17. Check the Mag Register

PULL X10 HORIZ MAG out

a. Horizontally position the sweep start (left end of sweep) on the graticule center line.

b. Adjust the generator for a vertical deflection of eight graticule divisions on the crt display.

b. Depress the PULL X10 HORIZ MAG switch.

c. Center the display on the crt screen with the POSITION controls.

c. Check—that the beginning of the trace is within 0.5 division of the graticule center line.

d. Check—that the horizontal opening, at screen center, is less than 0.4 graticule division.

d. Return the front-panel controls to the preliminary settings.

e. Disconnect all cables and return the front-panel controls to the preliminary settings.

### 18. Check the XY Phasing

VOLTS/DIV (CH 1 and CH 2)	5m
SOURCE	EXT

a. Connect a 50 kHz sine-wave signal from the leveled sine-wave generator through a 50  $\Omega$  coaxial cable, to the 50  $\Omega$  termination, to the dual input cable, to the CH 1 and CH 2 input connectors.

### 19A. Check the Trigger Sensitivity (below 5 MHz)

SECONDS/DIV	.5 $\mu$
VOLTS/DIV (CH 1 and CH 2)	.5
DC-GND-AC-INT DC	DC

a. Connect a 5 MHz signal from the leveled sine-wave generator through a 50  $\Omega$  coaxial cable, to a 50  $\Omega$  termination, to the CH 1 input connector.

b. Adjust the generator output amplitude for 0.4 graticule division on the crt screen.

- c. Check—that a triggered positive-going display can be obtained at some setting of the TRIGGERING LEVEL control.
- d. Set the SLOPE switch to – position.
- e. Check—that a triggered negative-going display can be obtained at some setting of the TRIGGERING LEVEL control.
- f. Depress the MODE NORM switch.
- g. Check—repeat parts c through e.
- h. Depress the CPLG AC LF REJ switch.
- i. Check—repeat parts c through e.
- j. Release the AC LF REJ switch (out position) and press in the CPLG AC pushbutton.
- k. Check—repeat parts c through e.
- l. Release the AC pushbutton and press the MODE AUTO button.
- m. Connect a 5 MHz signal from the leveled sine-wave generator through a  $50 \Omega$  coaxial cable, to a  $50 \Omega$  termination, to the CH 2 input connector.
- n. Set the front-panel controls as follows:

DISPLAY	CH 2
SOURCE	CH 2
SLOPE	+

- o. Repeat parts b through l of the above procedure to check the trigger sensitivity for CH 2.
- 19B. Trigger Sensitivity (5 MHz to 10 MHz)**
- a. Change the generator frequency to 10 MHz and adjust the output frequency for 10 MHz.
- b. Adjust the generator amplitude for one graticule division of display on the crt screen.
- c. Set the SLOPE switch to + position.
- d. Check—that a triggered positive-going display can be obtained at some setting of the TRIGGERING LEVEL control.
- e. Reset the SLOPE switch to – position.
- f. Check—that a triggered negative-going display can be obtained at some setting of the TRIGGERING LEVEL control.
- g. Press the MODE NORM switch.
- h. Check—repeat parts c through f.
- i. Press the CPLG AC LF REJ button.
- j. Check—repeat parts c through f.
- k. Release the AC LF REJ pushbutton to the out position and press the CPLG AC switch.
- l. Check—repeat parts c through f.
- m. Release the AC pushbutton and press the MODE AUTO button.
- n. Reconnect the generator to the CH 1 input connector.
- o. Set the front-panel controls as follows:

DISPLAY	CH 1
SOURCE	CH 1
SLOPE	+

- p. Repeats parts a through l in the above procedure to check the trigger sensitivity for CH 1.
- q. Disconnect all cables and return the front-panel controls to the preliminary settings.

## Specification and Performance Check—SC 503

### 20. Check Auto, Normal, and Single Sweep Modes

SECONDS/DIV	1 m
CH 1 DC-GND-AC-INT DC	DC
CH 1 VOLTS/DIV	1

- a. Connect the function generator to the CH 1 input connector through a  $50 \Omega$  coaxial cable and a  $50 \Omega$  termination.
- b. Set the generator for a 1 kHz sine wave and adjust the amplitude for a display of six divisions. Adjust the TRIGGERING LEVEL control for a stable display.
- c. Set the SOURCE switch to EXT.
- d. Check—that the sweep free runs.
- e. Set the SOURCE switch to CH 1.
- f. Press the NORM button.
- g. Check—for a visible trace.
- h. Set the SOURCE switch to EXT.
- i. Check—that the trace disappears.
- j. Set the SOURCE switch to CH 1.
- k. Release the NORM button (out position).
- l. Check—for a visible trace.
- m. Momentarily press and release the SGL SWP RESET button.
- n. Check—that the trace appears once each time the SGL SWP RESET button is pressed.
- o. Disconnect all cables and return the front-panel controls to the preliminary settings.

### 21. Check Stored Writing Speed

SECONDS/DIV	10 $\mu$ s
CH 1 VOLTS/DIV	.5 V
CH 1 DC-GND-AC-INT DC	DC
CPLG	AC
MODE	NORM

- a. Connect 10  $\mu$ s markers from the time-mark generator through a  $50 \Omega$  coaxial cable and a  $50 \Omega$  termination to the CH 1 input connector.
- b. Set the TRIGGERING LEVEL control for a stable display.
- c. Adjust the TIME/DIV variable for five markers in four horizontal divisions.
- d. Change the CH 1 input coupling to GND, TRIGGERING SOURCE to LINE, and TRIGGERING MODE to SGL SWP.
- e. Set the INTEN control to a point just below the unblanking level.
- f. Set the VIEW TIME to  $\infty$  and press ERASE PUSH after the crt background is fully lighted.
- g. Adjust the TRIGGERING LEVEL control, if necessary, to write one horizontal trace each time the SGL SWP RESET button is pressed.
- h. Repeatedly push and release the SGL SWP RESET button while slowly positioning the trace vertically.
- i. Check—that the stored lines over the innermost six vertical by eight horizontal graticule divisions show no breaks greater than 0.025 inch.
- j. Leave the INTEN control setting for the next step.

## 22. Check Enhanced Writing Speed

Use the INTEN control setting determined in the previous step.

VIEW TIME	NON-STORE
SOURCE	CH 1
MODE	NORM
CH 1 DC-GND-AC-INT DC DC	

a. Using the SECONDS/DIV and the sweep variable (CAL) control, set the sweep speed for one  $10 \mu\text{s}$  marker every four graticule divisions.

b. Reset the TRIGGERING SOURCE to LINE, MODE to SGL SWP, and CH 1 DC-GND-AC-INT DC to GND.

c. Adjust the CH 1 vertical POSITION control to position the trace one division above the bottom graticule line.

d. Set the VIEW TIME to  $\infty$ . After the crt background is fully illuminated, press the ERASE pushbutton.

e. Turn the ENHANCE control slightly clockwise, and press the SGL SWP RESET and ERASE pushbuttons sequentially until the stored trace becomes easily visible. The crt background should have minimum brightness and should contain no spots of illumination greater than 0.025 inch.

f. Press the ERASE pushbutton, adjust the CH 1 vertical POSITION control to position the trace slightly above the previously stored trace, and press the SGL SWP RESET button.

g. Check—that the stored trace has no breaks greater than 0.025 inch over the innermost eight horizontal graticule divisions.

h. Repeat parts f and g to check the screen area contained within the innermost six vertical by eight horizontal graticule divisions.

## 23. Check the Calibrator

CH 1 VOLTS/DIV	.1
CH 1 DC-GND-AC-INT DC DC	

a. Connect the output of the calibrator to the CH 1 input connector using the pin-jack-to-bnc adapter.

b. Check—that the display amplitude is six divisions within .06 division.

c. Disconnect all cables and return the front-panel controls to the preliminary settings.

## 24. Check the External Trigger Level Range

SECONDS/DIV	$10 \mu\text{s}$
MODE	NORM
SOURCE	EXT

a. Connect the leveled sine-wave generator through a  $50 \Omega$  coaxial cable and a  $50 \Omega$  termination to EXT TRIG.

b. Press and hold the TRIG VIEW pushbutton during the following steps.

c. Set the generator frequency range to 50 kHz and adjust the amplitude for a display of six divisions.

d. Set the TRIGGERING LEVEL control to midrange.

e. Check—that the READY TRIG'D light is on.

f. Adjust the TRIGGERING LEVEL control fully clockwise.

g. Check—that the READY TRIG'D light is off and the trace stops running.

h. Set the TRIGGERING LEVEL control fully counterclockwise.

i. Check—that the READY TRIG'D light is off and the trace stops running.

j. Release the TRIG VIEW pushbutton.

k. Disconnect all cables and return the front-panel controls to the preliminary settings.

**25. Check the Internal Trigger Level Range**

SECONDS/DIV	10 $\mu$ s
CH 1 DC-GND-AC-INT	DC
MODE	NORM
CH 1 VOLTS/DIV	.2

- a. Connect the leveled sine-wave generator output through a  $50 \Omega$  coaxial cable and a  $50 \Omega$  termination to the CH 1 input connector.
- b. Set the generator frequency to 50 kHz and adjust the amplitude for a display of six divisions.
- c. Adjust the TRIGGERING LEVEL control to midrange.
- d. Check—that the READY TRIG'D light is on.

- e. Set the TRIGGERING LEVEL control fully clockwise.
- f. Check—that the READY TRIG'D light is off and the sweep stops.
- g. Set the TRIGGERING LEVEL control fully counterclockwise.
- h. Check—that the READY TRIG'D light turns off and the sweep stops.
- i. Change TRIGGERING S?OPE to — and repeat parts c through h.
- j. Disconnect all cables and return the front-panel controls to the preliminary settings. This completes the Performance Check procedure.

## **WARNING**

THE FOLLOWING SERVICING INSTRUCTIONS ARE FOR USE BY QUALIFIED PERSONNEL ONLY. TO AVOID PERSONAL INJURY, DO NOT PERFORM ANY SERVICING OTHER THAN THAT CONTAINED IN OPERATING INSTRUCTIONS UNLESS YOU ARE QUALIFIED TO DO SO. REFER TO OPERATORS SAFETY SUMMARY AND SERVICE SAFETY SUMMARY PRIOR TO PERFORMING ANY SERVICE.

# THEORY OF OPERATION

## VERTICAL CIRCUITRY

The vertical input circuitry provides attenuation and amplification for the vertical signal before it is applied to the vertical deflection plates of the crt. The vertical amplifier circuitry (includes the delay line and trigger view circuit,) which allows the oscilloscope to display its trigger signal.

### NOTE

*Where both channels 1 and 2 exist and both channels are similar, only channel 1 will be described.*

### Input Coupling

Signals applied to the front-panel input connectors may be capacitively coupled (AC), directly coupled (DC), internally disconnected (GND) or dc coupled through the rear interface connector (INT DC). Input coupling is selected by S1021A at the input for channel 1.

Assuming that a signal is applied to the input, when S1021A is set to DC, the applied signal is passed directly to the attenuators. When S1021A is set to AC, C1012 is placed in the circuit to couple signals of about 10 Hz (-3 dB point) and higher to the attenuator. This capacitor blocks any dc component of the signal. When S1021A is set to GND, a ground reference is provided to the input of the amplifier without the need to remove the applied signal from the input connector.

When S1021A is in the INT DC position, the rear interface signals are internally coupled to the channel 1 or channel 2 attenuators. In channel 1, the vertical signal from pins 14A and 15A of the rear interface connector is fed into the CH 1 attenuator. When Q7021 conducts, K8041 is energized closing S8041. The operation of channel 2 input circuitry is identical to that of channel 1.

### NOTE

*When dc levels (above 10 volts) are to be blocked by ac coupling, the DC-GND-AC-INT DC switch should be set to GND while input connections are made or broken, or when voltage levels are changed. This allows the coupling capacitor to charge without overdriving the amplifier.*

### Input Attenuator

The input attenuator is a frequency-compensated voltage divider and provides 100X attenuation in positions 0.5 to 20 of the VOLTS/DIV switch. For dc and low frequency signals the divider is essentially resistive.

In addition to providing constant 100X attenuation at all frequencies within the bandwidth capabilities of the instrument, the input attenuator maintains a constant input rc characteristic (1 MΩ paralleled by about 47 pF).

### Gain Switching Stage

The preamplifier consists of two identical operational amplifiers, connected in a differential configuration.

The operational amplifiers are composed of Q2011B and Q1012 driving Q1014 and Q2011A and Q1011 driving Q1013. Transistor Q2011B and Q2011A provide a voltage follower input to output transistors Q1014 and Q1013. Total gain of the stage is determined by the resistance between the two sides of the amplifier and R4061, R4063 and R4064 (see Fig. 3-1). The Channel 2 gain is set by R4031, R4049 and R4041. Variable resistor R4031, CH 2 Gain, matches the gain of both preamplifiers to the channel switching circuitry.

Correct adjustment of the Step Bal 1 control, R4065, quiescently balances the two sides of the amplifier so that there is no current through the gain-setting resistor(s). This dc balancing is achieved by adjusting Step Bal 1 control R4065 for no trace movement while rotating the VOLTS/DIV switch from 0.2 V to 1 mV. When a signal is applied to the gate of Q2011B, the signal current is developed through gain-setting resistors located between the sources of Q2011A and Q2011B. Transistors Q1013 and Q1014 output the differential current. The value of the gain resistors is selected by the VOLTS/DIV switch, S1021A to determine the gain.

### Vertical Preamplifier and Trigger Pickoff

The channel 1 preamplifier and trigger pickoff circuitry is composed of Q4055, Q5051, Q4056, Q4053, Q4054, Q5052, Q4052, Q4051 and associated circuitry.

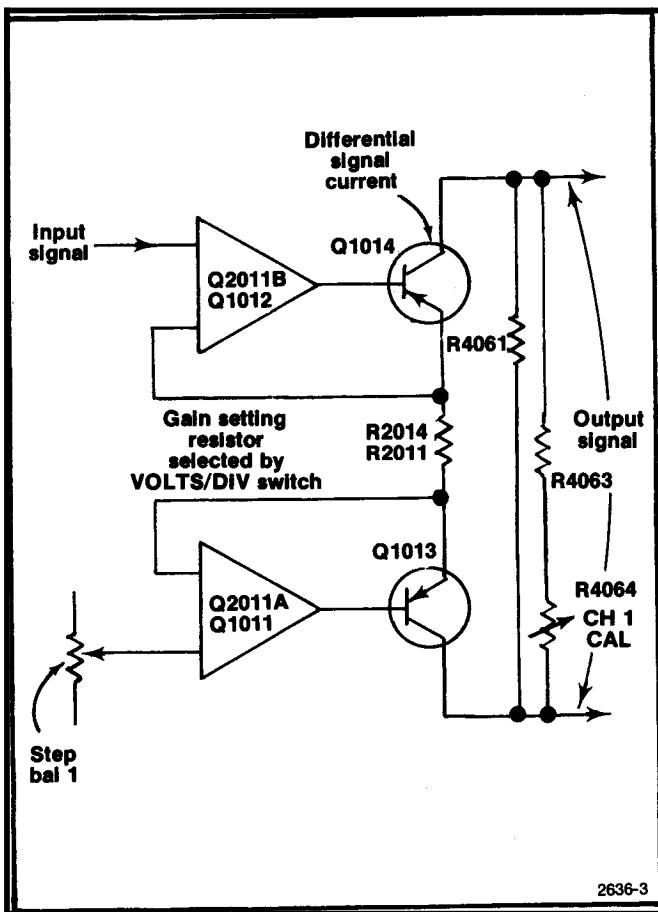

Fig. 3-1. Input channel 1 preamplifier detailed block diagram showing signal current paths.

The signals from the channel 1 input amplifier enter the bases of the common emitter preamplifiers, Q4053 and Q4054. The components located between these emitters are for circuit peaking and gain. High frequency compensation is attained by peaking components, C4051, R4052 and C4052. The circuit gain is set by R4054-L. The CH 1 trigger pick-off and CH 1 events out signals are outputs from the common emitter amplifier composed of Q4052 and Q4051 with associated circuitry.

The common base amplifiers composed of Q4056 and Q5052 drive the channel switch. The channel 1 position amplifier consisting of Q4055, Q5051 and associated circuitry sums the differential current from transistors Q1013 and Q1014 into the collectors of Q4056 and Q5052.

Both channel 1 and channel 2 preamplifiers use resistive thick film networks, R4054 and R4033. Channel 2 operation is similar to channel 1 with exception of the X signal which outputs to the horizontal deflection amplifier via transistors Q5031 and Q3031.

### Channel Switching

The channel switch is composed of three circuits, the chop oscillator, logic and the switching matrix.

The chop oscillator composed of Q6011 and Q6012 is an astable multivibrator. This oscillator when switched on from the +5 V by the DISPLAY switch S6021, drives the switch logic flip-flop, U5011 (see Fig. 3-2). In conjunction with the oscillator output is the end of sweep signal which turns on transistor Q5012 driving U5011 that controls the display switching between channels when ALT mode is selected by the DISPLAY switch.

In the switching matrix, the emitters of Q5043A and Q5053A are switched against diodes CR4031 and CR4042. The bases of Q5043 and Q5053 are switch between +300 mV and -600 mV. The amplifier currents are directed into the summing resistors, R5054 and R5055. The DISPLAY switch, S6021 drives the channel switch logic flip-flop, U5011 to select the proper currents for all modes of operation including CH 1, CH 2, 1-2 and 1+2.

When the TRIG VIEW switch is pressed, the CH 1 and CH 2 inputs are disabled by and Q5053E to the switch matrix.

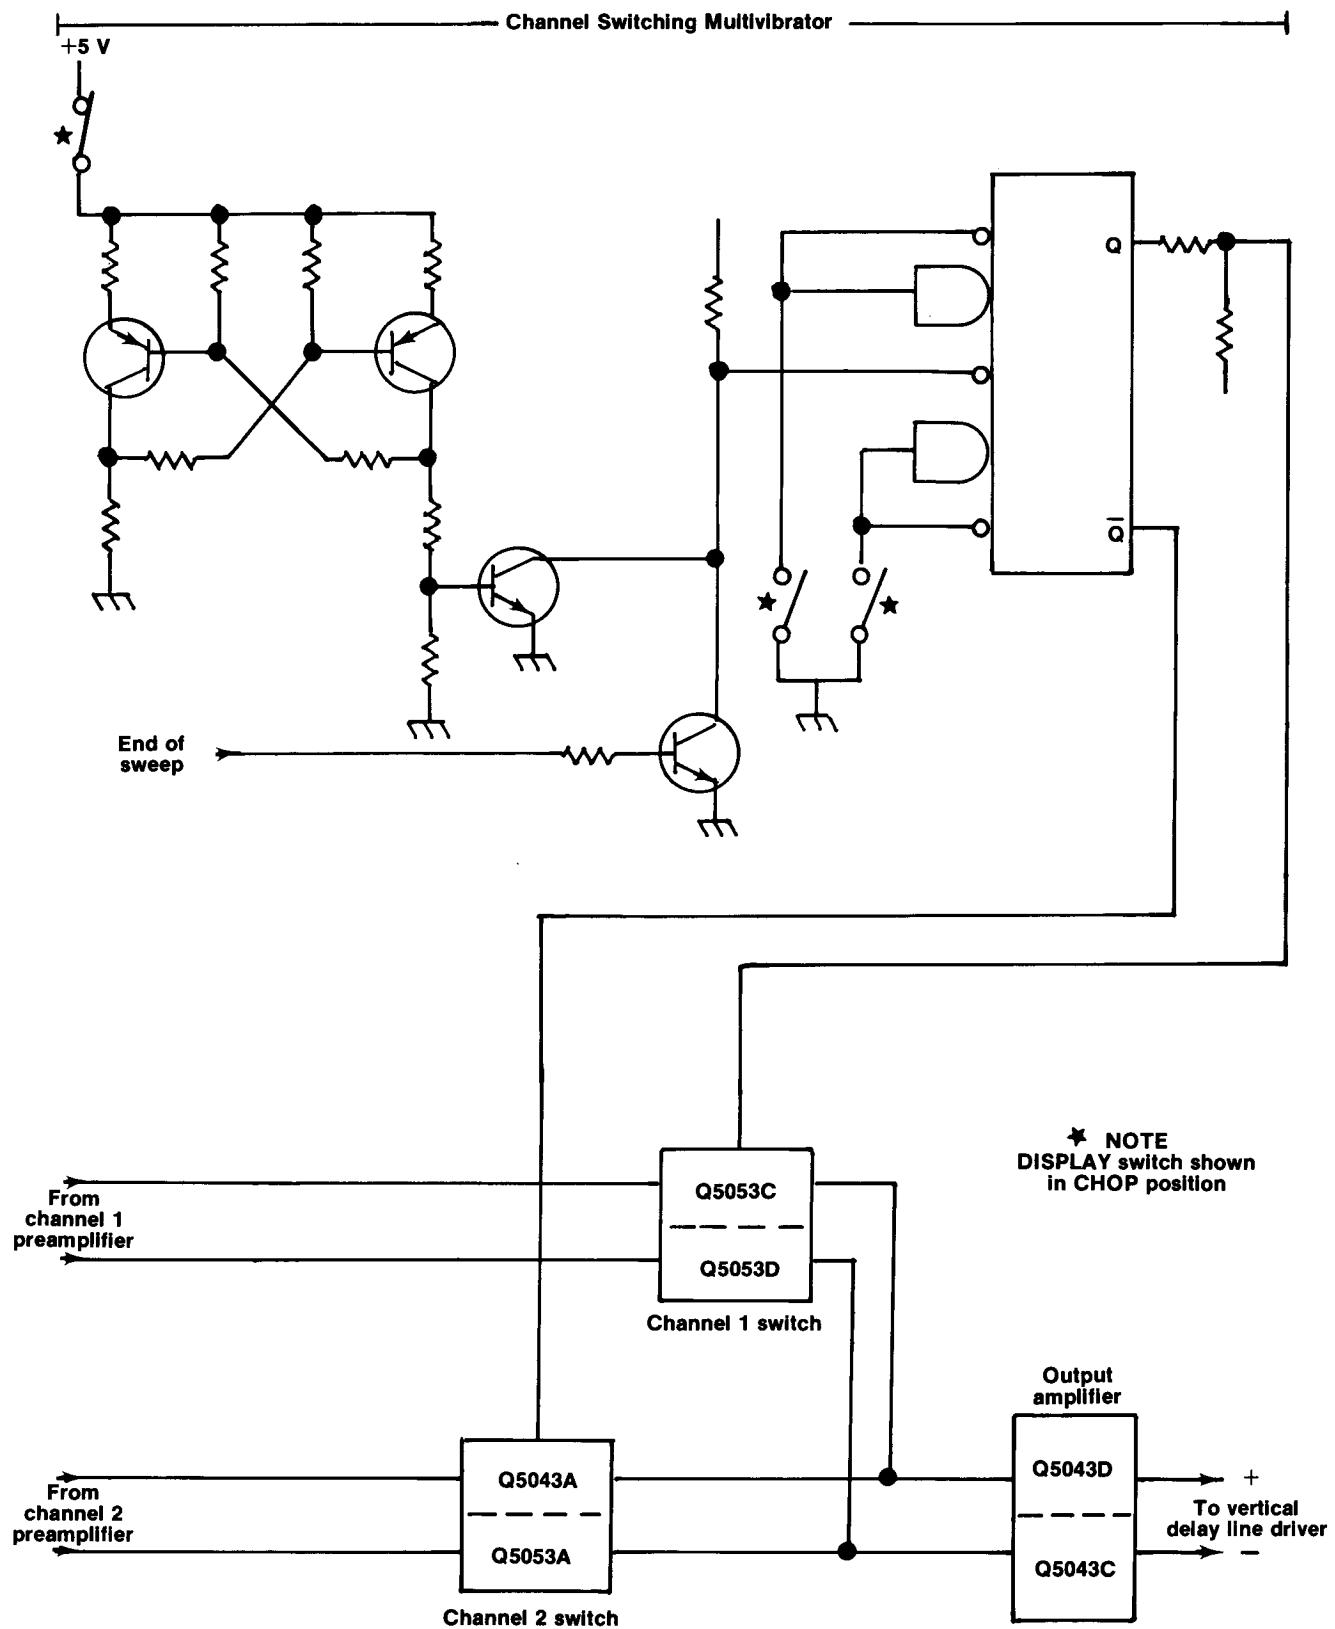

Fig. 3-2. Channel switching.

## VERTICAL AMPLIFIER

The vertical Amplifier circuit provides the final amplification for the vertical deflection signal. This circuit includes the Delay Line Driver, Delay Line, and Output Amplifier.

### **Delay Line Driver**

This circuitry consists of an input amplifier, limiter and an impedance matching circuit.

The input amplifier is composed of Q5042 and Q5033. The limiter consists of Q5035, Q5034, CR5031 and CR5032. The impedance matching is accomplished with the precision resistors R5021 and R5022 which are the collector load resistors for Q5034 and Q5035. The input amplifier has a high common mode rejection, storage gain correction and thermal compensation.

Transistor Q4042, the active current source, provides the high common mode rejection. This current source provides accurate limiting and common mode level on the delay line.

The storegain switching signal through Q5043E turns on FET Q5041, providing storage gain correction through R5037.

The thermal compensation for the vertical system consists of RT5041 and R5043.

The limiter is composed of Q5035, Q5034, CR5032, CR5031, R5047 and R5034. The outputs from the collectors of Q5042 and Q5033 are the input currents for the

limiter circuitry. When Q5035 turns off, the voltage on its emitter drops until diode CR5032 forward biases which takes current from transistor Q5034 limiting the output current swing. This action repeats itself for signal currents flowing in the opposite direction.

### **Delay Line**

The delay line impedance is  $75 \Omega$  and provides a nominal 140 ns delay for the vertical signal. This delay allows the sweep generator circuits time to initiate a sweep before the vertical signal reaches the crt deflection plates.

### **Output Amplifier**

The signals from the delay line feed the output amplifier composed of Q2021, Q2012, Q2022, Q2011, Q3031, Q3011, Q3034, Q3021, Q3014, Q3012, and associated circuitry.

Transistors Q2021 and Q2012 comprise a voltage amplifier with peaking. The peaking components are composed of R2014 and C2011 for the 200 ns peak and C2022 and R2018 for the 75 ns peak. The vertical output centering adjustment, R1012, and the vertical gain adjustment, R1011, are also included in the voltage amplifier stage.

Transistors Q2022, Q3031, Q3034, Q3021, and associated circuitry comprise a shunt-feedback amplifier connected to the upper vertical deflection plate. Transistors Q2011, Q3011, Q3012, Q3014, and associated circuitry are the shunt feedback amplifier output to the lower deflection plate. Components R3023 and C3018 in the feedback stage of the output amplifier control the 20 to 40 ns peaking.

## TRIGGERING AND SWEEP CIRCUITRY

### **Trigger Pickoff**

This circuit, through the setting of the TRIGGERING SOURCE switch, inputs one of several triggering signals to the trigger generator circuit. Triggering signals available are the external (EXT), interface (INT), channel one only (CH 1) channel two only (CH 2), and the power line (LINE).

In the EXT position of the TRIGGERING SOURCE switch, the sweep is triggered by the external signal connected to the EXT TRIG connector. The CH 1 or CH 2 input signal triggers the sweep when the TRIGGERING SOURCE switch is in the CH 1 or CH 2 position. In the INT position of the TRIGGERING SOURCE switch, the sweep is triggered by the signal connected to the rear interface trigger input connector.

### Trigger Coupling

The TRIGGERING CPLG pushbuttons select either ac or dc coupling. When the AC pushbutton is pressed, coupling capacitor C1011 blocks the dc component of the trigger signal and attenuates signal components below approximately 50 Hz. This capacitor discharges through the TRIGGERING SOURCE switch and R1033 when switched out of the EXT position. When the AC LF REJ pushbutton is pressed, coupling capacitor C1012 blocks the dc components of the trigger signal below about 10 kHz. The trigger signal is direct coupled when both the AC and AC LF REJ pushbuttons are released.

### Input Source Follower

Field effect transistor (FET) Q2014 operates as a source follower providing a high-impedance input for the triggering signals. It also provides isolation between the trigger generator circuit and the trigger signal source. Diode CR2011 protects Q2014. FET Q2016 is a high-impedance, relatively constant, current source providing temperature compensation for Q2014.

### Trigger Generator

The triggering signal from source follower Q2014 feeds a differential pair composed of Q2012 and Q2011. Transistor Q2016 is a current source for Q2012. Transistor Q2012 forms a voltage to a current converter. Transistors Q2012 and Q2011 are cascaded and protected by diodes CR2012 and CR2013. The output signal at the collector of Q2011 drives the peak detector circuitry and the trigger comparator circuitry composed of Q4021, Q4022, and their associated components.

When the MODE AUTO switch is pressed, the triggering signal enters the amplifier circuit, composed of Q4002 for the + peak circuitry and Q4001 for the - peak circuitry. The peak detector circuits sample the + and - peak signal levels, and are adjusted by dc level shift potentiometers R1002 and R1001. Peak sensing capacitors C4012 and C4011 hold peak voltage levels that are applied to the TRIGGERING LEVEL control via buffer level shifters U3001 and U2001. The LEVEL control is adjusted between the two voltage levels, equal to the most negative and most positive peaks of the triggering signal. With the MODE AUTO pushbutton out, the triggering LEVEL control limits are set by R3011, R3014, R2016, and R2015.

The trigger level is set by the TRIGGERING LEVEL control and sent to the base of trigger comparator Q4022. If the voltage at the base of Q4022 is higher than the base of Q4021, current flows through Q4022 and the collector of Q4021 goes high. If the base of Q4022 is lower than the base of Q4021, the collector of Q4021 is lowered. Both outputs of the trigger comparator are supplied to and

switched internally by the gate generator U4021. These signals are taken from U4021 via Q4031 and Q4032 and fed to the Trigger View Circuit.

### Trigger View

When the TRIG VIEW pushbutton is pressed, the triggering signal is displayed on the crt.

When the TRIG VIEW switch is in the off position (button out), Q5053B and Q5043A conduct for normal channel 1 and channel 2 preamplifier operation.

When the TRIG VIEW switch is pressed, Q5053E conducts cutting off (via diode paths) Q5053B and Q5043A, thus turning off the channel 1 and channel 2 preamplifiers.

### Gate Generator

Integrated circuit U4021 converts the output signals from the trigger comparator to a gate waveform, which is used for sweep generator control. With the + slope select, pin 1, of U4021 connected to ground, a high signal on pin 13 of U4021 causes pin 3 (gate output) to go more positive and pin 4 to go more negative. Pin 14 goes negative. The output gate occurs when pins 13 and 14 are within about 20 mV of each other. Ungrounding pin 1 causes gate outputs from pins 3 and 4 when pin 13 is negative going and pin 14 is positive going.

The reset (holdoff) signal from pin 9 of U6011 causes pins 7 and 10 of U7011 to go high during the holdoff time after the completion of the sweep. This inhibits the gate generator until after holdoff time, when pins 7 and 10 are driven low by pin 9 of U6011.

The triggered gate (25B and 26B) and holdoff outputs (20B and 21B) are available on the rear interface connector.

### Sweep Control Operation

The sweep control circuit recognizes initiating gates from the trigger circuitry and uses these gates to start and stop the sweep, as well as reset the trigger gating generator. The control circuitry also provides blanking pulses for the crt.

The sweep control circuit is composed of two OR gates. Transistors Q6026, Q7033 and Q6023 output the sweep and logic gates to U6011. Transistors Q6031, Q6021, Q6022 and Q6024 cause a current flow which initiates the sweep (see Fig. 3-3).

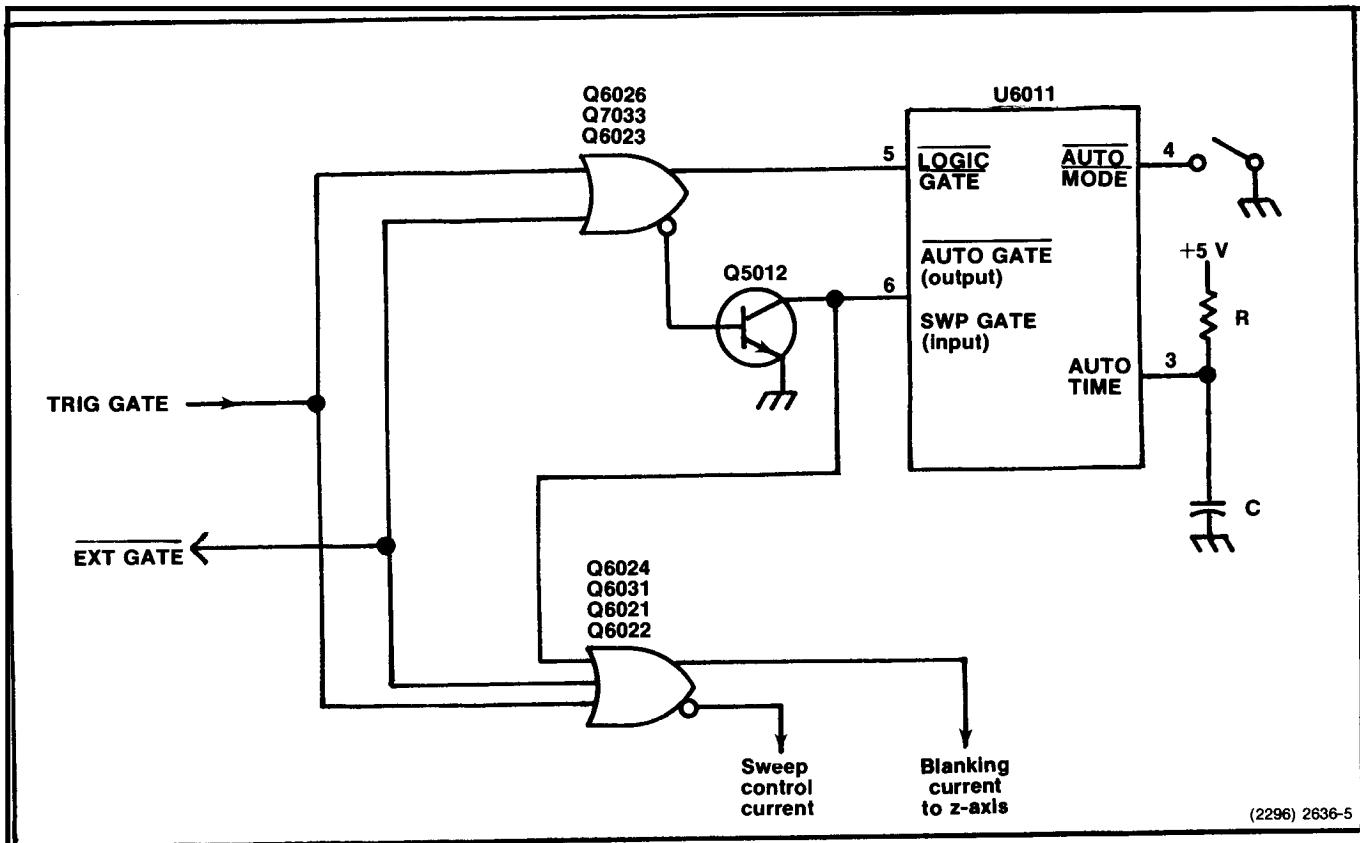

Fig. 3-3. Simplified sweep control circuit.

### Sweep Gates

The trigger gate is a low-level signal developed from U4021, pin 4 (Diagram 5). This signal turns on Q6023 causing Q5001 to initiate the sweep gate to pin 6 of U6011. The logic gate feeds pin 5 of U6011 when Q5001 conducts.

The auto gate is a low-level signal from U6011 developed at pin 6. Pressing the TRIGGERING AUTO MODE switch grounds pin 4 of U6011. If no logic gate is received at pin 5 of U6011, for a period of time determined by R6014 and C6011, the circuitry in U6011 outputs, from pin 6, a negative-going square wave. This square wave turns Q6021 on, when the bases of Q6022 and Q6024 are at a higher level than the threshold voltage on the base of Q6031. A blanking signal is developed from Q6031 that is positive going and outputs to the Z-axis circuitry.

The external gate must be an ECL input signal at the rear interface connector, and inputs to the gate enable circuit. This circuit consists of Q6027 and Q6011. The gate select signal from pin 24B on the rear interface connector causes Q6027 to conduct. Transistor Q6011 turns off, thus enabling the external gate. This gate turns Q6024 on causing current flow through CR4021, thus developing a sweep.

### Holdoff

The holdoff signal is available at pin 9 of U6011, which connects to the gate generator (U4021) at pin 10 (Diagram 5). This positive-going signal prevents the generation of sweep gates during holdoff times or after a single sweep has occurred. Holdoff begins when pin 12 of U6011 goes high. The resistor capacitor network, connected to pins 10 and 11 of U6011, determines the holdoff time. The setting of the SECONDS/DIV switch determines the duration of the holdoff.

### Single Sweep

In the SGL SWP mode, pin 1 of U6011 is grounded and pin 4 of U6011 is ungrounded. When the sweep is armed, pins 13 and 15 of U6011 are low, causing the READY TRIG'D indicator to light. This action, at pins 13 and 15, also occurs when the sweep is in a triggered mode. Resistor R6011 limits the LED current to a specified value. Pressing the SGL SWP switch (momentary pushbutton) grounds pin 2 of U6011 through R5006, causing the gate generator (U6011) to reset. This turns on the READY TRIG'D light and arms the circuit for another triggered ramp.

### Ramp Generator

The sweep ramp is generated during the time that Q3021 is off. A constant current, determined by the timing resistor, flows into the timing capacitor, due to the action of the operational amplifier composed of Q3022A, Q3023, and Q4021. This generates the sweep ramp. The negative-going ramp voltage decreases at a rate determined by the timing resistor and timing capacitor combination, until reaching approximately  $-10.5\text{ V}$ .

At the end of the sweep, the sweep current through diode CR4021 turns Q3021 on. If the ramp voltage attempts to go above 0 V, CR4022 conducts. This causes the current through Q3021 to equal the current through the timing resistor plus the timing capacitor discharge current. This action clamps the integrator output to 0 V until the next sweep turns Q3021 off.

The negative-going ramp is inverted through Q7044, and then emitter coupled to pin 18A of the rear interface connector. When the ramp turns Q7034 off, current through Q7032 creates a negative-going signal at the base of Q7031. Transistor Q7031 outputs a positive-going, end-of-sweep (eos) signal to pin 12 of U6011. This output signal also feeds the Z-axis circuitry (Diagram 9) to initiate blanking of the crt.

In the XY mode, Q4022 turns on, disabling the ramp; CR7031 conducts, disabling the end-of-sweep comparator; and Q5012 turns on, disabling the sweep gates.

### Horizontal Preamplifier and Output Amplifier

The horizontal preamplifier circuit is contained within U3037. A negative-going sweep ramp is fed to pin 9 of U3037 from the sweep generator.

The X1 gain control, R5013, is connected from pin 6 to pin 3 of U3037. In the HORIZ MAG position, the X10 gain control, R6011, is connected in parallel with R5013. The magnifier registration voltage on pins 1 and 8 of U3037 is provided by R5014. Horizontal positioning is controlled by the front-panel horizontal POSITION control.

The output sweep signals, from pins 7 and 2 of U3037, drive two separate current-driven, feedback amplifiers composed of Q3021, Q2011, and Q2012 for the positive-going sweep and Q3022, Q3011, and Q3012 for the negative-going sweep. Transistor Q2021 is the current source.

## STORAGE CIRCUITRY

### General

The storage circuit (see block diagram in Section 8) provides the voltage levels necessary to operate the crt flood guns, collimation electrodes, and storage target backplate.

The circuitry includes an erase monostable circuit, a storage target backplate amplifier, an enhance generator, and an integrate circuit. The enhance circuit permits storage of very fast single-sweep signals. Integrate permits storage of a number of repetitive sweeps, each of which would be too fast to store as a single-sweep event. The auto-erase generator circuit automatically initiates an erase pulse following the end of each sweep. The VIEW TIME control determines the length of time the stored information is held before erasure.

### Storage Tube

The crt used in the SC 503 is a direct-view, bistable storage cathode-ray tube. Storage, which is the retention on the crt of a displayed event, is based on a secondary emission principle. A stream of primary electrons strikes an insulated target surface with sufficient energy to

dislodge electrons. As the potential increases, each primary electron dislodges more than one secondary electron, resulting in the written target material charging positive. The written portion of the target approaches the storage target backplate potential, yielding higher-energy flood electrons, resulting in light output.

In addition to the conventional crt writing gun elements the storage cathode-ray tube contains flood guns, collimation electrodes, and a storage target backplate. The operating mode of the tube depends primarily on the voltage applied to the storage target backplate. With one condition of applied potential, the storage target backplate operates in the ready-to-write state. When the storage target backplate is bombarded with high-energy writing-beam current, the bombarded portion shifts to the stored mode to store the written display. With a lower applied voltage, the storage target backplate operates in the conventional mode, similar to a conventional refreshed crt.

### Flood Guns and Collimation Electrodes

Two low-energy electron guns (flood guns) are used in the SC 503 crt. The cathodes of these guns are biased to approximately  $-80\text{ V}$  by an operational amplifier con-

## Theory of Operation—SC 503

sisting of Q2024 and Q2031. The flood guns provide a continuous flood of low-energy electrons that cover the entire target area.

The collimation electrodes serve as an electrostatic lens to distribute the flood gun electrons uniformly over the storage target. Resistor R1038 determines the voltage level of the collimation electrodes, through R1037 and Q1024. During erase, approximately one-fifth of the erase waveform is coupled through C1022 and Q1024 to the collimation electrodes. This compensates for interaction between the storage target backplate and the collimation electrodes during the erase cycle.

### Storage Target Backplate Amplifier

This amplifier biases the storage target backplate into the store or the nonstore mode. It consists of Q1026, Q1022, and Q1021. When the VIEW TIME control, S7013B is in the nonstore position, a dc potential supplied through R4034 and R5031 is inverted and amplified by the storage target backplate amplifier to about 130 V below the store operating level. In this condition, the crt operates as a conventional crt.

With the VIEW TIME control, S7013B, in the store mode, less current is available to the storage target backplate operational amplifier through R4034 and R5031, raising the storage target backplate to a more positive potential. At this potential, the crt is in a ready-to-write state.

The input to the storage target backplate amplifier is a summing junction for the erase signal. Transistor Q1031 provides a bootstrap feedback for the erase-positive signal, through the zener action of VR1022. The store operating level of the storage target backplate is adjusted by R1039.

### Auto Erase Generator

In the auto-erase circuit, the positive-going end-of-sweep pulse from the sweep generator is inverted and buffered through Q7012 into a discrete set-reset latch composed of Q7011 and Q7014. A positive ramp with a two-second time constant is developed by R6037 and C6032. When this positive ramp reaches the switching level of comparator U6031A, the comparator steps negative. This comparison level is adjusted by R7013 and determines the view time of the stored display. An erase-negative step can also be entered into the circuit at this point either from the rear interface External Erase connection or by pushing the manual ERASE PUSH button.

### Erase Generator

To erase the stored display, a positive pulse is first applied to the storage target backplate. This pulse increases the potential difference between the flood-gun cathodes and the target backplate, raising the operating level above the upper writing limit and writing the entire target area with flood gun electrons. Next, the voltage is pulled negative, well below the retention threshold. Then, as the backplate potential is gradually returned, the target is charged to the storage target backplate potential and returned to a ready-to-write state.

The erase generator consists of an erase-positive monostable (Q5031, Q5032), an erase-negative ramp generator (Q6033), and associated circuitry. The erase-positive monostable generates the positive pulse portion of the erase waveform (see waveforms 13 and 14 in Section 8). The negative transition from U6031A, rear interface External Erase, or ERASE PUSH, turns off Q5031 allowing one side of C5032 to charge positive through R5038. This positive level is inverted through Q5032 and coupled to the summing junction of the storage target backplate operational amplifier. The erase-negative generator creates the positive-going ramp of the erase waveform (see waveform 15 in Section 8). When Q5031 turns on, the positive side of C5032 is pulled negative and gradually charged positive by Q6033. This ramp is coupled through Q6032 to the storage target backplate operational amplifier.

When Q6033 is saturated (collector at 5.6 V), comparator U6031B, pin 6 is more positive than its positive input pin 5, causing a low comparator output. During the erase-negative ramp (diagram 14 in Section 8) U6031B has a high output that holds Q7013 reset. The output of comparator U6031B is also coupled into the single sweep reset circuitry through Q7031.

### Enhanced Operation

Writing speed is primarily a function of the writing gun beam current density and the physical properties of the storage tube. At very fast sweep speeds, the writing beam does not charge the scanned portion of the target sufficiently to shift the target to the stored state. The flood gun electrons discharge the small deposited charge down to the bias potential before the next sweep occurs. Writing beyond the normal writing speed of the crt is accomplished through the process of enhancement or integration.

The enhance generator produces a 5-15 ms negative-going current pulse to the backplate amplifier summing junction resulting in a positive-going pulse to the target backplate. This pulse conditions the target so that less writing gun current is required to shift the scanned section to the stored state.

Transistors Q6031, Q5033, driven by Q7012, and associated circuitry form the enhance monostable to produce the enhance pulse. The amplitude of this pulse is set by R4023.

### Integrate Operation

In the integrate mode, the flood gun emission is interrupted by pressing the INTEGRATE button momentarily, permitting the writing gun beam to sum the charge on the backplate for successive sweeps. These areas of accumulated charge shift to the stored state when the flood electrons are turned on (INTEGRATE button released).

Pressing the INTEGRATE button grounds the input bias to the flood gun operational amplifier, consisting of Q2024 and Q2031, and turns off the flood-guns. This grounding also turns on Q3032 and Q2032, generating a compensating voltage into the HV adjust input. This compensating voltage shift corrects for deflection sensitivity changes that occur when the flood guns are turned off. This circuitry also turns on the FET switch Q5041, in the vertical delay line driver with Transistor Q5043E.

## CRT AND POWER SUPPLY CIRCUITRY

### Crt Circuit

This circuitry produces the high voltage potentials and provides the control circuits necessary for operation of the cathode ray tube. The Z-axis amplifier circuit sets the intensity of the display and controls the crt blanking.

### Z-Axis Amplifier

The Z-axis amplifier is a current-driven, shunt-feedback operational amplifier with a voltage output. The amplifier consists of Q7021, Q7022, and Q7023. The feedback path is from the collectors of Q7022 and Q7023, through C7023 and R7024 to a summing point at the base of Q7021. Collector-coupled complementary amplifiers Q7022 and Q7023 provide a fast linear output signal and consume minimum quiescent power. Transistor Q7023 acts as the pullup transistor and Q7022 acts as the pulldown transistor for the amplifier. The output voltage from the amplifier provides the drive signal to control the crt intensity level through the control-grid supply.

The output voltage level of the Z-axis amplifier is determined by the voltage drop across R7024 with reference to the voltage level at the summing point for the amplifier (base of Q7021). The current through R7024 is determined by the input current from a combination of the INTEN control setting and the sweep blanking.

During blanking Q5021 turns on biasing Q5031 off, so that the Z-axis amplifier's output is at a low level. Removing the blanking current source from the base of Q5021 permits the operating point of the differential amplifier to be set by the intensity control potentiometer, R530. The output current raises the output level of the Z-axis amplifier.

Diodes CR8021 and CR8022 act as protective clamps for the Z-axis amplifier. Transistors Q5031 and Q5021 form a comparator, with the sweep blanking signal setting the reference level. To unblank the crt, the voltage level at the base of Q5021 must be more positive than the level at the base of Q5031. The operating level at the control grid of V500, is determined by diodes CR7041 and CR8041. Diode CR8041 limits the negative excursion of the bias voltage, depending upon the Z-axis amplifier output voltage. The positive clipping level at the cathode of CR7041 is set by the Beam Current adjust. Diodes CR2012 and CR2011 act, with coupling capacitor C7035, as dc restorers driven by C7034. This results in a dc level across R2012 equal to the peak-to-peak excursion at the anode of CR7041.

### High Voltage Regulation

The regulator circuitry composed of Q7031, Q7032, Q6031, U6021, and associated circuitry provides the driving current to energize transformer T7041. Regulation is accomplished by sampling the -1.9 kV, via the voltage divider composed of R7027C and R7027D, and comparing it to +12.5 V reference. The junction of R7027C and R7027D, as well as pin 2 of U6021, is norminally 0 V. When the -1.9 kV supply becomes less negative, the junction of R7027C, R7027D and pin 2 of U6021 becomes more positive. The negative-going output at pin 6 of U6021 is inverted by transistor Q6031. This signal results in increased charging current for C6032, which causes Q7031 to conduct longer during each cycle increasing the average current to T7041 and T6041.

Transformer T6041 operates as a high Q tuned circuit producing nearly sinusoidal waveforms. Transistor Q7031 conducts and saturates, Pin 5 of T6041 goes negative. During the conduction of Q7031, C6032 discharges through the base of Q7031 until Q7031 no longer saturates. As Q7031 turns off, Q7032 starts to conduct and finally saturates through the action of the one-turn

## Theory of Operation—SC 503

winding of T7041 connected to the base of Q7032. The one-turn winding connected to the base of Q7031 aids in turn on.

The current through T7041 and the energy stored within the coil now flow through T6041 via Q7032 and CR7032. Transistor Q7032 remains on until T7041 completely discharges. With 0 V across the base-emitter of Q7032, the primary of T6041 now swings more positive than the input supply voltage. During the time that Q7032 is off, Q7031 charges C6032 to a voltage level that, when combined with voltage from the one-turn feedback winding of T7041, again causes Q7032 to conduct.

Initially, at instrument turn on, the reference supply voltage is allowed to go positive slowly. Once the voltage at the cathode of CR6051 becomes more positive than +12 V, CR6021 conducts and the reference supply is held at a constant +12.5 V. If a short occurs to the T6041 secondary, the voltage at the cathode of CR6051 will move toward zero, thereby reducing the reference voltage and consequently the transformer drive. If a T6041 secondary winding short remains for a time, F9051, located on the Trigger board, opens to protect Q7032.

### High-Voltage Outputs

The secondary windings of T6041 with associated circuitry provide the accelerating voltages and bias potentials for the crt, the floodgun and cathode heaters and power for the deflection amplifier and storage circuit.

### Crt Control Circuits

The FOCUS and Astig controls are adjusted for optimum spot size and shape. The Geom control, R8062, buffered by Q8061, varies the positive level on the horizontal deflection plate shields to control the overall geometry of the display. The Trace Rotation control, R7062, adjusts the dc current through the beam rotation coil, L500, to align the display with the horizontal graticule lines.

### Low-Voltage Power Supplies

The low-voltage power supply circuit (Diagram 11) provides the voltages for the oscilloscope. Electronic regulation is used, where necessary, to provide stable, low-ripple output voltages.

Power is applied to the supply by means of the TRIGGERING SOURCE switch, after the instrument has been inserted into the power module. The instrument is on in all positions of this switch, except in the STBY position. However, in the STBY position, unregulated voltages are still present in the instrument.

### +12 V Supply

The +12 V supply, besides providing power to circuitry throughout the instrument, is a reference voltage source to establish operating levels for the feedback regulators in the -12 V and +5 V supplies.

The +12 V supply consists of VR6062, Q7063, Q7062, Q8062, Q8061, Q7053, and Q8053 and uses a series pass transistor in the power module. Current to the load is delivered by the series pass transistors.

The +12 V is established by the drop across CR6061, R6062, and R6061, which is compared to the voltage drop across VR6062 and the emitter-base junction of Q7063. The feedback path is through Q8062 to the base of Q7053. Any variation in output voltage due to ripple, change of current through the load, etc. is immediately transmitted to the base of Q7053, which in turn drives the base of the series pass transistor in the power module. The change in conduction of Q7053 nullifies this voltage variation, thus maintaining a steady output. The output of the supply is set to exactly +12 V by the +12 Volts adjust, R6053.

### -12 V Supply

The -12 V supply consists of Q6041, Q7054, Q8051, Q7042, Q8052, Q7043, Q7051, and a series pass power module transistor. The operation of this supply is very similar to the +12 V supply. The supply voltage is established by comparing the voltage at the power module transistor output to the voltage drop across R6054 and the emitter-base junction of Q6041. The feedback path is through Q8051 to the base of Q7042, which drives the base of the series pass transistor located in the power module. Any variation in output voltage is sensed at the base of Q7042 and nullified, thus maintaining a steady output voltage.

When the TRIGGERING SOURCE switch is in the STBY position, the bases of Q7052 and Q7051 are at ground. This turns off the +12 V, -12 V and 5 V supplies in the SC 503. However, voltages from unregulated supplies are present.

### +5 V Supply

Power for the +5 V regulator is supplied from the power module +11.5 V unregulated supply. The regulator for the +5 V supply is composed of operational amplifier U4011 and the series pass transistor in the power module. The series pass transistor is driven by emitter follower Q4012. Feedback for the amplifier is through C4012 and R4016.

The supply voltage is established by comparing the voltage at the negative input, pin 2 of U4011, with the +12 V reference at the positive input, pin 3. Any difference between the negative and positive inputs of U4011 causes a change in the conduction of the series pass transistor correcting the output error.

For example, if the +5 V momentarily goes more positive, pin 2 of U4011 goes more positive causing pin 6 of U4011 to go more negative. This reduces conduction in Q4012, which in turn reduces conduction in the series pass transistor located in the power module, causing the output voltage to drop back to +5 V.

*An overvoltage on the +5 V line can damage VR4021 and open F8051.*

### Calibrator Circuit

This circuitry produces a square-wave output with accurate amplitude at a 1 kHz frequency. The output is available at the front panel as a 0.6 V (ground to peak) square-wave voltage.

This circuit is composed of Q1022 and Q1021 with associated components and is a free running emitter-coupled multivibrator.

# ADJUSTMENTS

## INTERNAL ADJUSTMENT PROCEDURE

Adjustment is generally required after a repair has been made or after long time intervals in which normal aging of components may affect instrument accuracy.

To ensure instrument accuracy, check the calibration every 2000 hours of operation or every six months if used infrequently.

Before complete calibration, thoroughly clean and inspect this instrument as outlined in the Service section of the power module manual. The power module manual also contains information for general maintenance of this instrument, including preventive, component identification and replacement, etc.

### NOTE

*Tektronix, Inc. provides complete instrument repair and calibration at local Field Service Centers and at the Factory Service Center. Contact your Tektronix Field Office or representative for further information.*

### WARNING

*Dangerous potentials exist at several points throughout this instrument. When the instrument is operated with the covers removed, do not touch exposed connections or components. Disconnect power by removing the SC 503 from the TM 500-series power module before cleaning the instrument or replacing parts. The SC 503 TRIGGERING SOURCE switch STBY position does not remove all power from the oscilloscope.*

## Equipment Required

1. TM 500-series power module having at least three compartments.
2. Dc voltmeter with accuracy within 0.1% and measurement range of at least 20 V. A TEKTRONIX DM 501 Digital Multimeter (operates in a TM 500 series power module), or equivalent, may be used.
3. Time-mark generator with marker output periods of 0.5 ms, 0.2 ms, 20  $\mu$ s, 5  $\mu$ s, 2  $\mu$ s, 1  $\mu$ s, 0.5  $\mu$ s, and 0.2  $\mu$ s (all within  $\pm 0.1\%$ ). A TEKTRONIX TG 501 Time Mark Generator (operates in a TM 500 series power module), or equivalent time mark generator, may be used.
4. Calibration generator with the following characteristics: Standardized amplitudes of 20 mV to 50 V in a 1-2-5 sequence, with an accuracy of  $\pm 0.25\%$  into 1  $\Omega$ . Fast-rise pulse with a positive-going risetime of 1 ns or less and selectable periods of 10 ms, 10  $\mu$ s, and 1  $\mu$ s, with an amplitude adjustable from 60 mV to 500 mV. High-amplitude pulse with a positive-going risetime of 10 ns or less with a 1 ms period, and an amplitude adjustable from 100 mV to 5 V. A TEKTRONIX PG 506 Calibration Generator (operates in a TM 500 series power module), or equivalent, may be used.
5. Leveled sine-wave generator with output frequencies of 50 kHz and 10 MHz with leveled amplitudes of 60 mV and 3 V. A TEKTRONIX SG 503 Leveled Sine Wave Generator (operates in a TM 500 series power module), or equivalent, may be used.
6. 47 pF Input Normalizer with 2X attenuation, and bnc connectors. Use Tektronix Calibration Fixture 067-0541-00 or equivalent.
7. 50 ohm termination, bnc connectors, and 2% accuracy. Use Tektronix Part No. 011-0049-01 or equivalent.
8. 50 ohm coaxial cable, 42 inches long with bnc connectors. Use Tektronix Part No. 012-0057-01 or equivalent.
9. Plug-in extension, Tektronix Calibration Fixture 067-0645-02 (two required).
10. 10X attenuator, 50  $\Omega$  with bnc connectors and 2% accuracy. Use Tektronix Part No. 011-0059-02 or equivalent.
11. Low-capacitance screwdriver, approximately four inches long with a bit size of 3/32 inch. Use J.F.D. Electronics adjustment tool No. 5284.

## Adjustments—SC 503

12. Extender board (Troubleshooting only) Tektronix  
Part No. 067-0819-00.

### Preliminary Procedure

#### NOTE

The performance of this instrument can be checked at any temperature from 0°C to +50°C. Make adjustments at a temperature of +25°C, ±5°C.

1. Check that the power is off to the TM 500 series power module.
2. Connect the nominal line selector block of the power module to the correct line selector pins (120 V ac or 220 V ac). Also check that the regulating range selected includes the input line voltage. See the Installation section of the power module manual.
3. Remove the SC 503 Oscilloscope side, top, and bottom covers and connect the oscilloscope to the power module, using the plug-in extensions. Observe the caution signs on the plug-ins when making the connections. Align the plug-in correctly when making the connection to the short board.
4. Turn on the power module by pulling the power switch out.

#### CAUTION

If any work has been performed on the SC 503 power supplies, check the +12 V, -12 V, and +5 V power supplies. These supplies must be within 0.2 V of the correct voltage immediately after turn on.

5. Allow fifteen minutes for the SC 503 to warm up and stabilize.

#### NOTE

The tabbed foldout page labeled Adjustment locations contains illustrations showing the location of each adjustment in this procedure.

### Preliminary Settings

Set the following controls during warm-up time:

FOCUS	Midrange
INTEN	Fully counterclockwise
STORAGE DISPLAY	CH 1
VIEWTIME	NON STORE
POSITION (vertical)	
CH 1	Midrange
CH 2	Midrange
CH 1	
VOLTS/DIV	.1
DC-GND-AC-INT DC	AC
CH 2	
VOLTS/DIV	.2
DC-GND-AC-INT DC	GND
POSITION (horizontal)	Midrange
SECONDS/DIV	.5m
PULL X10 HORIZ	Fully clockwise
MAG/CAL	and pushed in
TRIGGERING	
MODE	AUTO
CPLG	AC
SOURCE	CH 1
SLOPE	+
LEVEL	Midrange

### ADJUSTMENT PROCEDURE

#### 1. Adjust Calibrator Output

- a. Set the voltmeter to the 2 V range.
- b. Connect the voltmeter positive lead to the front-panel CAL jack and the negative lead to the ground jack.
- c. Short test points TP1011 and TP1012 on the Main circuit board.
- d. Check—that the voltage measured is 0.600 V.
- e. Adjust—R6053, Cal (on the Trigger board), for a voltmeter reading of 0.600 V.
- f. Disconnect the voltmeter.
- g. Disconnect the short between TP1011 and TP1012.

#### 2. Check Power Supplies and Test Points

- a. Set the voltmeter to the 20 V range.

- b. Connect the voltmeter positive lead to test point TP4011 located on the F & I board and the negative lead to chassis ground.
- c. Check—that the voltage readout is between +5.20 V and +4.80 V.
- d. Reconnect the voltmeter positive lead to test point TP6051 located on the Trigger board.
- e. Check—that the voltage readout is between +12.30 V and +11.70 V.
- f. Reconnect the voltmeter positive lead to test point TP6041 located on the Trigger board.
- g. Check—that the voltage readout is between -12.40 V and -11.60 V.
- h. Set the voltmeter to the 200 V range.
- i. Reconnect the voltmeter positive lead to the junction of L1021 and C1011 on the Horizontal Deflection Board.
- j. Check—that the voltage readout is between +170.0 V and +190.0 V.
- k. Reconnect the voltmeter positive lead to the + side of C2031 on the F & I board.
- l. Check—that the voltage readout is between +105.0 V and +115.0 V.
- m. Reconnect the voltmeter positive lead to the negative side of C2021 on the F & I board.
- n. Check—that the voltage readout is between -115.0 V and -155.0 V.

#### *NOTE*

If the supply is less negative than -115.0 V a .047  $\mu$ F (283-0341-00) or .1  $\mu$ F (288-0178-00) 50 volt capacitor may be added across the existing value of C6032 on the Main board. (Shown on schematic **9** as C6031 SEL), use the .047  $\mu$ F value when possible. The above selection procedure should only be necessary if parts were changed in the HV oscillator circuitry.

### 3. Adjust Triggering Dc Balance

The front-panel control settings are the same as the preliminary settings with the following exception:

TRIGGERING SOURCE      INT

- a. Set the voltmeter to measure 2 V full scale.
- b. Connect the positive lead of the voltmeter to test point TP2011 and the negative lead to test point TP2012 on the Trigger Switch board.
- c. Check—that the voltmeter reads 0 V,  $\pm$  10 mV.

- d. Adjust—R2015, Dc Bal (on the Trigger Switch board), for a reading on the voltmeter of 0 V,  $\pm$  10 mV.
- e. Disconnect the voltmeter and return the front-panel controls to the preliminary settings.

### 4. Adjust Crt Beam Current

The front-panel control settings are the same as the preliminary settings with the following exceptions:

TRIGGERING SOURCE	EXT
SECONDS/DIV	2m

- a. Connect the positive lead of the voltmeter to the beam current test point, TP6061 (on the Main circuit board), and the negative lead to chassis ground.
- b. Set the voltmeter to the 2 V range.
- c. Position the beam off the crt viewing area.
- d. Turn the INTEN control fully clockwise.
- e. Check—that the voltmeter reads 1.35 V  $\pm$  0.01 V.
- f. Adjust—R8064, Beam (on the Main circuit board), for a voltmeter reading of 1.35 V,  $\pm$  0.01 V.
- g. Turn the INTEN control to midrange.
- h. Disconnect the voltmeter and return the front-panel controls to the preliminary settings.

### 5. Adjust Crt Astigmatism

The front-panel control settings are the same as the preliminary settings with the following exception:

DISPLAY      XY

*Damage to the crt phosphor can occur under adverse conditions. Avoid any condition where an extremely bright, sharply focused spot exists on the crt.*

- a. Reduce the spot intensity to prevent crt phosphor damage.
- b. Position the crt spot to the center of the viewing area.
- c. Turn the FOCUS control fully counterclockwise.
- d. Check—the crt spot for maximum roundness.
- e. Adjust—R7064, Astig (on the Main circuit board), for the roundest crt spot.

## Adjustments—SC 503

- f. Set the FOCUS control for the best focused spot.
- g. Return the front-panel controls to the preliminary settings.

### 6. Adjust Crt Balance

The front-panel control settings are the same as the preliminary settings with the following exception:

DISPLAY XY

*Damage to the crt phosphor can occur under adverse conditions. Avoid any condition where an extremely bright, sharply focused spot exists on the crt.*

- a. Reduce the spot intensity to prevent crt phosphor damage.
- b. Position the crt spot to the center of the viewing area.
- c. Turn the FOCUS control fully counterclockwise.
- d. Rotate the INTEN control for maximum illumination.
- e. Check—the crt spot for maximum illumination.
- f. Adjust—R7061, Crt Bal (located on the Main circuit board), for maximum spot illumination.
- g. Reduce the spot intensity and adjust the FOCUS control for the best focused spot.
- h. Return the front-panel controls to the preliminary settings.

### 7. Adjust Crt Trace Rotation

The front-panel control settings are the same as the preliminary settings with the following exception:

DISPLAY CH 2

- a. Use the vertical POSITION control to move the trace to the center horizontal graticule line.

- b. Check—that the horizontal trace is parallel to the center horizontal graticule line.

- c. Adjust—R7062, Rotn (on the Main circuit board), until the crt trace is parallel to the center horizontal graticule line.

- d. Return the front-panel controls to the preliminary settings.

### 8. Adjust Crt Geometry

The front-panel control settings are the same as the preliminary settings with the following exceptions:

CH 2 VOLTS/DIV .1  
CH 2 DC-GND-AC-INT DC DC

- a. Connect 0.2 ms time markers from the time-mark generator through a coaxial cable and  $50\ \Omega$  termination to the CH 2 input connector. Trigger the display and position the baseline of the time-mark below the bottom graticule line.

- b. Check—the vertical lines for minimum bow or tilt.

- c. Adjust—R8062, Geom (on the Main circuit board), for minimum bow or tilt of the vertical lines. If necessary, compromise the adjustment of R8062 to obtain less than 0.1 division bowing and tilt everywhere within the graticule area.

- d. Interaction—between geometry and vertical, horizontal gain adjustments. If any change in geometry level is significant, vertical and horizontal gain should be checked for accuracy. The vertical and horizontal adjustments follow later in this procedure.

- e. Disconnect the time-mark generator and return the front-panel controls to the preliminary settings.

### 9. Adjust Preamplifier Attenuator Balance

The front-panel control settings are the same as the preliminary settings with the following exceptions:

CH 1 VOLTS/DIV .2  
CH 1 DC-GND-AC-INT DC GND

- a. Position the crt trace to the center horizontal graticule line using the CH 1 vertical POSITION control.

- b. Set the CH 1 VOLTS/DIV switch to 1m.
  - c. Check—that the trace is on the center horizontal graticule line.
  - d. Adjust—R4065, Step Bal 1 for CH 1 (R3031, Step Bal 2 for CH 2), on the Main circuit board, to bring the crt trace back to the center horizontal graticule line.
  - e. Return the CH 1 VOLTS/DIV switch to its .2 position.
  - f. Repeat parts a through e until trace shift is eliminated when turning the VOLTS/DIV switch from .2 to 1m.
  - g. Change the DISPLAY switch to CH 2 and repeat parts a through e for channel 2.
  - h. Return the front-panel controls to the preliminary settings.
  - f. Remove the 10X attenuator from the signal setup and set the CH 2 VOLTS/DIV switch to the .5 position.
  - g. Increase the output amplitude of the calibration generator to obtain a five-division display.
  - h. Check—the front corner of the displayed waveform for squareness.
  - i. Adjust—C2012 for a flat top and C2014 for a square front corner (adjustments on the Attenuator board).
  - j. Interaction—may occur between the settings of C2011 and C2012-C2014. Repeat parts a through i and readjust if necessary.
- Change the following front-panel control settings:
- |                       |      |
|-----------------------|------|
| DISPLAY               | CH 1 |
| CH 1 VOLTS/DIV        | 10m  |
| CH 1 DC-GND-AC-INT DC | DC   |
| TRIGGERING SOURCE     | CH 1 |

## 10. Adjust Preamplifier Input Capacitance

The front-panel control settings are the same as the preliminary settings with the following exceptions:

DISPLAY	CH 2
CH 2 VOLTS/DIV	10m
CH 2 DC-GND-AC-INT DC	DC
TRIGGERING SOURCE	CH 1

a. Connect a coaxial cable from the high-amplitude output of the calibration generator through a 10X attenuator, to a  $50\ \Omega$  termination, to a 47 pF input normalizer, to the CH 2 input of the SC 503.

b. Adjust the calibration generator for a 1 millisecond period and a display amplitude of five divisions.

c. Adjust the TRIGGERING LEVEL control for a stable display.

d. Check—the front corner of the displayed waveform for squareness.

e. Adjust—C2011 on the Attenuator board for a square front corner on the displayed waveform.

- k. Repeat parts a through j for channel 1.
- l. Disconnect the signal setup.

m. Return the front-panel controls to the preliminary settings.

## 11. Adjust Deflection Plate Dc Level

The front-panel control settings are the same as the preliminary settings with the following exception:

DISPLAY	CH 2
---------	------

a. Set the digital voltmeter to the 20 V scale and connect the test leads between the collectors of Q3014 and Q3034 on the F & I circuit board.

b. Set the CH 2 vertical POSITION control until the voltmeter indicates 0 V,  $\pm 50$  mV.

c. Disconnect the voltmeter leads.

d. Set the voltmeter to the 200 V scale, and reconnect the positive lead of the voltmeter to either connection listed in part a. Connect the negative lead to chassis ground.

## Adjustments—SC 503

e. Check—the voltmeter for a reading between +49.75 V and +50.25 V.

f. Adjust—R2021, Dc Level (on the F & I board), for a voltmeter reading of +50.00 V.

g. Disconnect the voltmeter and return the front-panel controls to the preliminary settings.

## 12. Adjust Vertical Centering

The front-panel control settings are the same as the preliminary settings.

a. Rotate the CH 1 POSITION control fully clockwise.

b. Set the digital voltmeter to the 200 V scale and measure the voltage between the collectors of Q3014 and Q3034 (on the F & I board). Note this reading.

c. Rotate the CH 1 POSITION control fully counterclockwise.

d. Measure the voltage between the collectors of Q3014 and Q3034. Note this reading.

e. Check—for less than 1 V difference between the measurements found in parts b and d.

f. Adjust—R1012, Centering (on the F & I board), for less than 1 V difference between the two measurements found in parts b and d.

g. Disconnect the voltmeter and return the front-panel controls to the preliminary settings.

## 13. Adjust Preamplifier Gain

The front-panel control settings are the same as the preliminary settings with the following exceptions:

CH 1 VOLTS/DIV	10m
TRIGGERING SOURCE	EXT

a. Turn the TRIGGERING LEVEL control fully clockwise.

b. Connect 50 mV of standardized amplitude signal from the calibration generator, through a coaxial cable to the SC 503 CH 1 input connector.

c. Check—for five divisions of deflection.

d. Adjust—R1011, Gain (on the F & I circuit board), for exactly five divisions of deflection.

e. Check—the remaining CH 1 VOLTS/DIV switch positions for deflection accuracy within the tolerances listed in Table 4-1.

**Table 4-1**  
**VERTICAL DEFLECTION ACCURACY**

VOLTS/DIV Setting	Standardized Amplitude Applied to Input	Display Amplitude In Divisions	Tolerance
1 mV	5 mV	5	5%
2 mV	10 mV	5	5%
5 mV	20 mV	4	3%
10 mV	50 mV	5	Adjusted
20 mV	.1 V	5	3%
50 mV	.2 V	4	3%
.1 V	.5 V	5	3%
.2 V	1 V	5	3%
.5 V	2 V	4	3%
1 V	5 V	5	3%
2 V	10 V	5	3%
5 V	20 V	4	3%
10 V	50 V	5	3%
20 V	100 V	5	3%

f. Set the DISPLAY switch to CH 2 and the CH 2 VOLTS/DIV switch to 10m. Change the calibration generator output to 50 mV and move the coaxial cable to the CH 2 input connector.

g. Change the TRIGGERING SOURCE switch to CH 2.

h. Check—for a displayed waveform amplitude of five divisions.

i. Adjust—R4031, CH 2 Gain (on the Main circuit board), for a displayed waveform amplitude of exactly five divisions.

j. Check—the remaining CH 2 VOLTS/DIV switch positions for accuracy within the tolerances listed in Table 4-1.

k. Return the front-panel controls to the preliminary settings.

#### 14. Adjust Vertical Amplifier Frequency Compensation

The front-panel control settings are the same as the preliminary settings with the following exceptions:

DISPLAY	CH 2
TRIGGERING SOURCE	CH 2
CH 1 DC-GND-AC-INT DC	AC
CH 2 DC-GND-AC-INT DC	AC
CH 1 VOLTS/DIV	.2
SECONDS/DIV	5μ

a. Connect the positive-going, fast-rise output of the calibration generator through a coaxial cable with a 50 Ω termination to the CH 2 input connector.

b. Adjust the calibration generator output for a 10 μs period and a display amplitude of five divisions.

c. Set the TRIGGERING LEVEL control for a stable display.

d. Check—the displayed waveform for a flat top without rolloff or overshoot.

e. Adjust—R2014 (on the F & I board), for a flat top (without rolloff or overshoot) on the displayed waveform.

f. Adjust the calibration generator output for a 1 μs period.

g. Set the PULL X10 HORIZ MAG switch to the out position (resultant sweep rate is 0.5 μs/division).

h. Check—the displayed waveform for a flat top without rolloff or overshoot.

i. Adjust—R2018 and C2022 (on the F & I board), using a low-capacitance screwdriver, for a square front corner (without rolloff or overshoot) on the displayed waveform.

j. Set the SECONDS/DIV switch to 2 μ.

k. Check—the displayed waveform for a flat top without rolloff or overshoot.

l. Change the DISPLAY and SOURCE switches to CH 1.

m. Adjust—R3023 and C3018 (on the F & I board), using a low-capacitance screwdriver, for a square front corner (without rolloff or overshoot) on the displayed waveform.

n. Disconnect the calibration generator and return the front-panel controls to the preliminary settings.

o. Interaction—between CH 1 and CH 2 frequency compensation. Change the TRIGGERING SOURCE switch to CH 2 and repeat parts b through i for channel 2. If necessary, compromise the above adjustments so that the amplifier response is equal for both vertical channels.

p. Disconnect the calibration generator and return the front-panel controls to the preliminary settings.

#### 15. Adjust Mag Registration

The front-panel control settings are the same as the preliminary settings with the following exceptions:

CH 1 VOLTS/DIV	.5
SECONDS/DIV	.1m

a. Connect .1 ms time markers from the time-mark generator through a coaxial cable and 50 Ω termination to the CH 1 input connector. Note one time mark/div on the crt screen.

b. Turn the TRIGGERING LEVEL control to obtain a stable display.

c. Pull the SECONDS/DIV CAL control out.

d. Horizontally position the first time mark to the center graticule line.

e. Push the SECONDS/DIV CAL control in.

f. Check—the display for coincidence of the first time mark and the vertical graticule center line.

## **Adjustments—SC 503**

g. Adjust—R5014, Mag Reg (on the Main circuit board), to set the first time mark at the center graticule line.

h. Interaction—between setting of R5014, Mag Reg adjustment and magnified sweep. Repeat parts c through g until there is no interaction between the X1 and X10 positions.

### **16. Adjust X1 Gain**

- a. Set the SECONDS/DIV control to the .5m position.
- b. Set the time-mark generator to supply 0.5 ms time markers.
- c. Check—the display for one time mark per division with the second and tenth time marks coincident with the second and tenth vertical graticule lines.
- d. Adjust—R5013, X1 Gain (on the Main circuit board), until a display of one time marker per division is obtained. The second and tenth time markers must line up exactly with their respective graticule lines.

### **17. Adjust X10 Gain**

- a. Set the time-mark generator to supply 50  $\mu$ s markers.
- b. Pull the SECONDS/DIV CAL/HORIZ MAG control out.
- c. Check—the display for one time mark per division with the second and tenth time marks coincident with the second and tenth vertical graticule lines.
- d. Adjust—R6011, X10 Gain (on the Main circuit board), until one time marker per division is obtained. The second and tenth time markers must line up exactly with their respective graticule lines.
- e. Disconnect the time-mark generator and return the front-panel controls to the preliminary settings.

### **18. Adjust X Gain**

The front-panel control settings are the same as the preliminary settings with the following exceptions:

DISPLAY	XY
CH 2 DC-GND-AC-INT	DC
CH 2 VOLTS/DIV	10m

a. Connect 50 mV of standard amplitude signal from the calibration generator, through a coaxial cable to the CH 2 input connector.

b. Center the two-dot display on the center horizontal graticule line with the positioning controls.

c. Check—the display for five divisions between the dots.

d. Adjust—R5012, X Gain (on the Main circuit board), for a two-dot display with dot centers five divisions apart.

e. Disconnect the calibration generator and return the front-panel controls to the preliminary settings.

### **19. Adjust Trigger View Centering**

The front-panel control settings are the same as the preliminary settings with the following exceptions:

SECONDS/DIV	2m
TRIGGERING SOURCE	LINE

a. Depress and hold in the TRIG VIEW switch during the following steps.

b. Check—the display for trace start at the center horizontal graticule line.

c. Adjust—R4031, Trig View Bal (on the Trigger board), so that the start of the trace is at the center horizontal graticule line.

d. Set the TRIGGERING SLOPE switch to — and recheck the starting position of the display.

e. Compromise the final adjustment of R4031 between the trace starts for both the + and — SLOPE switch positions.

f. Release the TRIG VIEW switch and return the front-panel controls to the preliminary settings.

### **20. Adjust Triggering + Peak and — Peak Offset**

The front-panel control settings are the same as the preliminary settings with the following exceptions:

TRIGGERING SOURCE	LINE
TRIGGERING LEVEL	fully counterclockwise
SLOPE	—

- a. Depress and hold in the TRIG VIEW switch during the following steps.
- b. Check—the bottom of the displayed waveform for a position one-half division below the point where the waveform just loses triggering.
- c. Adjust—R1001, — Peak (on the Trigger board), to position the bottom of the displayed waveform to one-half division below the point where the waveform just loses triggering.
- d. Rotate the TRIGGERING LEVEL control to the + side and set the SLOPE switch to the + position.
- e. Check—the top of the displayed waveform for a position one-half division above the point where the waveform just loses triggering.
- f. Adjust—R1002, + Peak (on the Trigger board) to position the top of the displayed waveform to one-half division above the point where the waveform just loses triggering.
- g. Release the TRIG VIEW switch and return the front-panel controls to the preliminary settings.

## 21. Adjust Storage Operating Level

The front-panel control settings are the same as the preliminary settings with the following exceptions:

CH 1 DC-GND-AC-INT DC	GND
SECONDS/DIV	1m
VIEW TIME	$\infty$

- a. Set R1039, Store (on the F & I board), fully counter-clockwise. Set the ENHANCE control to minimum.
- b. Set the INTEN control for a normal viewing level.
- c. Turn the vertical POSITION control to produce a series of horizontal lines in the viewing area. Note that the lines fade out rapidly.
- d. Erase and rewrite the lines while adjusting R1039 in small increments. Continue until there is no deterioration of the stored lines for approximately one minute after erasure.
- e. Set the voltmeter to the 200 V dc scale and measure the voltage on pin 1 of J1021. Note the voltage reading.

- f. Turn R1039 fully clockwise.
- g. Turn the vertical POSITION control to produce a series of lines in the viewing area. Note that the background light level is high.
- h. Erase and rewrite the lines, as in part d, while adjusting R1039 counterclockwise in small increments until there is no fadeup.
- i. Reconnect the voltmeter to pin 1 of J1021 and measure the voltage.
- j. Check—that the voltage reading is about half way between the voltage measured in part e and part i.
- k. Adjust—R1039 for a voltage reading half way between the voltages measured in part e and part i.

- l. Disconnect the voltmeter and return the front-panel controls to the preliminary settings.

## 22. Adjust Collimation Level

The front-panel control settings are the same as the preliminary settings with the following exception:

VIEW TIME	midrange
-----------	----------

- a. Check—the display for a uniformly illuminated background.
- b. Adjust—R1038, CE Level (located on the F & I board), to produce a uniformly illuminated background display.
- c. Return the front-panel controls to the preliminary settings.

### NOTE

*Uniform background display depends upon the proper floodgun heater current, which is affected by the efficiency of the high voltage power supply. If components have been replaced in the high voltage supply circuitry, particularly transistor Q7031 or transformer T6041, make the following check:*

*Temporarily remove, if present, the selected capacitor, C6031 in parallel with capacitor C6032. Check the -135 V supply. If less than -115 V, select capacitor C6031 with values of 0.047  $\mu$ F or 0.1  $\mu$ F, to bring the -135 V supply within  $\pm 20$  V.*

**23. Adjust High Voltage Compensation**

The front-panel control settings are the same as the preliminary settings with the following exception:

CH 1 DC-GND-AC-INT DC DC

a. Connect 100 mV of 1 kHz square-wave signal from the calibration generator, through a coaxial cable, to the CH 1 input connector.

b. Set the CH 1 VOLTS/DIV switch to 10m and adjust the variable VOLTS/DIV control for exactly five divisions of vertical display.

c. Set the VIEW TIME control to  $\infty$ . When the background fully lights, push the ERASE button.

d. Check—the crt for five divisions of vertical display while pressing the INTEGRATE pushbutton.

e. Adjust—R2034, HV Adjust (on the F & I board), for five divisions of vertical display while pressing the INTEGRATE pushbutton.

f. Disconnect the calibration generator and return the front-panel controls to the preliminary settings. This completes the Adjustments procedure.

# MAINTENANCE AND INTERFACING INFORMATION

General system maintenance procedures are provided in the power module instruction manual; i.e., preventive maintenance, troubleshooting aids, parts removal and replacement procedures, parts ordering information, etc.

Numbers in parentheses, in the following discussion, refer to mechanical parts referenced in Fig. 5-1.

## Instrument Covers and Bottom Frame Removal

The following procedure outlines removal of the instrument covers and bottom frame.

- a. Using a blade-type screwdriver, pry up the rear corner of each side cover and carefully pull the covers away from the guides.
- b. Remove the two pan-head screws that secure the bottom cover and pull the cover forward.
- c. Remove the two pan-head screws that attach the high voltage cover. Pull up and remove the cover.
- d. Remove the ground stud located at the bottom right corner of the front panel and the truss-head screw at the bottom left corner of the front panel. Remove the rear hexagonal-head screws with a hexagonal nut driver and pull the bottom frame away.

## Crt Removal and Replacement

The following procedure outlines removal and replacement of the cathode-ray tube.

### **WARNING**

*Use care when handling the crt. Protective clothing and safety glasses should be worn. Avoid striking the crt on any object which might cause it to crack or implode. When storing a crt, place it in a protective carton. Set the crt face down in a protected location on a smooth surface, with a soft mat underneath to protect the faceplate from scratches.*

### 1. CRT REMOVAL

- a. Remove the instrument side and top covers.
- b. Remove the implosion shield filter (1) and the implosion shield spring (2).
- c. Disconnect the FOCUS extension shaft (3) from the focus potentiometer.
- d. Loosen the black screw (4). Remove the three screws holding the rear panel bracket and remove the rear panel bracket.
- e. Remove the screw (5) holding the horizontal deflection circuit board. Disconnect the two horizontal crt deflection pin leads. Lift the board straight up, disconnecting the square pins at the bottom.
- f. Disconnect the trace rotation coil from the F and I circuit board by removing the two-pin connector. Remove the two crt vertical deflection pin leads.
- g. Remove the two screws (6) that secure the high voltage cover and remove the cover (7). Remove the eight screws (8) holding the rear panel (9) and remove the panel.
- h. Disconnect the crt socket (10); then remove the crt shield with the crt inside.

### 2. CRT REPLACEMENT

- a. Install the front crt support spacer (11) into the rear bezel opening of the front subpanel (12).
- b. Install the crt in the crt shield; then install the assembly in the oscilloscope. During installation, be careful not to bend the protruding connector pins. Place the crt shield (13) against the front crt support spacer. Push the crt into the front crt support. See Fig. 5-2. Connect the crt socket to the crt. Hold the crt assembly in position and install the rear panel with enough screws to hold the crt assembly in place.

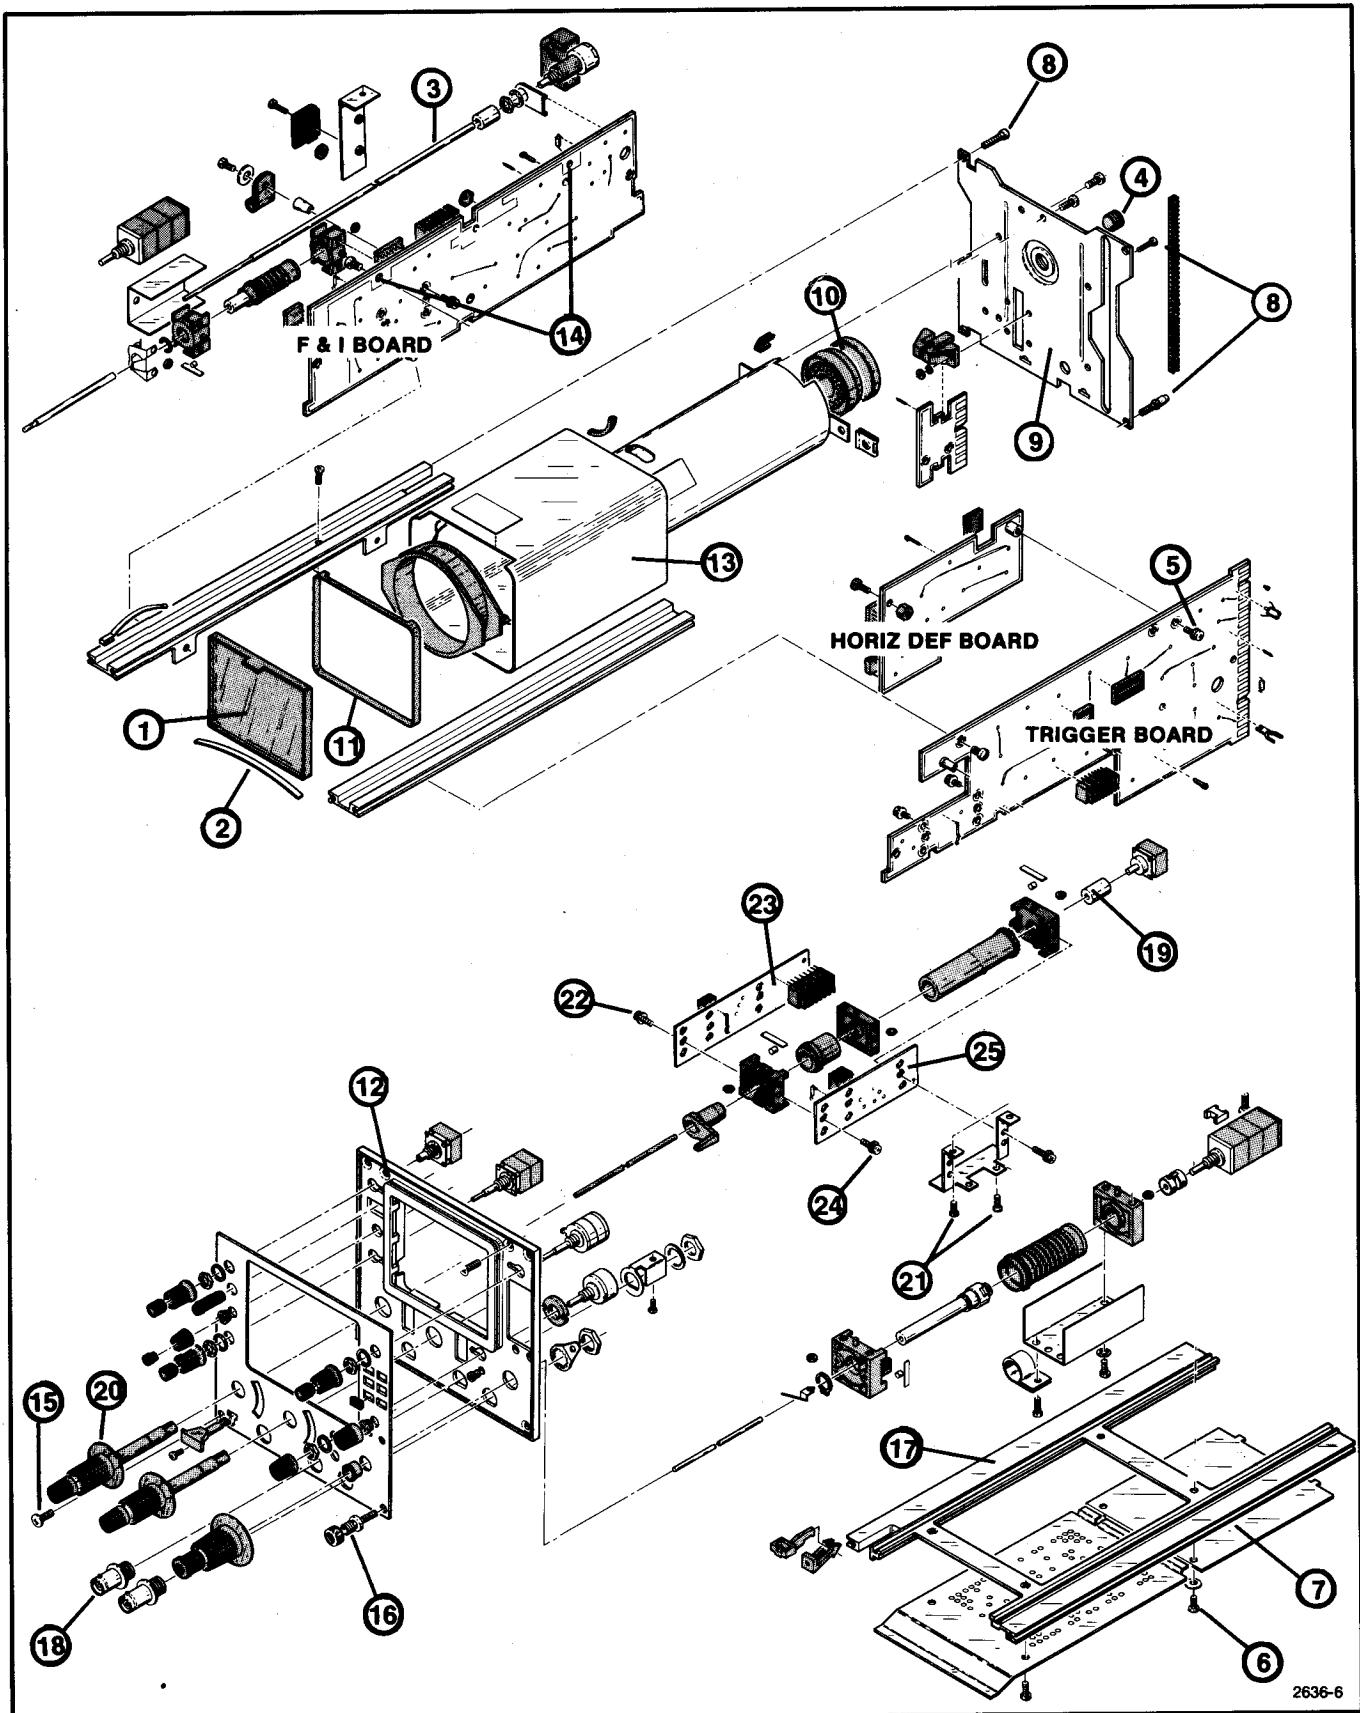

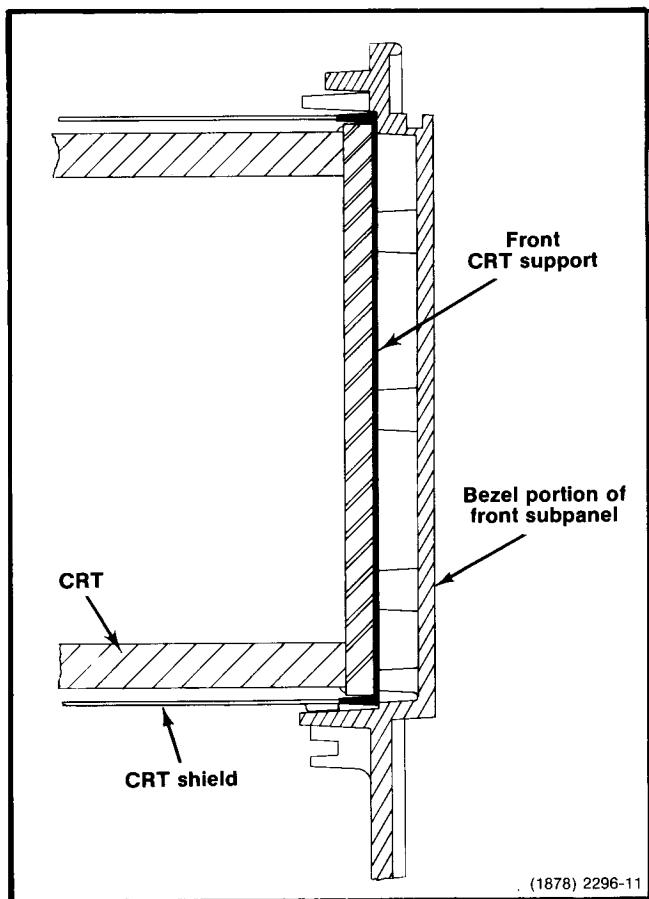

Fig. 5-1. Cathode-ray tube, circuit board, and cam switch parts details.

**Fig. 5-2. Cross sectional view showing placement position of front crt support, crt shield, and crt.**

- c. Insert two screws (6) to secure the high voltage cover and replace the remaining screws (8) to secure the rear panel.
- d. Connect the two crt vertical deflection pin leads to the F and I circuit board.
- e. Reconnect the two-pin connector from the trace rotation coil to the F and I circuit board.
- f. Reinstall the horizontal deflection board. Reconnect the two horizontal crt deflection pin leads. Replace the screw that holds the board.
- g. Position the rear-panel bracket and insert the three screws securing the bracket. Tighten the black screw.
- h. Reconnect the FOCUS extension shaft to the focus potentiometer.

i. Install the implosion shield spring, with the spring ends down, in the bottom groove of the front bezel portion of the front subpanel. Install the filter into the front bezel portion of the front subpanel by compressing the spring and pushing into the groove.

j. Reinstall the instrument side and top covers.

k. Replacing the crt requires partial instrument readjustment. Refer to the Adjustments section of this manual.

### Circuit Board Removal and Installation

The following procedure outlines removal and installation of the circuit boards.

#### 1. CIRCUIT BOARD REMOVAL

a. Remove the crt using the crt removal procedure.

b. Remove all of the front-panel knobs except SLOPE, LEVEL, horizontal POSITION, vertical POSITION and INTEN.

c. Remove the two screws (14) holding the circuit board assembly to the top rails. Remove the screw (15) and the stud post with knurled nut (16) and remove the bottom section frame (17).

d. Disconnect from the circuit boards those connectors with leads to the front-panel connectors and controls with knobs. Unsolder the leads at the three bnc connectors. Remove the screw at the vertical bnc connector ground lugs.

e. Slide the circuit board assembly away from the front panel until clear of the subpanel.

f. Disconnect the plugged-together circuit board assembly as required.

#### 2. CIRCUIT BOARD INSTALLATION

a. Reverse the circuit board removal procedure; then follow the crt replacement procedure.

### Cam Switch Removal and Installation

The following procedure outlines removal and installation of the cam switches. See the instrument covers and bottom frame removal procedure.

1. CAM SWITCH REMOVAL

a. Unsolder the resistor (R510-channel one, R520-channel two) from the front-panel bnc connector (18).

b. Loosen the front set screw (19) from the shaft coupling and pull the CAL extension shaft through the front panel.

c. Pull out the skirted knob (20).

d. Remove the four screws (21) securing the cam switch assembly and carefully lift the assembly straight out.

2. CAM SWITCH INSTALLATION

a. Reverse the cam switch removal procedure.

*NOTE*

*Carefully align the cam switch sockets to the board pins before installing the cam switch assembly.*

**Gain Board Removal and Installation**

See cam switch removal and installation procedure.

1. GAIN BOARD REMOVAL

a. Unsolder the connecting wire between the gain board and the attenuator board.

b. Remove the three truss-head screws (22) and lift out the gain board (23).

2. GAIN BOARD INSTALLATION

a. Reverse the gain board removal procedure.

**Attenuator Board Removal and Installation**

See cam switch removal and installation procedure.

1. ATTENUATOR BOARD REMOVAL

a. Unsolder the connecting wire between the gain board and the attenuator board.

b. Remove the three truss-head screws (24) and lift out the attenuator board (25).

2. ATTENUATOR BOARD INSTALLATION

a. Reverse the attenuator board removal procedure.

**Using the Rear Interface**

The tabbed foldout pages labeled Waveforms and Rear Board Connections, refer to the following information:

**CH 1 Trigger Out (contact 28B) and Ground (27B).** The analog output is on contact 28B. The source resistance is less than  $50\ \Omega$ . The sensitivity is typically 50 mV/div and bandwidth is typically 4 MHz.

**Triggered Gate Out (contacts 26B and 25B).** These contacts provide an ECL-balanced output operating between +5 V and ground. A high logical state on contact 26B indicates a holdoff condition, and the sweep cannot be triggered or gated on. This output is designed to drive a  $100\ \Omega$  side-to-side terminated line with an ECL line receiver. The outputs are protected with two  $47\ \Omega$  resistors.

**Gate Select In (contact 24B).** Grounding 24B through  $1\ k\Omega$  (or less) selects the external gate as the sweep controlling signal. An open circuit causes normal operation.

**External Gate In (contacts 23B and 22B).** These contacts accept an ECL-balanced input operating between +5 V and ground. Input resistance is  $100\ \Omega$  (side-to-side). A transition to a high logical state on contact 23B causes the sweep to start, run once, and reset if contact 24B (gate select) is grounded. A transition from a high to a low state will stop the sweep, if it is running. The ECL input is protected with a diode clamp.

**Holdoff Out (contacts 21B and 20B).** This is an ECL-balanced output operating between +5 V and ground designed to drive a  $100\ \Omega$  side-to-side line terminated with an ECL receiver. The outputs are protected with  $47\ \Omega$  resistors. A high logical state on 20B (low level on 21B) indicates a sweep holdoff period.

**Intensify In (contact 19B).** The input signal to contact 19B must be equivalent to a single output from an ECL driver operating between +5 V and ground. Input resistance is approximately  $1\ k\Omega$ . A low logical state intensifies the trace. An open circuit defaults to a high logical state.

**Trigger In (contact 15B) and Ground (14B).** Contact 15B is selected when the SOURCE switch on the front panel is in the INT (interface) position. Input resistance is nominally  $50\ \Omega$  when INT is selected and  $25\ \Omega$  when another source is selected. Input resistance (when selected) can be modified by changing the value of R3041 to  $1\ M\Omega$ . Parallel capacitance is approximately  $60\ pF$ . Maximum input voltage is  $2.5\ V$  rms,  $40\ V$  peak ac. The maximum input power is  $1/4\ W$  or less.

**Sweep Gate Out (contact 26A) and Ground (25A).** The level is  $+5\ V$  during sweep time and approximately  $0\ V$  otherwise from a source impedance of  $1\ k\Omega$ .

**Z-Axis In (contact 24A) and Ground (23A).** This is an analog input summed with voltage from the front panel INTEN control. When the INTEN control is fully counterclockwise (ccw),  $+5\ V$  at this contact will turn the crt beam on. When the INTEN control is fully clockwise (cw),  $-5\ V$  turns the crt beam off. The nominal input resistance is  $1.5\ k\Omega$ .

**Erase Function (contact 22A).** A remote switch closure to ground performs the same function as the ERASE PUSH function on the front panel. The voltage is  $+5\ V$  when the contact is not grounded.

**Reset In (contact 21A).** Grounding contact 21A through a  $1\ k\Omega$  (or less) causes single sweep reset.

**Light Out (contact 20A).** This output is less than  $+1\ V$  through  $1\ k\Omega$  when the READY TRIG'D light is on,  $+5\ V$  through a high impedance otherwise. A loading greater than  $1\ mA$  when output is in the high voltage state may cause erroneous READY TRIG'D light operation.

**+5 V Out (contact 19A).** This is a power supply output. The maximum current capability is  $15\ mA$ .

**Ramp Out (contact 18A).** This is a positive-going sweep (ramp), typically  $0\ V$  to  $+10\ V$ . The output resistance is approximately  $500\ \Omega$ . Not recommended for use at sweep rates faster than 1 microsecond/division.

**CH 2 Vertical In (contact 16A) and Ground (17A).** Contact 16A is selected as the source for the CH 2 vertical signal when the front panel CH 2 coupling switch is in the INT DC position. The input resistance is nominally  $50\ \Omega$ . This can be modified by changing the value of R2051 to  $1\ M\Omega$ . The parallel capacitance is approximately  $100\ pF$ . The maximum input voltage is  $5\ V$  rms,  $40\ V$  peak ac. Displayed noise may exceed  $1\ mV$ , peak to peak.

**CH 1 Vertical In (contact 14A) and Ground (15A).** Contact 14A is selected as the source for the CH 1 vertical signal when the front panel CH 1 coupling switch is in the INT DC position. The input resistance is nominally  $50\ \Omega$ . This can be modified by changing the value of R2031 to  $1\ M\Omega$ . The parallel capacitance is approximately  $100\ pF$ . The maximum input voltage is  $5\ V$  rms,  $40\ V$  peak ac. Displayed noise may exceed  $1\ mV$ , peak to peak.

## Repackaging Information

If the Tektronix instrument is to be shipped to a Tektronix Service Center for service or repair, attach a tag showing: owner (with address) and the name of an individual at your firm that can be contacted. Include complete instrument serial number and a description of the service required.

Save and re-use the package in which your instrument was shipped. If the original packaging is unfit for use or not available, repack the instrument as follows:

Surround the instrument with polyethylene sheeting to protect the finish of the instrument. Obtain a carton of corrugated cardboard of the correct carton strength and having inside dimensions of no less than six inches more than the instrument dimensions. Cushion the instrument by tightly packing three inches of dunnage or urethane foam between carton and instrument, on all sides. Seal carton with shipping tape or industrial stapler.

The carton test strength for your instrument is 200 pounds.

# **OPTIONS**

**None available at this time.**

# REPLACEABLE ELECTRICAL PARTS

## PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

## SPECIAL NOTES AND SYMBOLS

X000      Part first added at this serial number

00X      Part removed after this serial number

### ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

## ABBREVIATIONS

ACTR	ACTUATOR	PLSTC	PLASTIC
ASSY	ASSEMBLY	QTZ	QUARTZ
CAP	CAPACITOR	RECP	RECEPTACLE
CER	CERAMIC	RES	RESISTOR
CKT	CIRCUIT	RF	RADIO FREQUENCY
COMP	COMPOSITION	SEL	SELECTED
CONN	CONNECTOR	SEMICOND	SEMICONDUCTOR
ELCTLT	ELECTROLYTIC	SENS	SENSITIVE
ELEC	ELECTRICAL	VAR	VARIABLE
INCAND	INCANDESCENT	WW	WIREWOUND
LED	LIGHT EMITTING DIODE	XFMR	TRANSFORMER
NONWIR	NON WIREWOUND	XTAL	CRYSTAL

# DIAGRAMS AND CIRCUIT BOARD ILLUSTRATIONS

## Symbols and Reference Designators

Electrical components shown on the diagrams are in the following units unless noted otherwise:

Capacitors = Values one or greater are in picofarads (pF).  
Values less than one are in microfarads ( $\mu\text{F}$ ).  
Resistors = Ohms ( $\Omega$ ).

Graphic symbols and class designation letters are based on ANSI Standard Y32.2-1975.

Logic symbology is based on ANSI Y32.14-1973 in terms of positive logic. Logic symbols depict the logic function performed and may differ from the manufacturer's data.

The overline on a signal name indicates that the signal performs its intended function when it goes to the low state.

Abbreviations are based on ANSI Y1.1-1972.

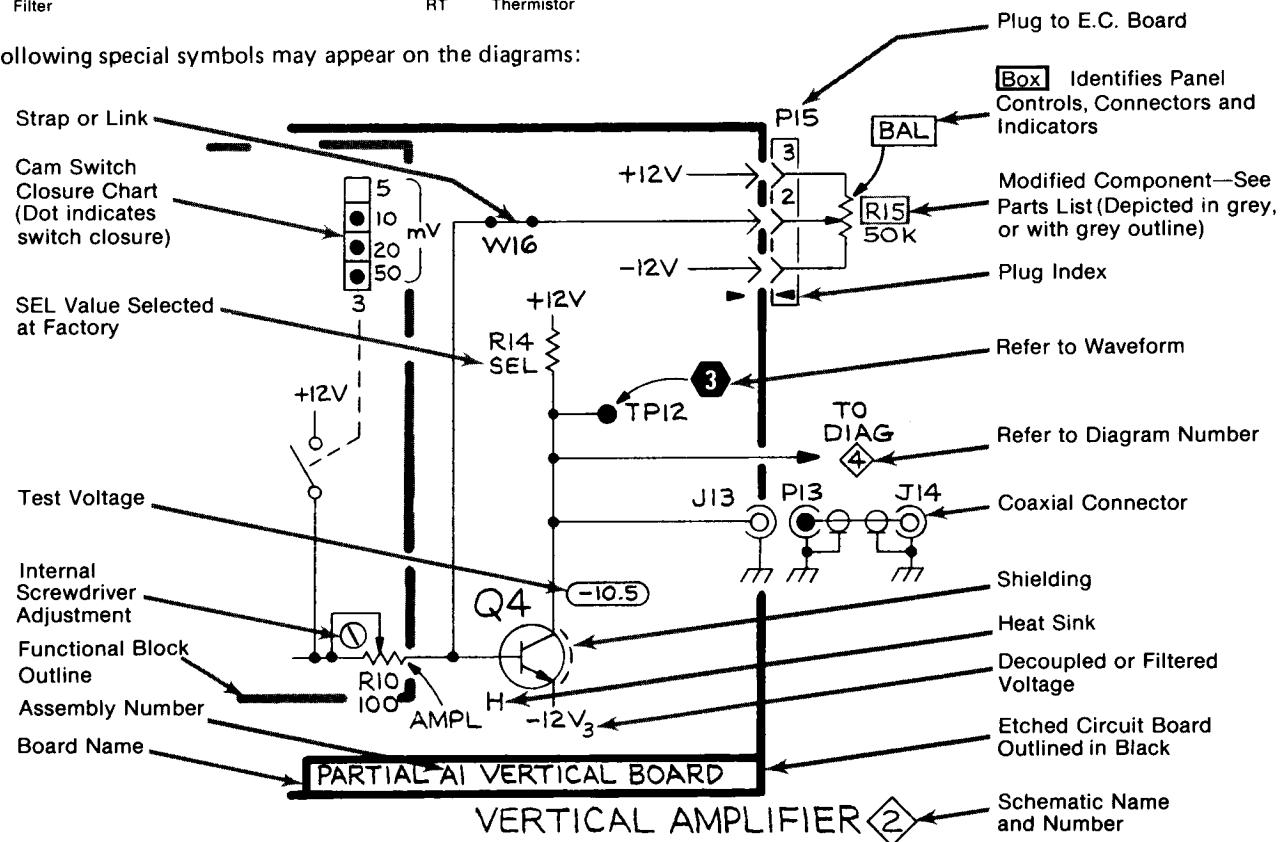

Other ANSI standards that are used in the preparation of diagrams by Tektronix, Inc. are:

- Y14.15, 1966 Drafting Practices.
- Y14.2, 1973 Line Conventions and Lettering.
- Y10.5, 1968 Letter Symbols for Quantities Used in Electrical Science and Electrical Engineering.

The following prefix letters are used as reference designators to identify components or assemblies on the diagrams.

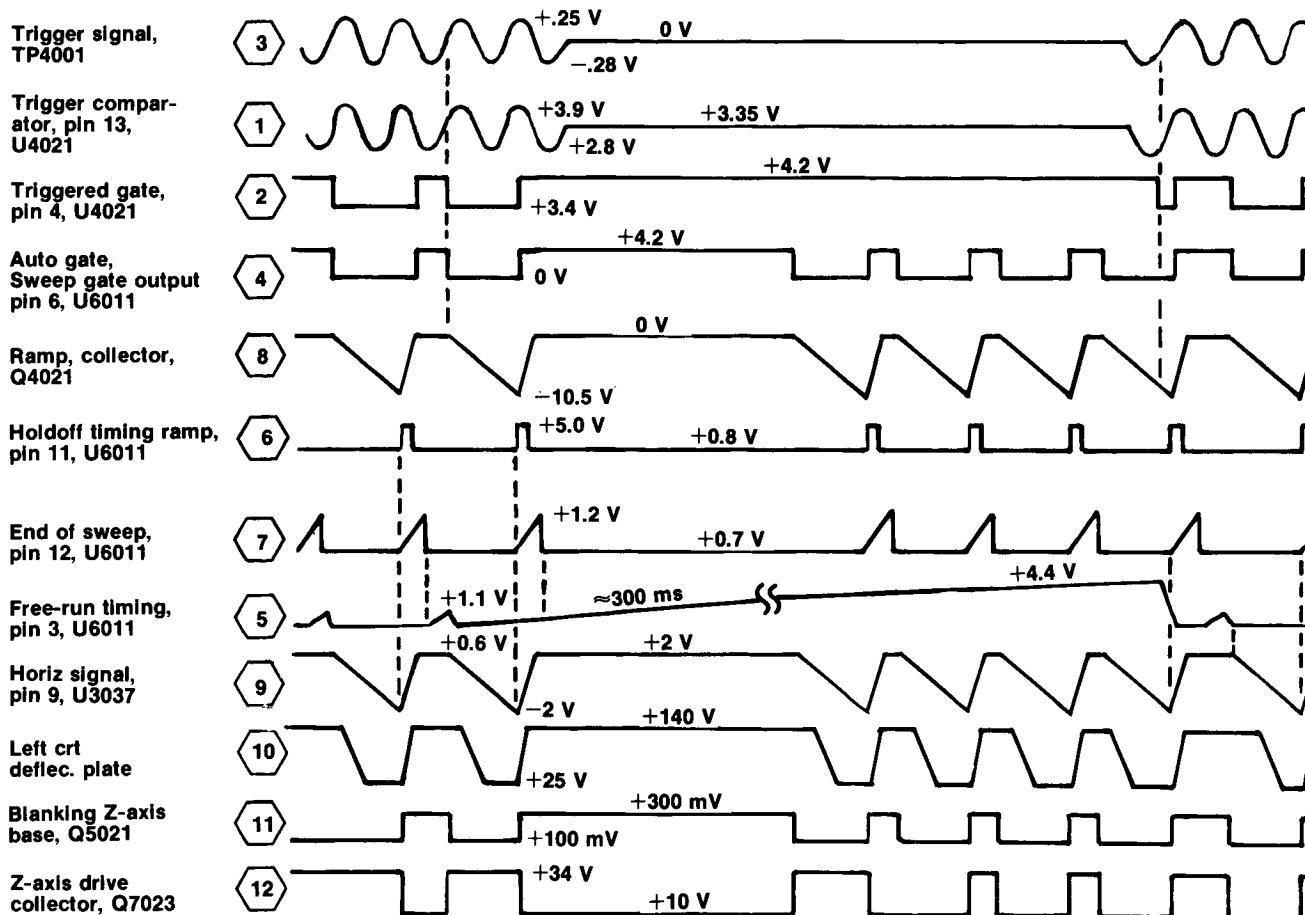

A	Assembly, separable or repairable (circuit board, etc)	H	Heat dissipating device (heat sink, heat radiator, etc)	S	Switch or contactor
AT	Attenuator, fixed or variable	HR	Heater	T	Transformer
B	Motor	HY	Hybrid circuit	TC	Thermocouple
BT	Battery	J	Connector, stationary portion	TP	Test point
C	Capacitor, fixed or variable	K	Relay	U	Assembly, inseparable or non-repairable (integrated circuit, etc.)
CB	Circuit breaker	L	Inductor, fixed or variable	V	Electron tube
CR	Diode, signal or rectifier	M	Meter	VR	Voltage regulator (zener diode, etc.)
DL	Delay line	P	Connector, movable portion	W	Wirestrap or cable
DS	Indicating device (lamp)	Q	Transistor or silicon-controlled rectifier	Y	
E	Spark Gap, Ferrite bead	R	Resistor, fixed or variable	Z	Phase shifter
F	Fuse	RT	Thermistor		
FL	Filter				

The following special symbols may appear on the diagrams:

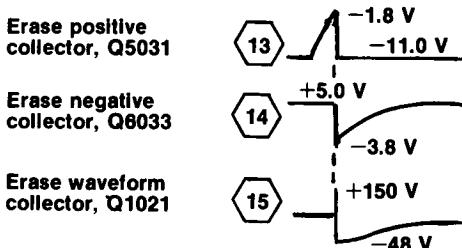

# WAVEFORM DIAGRAMS

TRIGGERING SOURCE	LINE
TRIGGERING MODE	Auto
TRIGGERING CPLG	AC
TRIGGERING SLOPE	+
TRIGGERING LEVEL	Midrange
INTEN	Midrange
DISPLAY	ALT
HORIZ Position	Midrange
SECONDS/DIV	2 m
CAL/HORIZ MAG	cw and in
VIEW TIME	ccw
ENHANCE	ccw

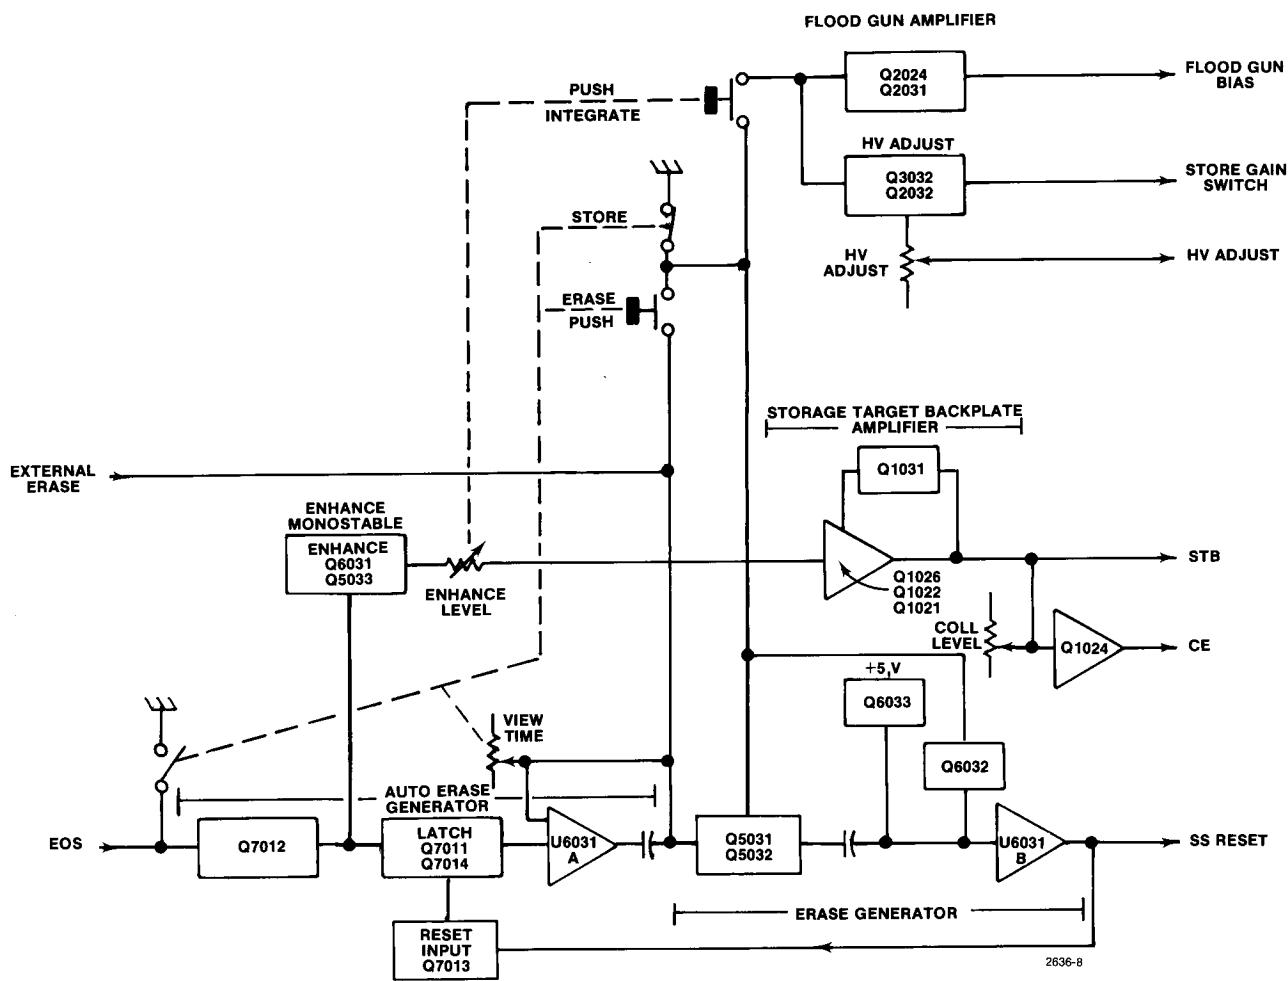

For waveforms 13 to 15, the control settings are the same as above with exception of VIEW TIME which is set to midrange.

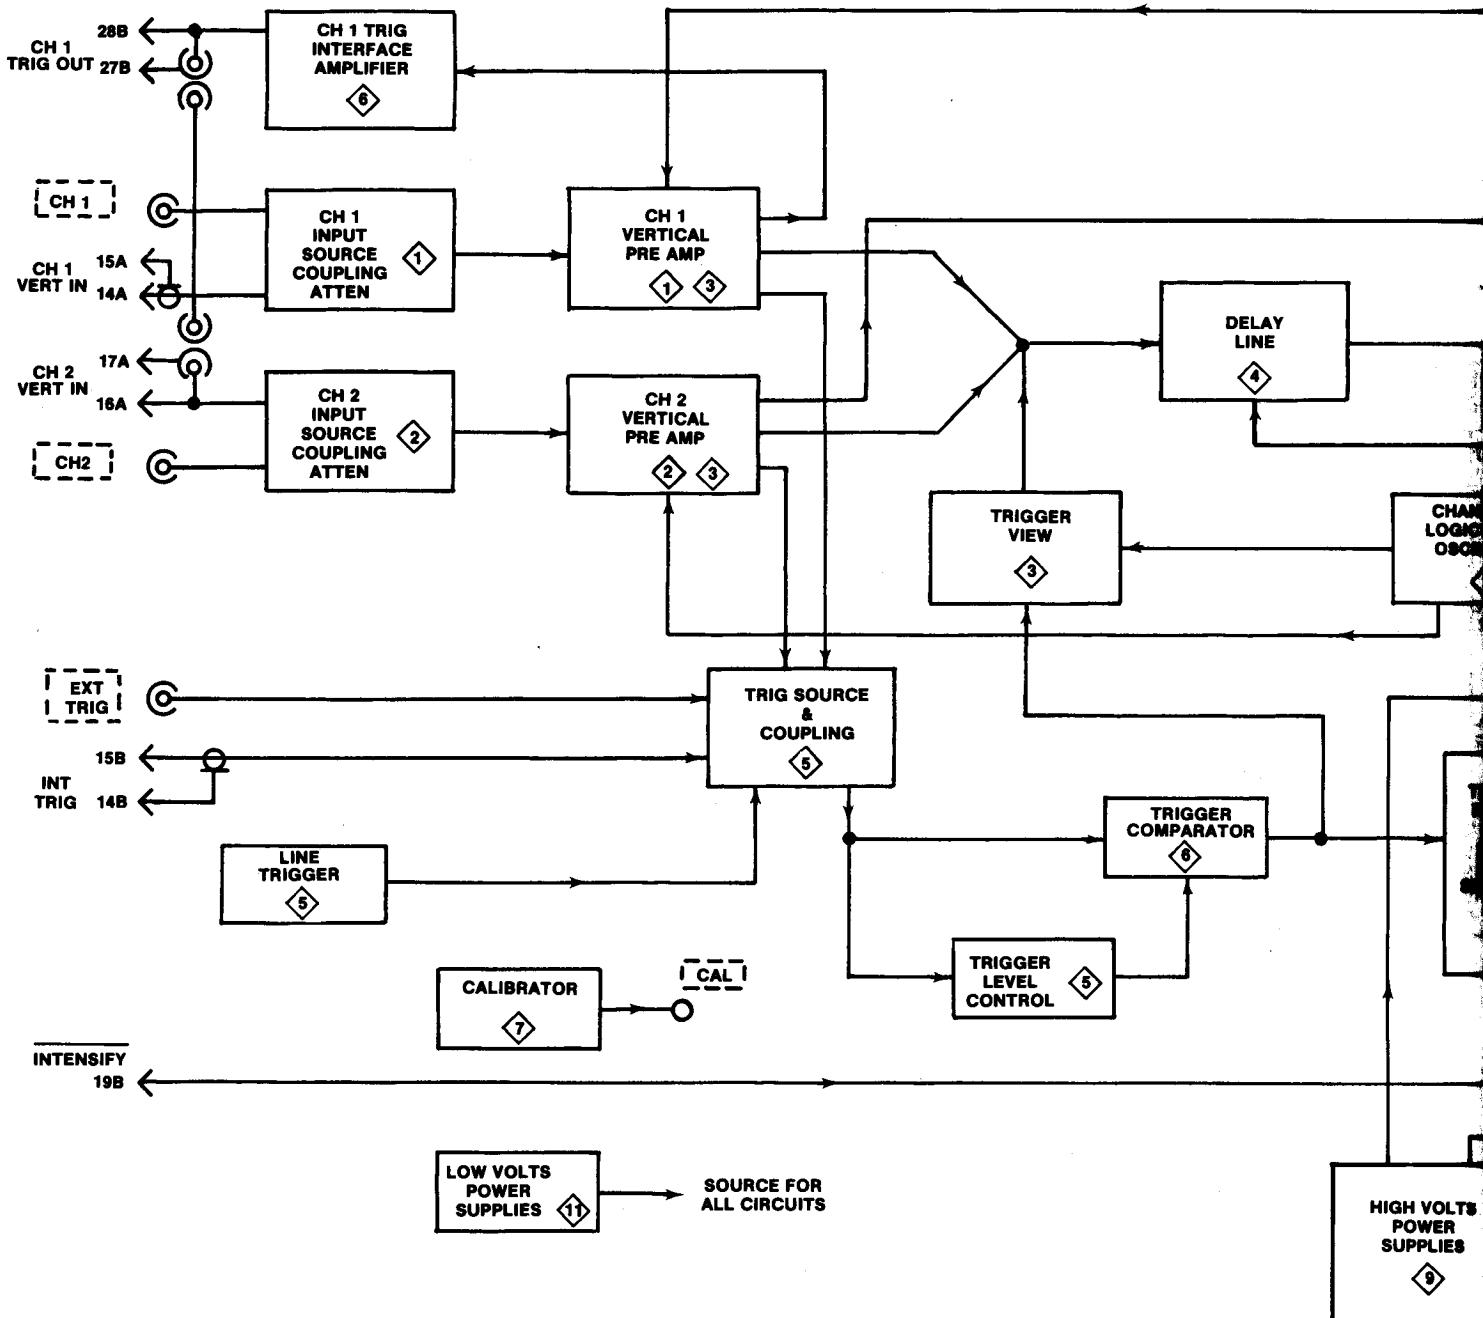

#### WARNING

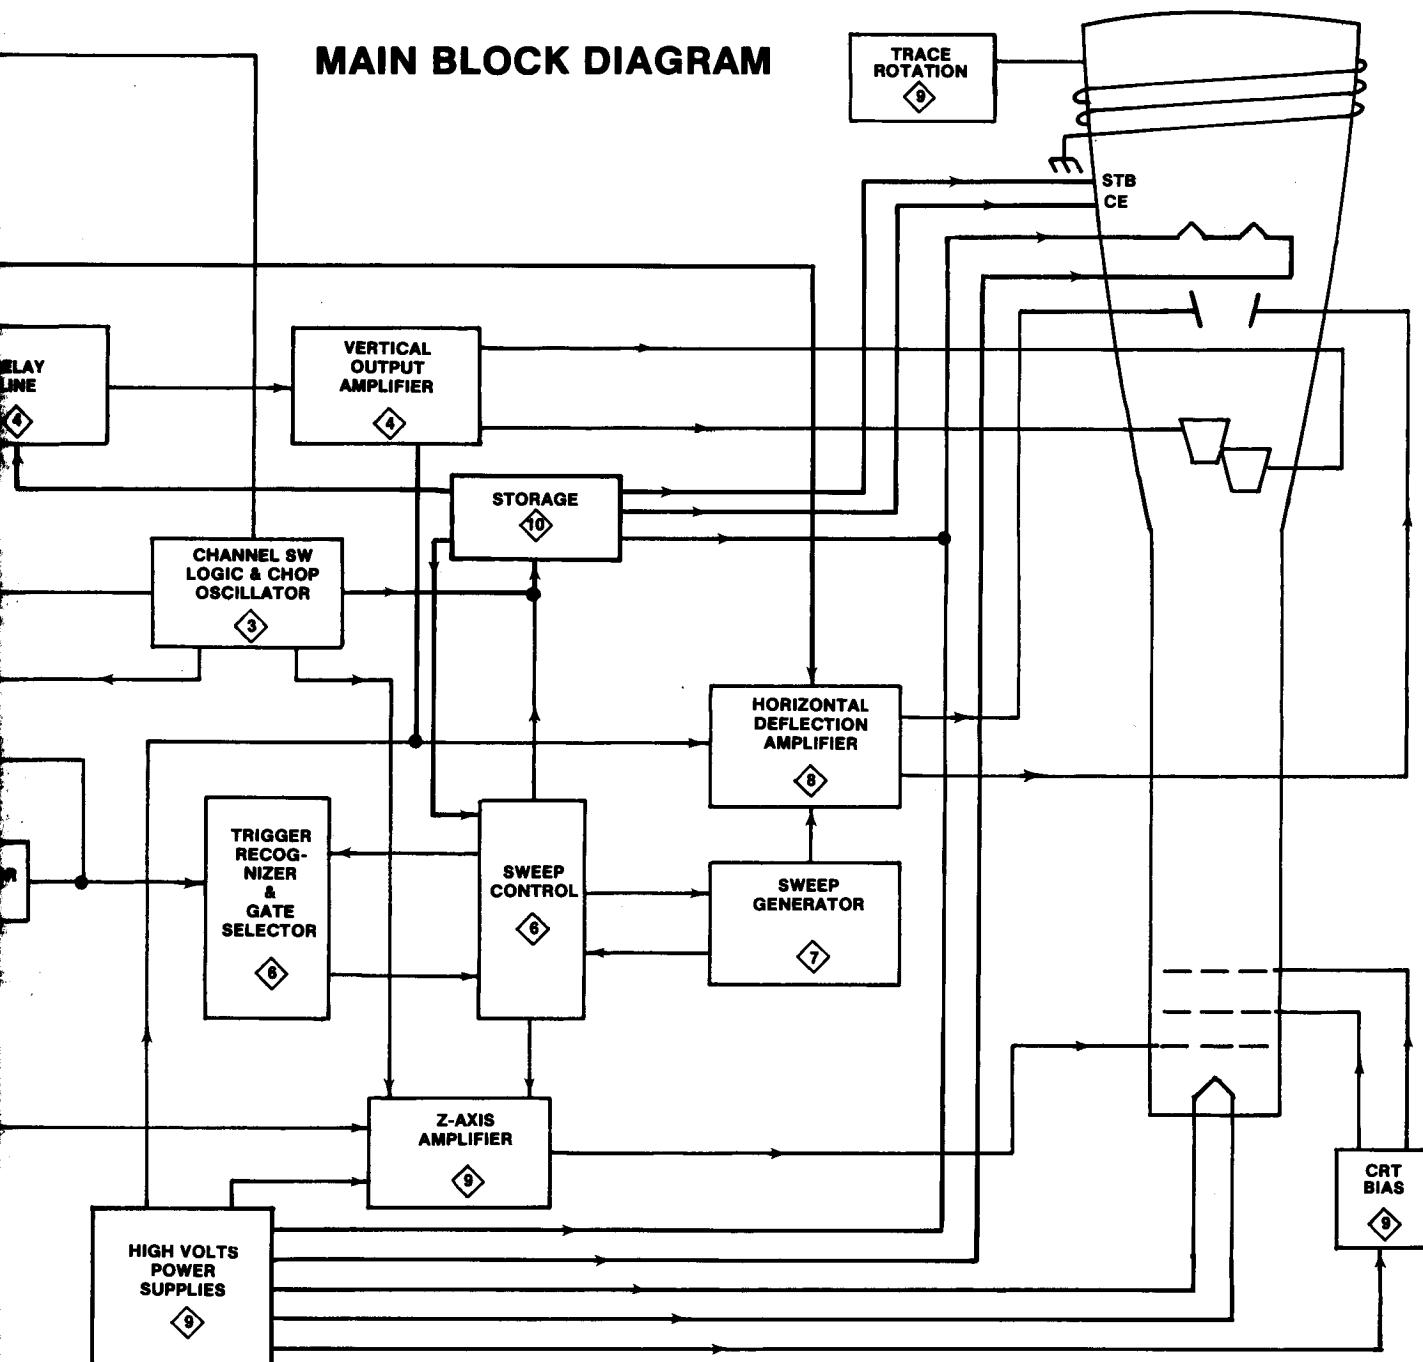

*Potential on collector of Q1021 may exceed 200 V peak-to-peak.*

# REPLACEABLE MECHANICAL PARTS

## PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

## SPECIAL NOTES AND SYMBOLS

X000      Part first added at this serial number

00X      Part removed after this serial number

## FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

## INDENTATION SYSTEM

This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

1 2 3 4 5	Name & Description
	<i>Assembly and/or Component</i>
	Attaching parts for Assembly and/or Component
	-----
	<i>Detail Part of Assembly and/or Component</i>
	Attaching parts for Detail Part
	-----
	<i>Parts of Detail Part</i>
	Attaching parts for Parts of Detail Part
	-----

Attaching Parts always appear in the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation. The separation symbol ----- indicates the end of attaching parts.

**Attaching parts must be purchased separately, unless otherwise specified.**

## ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.
