

TEKTRONIX®

**TG 501
TIME MARK
GENERATOR**

INSTRUCTION MANUAL

Tektronix, Inc.
P.O. Box 500
Beaverton, Oregon 97005

Serial Number _____

WARRANTY

All TEKTRONIX instruments are warranted against defective materials and workmanship for one year. Any questions with respect to the warranty should be taken up with your TEKTRONIX Field Engineer or representative.

All requests for repair and replacement parts should be directed to the TEKTRONIX Field Office or representative in your area. This will assure you the fastest possible service. Please include the instrument Type Number or Part Number and Serial Number with all requests for parts or service.

Specifications and price change privileges reserved.

OPERATING INSTRUCTIONS

INTRODUCTION

Description

The TG 501 is a general purpose Time Mark Generator plug-in designed to operate in a TM 500 Series Power Module. A Variable Timing Readout provides a simple, but accurate means of measuring timing errors over $\pm 7.5\%$ minimum range. Since many specifications are given in percentages, the error readout eliminates the need for computations and, additionally, lessens parallax discrepancies.

Marker selection from 5 s through 1 ns in a 1,2,5, sequence is available. 5 s through 10 ns markers are selected by a rotary switch. 5,2, and 1 ns modified sine waves are selected by self-canceling push-buttons when the rotary switch is in the 521N position.

All outputs are available at the front-panel connectors or by modification of the interface connector, located at the back of the plug-in, and the TM 500 Series Power Module.

Power supplies are current limited. The 5 volt supply is over-voltage protected to avoid damage to the integrated circuits.

Installation

The TG 501 is calibrated and ready for use when received. Referring to Fig. 1-1, install the Generator and turn on the Power Module. Check the front-panel of the Generator to see that the knob skirt is lighted. The TG 501 is designed to operate in any compartment of a TM 500

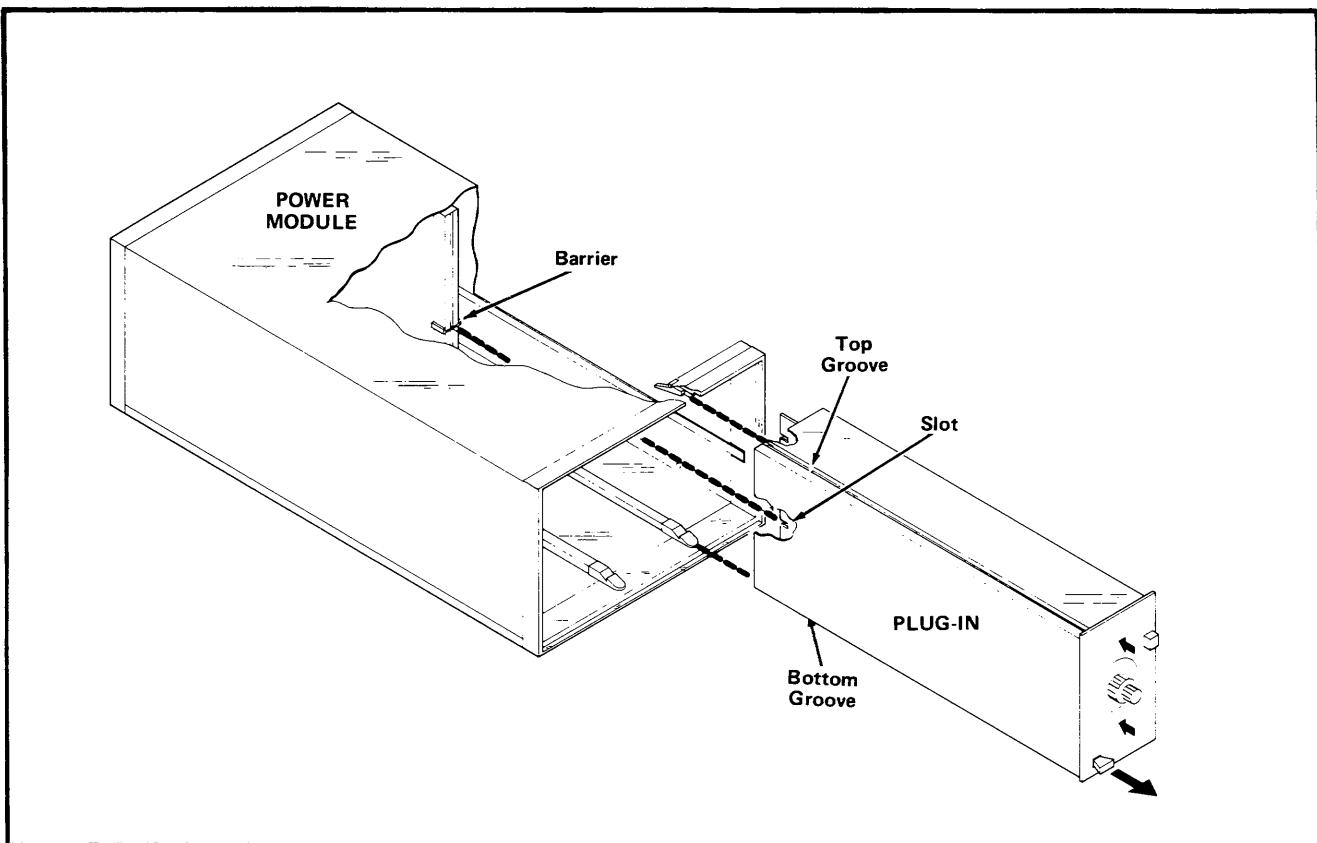

Fig. 1-1. Plug-in Installation and Removal.

Operating Instructions—TG 501

Series Power Module. Refer to the Power Module Instruction Manual for line voltage requirements and Power Module operation.

at the connector terminals can reduce connector life. However, no internal damage will result if the Generator is inserted into a live Power Module.

NOTE

It is recommended that the Power Module be turned off before inserting or removing the TG 501. Arcing

Refer to the Controls and Adjustments fold out page for front-panel controls, connectors and indicator descriptions.

OPERATING CONSIDERATIONS

The internal reference of the TG 501 is a 1 MHz crystal. If Option 1 is ordered, a high accuracy 5 MHz crystal is provided and Integrated Circuit, U50 is installed on the back of the main circuit board. Provisions are made for buffered output of either 1 MHz or 5 MHz internal clock through interface connector pin 25A with associated ground on pin 26A.

A 1 MHz, 5 MHz or 10 MHz external clock can be substituted. To use an external 5 or 10 MHz clock, U50 must be installed on the back of the main circuit board and the necessary jumpers added (see Fig. 1-2) to divide down the input to meet the 1 MHz internal requirement. U50 is not required for a 1 MHz external clock, but jumpers must be added.

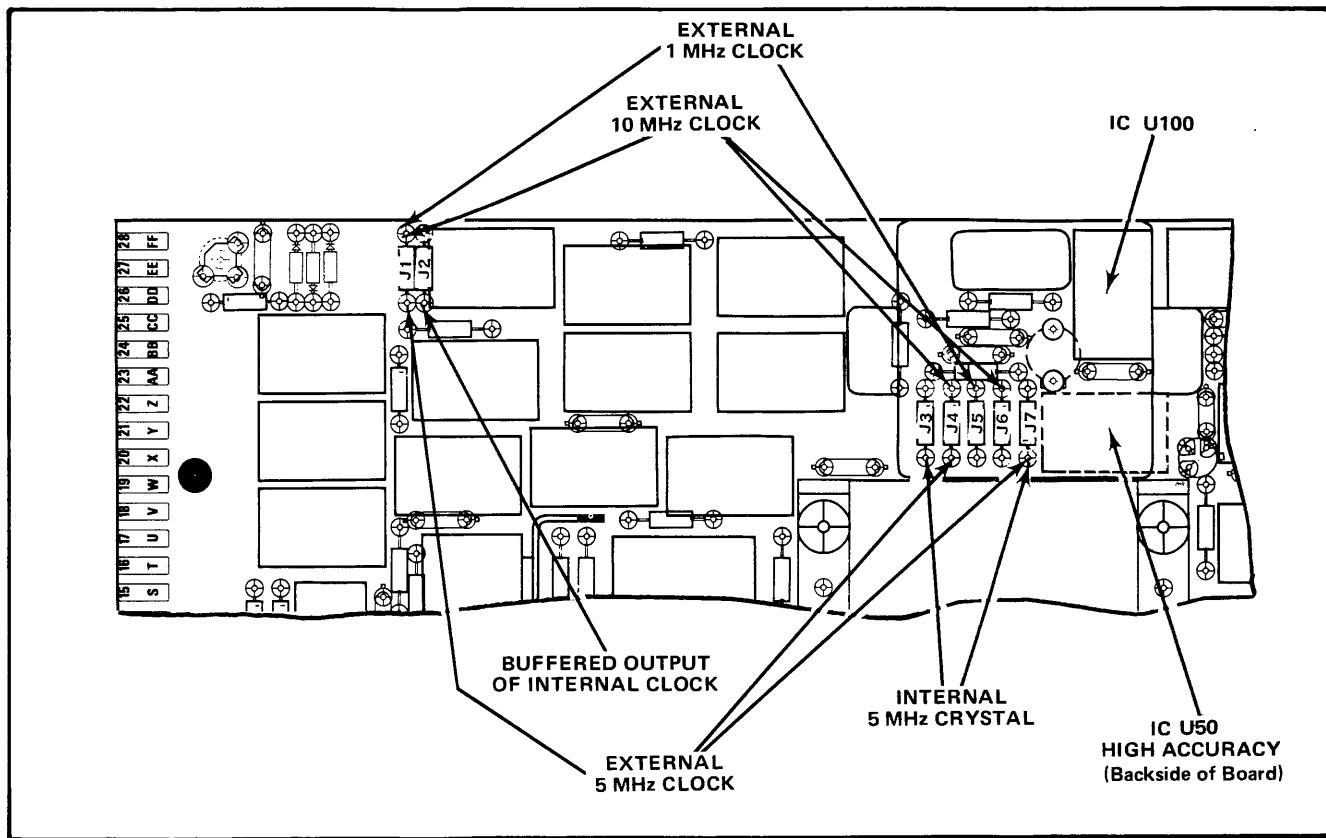

Fig. 1-2. Location of Jumpers and Integrated Circuits required for various clock choices.

Remove U100 before using external clocks. Interface connector pin 24B is used for External Clock Input with the associated ground on pin 25B. Fig. 1-2 shows the location on the main circuit board of the jumpers that must be installed to use the TG 501 with the various clock choices. The required jumpers are:

Standard Internal Reference	
1 MHz Crystal	No jumpers required

Buffered Output of Internal Clocks	Install J2
External 1 MHz clock (Remove U100)	Install J1, J5
External 5 MHz clock (Remove U100, Add U50)	Install J1, J4, J7
External 10 MHz clock (Remove U100, Add U50)	Install J1, J4, J6

OPERATING MODES

Calibrated Mode

When center-button of VARIABLE TIMING Control is pushed in, the MARKER Control selects calibrated marker intervals from 5 s to 10 ns indicated by the lighted knob skirt. To select 5, 2 or 1 ns modified sine wave markers, set MARKER Control to 521N position and depress desired pushbutton.

Variable Timing Mode

When center button of VARIABLE TIMING Control is out, output timing is faster or slower than the calibrated

marker to the percentage indicated by the VARIABLE TIMING READOUT Display and the FAST-SLOW Indicator lights. 5, 2 and 1 ns push-button controlled modified sine waves are not variable and Readout Display is turned off when MARKER Control is in 521N position.

Readout Display Test

To check the operation of the display LED's (Light-Emitting Diodes), fully depress the center button of the VARIABLE TIMING Control (push in firmly). All LED segments should light, displaying 8.8 in the Readout.

TYPICAL APPLICATIONS

The TG 501 can be used for many applications not described in the manual. Use the following examples to become familiar with the TG 501's VARIABLE TIMING READOUT. Contact your Tektronix Field Office or representative for making specific measurements with this instrument.

Time Base Measurements

To accurately determine the timing error of a time base:

1. Connect the MARKER OUT of the TG 501 to the Vertical Input of the oscilloscope. Use a 50Ω coaxial cable terminated into 50Ω .

2. connect the TRIGGER OUT of the TG 501 to the External Trigger Input of the time base. Use a 50Ω coaxial cable terminated into 50Ω .

3. Select external trigger source on the time base.
4. Select, for example, $1 \mu\text{s}$ sweep rate of the time base.
5. Set MARKER Control rotary switch of TG 501 to $1 \mu\text{s}$.
6. Make sure center button of VARIABLE TIMING Control, concentric with MARKER Control, is out (Variable Timing Mode).
7. Use Horizontal Position control of time base to make first time mark coincide with first graticule line on the oscilloscope. See Fig. 1-3.
8. Rotate VARIABLE TIMING knob until all time markers coincide with graticule lines on the oscilloscope, as shown in Fig. 1-4.

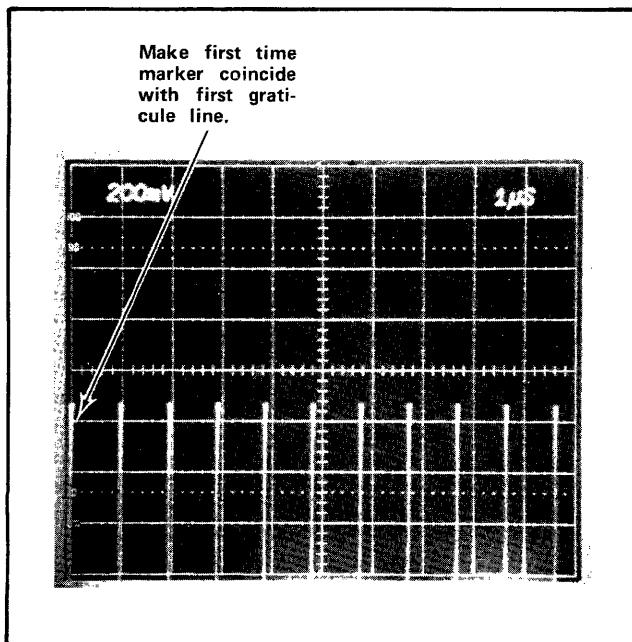

Fig. 1-3. Timing Error of Time Base.

9. Either the FAST or SLOW Indicator will light showing whether the time base is faster or slower than the calibrated markers of the TG 501. Read the percentage of error from the VARIABLE TIMING READOUT Display.

Pulse Generator Measurements

To accurately determine pulse duration or period of a Pulse Generator.

1. A dual-trace vertical oscilloscope is required. Select alternate mode.
2. Connect the MARKER OUT of the TG 501 to one channel of the dual-trace oscilloscope. Use a $50\ \Omega$ coaxial cable terminated into $50\ \Omega$.
3. Connect the Output of the pulse generator to the other channel of the dual-trace, using a $50\ \Omega$ coaxial cable terminated into $50\ \Omega$.
4. Set the time/div switch to display 1 cycle of a pulse in 10 divisions of the graticule on the oscilloscope, as indicated in Fig. 1-5.
5. Use the MARKER Control switch of the TG 501 to display one time marker approximately at pulse duration

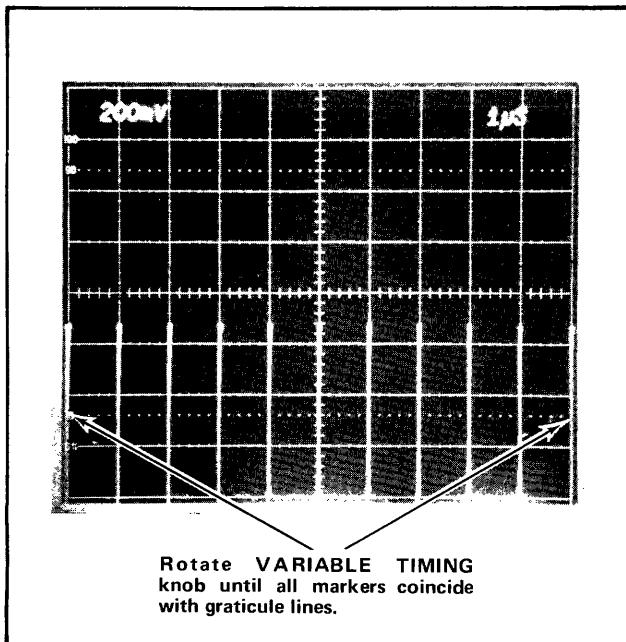

Fig. 1-4. Measuring Timing Error of Time Base.

and one at pulse period. Align first time marker with beginning of pulse wave-form. See Fig. 1-5.

6. Select Variable Timing Mode on the TG 501, VARIABLE TIMING Control center button out.

7. Use the Vertical Position control of the oscilloscope to set the peaks of the time markers at 50% amplitude of pulse shown in Fig. 1-5.

8. To check the timing of pulse duration, rotate the VARIABLE TIMING knob until time marker coincides with pulse duration, as shown in Fig. 1-6.

9. Either the FAST or SLOW Indicator will light, showing whether the pulse duration of the pulse generator is faster or slower than the calibrated time mark of the TG 501. Read the percentage of error from the VARIABLE TIMING READOUT Display.

10. To check the timing of pulse period, rotate the VARIABLE TIMING knob until time marker coincides with pulse period. See Fig. 1-7.

11. Read the VARIABLE TIMING READOUT Display and check the FAST-SLOW Indicators as described in step 9 to find the percentage of error from standard timing.

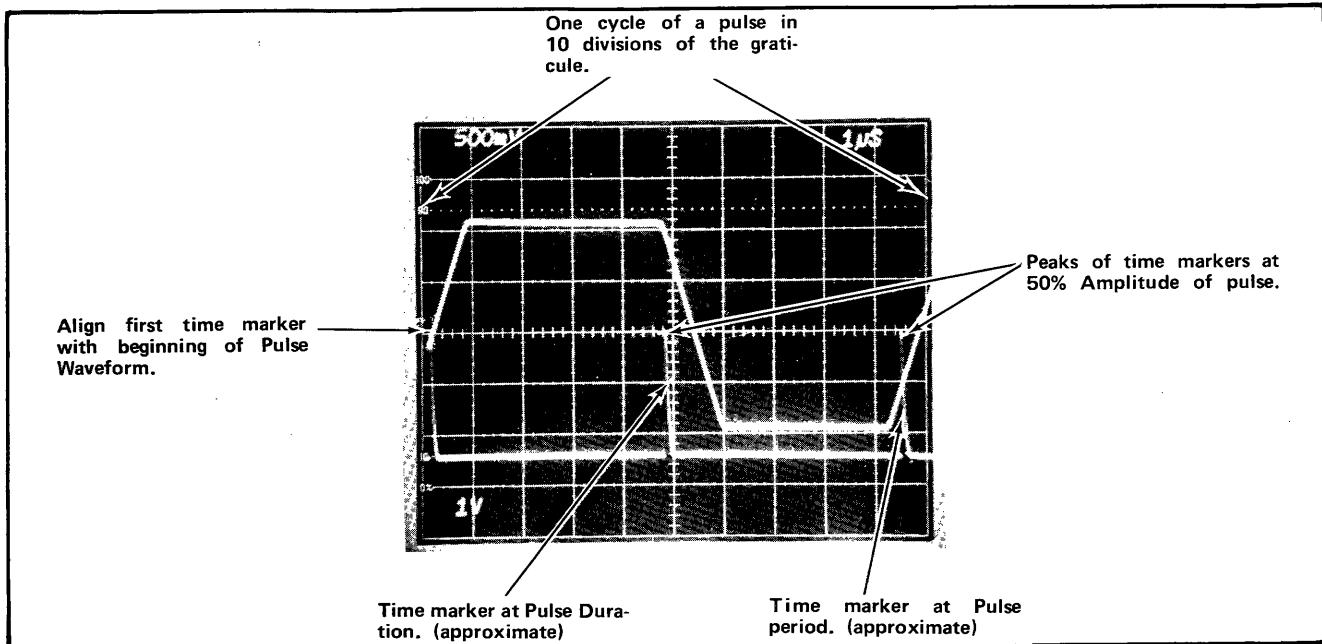

Fig. 1-5. Markers approximately at pulse duration and period.

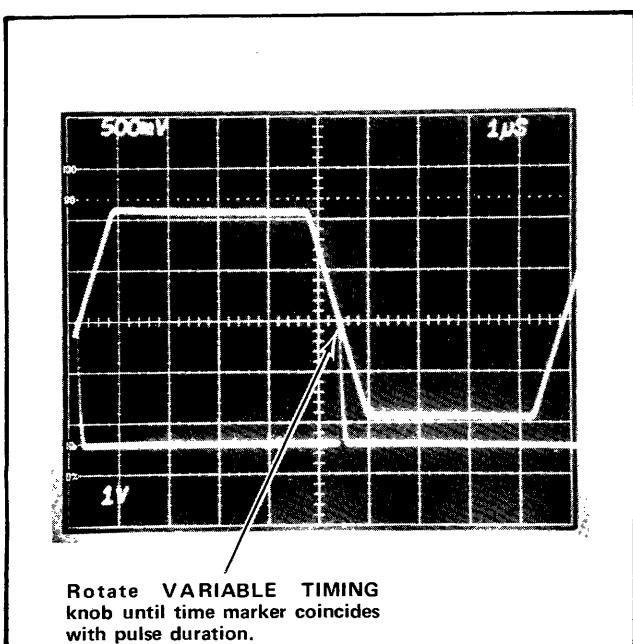

Fig. 1-6. Measuring Pulse Duration.

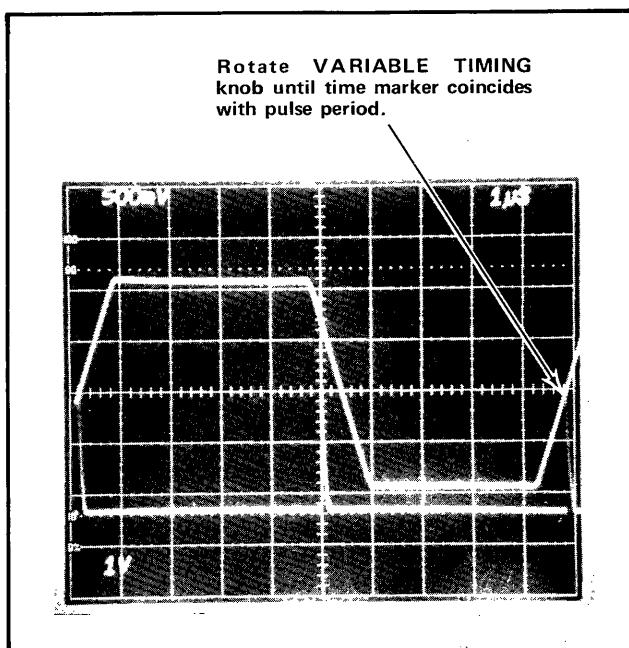

Fig. 1-7. Measuring Pulse Period.

REAR INTERFACE

Unused pins are available at the rear connector for routing signals to and from the TG 501 for specialized applications (see Rear Connector Pin Assignments in Section 2). One or more compartments of a multi-plug-in

Power Module can be wired with barriers installed to provide specific functions between compartments. See Power Module instruction manual for additional information.

Operating Instructions—TG 501

A Power Module mainframe option (Option 2) is available which provides a rear-panel, multi-pin connector to which I/O lines can be hard-wired for external access.

Also possible are intra-compartment connections with other plug-in modules in multiple-compartment mainframes.

SPECIFICATIONS

The electrical specifications are valid only if (1) the instrument has been calibrated at an ambient temperature between +20°C and +30°C; (2) the instrument is operating at an ambient temperature between 0°C and +50°C, unless

otherwise noted; (3) plug-in must be operating (fully installed) in a calibrated system.

Any conditions that are unique to a particular specification are stated as part of that specification.

TABLE 1-1
ELECTRICAL CHARACTERISTICS

TABLE 1-2
ENVIRONMENTAL CHARACTERISTICS

Characteristics	Performance Requirements	Supplemental Information
Temperature		
Operating	0°C to +50°C	
Storage	-40°C to +75°	
Altitude		
Operating	To 15,000 feet	
Storage	To 50,000 feet	
Vibration		
Operating and Non-Operating	With the instrument complete and operating, vibration frequency swept from 10 to 50 to 10 Hz at 1 minute per sweep. Vibrate 15 minutes in each of the three major axes at 0.015" total displacement. Hold 3 minutes at any major resonance, or if none, at 50 Hz. Total time, 54 minutes	
Shock		
Operating and Non-Operating	30 g's, 1/2 sine, 11 ms duration, 2 shocks in each direction along 3 major axes, for a total of 12 shocks	
Transportation	Qualified under National Safe Transit Committee Test Procedure 1A, Category II	

SERVICE INFORMATION

SYMBOLS AND REFERENCES DESIGNATORS

Electrical components shown on the diagrams are in the following units unless noted otherwise:

Capacitors = Values one or greater are in picofarads (pF).

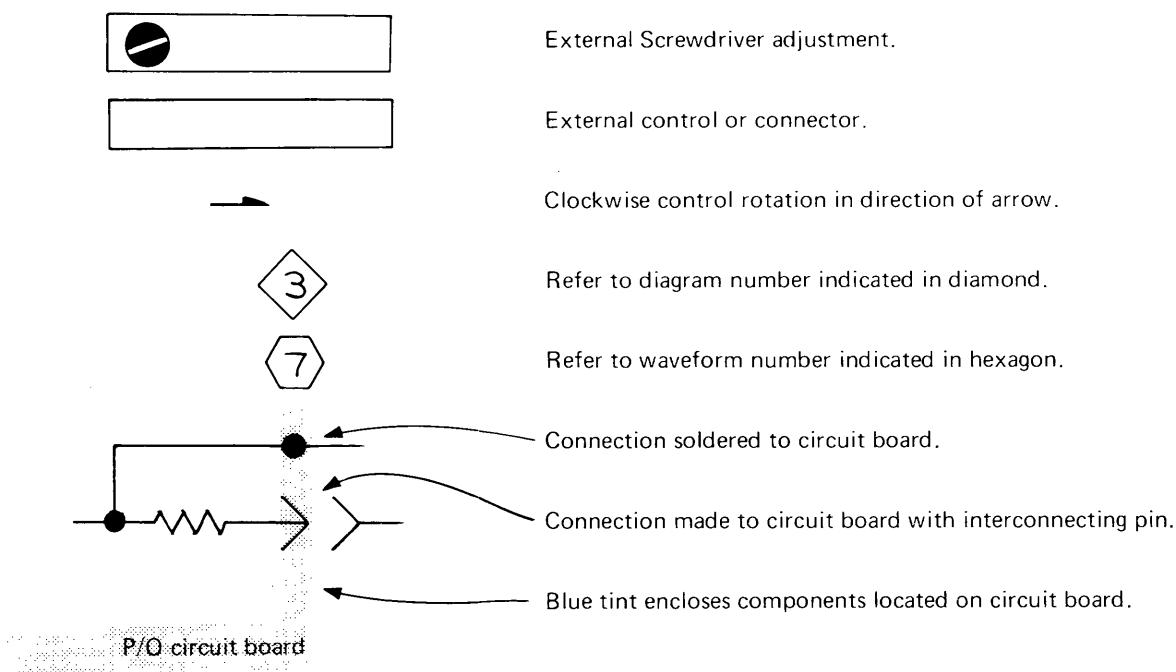

Values less than one are in microfarads (μF).

Resistors = Ohms (Ω)

Symbols used on the diagrams are based on ANSI Y32.2 – 1970.

Logic symbology is based on MIL-STD-806B in terms of positive logic. Logic symbols depict the logic function performed and may differ from the manufacturer's data.

The following special symbols are used on the diagrams:

ELECTRICAL REPLACEABLE PARTS LIST

PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

SPECIAL NOTES AND SYMBOLS

X000	Part first added at this serial number
00X	Part removed after this serial number

ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

MECHANICAL REPLACEABLE PARTS LIST

PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

SPECIAL NOTES AND SYMBOLS

X000 Part first added at this serial number

00X Part removed after this serial number

FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

INDENTATION SYSTEM

This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

1 2 3 4 5	<i>Name & Description</i>
	<i>Assembly and/or Component</i>
	<i>Attaching parts for Assembly and/or Component</i>

	<i>Detail Part of Assembly and/or Component</i>
	<i>Attaching parts for Detail Part</i>

	<i>Parts of Detail Part</i>
	<i>Attaching parts for Parts of Detail Part</i>

Attaching Parts always appear in the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation. The separation symbol ---*--- indicates the end of attaching parts.

Attaching parts must be purchased separately, unless otherwise specified.

ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

Rear-view of plug-in

Assignments listed for pins 1A-13A and 1B-13B are available in all power modules; however only those pins marked with an asterisk (*) are used by the TG 501.

ADJUSTMENTS

Equipment Required

1. Correctly functioning TM 500-Series Power Module.
2. Plug-In Extension. Tektronix Calibration Fixture 067-0645-01.
3. Sampling Test Oscilloscope. Must have an equivalent bandpass of at least 1 GHz and a deflection factor of 0.2 V/div. For example a 5403/D40 Oscilloscope with a 5S14N Dual Trace Delayed Sweep Sampler.

5. Adjust 1 ns/2 ns Output Amplitude C515

With the coaxial cable from the sampling test oscilloscope connected to MARKER OUT and the 2 ns pushbutton depressed as stated in steps 2, 3, and 4, adjust C515 so that amplitude of 2 ns markers is at least 1 V. Disconnect cable from MARKER OUT and connect it to 1 ns ONLY. Depress 1 ns pushbutton. The amplitude of 1 ns markers should be at least 0.5 V. If not, adjust C515 again, then switch the cable back to MARKER OUT, depress 2 ns pushbutton and verify that the amplitude is at least 1 V.

Set C515 so that the amplitudes of both the 2 ns markers and 1 ns markers are proportional.

4. Adjust 2 ns Tuned Stub Filter C510, C511, C512, and C513

Sampling test oscilloscope is still connected and controls set as stated in steps 2 and 3.

Adjust C510, C511, C512, and C513 in the order of the arrow for maximum marker amplitude on the sampling test oscilloscope.

Preliminary Procedure

NOTE

The performance of this instrument can be checked at any temperature within the 0°C to +50°C range. Make any adjustment at a temperature of +25°C ±5°C.

a. Check that the correct nominal line-selector block (110 VAC or 220 VAC) has been installed on the line selector pins and that the regulating range selected includes the input line voltage, see Installation section of Power Module manual.

6. Adjust 1 ns Tuned Stub Filter C517, C518, C519, and C520

Depress the TG 501 1 ns pushbutton.

Connect the sampling test oscilloscope to the TG 501 1 ns ONLY connector using a coaxial cable. Set the test oscilloscope vertical sensitivity for 0.2 V/div,

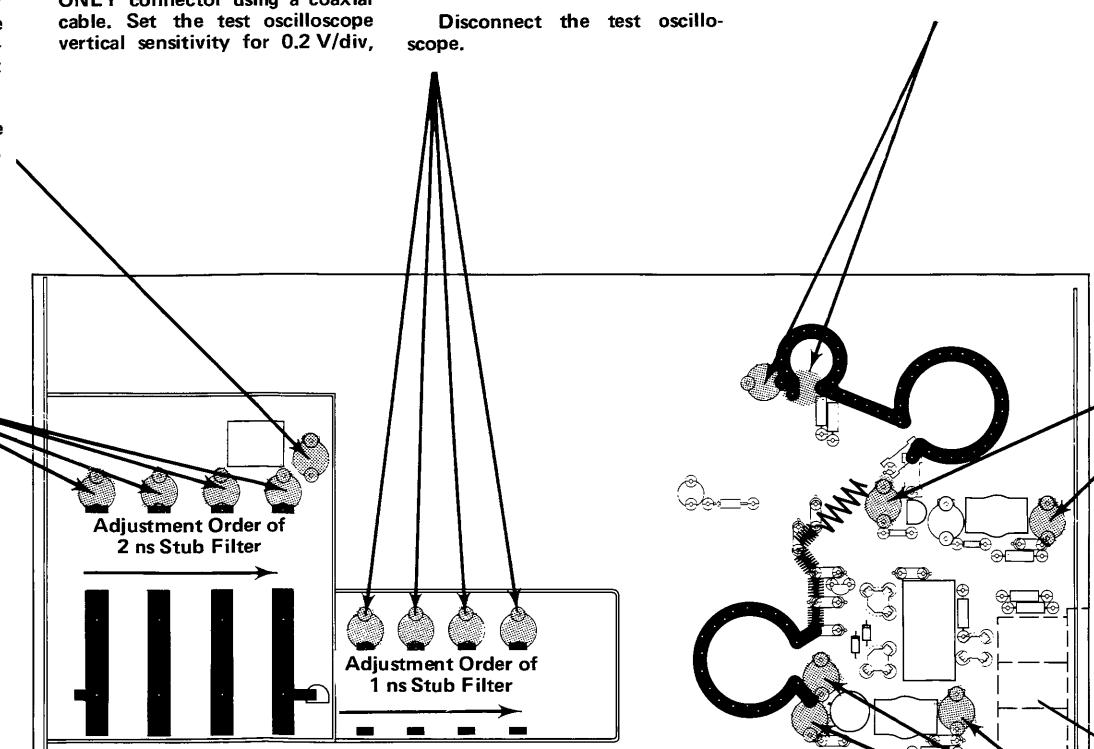

time/div to 1 ns and the triggering controls for an internal triggered display.

Adjust C517, C518, C519, and C520 in the order of the arrow for maximum marker amplitude on the sampling test oscilloscope.

Disconnect the test oscilloscope.

3. Adjust 2 ns Ring Circuit Capacitors C505 and C504

With sampling test oscilloscope still connected and controls set as in step 2, adjust C505 and C504 for maximum marker amplitude on the test oscilloscope.

NOTE

Step 1 on the main circuit board adjustments foldout must be accomplished before proceeding with the adjustments on this foldout.

b. Remove the TG 501 side covers and connect the Time Mark Generator to the Power Module using the plug-in extension.

c. Connect the Power Module to the line voltage source and apply power to the TG 501.

d. Set the following controls:

MARKER	521N
5 ns (pushbutton)	Pushed in

2. Adjust 2 ns Output Tank Capacitance C498 and Amp Bias R482

With the sampling test oscilloscope still connected as in step 1, depress the TG 501 2 ns pushbutton. Set the sampling test oscilloscope time/div switch to 2 ns and adjust the triggering controls for a stable display.

Adjust C498 and R482 for maximum marker amplitude on the sampling test oscilloscope.

1. Adjust 5 ns Output Tank Capacitance C465, 5 ns Output Series Capacitance C467, and 5 ns 100 MHz Drive Tank Capacitance C450

Connect the TG 501 MARKER OUT connector to the vertical input of the sampling test oscilloscope using a coaxial cable. Connect a coaxial cable from the TRIGGER OUT connector of the TG 501 to external trigger input of the test oscilloscope. Set the sampling test oscilloscope vertical sensitivity for 0.2 V/div, time/div to 5 ns and the triggering controls for an externally triggered display.

Adjust C450, C465, and C467 for maximum marker amplitude on the sampling test oscilloscope.

THEORY OF OPERATION

DIAGRAMS 1 & 2

PHASE LOCK LOOP

1 MHz Crystal Reference and Enable Gate

The reference frequency is supplied by the 1 MHz crystal reference circuitry of Y100, U100 and U350A. The output of the crystal reference circuit is supplied to pin 12 of U110D, which is part of the enable gate circuit. The enable gate circuit, which determines whether the 1 MHz crystal reference or the 1 MHz variable clock is connected to the phase lock loop, is composed of U110A, U110B, U110D, and U115D. When the VARIABLE TIMING (OUT) knob is pushed in and locked, a low is on pin 11 of U110D, allowing the crystal reference oscillator to be available at pin 13 of U110D. A low is also created at pins 12 and 13 of U115D, resulting in a high at pin 11 of U115D and at pin 3 of U110A. The high at pin 3 of U110A causes a low at pin 5 of U110B, which allows U110B to pass the crystal reference oscillator signal to pin 1 of U230A.

100 MHz Voltage Controlled Oscillator, Divide-By-Five Counter ECL-To T^2L Translator, and Divide-By-Two Counter

The voltage controlled oscillator is composed of an astable multivibrator Q280-Q285-Q290, etched capacitor, and Q272, which supplies the charge current for the etched circuit board capacitor. U290D acts as a buffer for the voltage controlled oscillator. The NOR output of U290D is connected to the Divide-By-Five Counter. The $\div 5$ counter contains U310A, U310B, and U315A. The output of the $\div 5$ counter is translated from ECL into T^2L logic levels by Q330, then supplied to $\div 2$ counter U320.

Divide-By-Five counter, Divide-By-Two counter, Phase Comparator, and Loop Amplifier/Filter

The output of $\div 2$ counter U320 is supplied to the input of U325. The output, pin 11 of U325 is applied to $\div 2$ counter U225 pin 12. The Q output of U225 is supplied to pin 5 of U230B.

U230A pin 1 receives 1 MHz from either the crystal reference or the variable clock. U230B pin 5 receives the counted down ($\div 100$) 100 MHz signal from the VCO (Voltage-Controlled Oscillator). Pin 9 and 12 of U230 go high if the negative edges of the input signals coincide; this occurs when the 100 MHz VCO is operating on frequency. The high inputs to U235A produces a low output that clears U230A and U230B. The transition to a low that occurs at pin 12 of U230A is integrated by R231 and C231; the transition to a high level that occurs at pin 8 of U230B is integrated by R239 and C239. The two integrated output levels are summed by R234 and R239. This summation is then fed to the negative input of the loop amplifier/filter.

The input signal to the loop amplifier/filter is amplified and inverted by operational amplifier U250. The output of U250 is kept from changing rapidly by C250 and C251. The slow change in the output of U250 causes it to be an apparent DC level. VR250 level-shifts the output of U250 to a level that can be used to control the current flow through Q272.

Frequency Regulation of the 100 MHz Voltage Controlled Oscillator

Assume that the frequency has been correct up to this cycle, and that pins 9 and 12 of U230 are low. When the 100 MHz VCO frequency is slower than 100 MHz the negative edge to the phase comparator will toggle U230A first. This results in a high at pins 8 and 12 of U230 and a more negative voltage at the output of U250. This more negative voltage causes Q272 to conduct harder, which allows the etched circuit board capacitor to charge more quickly, to increase the oscillator frequency.

Again assume that the frequency has been correct up to this cycle, but this time the voltage controlled oscillator is faster than 100 MHz. The negative edge of the next cycle will toggle U230B first, resulting in a low at pins 8 and 12 of U230. This in turn causes a more positive voltage at the output of U250 which reduces the conduction of Q272. The etched circuit board capacitor now requires longer to charge since its available charging current has been reduced by Q272.

Out of Lock Detector

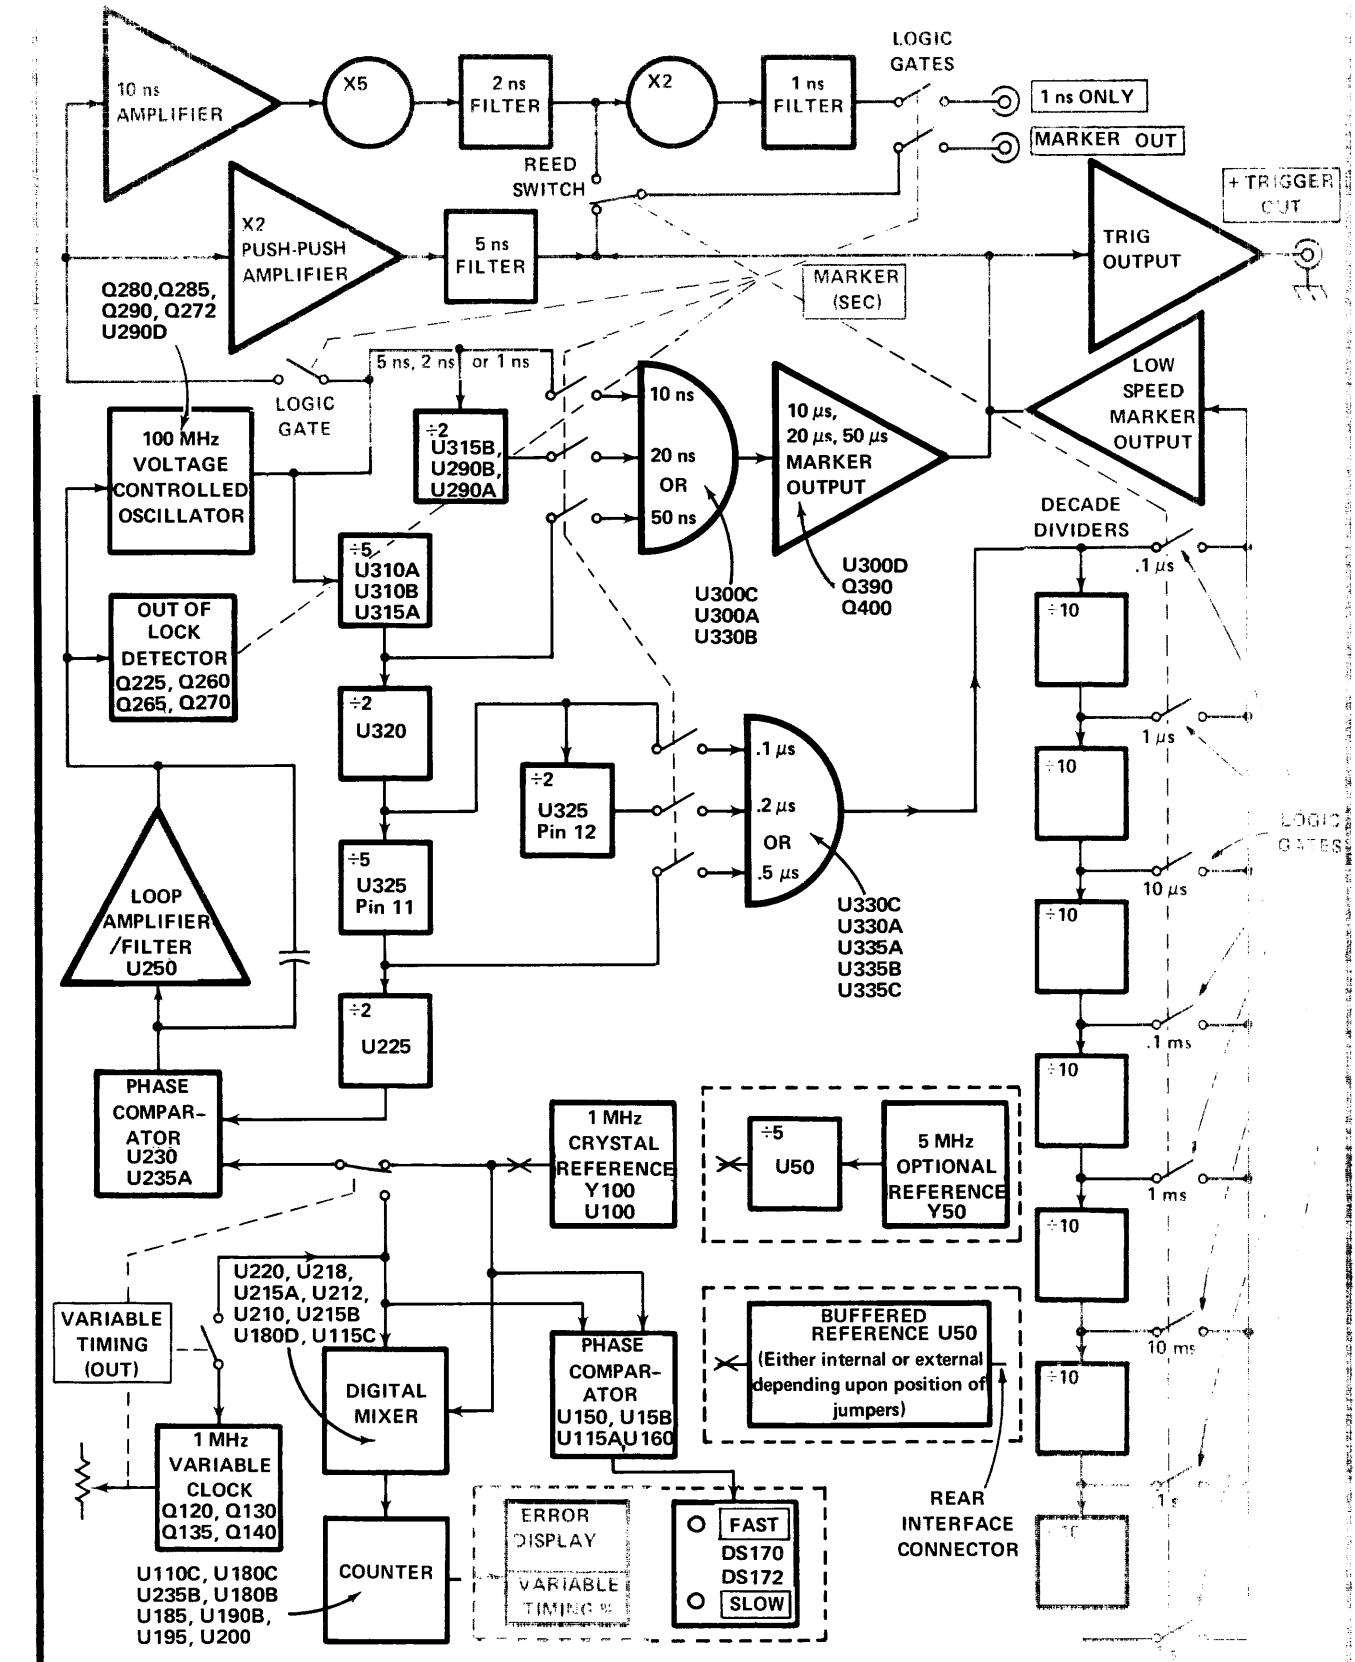

Ground via the cam switch for all the marker output enable logic gates is via Q270. If the 100 MHz voltage controlled oscillator is running quite slowly (out of specifications), the voltage at the output of the loop amplifier/filter operational amplifier U250 will be quite high. This high voltage will turn off normally conducting Q265, which in turn will turn off Q270, breaking the ground on the enable logic gates ground. Without ground there is no marker output.

On the other hand, if the 100 MHz VCO is running very fast (out of specifications), the voltage at the output of U250 will be very low. This low voltage will turn on Q255 and Q260, which will turn off Q270, stopping the marker output.

20 ns AND .2 μ s DIVIDE-BY-TWO COUNTERS,

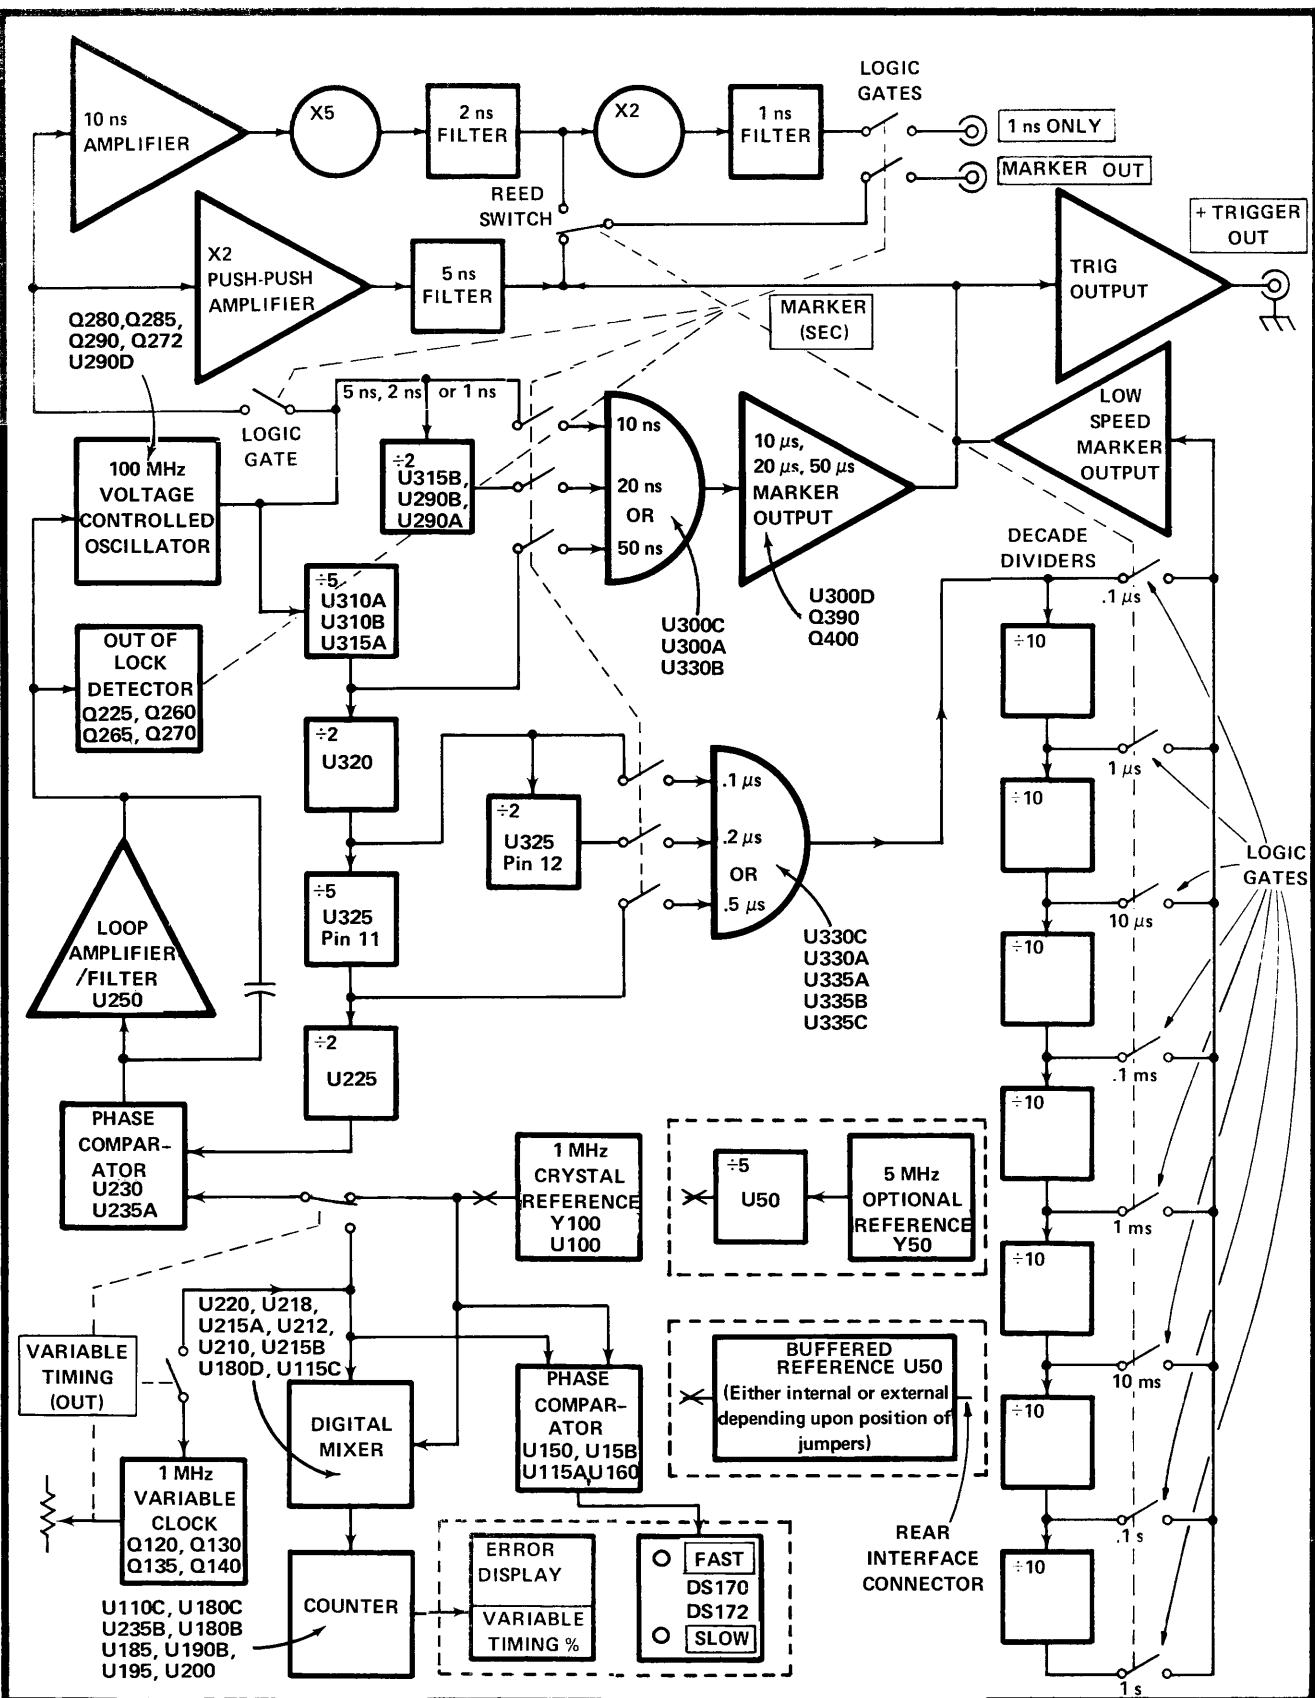

10 ns, 20 ns, or 50 ns AND .1 μ s, OR .5 μ s
ENABLE GATES

The 20 ns $\div 2$ counter contains U315B, U290B and U290A. The input to the counter is the output of the

THEORY OF OPERATION

DIAGRAMS **1** & **2**

100 MHz VCO. The 20 ns markers from the $\div 2$ counter are coupled to enable gate U300B.

The $.2 \mu\text{s} \div 2$ counter is part of U325. The $\div 2$ counter output is pin 12 of the integrated circuit, which is supplied to enable gate U330A.

Enable gates for the 10 ns, 20 ns, and 50 ns markers are U300C, U300B, and U300A respectively, while the enable gates for the $.1 \mu\text{s}$, $.2 \mu\text{s}$, and $15 \mu\text{s}$ markers are U330C, U330A, and U335A-U335B respectively. U335C is an OR gate that couples the selected $.1 \mu\text{s}$, $.2 \mu\text{s}$, or $.5 \mu\text{s}$ markers to the decade dividers.

1 MHz VARIABLE CLOCK

The 1 MHz variable clock circuit is an emitter-coupled astable multivibrator. Temperature compensation transistor Q120, which is the same type of transistor of Q130 and Q135, establishes the power supply voltage for the multivibrator. Q130, Q135 and Q140 are the multivibrator transistors, with Q130 controlling the charge current available to timing capacitor C127. VR140 provides level shifting for the Q130 base voltage. R135 controls the frequency of the multivibrator by controlling the conduction of Q130. The lower end of R135 is the higher frequency end while the top reduces the frequency. R145, Variable Timing Center, is used to set the frequency of the multivibrator to 1 MHz when R135 is set to its mechanical midrange position.

PHASE COMPARATOR AND FAST-SLOW LED'S

Description

1 MHz is fed to pin 1 of U150B by either the crystal reference or the variable clock. The 1 MHz crystal reference is fed to pin 5 of U150A. Pins 12 and 9 of U150 will go high if the negative edges of the two 1 MHz input signals coincide. This occurs when the 1 MHz variable clock is on frequency. With these inputs high, U115A produces a low that clears U150A and U150B. The low now at pin 9 of U150B and the high now at pin 13 of U150A are summed by R152 and R153. The output of the summing resistors is then fed to the negative input of amplifier U160.

The input signal to U160 is amplified and inverted by the operational amplifier. The output of U160 is kept from changing rapidly by C160. The slow change in the output of U160 causes it to be an apparent DC level. If U115B has been enabled by releasing the VARIABLE TIMING (OUT) control, the output voltage level of U160 is applied to the junction of DS170 and DS172.

Fast-Slow Indication (VARIABLE TIMING (OUT) Control released)

Assume that the frequency has been correct up this cycle, pins 9 and 12 of U150 are low. When the 1 MHz variable clock frequency is slower than 1 MHz, the negative edge to the phase comparator will toggle U150A first. This results in a high at pins 9 and 13 of U150 and a more positive voltage at the output of U115B. This more positive voltage causes DS172 to conduct and become illuminated.

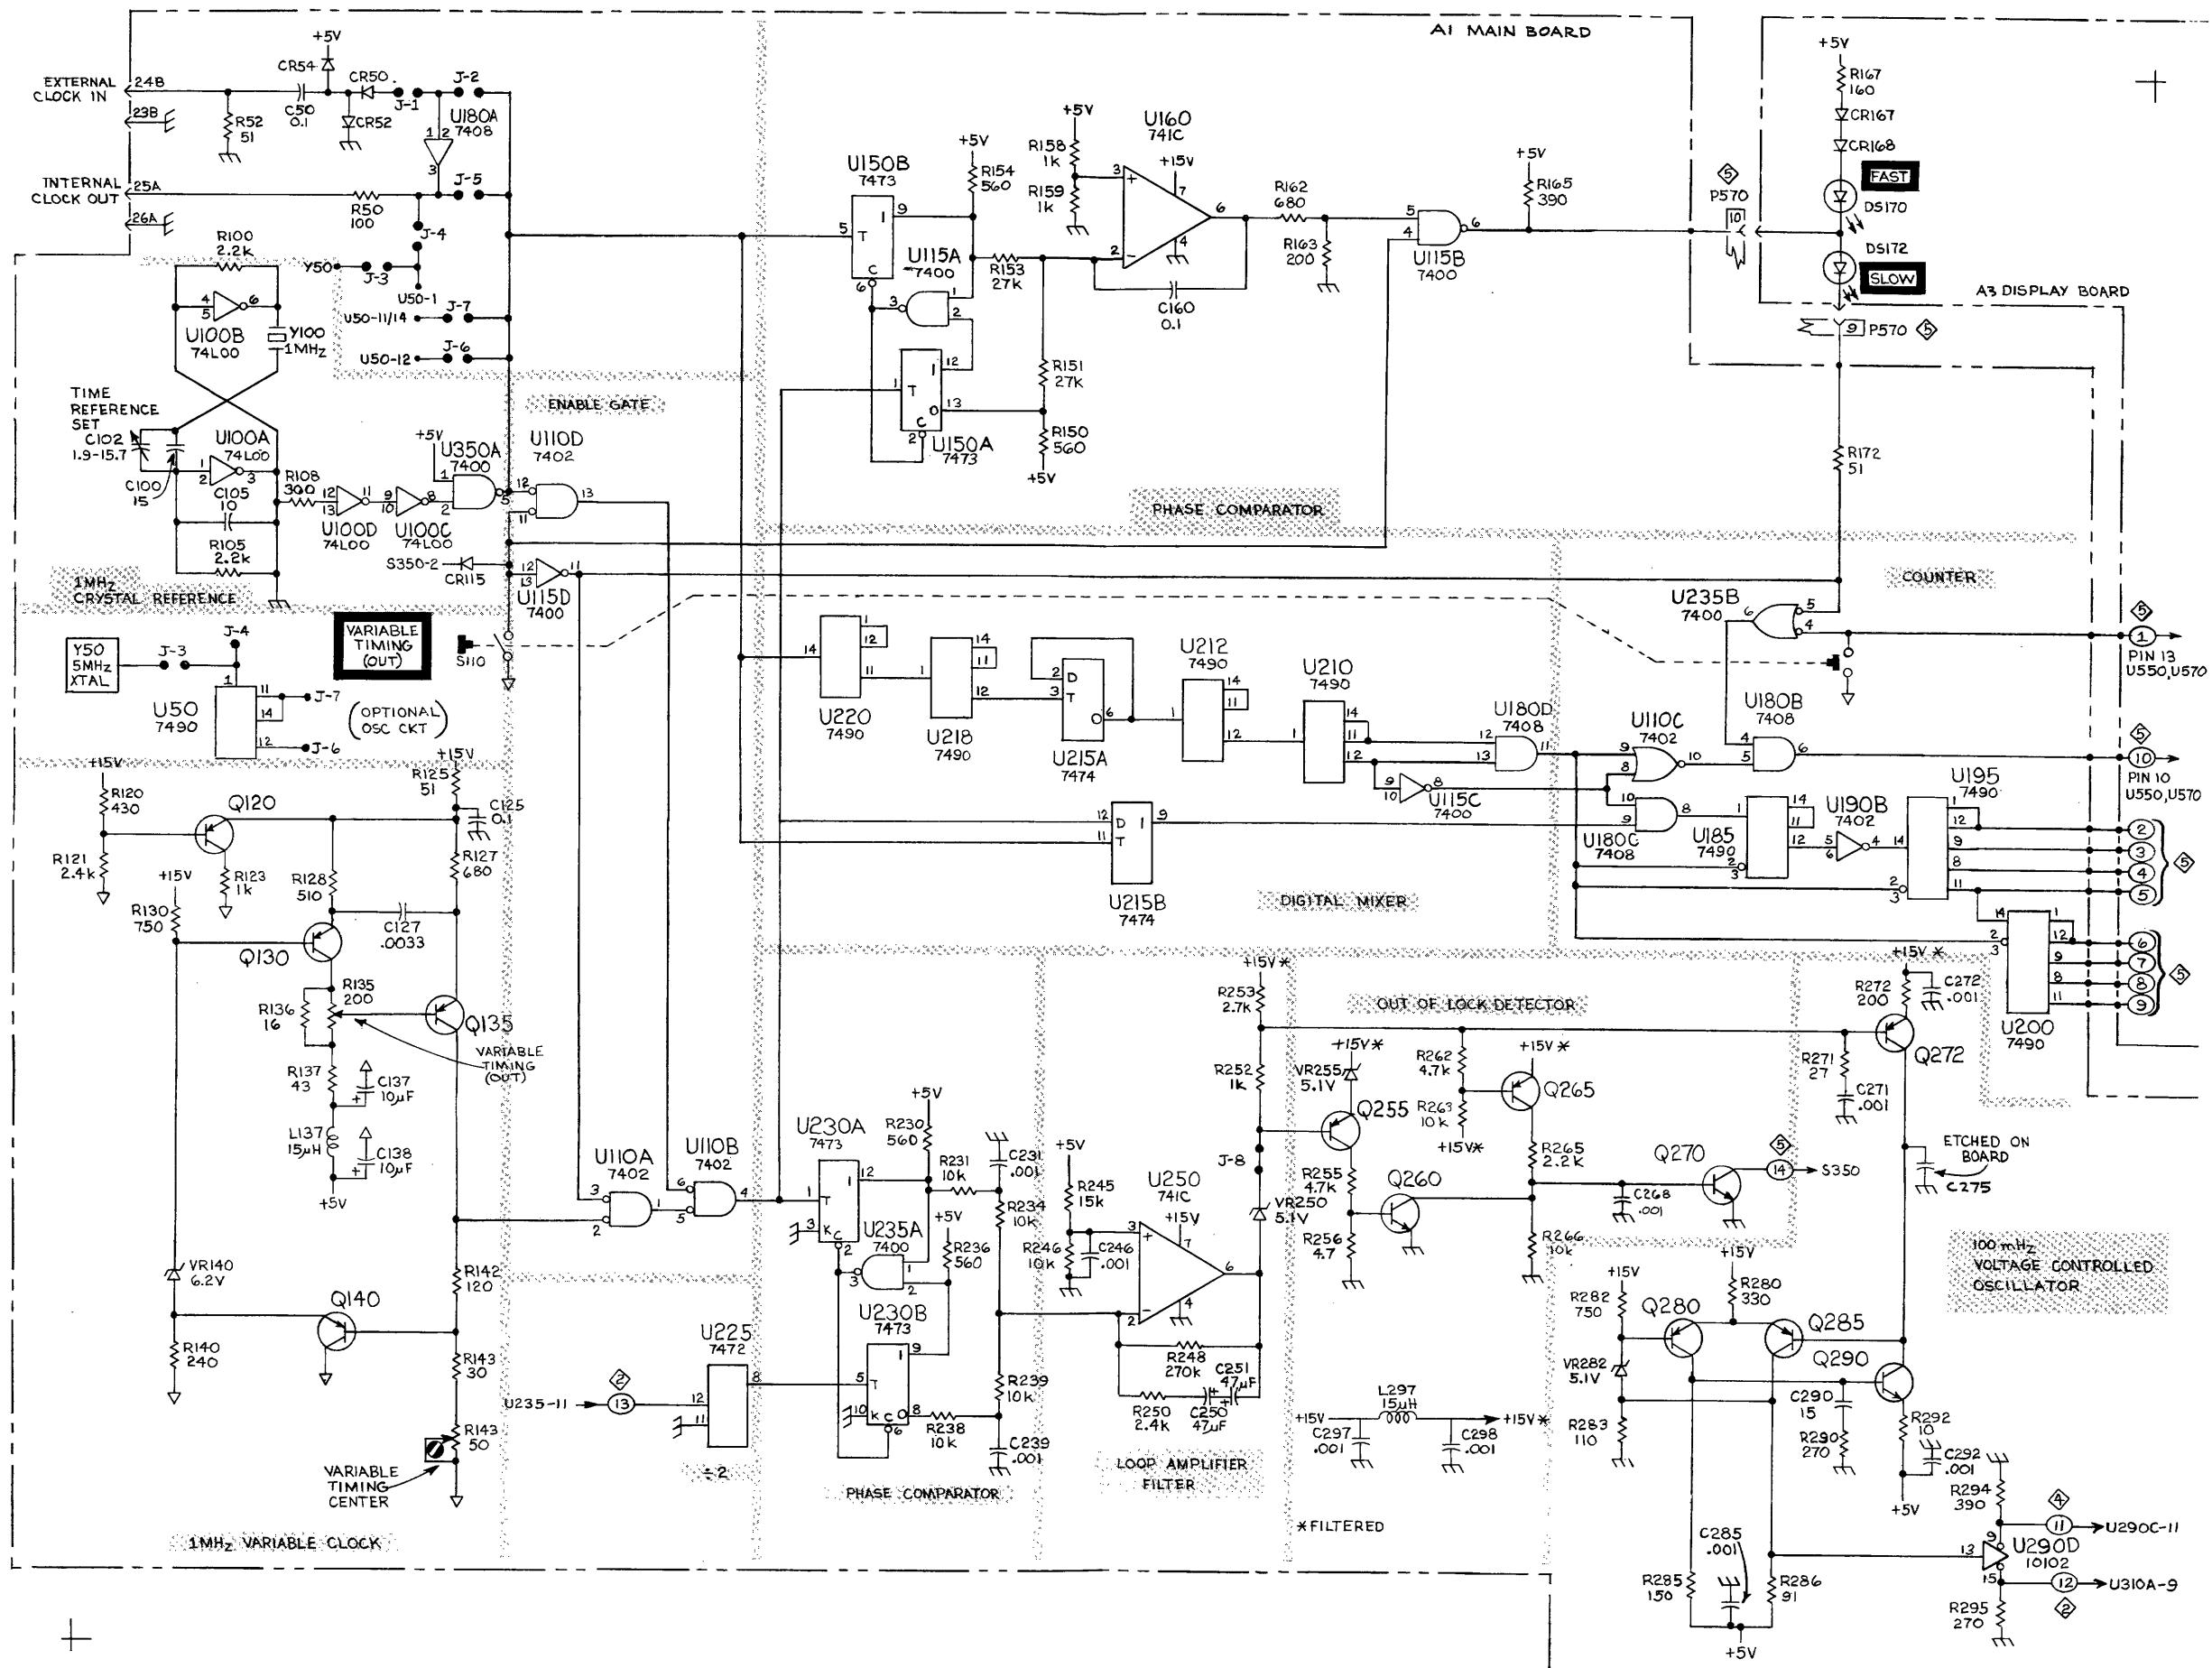

Again assume that the frequency has been correct up to this cycle, but this time the 1 MHz variable clock frequency is faster than 1 MHz. The negative edge of the next cycle will toggle U150A first, resulting in a low at pins 9 and 13 of U150. This in turn causes a more negative voltage at the output of U115B, which results in the conduction and illumination of DS170.

DIGITAL MIXER AND COUNTER

The 1 MHz Crystal reference is counted down by 2×10^4 using gate chain interval decade counters U220, U218, U212, and U210 and flip-flop U215A. The resultant 50 Hz gate frequency (20 ms gate period) available at the outputs of U210 is used to control the VARIABLE TIMING % LED display time. Pin 11 of U210 is the $\div 5$ output; pin 12 is the $\div 2$ output. The two outputs of U210 are ANDed by U180D to produce a 2 ms pulse, which is used to clear BCD counters U185 (0.01% digit, which is not displayed), U195 (0.1% digit) and U200 (units % digit).

The 1 MHz Crystal Reference and the 1 MHz variable clock output frequencies are compared by digital mixer U215B, with only the frequency difference of the two input frequencies appearing at the output. The output of U215B is ANDed in U180C with the inverted $\div 2$ output (10 ms wide gate) of U210. The output of U180C goes to the first of the three BCD counters. Inverter U190B, located between U185 and U195, provides averaging so that U195 (0.1% digit) changes on the count of five instead of nine.

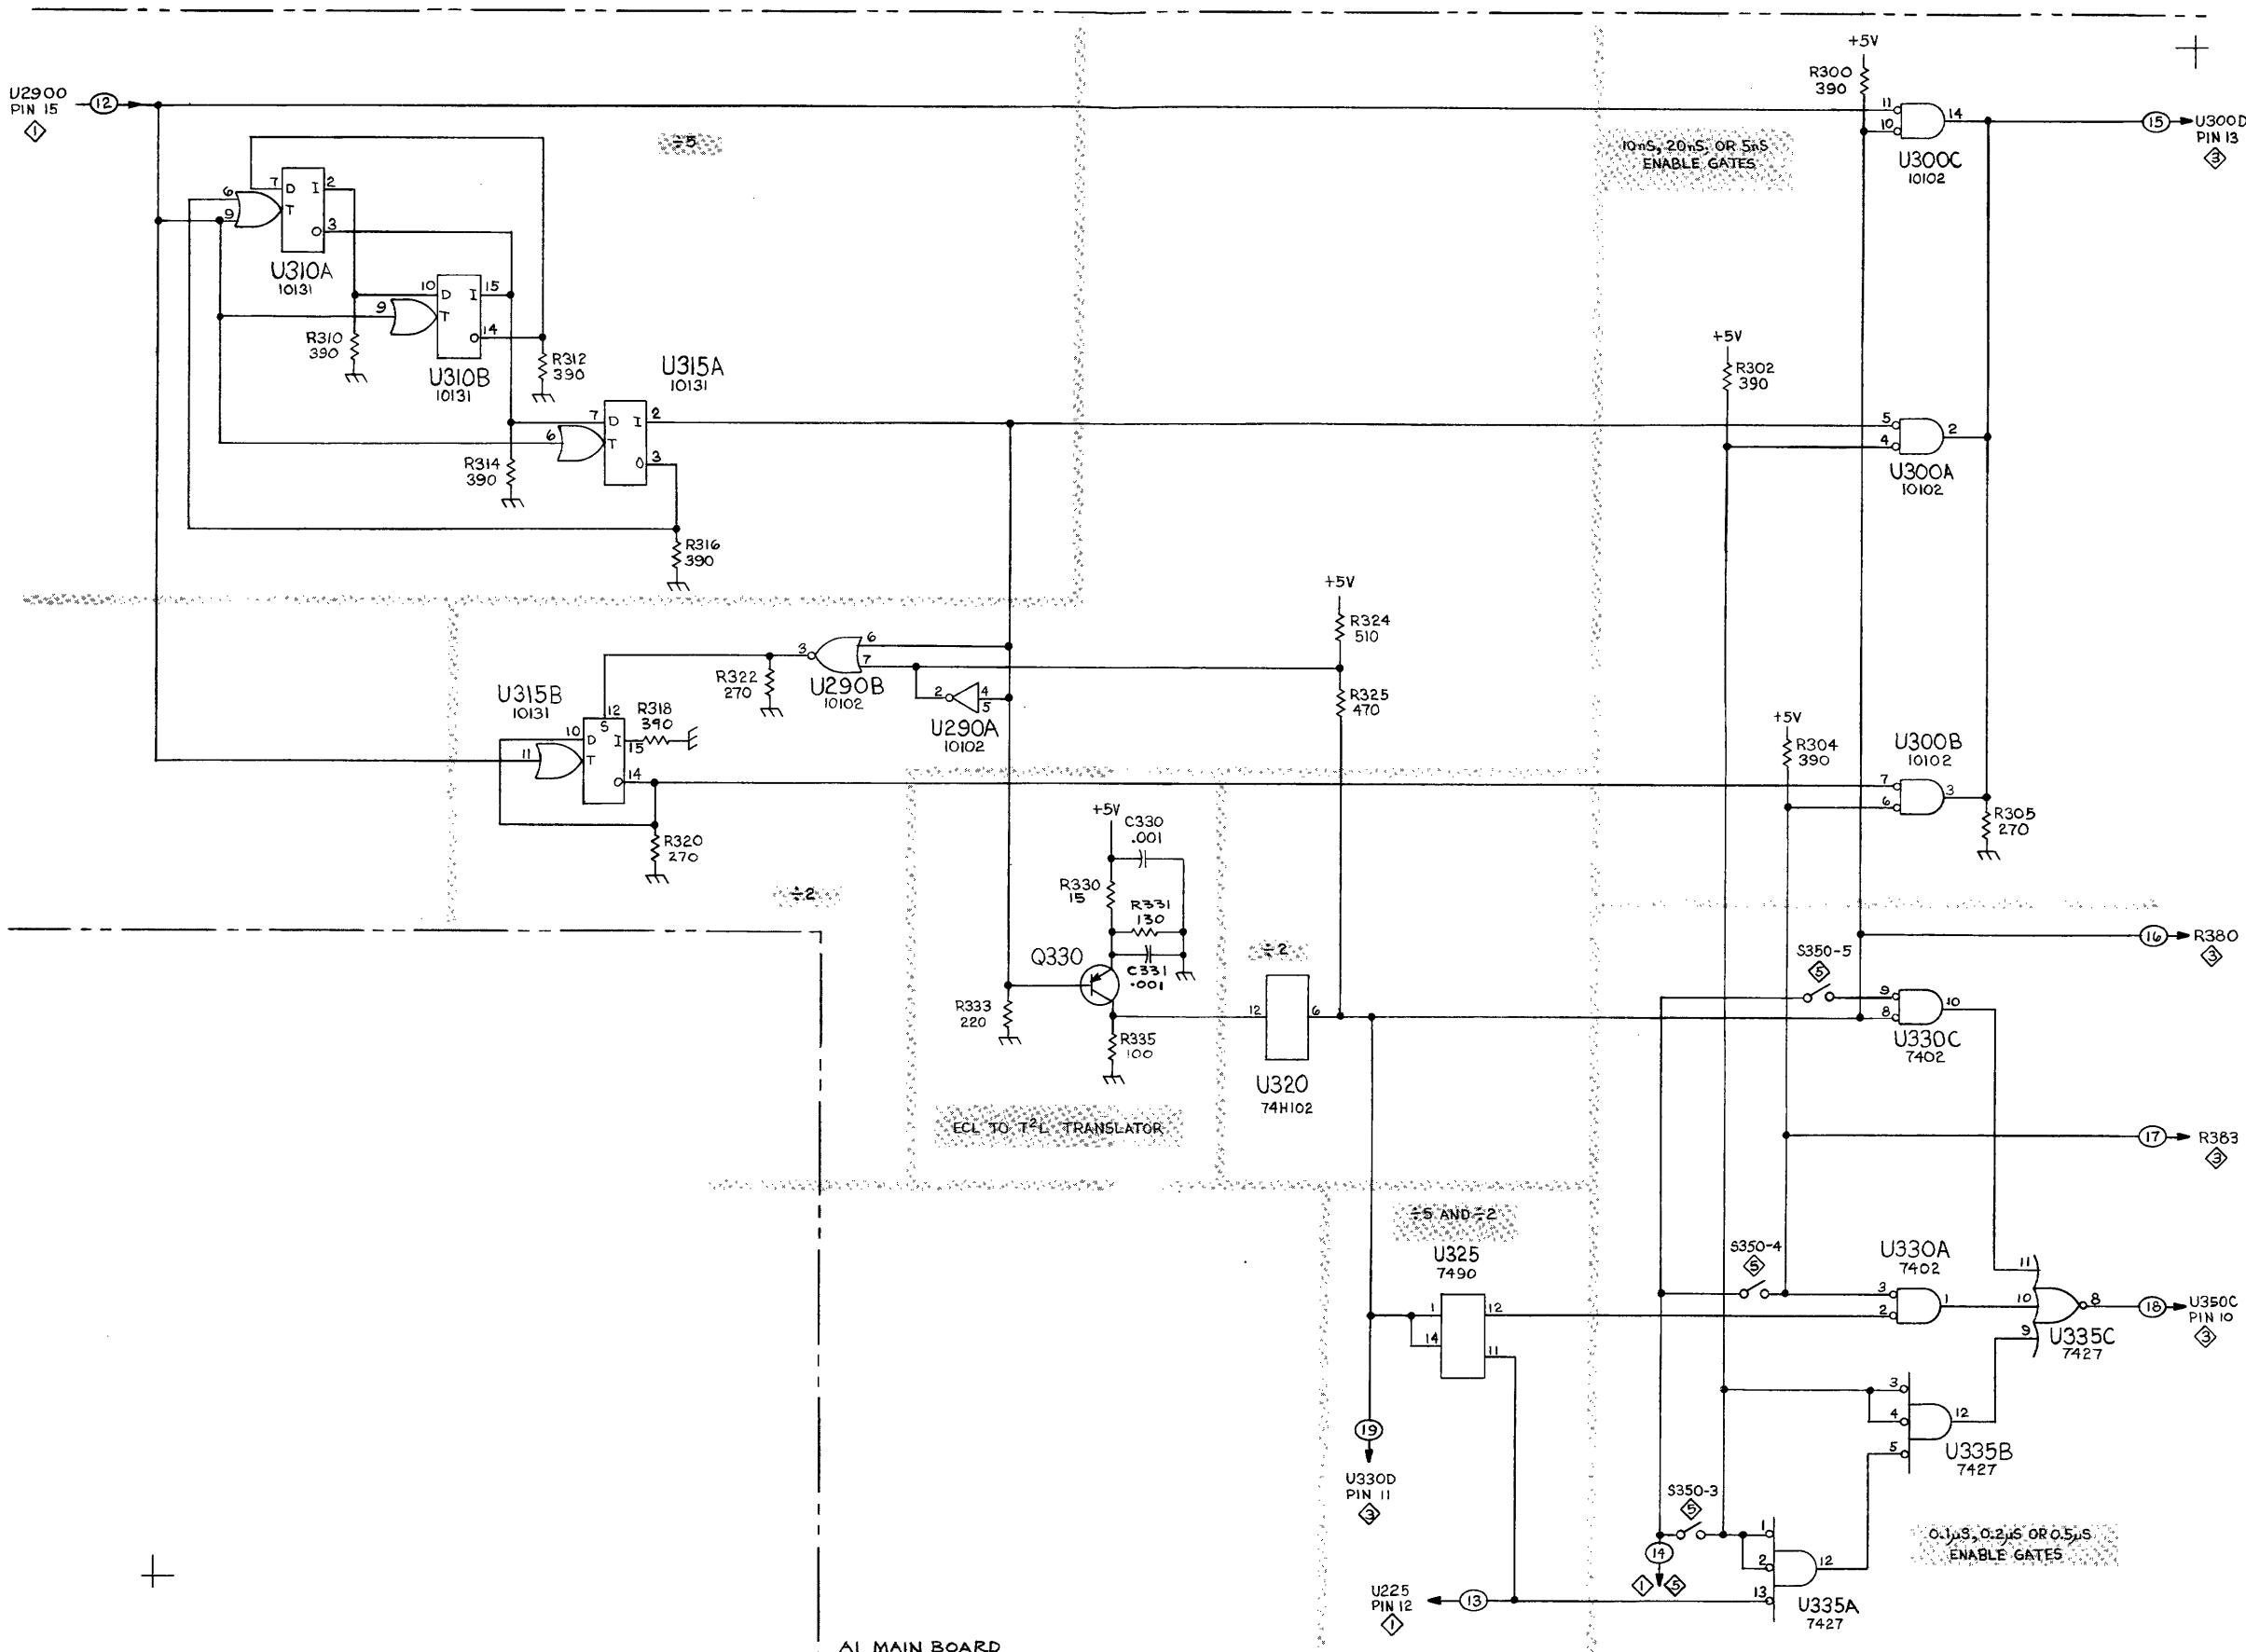

The 2 ms output pulse of U180D and the 10 ms output pulse of U115C go to NOR gate U110C. The output of U110C (which is an 8 ms pulse that determines LED display time) is one input to AND gate U180B. The other input to U180B must be a high from U235B to enable U180B and cause the LED display to be unblanked. A high out of U235B is caused by either depressing the VARIABLE TIMING % Control fully in to check the LEDs, or by releasing the VARIABLE TIMING % control to its out position. The low to pin 5 of U235B in the out position of the VARIABLE TIMING % control is from pull-up resistor R450 via CR115 and inverter U115D. In the 521N position of the MARKER Control, the cathode of CR115 is connected to ground via S350 to disable the variable timing circuit, since the 1 ns, 2 ns, or 5 ns markers are not variable.

THEORY OF OPERATION

DIAGRAM 3

DECADE DIVIDERS

The decade dividers operate continuously; however, the output is selected by enabling the appropriate enable logic gate with a low via the cam switch S350. The $\div 10$ dividers are U355, U360, U362, U364, U368, and U372. The NAND enable logic gates are U330B, U350C, U190A-C-D and U366A-B-C-D. The square-wave pulse from the logic gates is differentiated by an RC circuit using capacitors C358, C360, C362, C366, C368, C370 and C372. The resistance for the RC circuit is selected by cam switch S350 via the 5-2-1 sequence logic gates, depending upon the timing position in the 5-2-1 sequence.

The selection of the resistance for the RC circuit determines the slope of the falling edge of the marker and hence controls the marker brightness. R385, the largest resistance, is selected in all positions of the 5-2-1 sequence. In the 2 position, a low from the 5-2-1 sequence logic gate turns on Q384 and connects R384 in parallel with R385, reducing the resistance and the marker brightness. In the 1 position, Q380 turns on and R381 parallels R385 to reduce the resistance and brightness from that obtained in the 2 position.

Q405 provides a stage of isolation between the decade dividers and the low speed marker output amplifier. The isolation stage increases the impedance seen by the input to the low speed marker output operational amplifier.

LOW SPEED MARKER OUTPUT AMPLIFIER

The low speed marker output amplifier is an operational amplifier having a gain of 1.5. The amplifier consists of Q408 and Q415 with R406 and R410 being the input resistor and feedback resistor respectively.

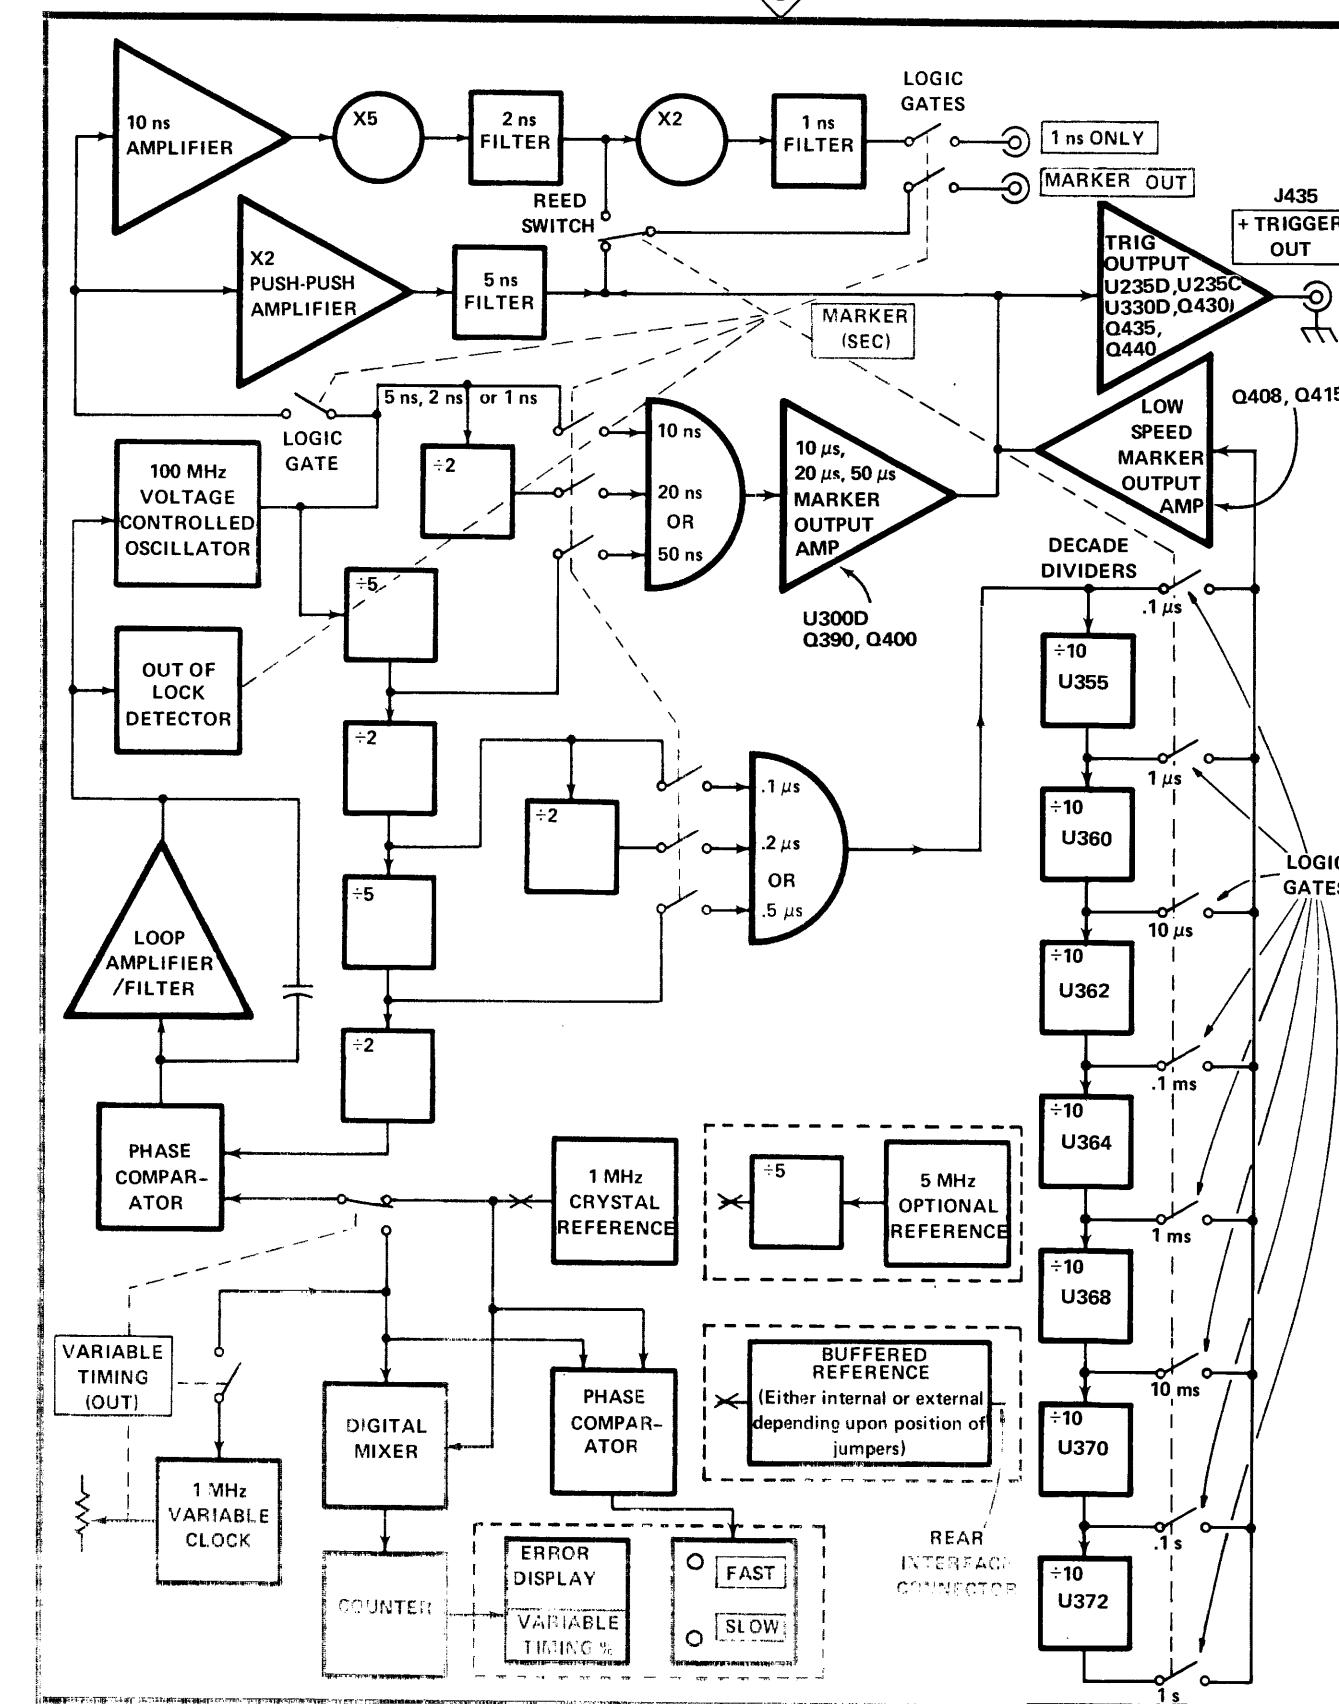

10 ns, 20 ns, 50 ns MARKER OUTPUT AMPLIFIER

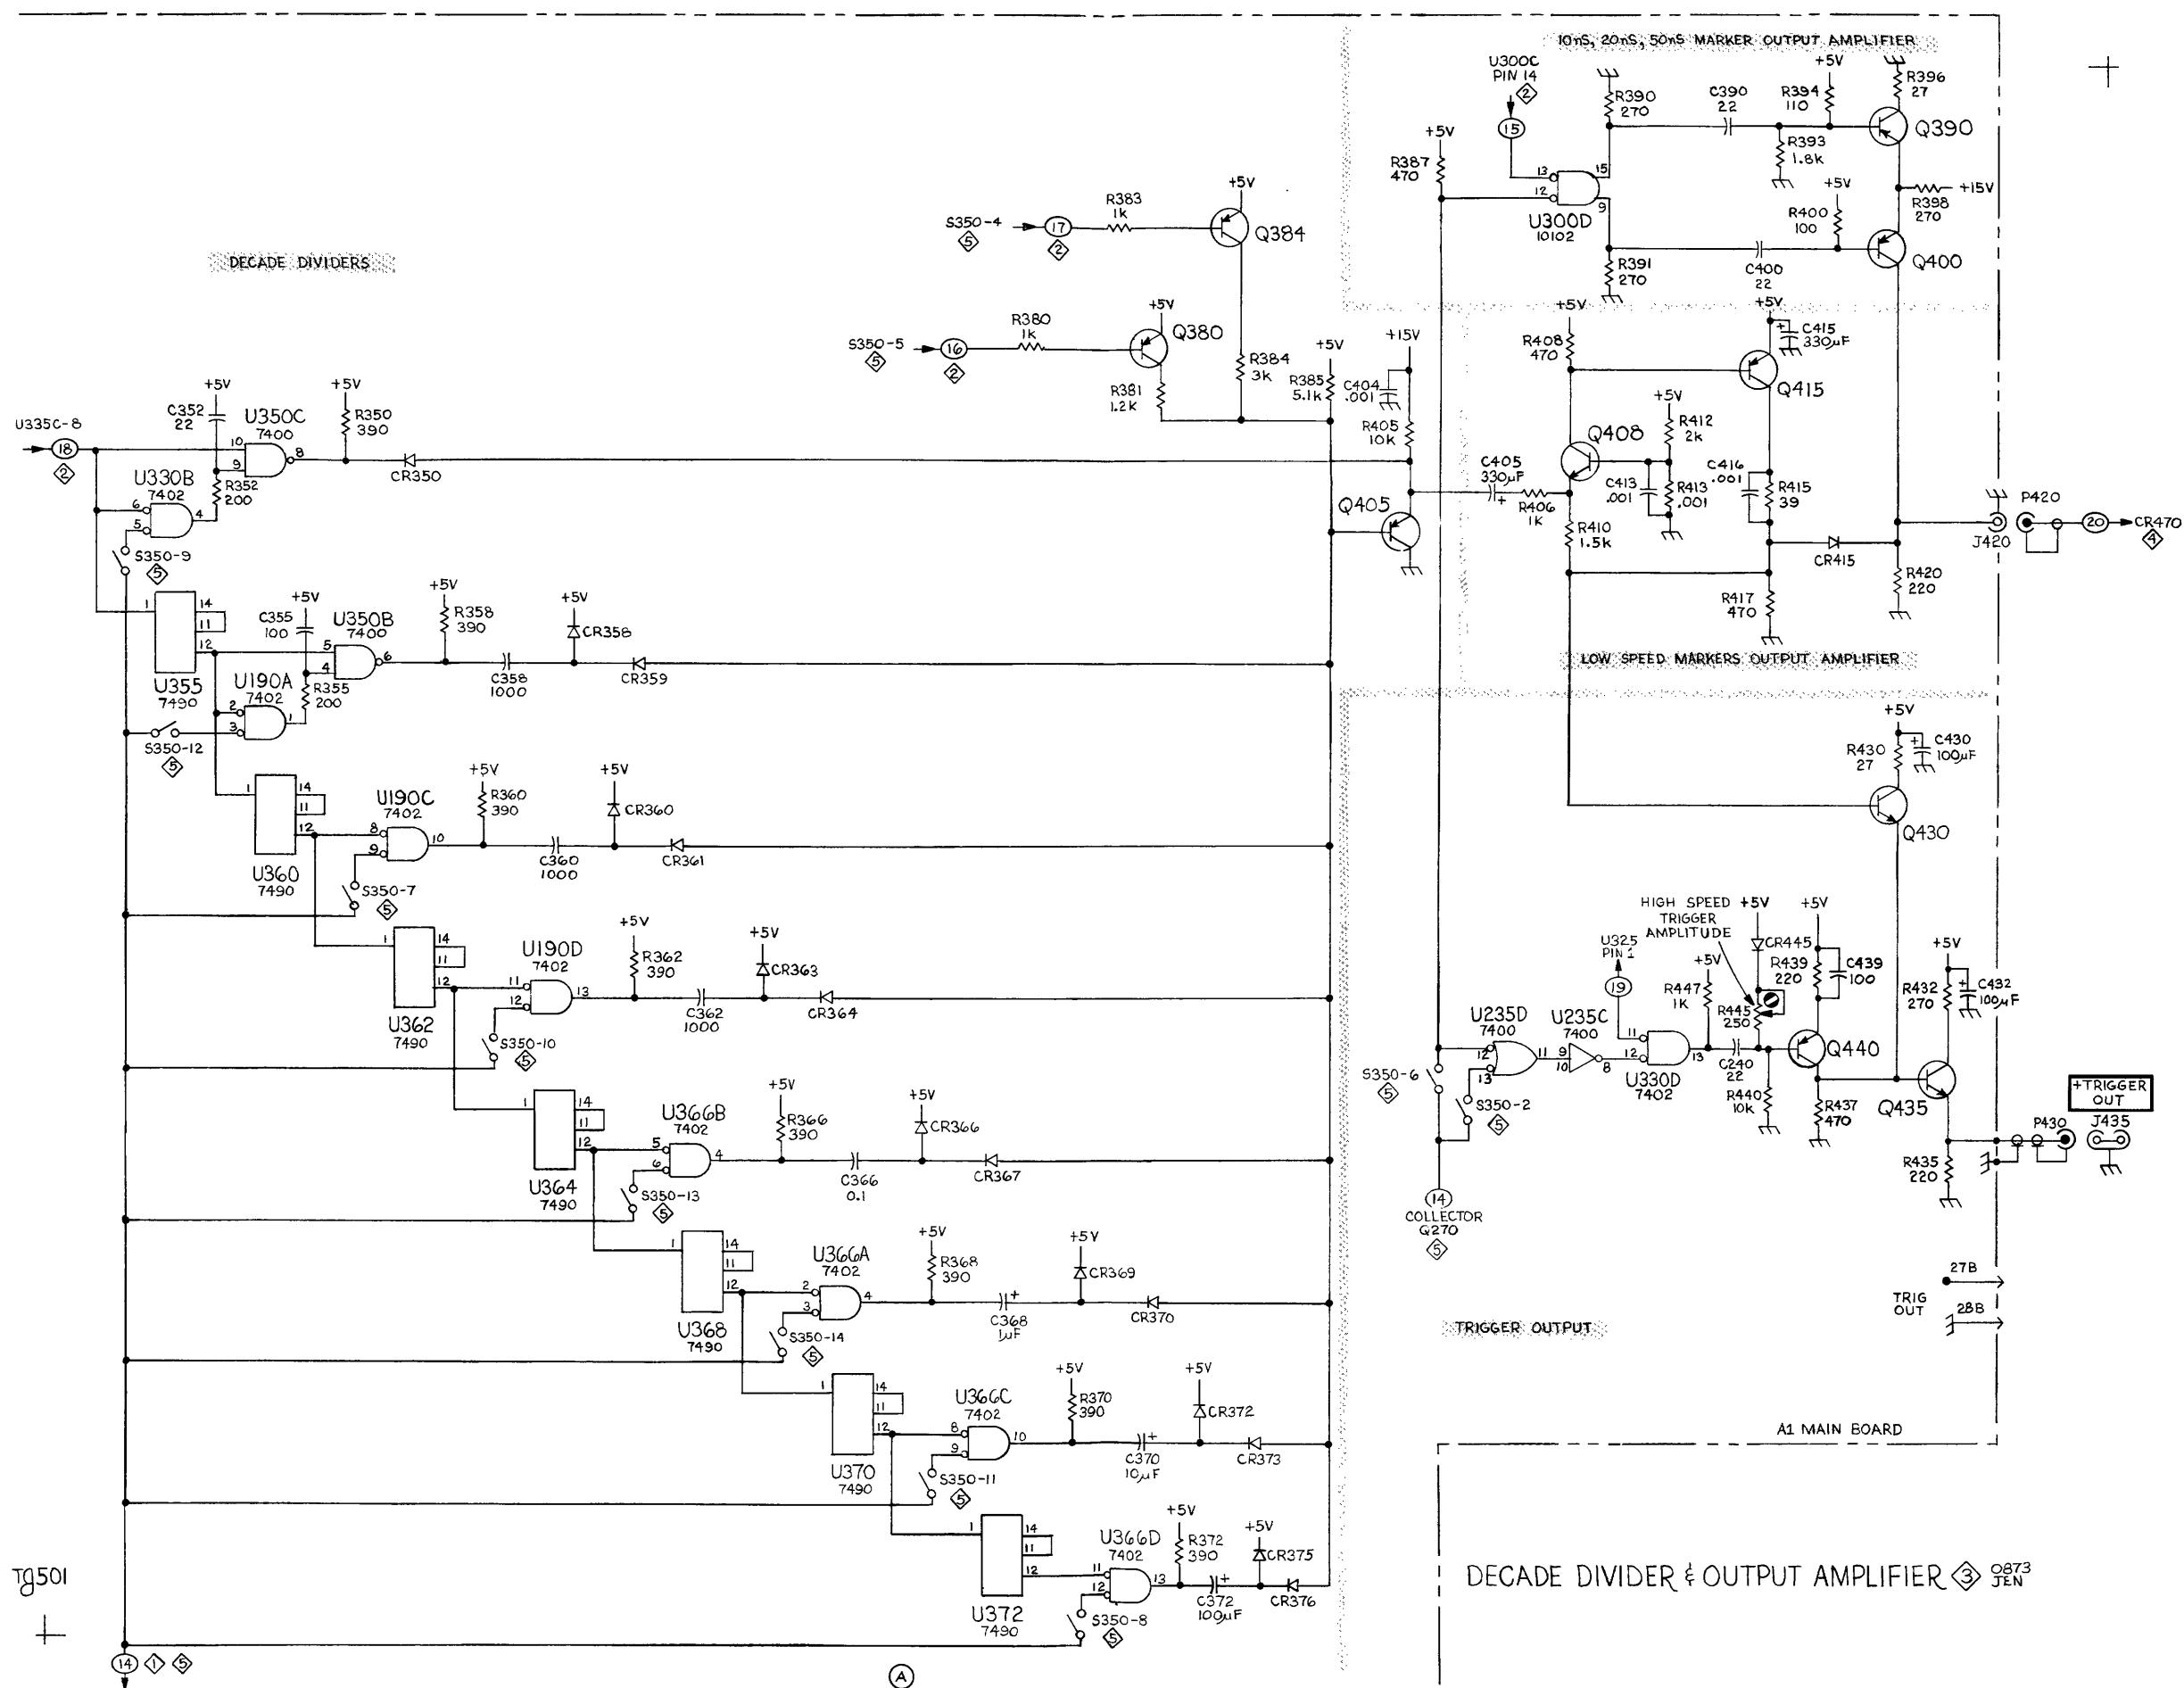

Q390 and Q400 form an emitter coupled switch which is controlled by U300D, an ECL enable logic gate. U300D requires a low from the 10 ns, 20 ns, or 50 ns logic gate to pass the square-wave. The square-wave at output pins 15 and 9 of U300D is differentiated by RC networks C390-R394 and C400-R400. The differentiated signal is coupled through Q400 as long as pin 13 of U300D remains low. The output from Q400 is summed with the output from the low speed marker output amplifier and supplied to the MARKER OUT connector J470.

TRIGGER OUTPUT

At MARKER Control settings of 5 s through $.1\ \mu s$ the marker available at the MARKER OUT connector is used as a slave trigger. The slave trigger from the low speed marker output amplifier is coupled through emitter followers Q430 and Q435 and made available at + TRIGGER OUT connector J435.

At Marker Control settings of 50 ns and faster, the trigger signal rate available at the + TRIGGER OUT connector remains $.1\ \mu s$. The $1\ \mu s$ output is obtained by enabling logic gates U235C and U330D. Enabling U330D allows the output square-wave from U320 to be differentiated by RC network R400-R445-C440, then amplified by Q440 before being coupled to the + TRIGGER OUT connector via emitter follower Q435. The RC network determines the width and amplitude of the trigger signal, while R439-C439 network in the emitter of Q440 controls the signal gain. R445 High Speed trigger amplitude provides a means of adjusting the high speed trigger amplitude to match the low speed trigger amplitude.

X2 PUSH-PUSH AMPLIFIER AND 5 ns FILTER

Placing the MARKER Control at its 521N position enables ECL logic gate U290C, which allows the 100 MHz signal to pass to J450. Pushing the 5 ns pushbutton enables ECL logic gate U450B, applying the 100 MHz (10 ms) signal to the primary of T450.

T450 is a toroidal transformer having a center-tapped primary and secondary winding. C450 tunes the resonance frequency of the T450 primary to 100 MHz. The secondary of T450 connects to a push-push amplifier U455, which effectively acts as a frequency doubler. The output of U455 connects to the 5 ns filter, which contains a parallel resonant (as seen at the output) tank circuit consisting of L462, part of the etched circuit board, and C465. C465 is used to tune the tank circuit to 5 ns (200 MHz). C467 acts as an amplitude adjustment for the 5 ns markers. From the output of the 5 ns filter, the 5 ns markers connect to the MARKER OUT connector, J470.

10 ns AMPLIFIER, X5 2 ns FILTER, X2 and 1 ns FILTER

Placing the Marker control at its 521N position enables ECL logic gate U290C, which allows the 100 MHz signal to pass to J450. Pushing the 2 ns or 1 ns pushbutton enables ECL logic gate U450C, applying the 100 MHz (10 ns) signal to the base of Q484.

Q484 and Q486 compose a Class C amplifier. R482, CR482, and U450C make up a temperature compensation network for the amplifier. R482, Amp Bias, is used to peak the amplifier gain.

amplifier, Q486, while the other half of the transformer secondary is used for neutralization to compensate for amplifier instability. R486 and CR486 make up a temperature compensation network for amplifier Q486.

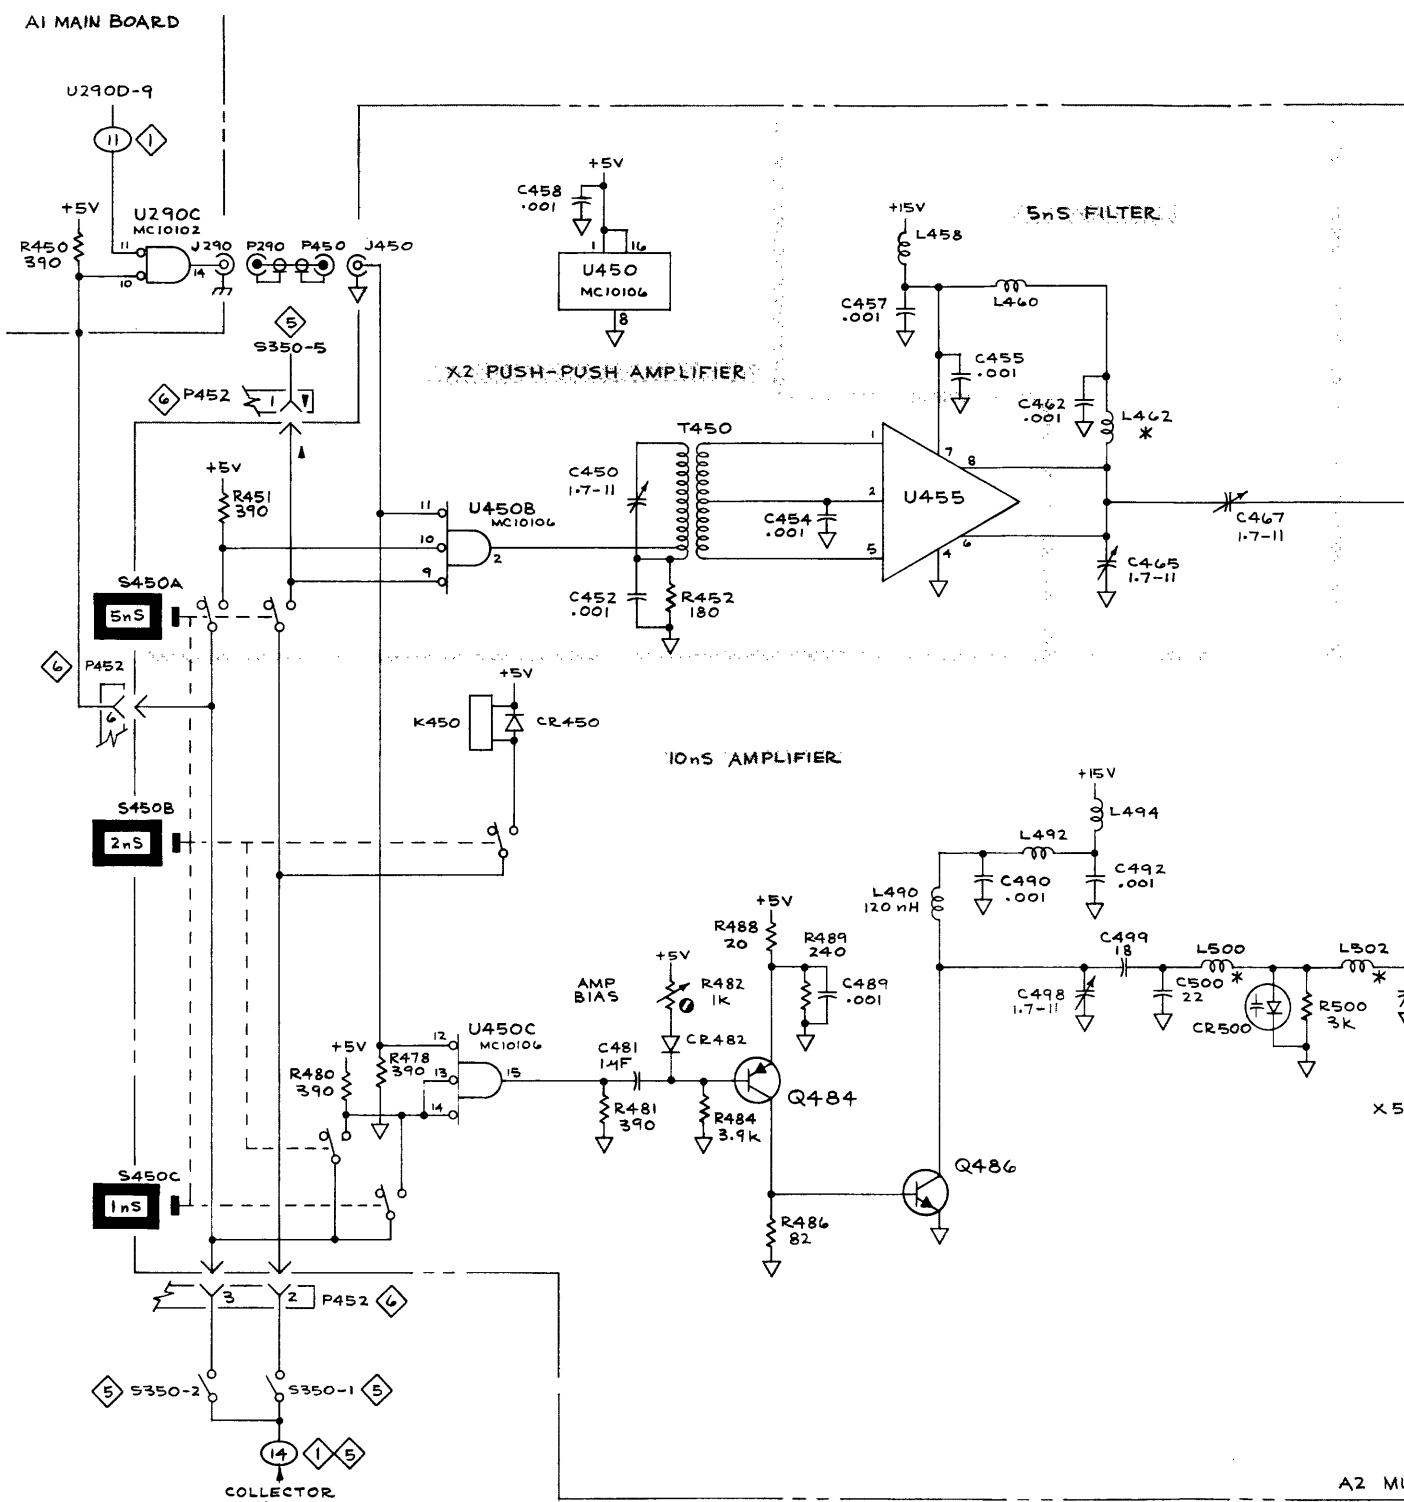

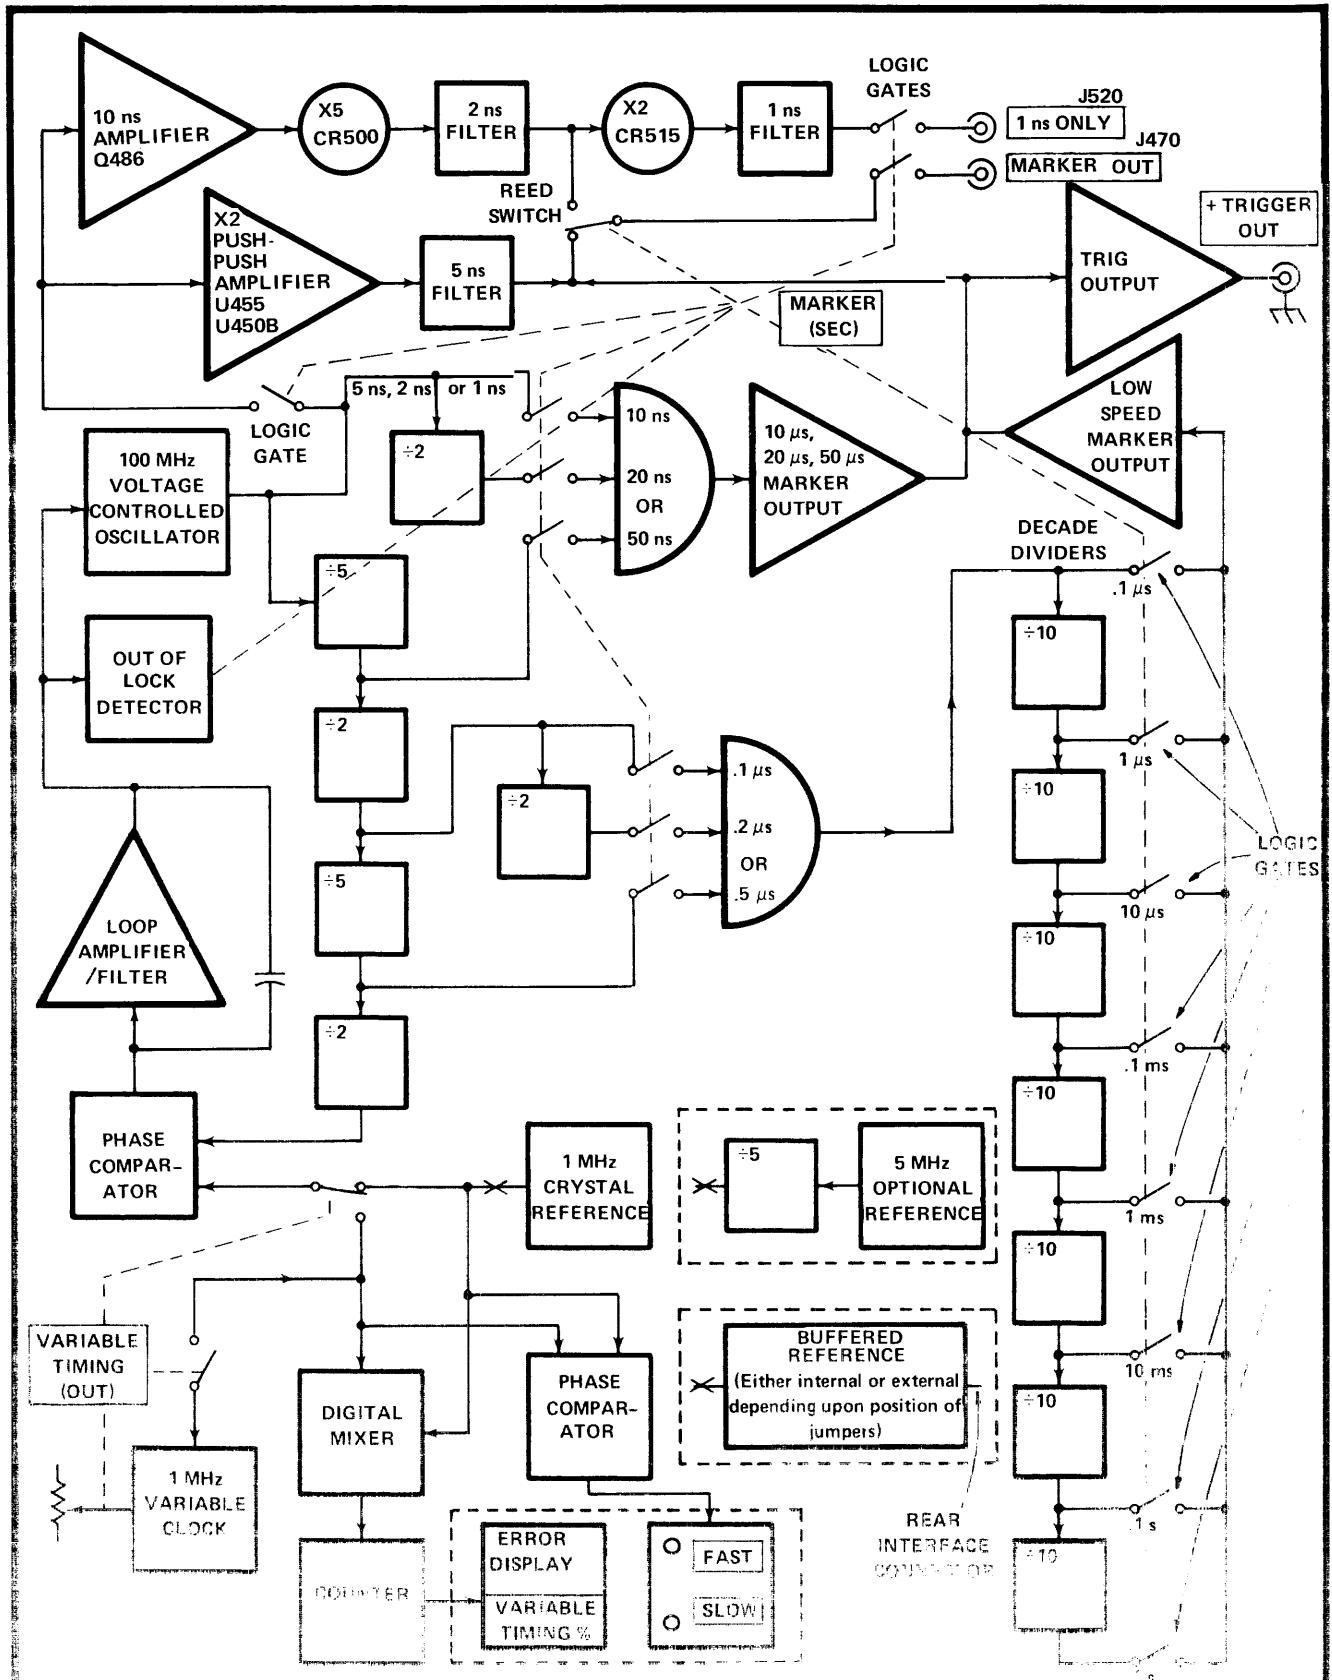

The output of the amplifier connects to a parallel resonant tank circuit consisting of L490 and C498. C498 is used to tune the tank circuit to 10 ns (100 MHz). L500, part of the etched circuit board, and C500 make up a matching network for the input to varactor CR500.

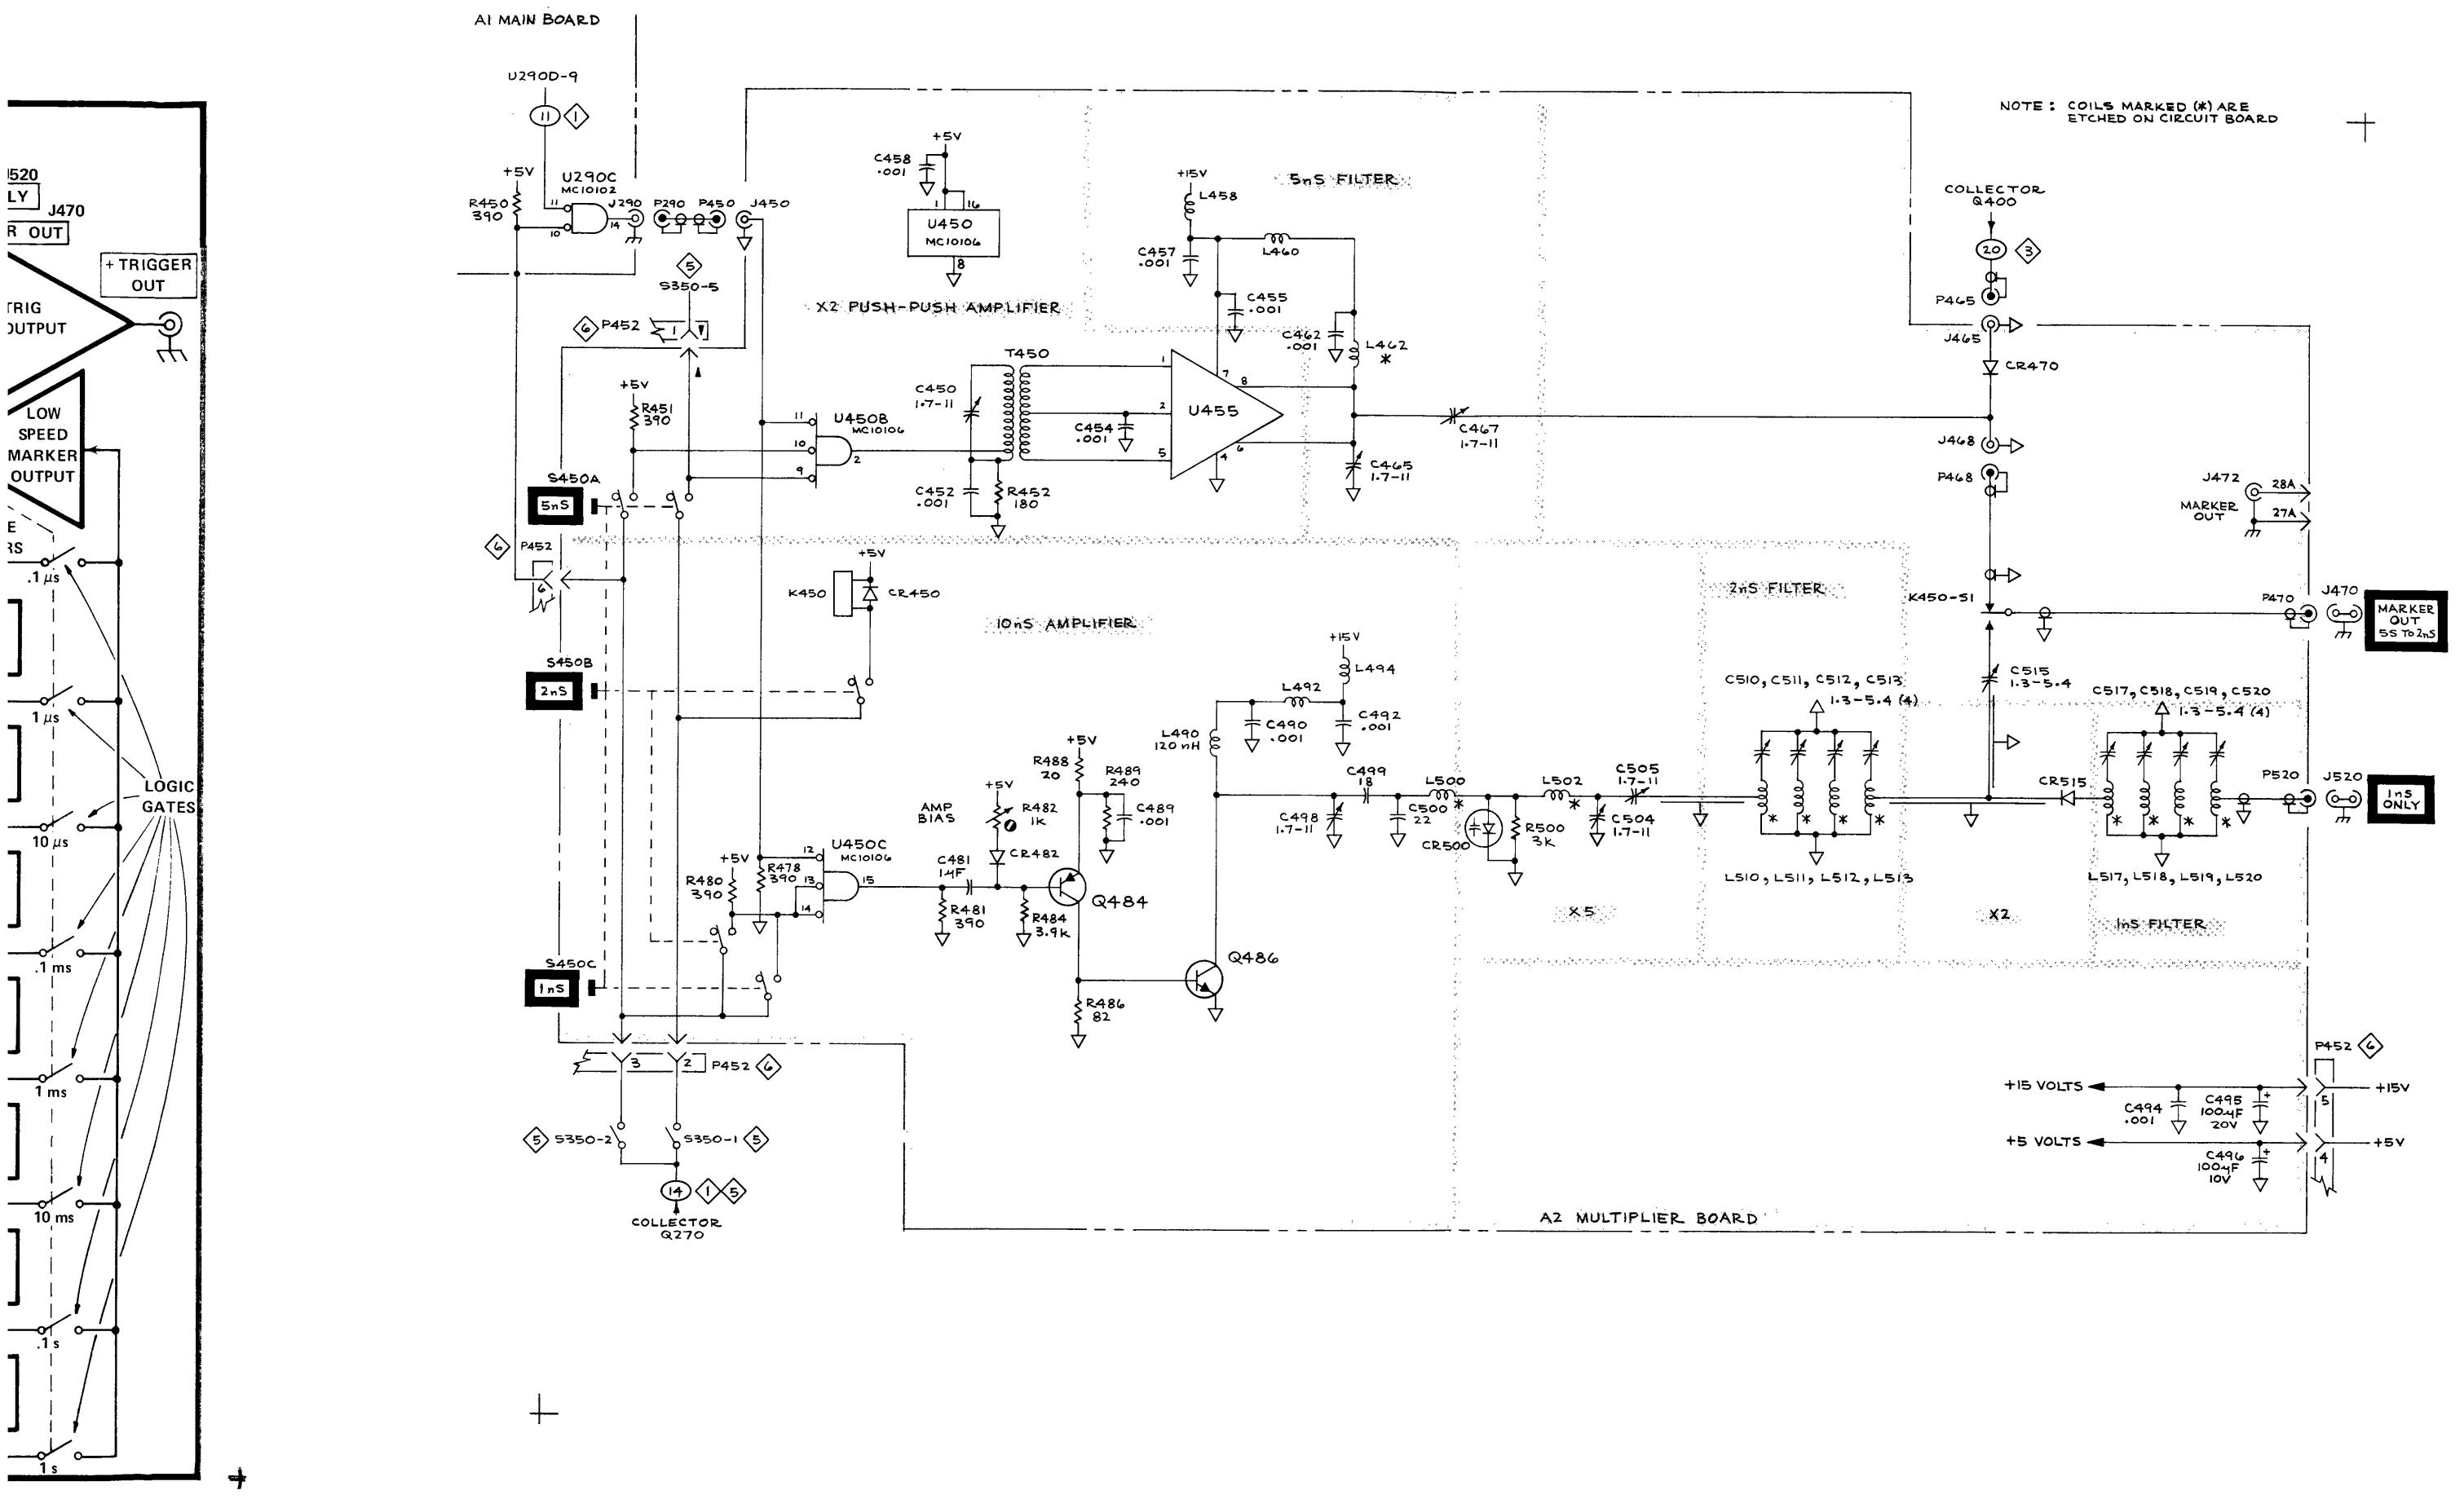

CR500 is a snap type varactor, i.e. a varactor that snaps off. The varactor is triggered at a 100 MHz rate. The sudden current change that occurs when CR500 snaps off at its 100 MHz rate causes L502, part of the etched circuit board, and C504 to ring at a 2 ns (500 MHz) rate. C504 tunes the ring circuit to resonate at a 2 ns rate.

The 2 ns filter is a tuned stub comb filter with each stub tuned successively to resonance. The input to the filter is a damped sine-wave, which is then electromagnetically coupled between the sections of the filter.

The 2 ns output sine-wave is hard-wired to CR515 and connected to J470 the MARKER OUT connector only if K450 has been enabled by depressing the 2 ns pushbutton.

The 2 ns sine-wave input to CR515 is distorted by the non-linear device (diode) to achieve a 1 ns sinewave. The 1 ns sinewave is then filtered by the 1 ns filter which is similar in operation to the 2 ns filter discussed previously. The output from the filter is available through the 1 ns ONLY connector. The 1 ns markers are available from the 1 ns ONLY connector whenever the MARKER Control is set to 521N and either the 2 ns or 1 ns pushbutton has been depressed.

THEORY OF OPERATION

DIAGRAM 6

POWER SUPPLY

+15-Volt Supply

The regulator for the +15 volt supply consists of short circuit protection and error sensing amplifier transistor Q605, error amplifier transistor Q600, Reference Zener diode VR605, and a Darlington transistor pair (Q610 and a series-pass transistor located in the power module mainframe). The supply voltage is established by comparing the supply voltage sample (which is established by the R616-R605 divider at the base of Q605) with the reference voltage established by VR605 at the emitter of Q605. Any difference between the Q605 base and emitter is amplified by Q605 and Q600, and used to change the conduction of the series-pass transistor to correct the output voltage. VR605 is temperature compensated by the base-emitter junction of Q605. R614 provides current limiting for the series pass transistor. R603 and Zener diode VR600 establish the operating voltage range for Q600.

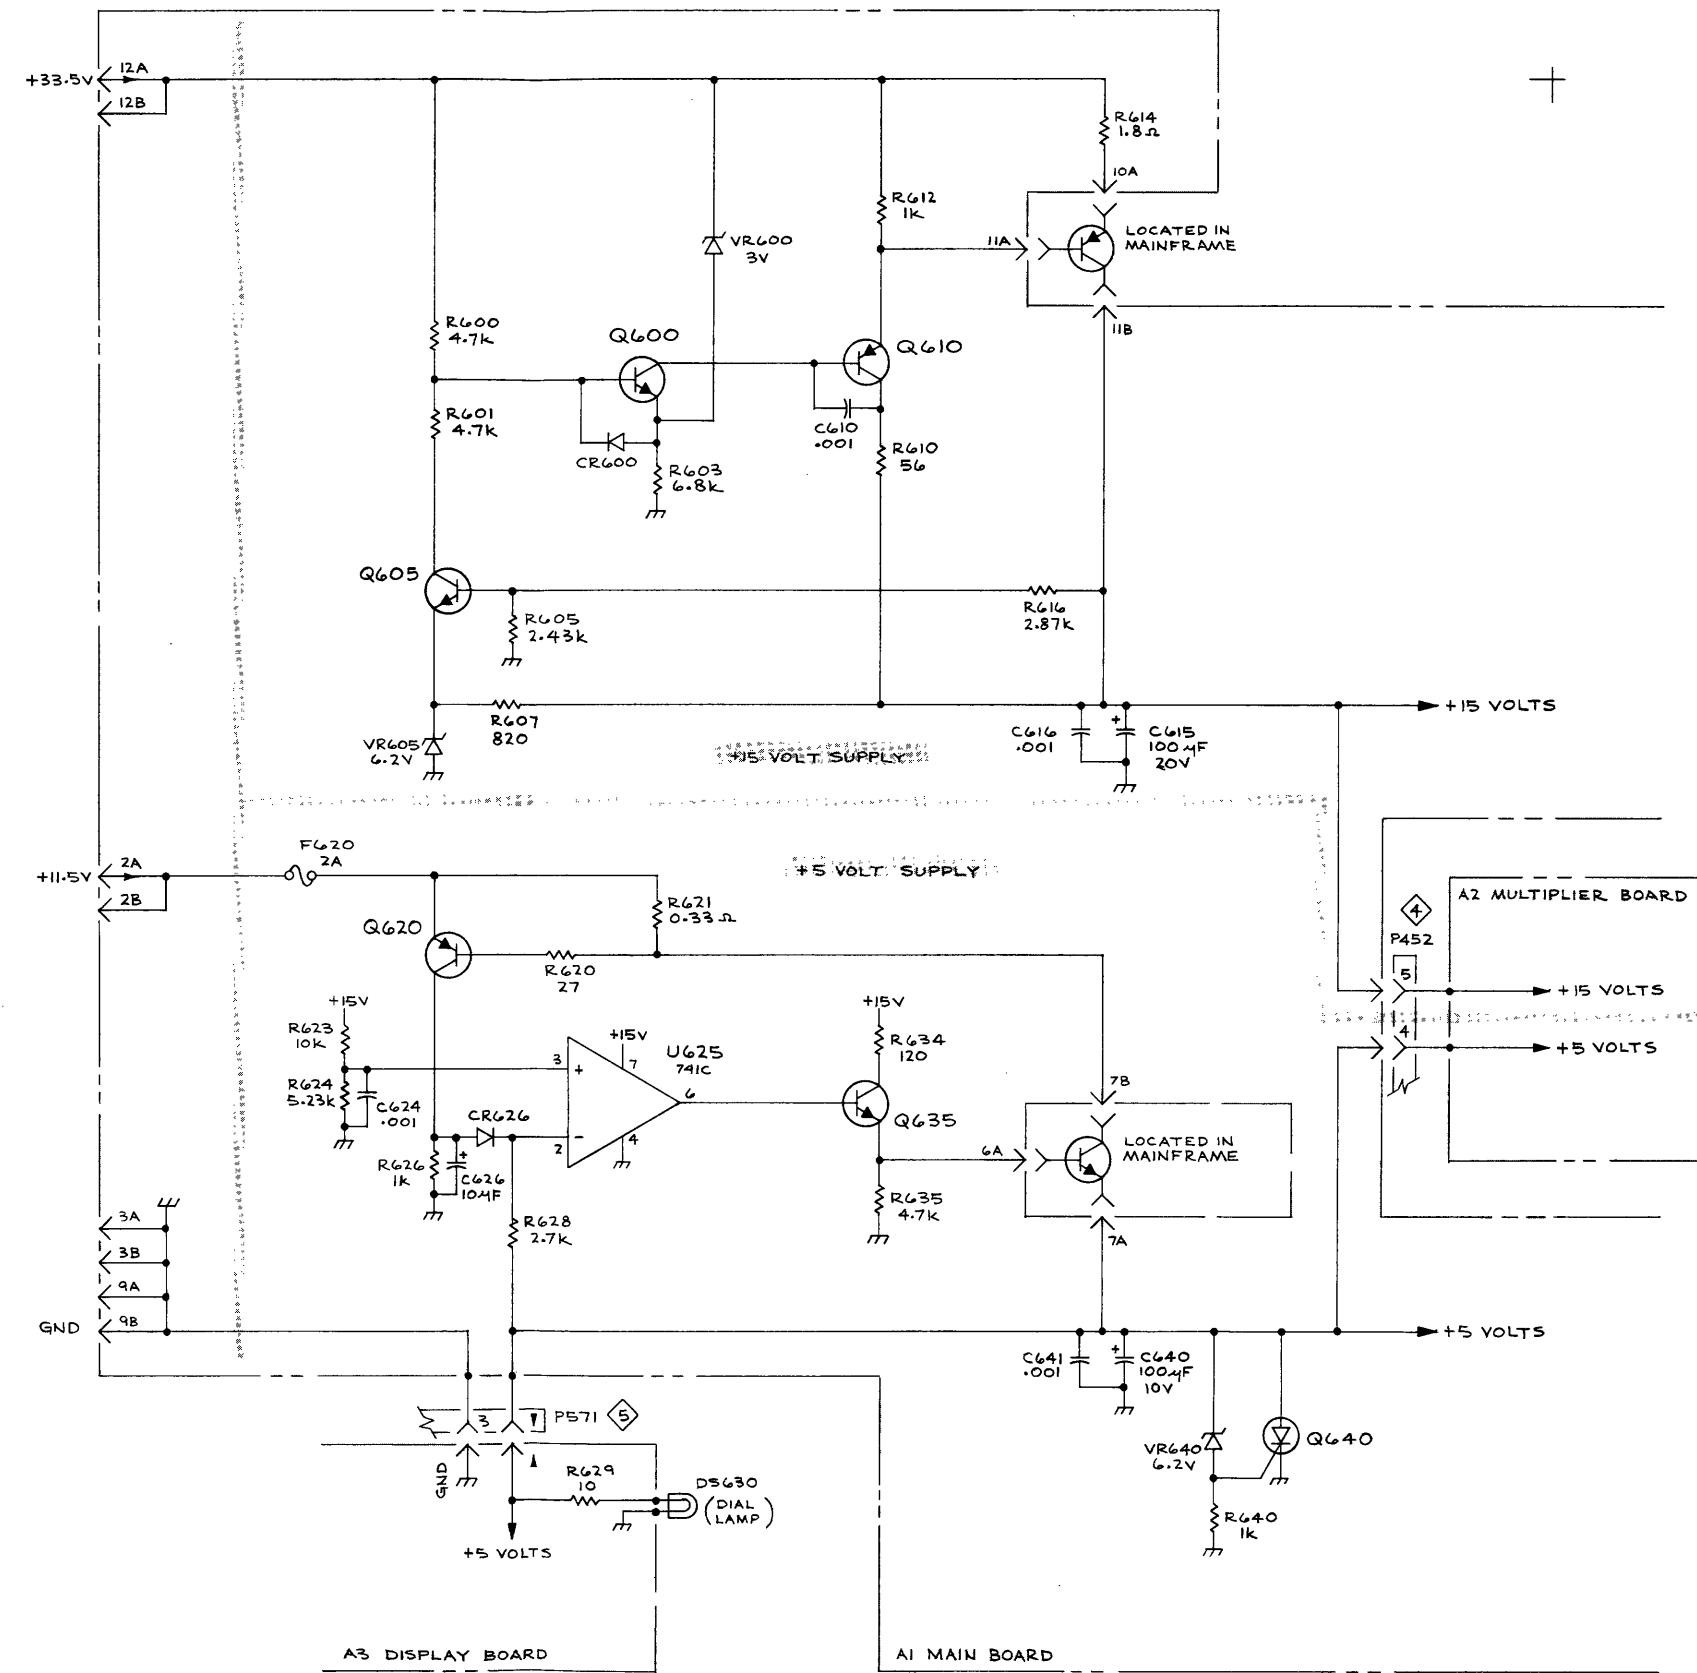

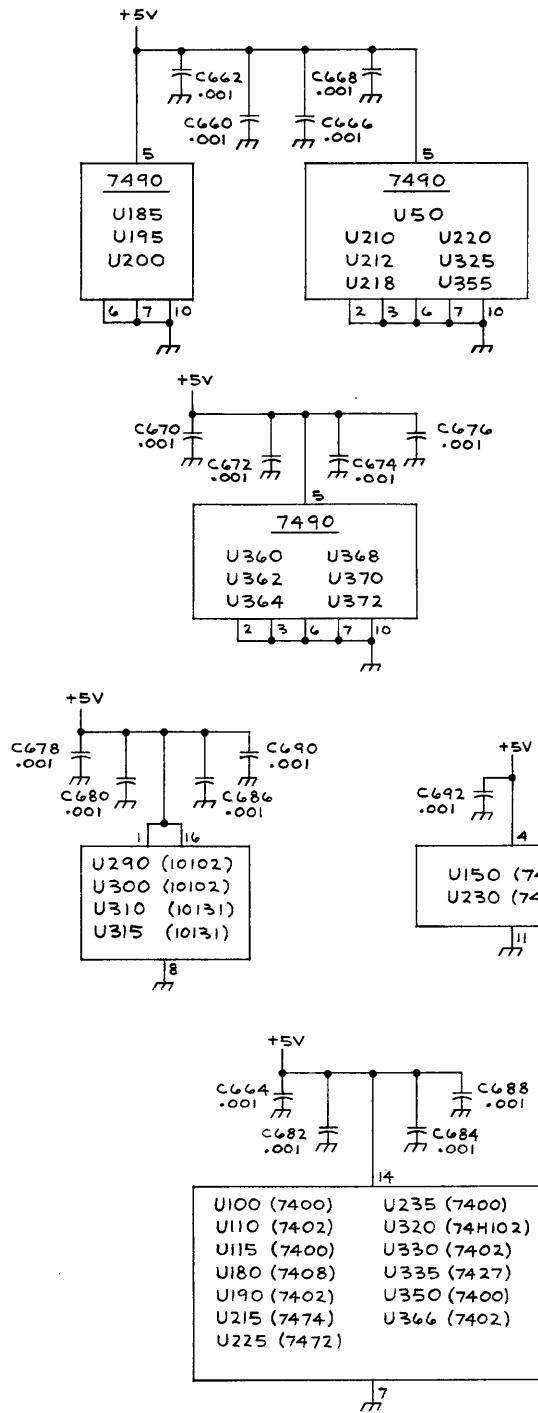

If the +15 V output is shorted (i.e., output goes low), Q605 starts to turn off which pulls the base of Q600 high through R600. Consequently, transistor Q600 saturates against the voltage established by 3 V Zener VR600 and R603. Thus, the voltage at the collector of Q600 is nearly 3 V below the unregulated line. The 3 V is reduced by the voltage drops at the base-emitter of Q610 and the base-emitter of the series-pass transistor in the power module mainframe to a maximum of approximately 1.6 V across R614. The 1.6 V across R614 establishes the maximum current that can be drawn from the +15 V supply.

+5-Volt Supply

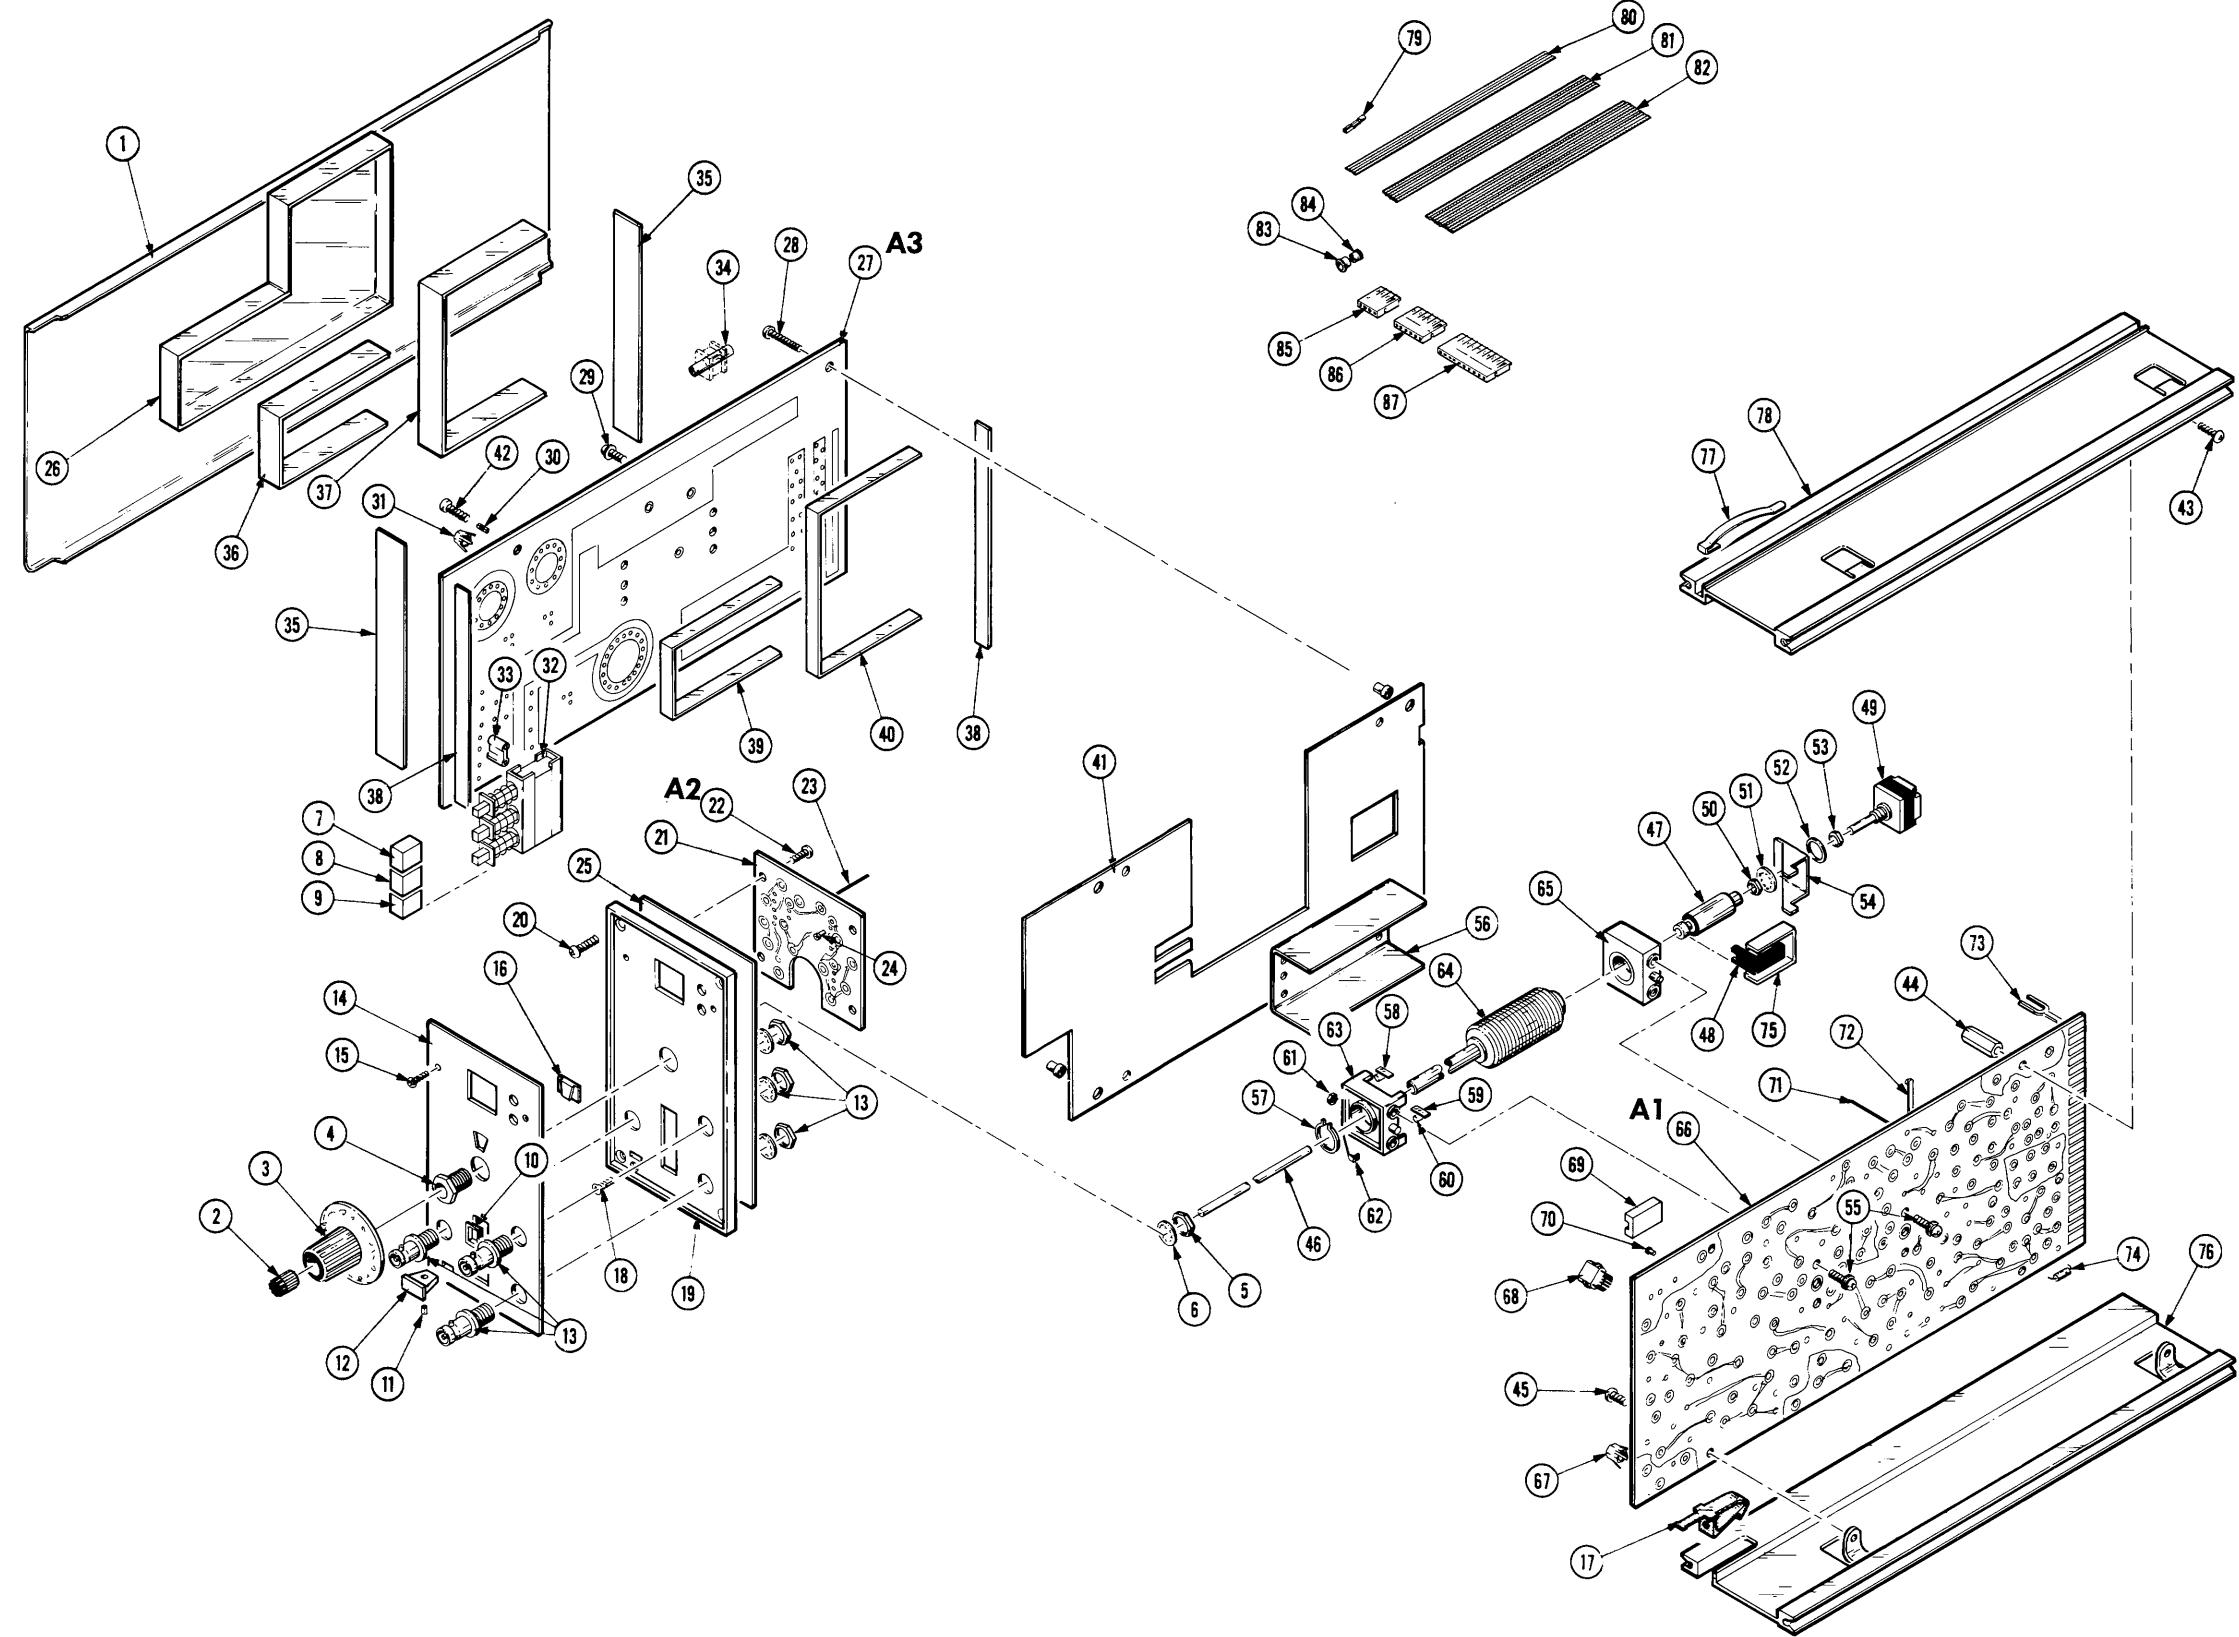

The regulator for the +5 volt supply consists of error sensing amplifier integrated circuit U625, short circuit protection transistor Q620, over-voltage protection circuit VR640-Q640 and a Darlington transistor pair (Q635 and a series-pass transistor in the power module mainframe). The supply voltage is established by comparing the supply voltage sample at the negative input to U625 with the reference at the positive input to U625. Any difference between the inputs to U625 causes an amplified correction voltage to be sent to the base of Q635, which in turn will cause a change in the conduction of the series pass transistor to correct the output voltage. R621 provides current limiting for the series pass transistor.

If the +5 V output is shorted (i.e., output goes low), the increased voltage drop across R621 causes Q620 to turn on. This pulls the negative input of U625 positive, which turns off Q635 and the series pass transistor. Fuse F620 protects Q620 if the short causes excessive current to be drawn from the supply.

In case the regulator causes the voltage to become more positive (i.e., +7 V or more), silicon controlled rectifier (SCR) will fire and short the +5 V output to ground.

OPTION 1

The TG 501 Option 1 is equipped with a temperature-compensated, 5 MHz crystal oscillator for a highly stable and precise internal clock. U50 provides countdown circuitry for the 5 MHz crystal.

The main circuit board jumpers that must be installed for Option 1 are: J3 and J7 (see Fig. 1-2 for jumper location).

MANUAL CHANGE INFORMATION

At Tektronix, we continually strive to keep up with latest electronic developments by adding circuit and component improvements to our instruments as soon as they are developed and tested.

Sometimes, due to printing and shipping requirements, we can't get these changes immediately into printed manuals. Hence, your manual may contain new change information on following pages.

A single change may affect several sections. Sections of the manual are often printed at different times, so some of the information on the change pages may already be in your manual. Since the change information sheets are carried in the manual until ALL changes are permanently entered, some duplication may occur. If no such change pages appear in this section, your manual is correct as printed.
