January 1974

INTRODUCTION

The D61 is a 10 MHz all solid-state dual trace oscilloscope. An 8 x 10 cm CRT provides a bright and clear display. The vertical amplifier has a dual trace facility and displays either channel separately or alternates or chops between Channels. Channel 2 can be switched to become the horizontal amplifier to provide an X-Y display. The solid-state design using FET input circuitry provides minimum drift and fast stabilization time.

The design of this instrument is subject to continuous development and improvement, consequently this instrument may incorporate minor changes in detail from the information contained herein. This would, in the main, affect the Component List and Circuit Diagrams. The reader should pay particular attention to the notes at the beginning of Chapter 5.

NOTICE TO OWNER

In the event of this instrument being returned to TELEQUIPMENT for servicing: the owner is requested NOT to send the following items unless they are suspect, in order to prevent damage during transit and facilitate packaging:

Manual

Probes

Plug Assemblies

CHAPTER 1

SPECIFICATION

1.1 VERTICAL SYSTEM

Operating Modes	Channel 1 Channel 2 Channels 1 & 2 Alternate (at time/div speeds between 1 ms and 0.5μs) Chop (100 kHz approx. at time/div between 500 ms and 2 ms and on EXT X) X-Y
3 dB bandwidth	D.C. – 10 MHz
D.C. coupled	2 Hz – 10 MHz
A.C. coupled	35 ns
Risetime	5 div at 10 MHz
Max. amplitude	
X-Y	Via CH1 with CH2 input selected via TIME/DIV switch as horizontal amplifier
Bandwidth (3 dB)	D.C. – 1 MHz
Deflection factors Calibrated (9 ranges 1, 2 & 5 sequence)	10 mV/div – 5 V/div ± 5%
Input impedance	1 MΩ and 35 pF in parallel
Maximum input	400 V peak

1.2 HORIZONTAL SYSTEM

Sweep generator rates (19 ranges 1, 2 & 5 sequence)	500 ms – 0.5 μs/div ± 5%
X5 magnification	> 200 ns/div ± 7% 100 ns/div ± 10%
External horizontal amplifier	
3 dB bandwidth	2 Hz – 1 MHz
Deflection factor	100 mV/div approximately
Input impedance	1 MΩ and 10 pF in parallel

1.3 TRIGGER

Level	Variable Variable with auto free running in absence of trigger signal
Coupling	A.C. or TV field for sweep ranges up to 100 μs/div and TV line from 50 μs/div to 0.5 μs/div
Source	CH1, CH2 or external. All positive or negative

Sensitivity

Internal
40 Hz – 1 MHz

0.5 div,
falling 1 div at 10 MHz

External
40 Hz – 1 MHz
1 MHz – 10 MHz

100 mV
1 V

1.4 CATHODE RAY TUBE (CRT)

Display area	8 x 10 cm
Phosphor	
Standard	P31
Special order	P7

Overall accelerating potential 3.5 kV

1.5 OUTPUTS FRONT PANEL

Calibrator peak to peak	500 mV squarewave ± 2% at supply frequency
Probe test	2.5 V approx. rectangular pulse at sweep repetition rate and sweep width.

1.6 POWER SUPPLY

Voltage Model 1	100 – 120 in 10 V steps
Voltage Model 2	200 – 240 in 20 V steps
Frequency	48 – 400 Hz
Consumption	25 VA

1.7 SIZE

Height	280 mm
Width	180 mm
Depth	420 mm

1.8 WEIGHT

6.5 Kg

1.9 COOLING

Convection

1.10 TEMPERATURE LIMITS, ambient

Operating	-15 to +40°C
Non-operating	-25 to +70°C

CHAPTER 2

OPERATING INSTRUCTIONS

2.1 FUNCTION OF CONTROLS AND CONNECTORS

These are situated on the front panel except when otherwise specified.

To operate slide switches, press and slide.

2.1.1 CRT

INTENSITY varies the intensity of the display and serves as the power ON-OFF switch.

FOCUS controls the definition of the display.

2.1.2 VERTICAL

VOLTS/DIVISION provides nine steps of attenuation of the input signal. In the X-Y mode, CH1 provides the vertical input and CH2 the horizontal input.

POSITION moves the respective trace in the vertical axis and serves as the channel ON-OFF switch.

AC-DC-GND selects the input signal coupling. In the DC position, the signal from the INPUT connector is coupled directly to the attenuator. In the AC position a capacitor is inserted in series.

In the GND position the input to the amplifier is grounded; this position enables the 0 V D.C. level of a trace to be ascertained.

When not in use should be set to GND.

2.1.3 SWEEP

TIME/DIVISION selects –
Sweep speeds
EXT X
CH2 (X-Y) mode (see VOLTS/DIV)
CHOP between 500 ms/div and 2 ms/div, and on EXT X.
ALTERNATE between 1 ms/div and 0.5 μ s/div.

POSITION moves the trace in the horizontal axis and when pulled provides X5 magnification on the horizontal axis.

LEVEL selects the point on the signal waveform at which the sweep starts. When pulled selects AUTO where the timebase free runs if the level control is set beyond the range in which triggering occurs.

EXT-CH1-CH2 enables the sweep to be triggered either externally or internally from either channel of the vertical amplifier.

\pm selects triggering from the positive or negative-going slope of a waveform.

AC-TV selects either normal AC coupled triggering or triggering from:–
(1) TV field (frame) at sweep speeds between 500 ms and 100 μ s.
(2) TV line at sweep speeds between 50 μ s and 0.5 μ s.

2.1.4 CONNECTORS

INPUTS

INPUT (CH1 & CH2)

the sockets connect the signal to be viewed to the respective vertical amplifiers.

TRIG/EXT X

the socket connects either a triggering or EXT X signal to the trigger or horizontal circuits. Dependent on the TIME/DIV switch.

Z MOD

situated on the rear panel and connected via an isolating capacitor to the CRT grid. A positive-going signal is necessary to intensify the trace while a negative-going signal will blank it. 10 V signal will give a good contrast.

CAL

socket provides a waveform for checking the calibration of the vertical channels or for triggering the sweep at supply frequency.

PROBE TEST

provides a rectangular pulse at timebase frequency to facilitate calibration of probes. For probe compensation, see page 2/2.

GND

this is connected to the chassis of the instrument.

2.2 PRE-OPERATION CHECKS

2.2.1 SUPPLY

Check the following:

1. Rear voltage-selector is indicating the local supply voltage or nearest value.
2. Fuse fitted is a 500 mA on 100–120 V model and 250 mA on 200–240 V model.

Note: The 3-core supply lead is colour-coded as follows:

	LINE	NEUTRAL	GND (Chassis)
Model 1	Black	White	Green
Model 2	Brown	Blue	Green/Yellow

2.2.2 Set controls as follows:

- | | | |
|---------------|----------------------|-----------------------|
| 1. CRT | INTENSITY | Fully anti-clockwise |
| | FOCUS | Mid-range |
| 2. HORIZONTAL | TIME/DIV | 2 ms |
| | POSITION | Mid-range and push-in |
| | TRIG LEVEL | Mid-range and out |
| | \pm | + |
| | AC/TV | AC |
| | EXT-CH1-CH2 | CH1 |
| 3. VERTICAL | CH 1 & 2 | 0.1 V |
| | POSITION (CH1 & CH2) | Mid-range |
| | AC-DC-GND | DC |

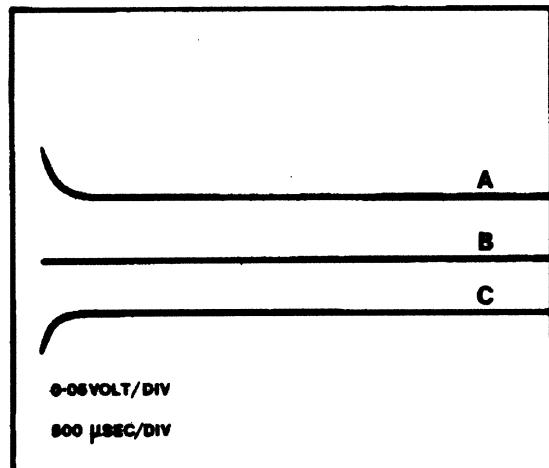

2.3 OPERATION

1. Plug into supply; turn INTENSITY clockwise – POWER ON.
2. Connect CAL to both INPUTs via co-axial cables.
3. Allow a few minutes for CRT to warm up.
4. Set TRIG for locked display.
5. Observe two traces of 5 divisions amplitude.

PROBE COMPENSATION

When using PROBE TEST output for probe compensation: apply the output via x10 probe for compensation. Select AUTO and turn TRIG LEVEL fully anticlockwise. Set TIME/DIVISION and VOLTS/DIVISION to 500 μ s and 0.05 V respectively and adjust the probe trimmer so that the leading corner of the displayed step is completely free from under and over-shoots.

The adjacent illustration shows three conditions: (A) over-compensated; (B) correctly compensated; (C) undercompensated.

CHAPTER 3

CIRCUIT DESCRIPTION

3.0 ATTENUATOR AND VERTICAL INPUT AMPLIFIER Figures 1A & 1B

CH1 and CH2 are identical and the following description covers both channels.

The input to the attenuator is connected via C901 to the input socket SK901 on AC, directly to the input socket on DC or to ground on GND. The capacity compensated attenuator is switched by S902 wafer 1 in steps of 100, 10 and 1 and the output is fed to the gate of TR801 via C801 and R602 which, together with D601, protect the input against overloads up to ± 400 V. TR801 is a F.E.T. source follower whose output DC level is adjusted to zero by R804 and R608. The output is then attenuated in steps of 5, 2 and 1 selected by S902 wafer 2 F and fed to the base of TR803 which together with TR804 forms a longtailed pair. The diodes D602 and D603 in the emitters increase the signal handling capacity without affecting the change in gain which remains directly proportional to current and, therefore, to supply voltage. This compensates for the CRT sensitivity which is inversely proportional to supply voltage and hence the overall vertical sensitivity remains independent of supply voltage. Vertical shift is fed to the base of TR804. The gain of the channel is set up by R813 which controls the total stage emitter current. The collector currents of TR803 and TR804 pass through thermal compensating networks R611, C602 and R614, C603 and also through grounded base stage TR802 to the output stages. TR802 isolates the channel switching waveforms from the input circuit.

3.1 VERTICAL OUTPUT AMPLIFIER Figure 2

The collector currents of the selected channel pass through diodes D637 and D638 for Channel 1, or D642 and D643 for Channel 2, to the bases of shunt feedback stages TR633 and TR636. The outputs of TR633 and TR636 are fed to the bases of TR634 and TR635, a longtailed pair whose collectors feed the Y plates of the CRT. C641 and R671 in the emitter circuit are adjusted for the best pulse response and TH631 compensates for the temperature coefficient of the input stages. The appropriate channel is selected either manually by S631 and S632 which are ganged to the vertical shift controls, or automatically by the Chop/Alternate circuit TR631 and TR632. On EXT X and Time/Div speeds of 2 ms/div and slower, TR631 and TR632 operate as a free-running multivibrator at a frequency of approx. 100 kHz. When TR632 conducts D635 and D638 conduct and turn off D637 and D638 thus disconnecting Channel 1. Conversely when TR631 conducts D639 and D641 conduct and turn off D642 and D643 thus disconnecting Channel 2. C632 and C634 feed pulses to the unblanking amplifier to blank out the trace during the transitions. On Time/Div speeds above 2 ms/div, TR631 and TR632 operate as a bistable whose state is changed at the end of each timebase sweep by an edge from the emitter of TR34. The network L631, C640, R640 in CH1 and L632, C649, R669 in CH2 delay the transitions until the trace is blanked. The vertical output amplifier current supplies the +13 V line which is decoupled by C645 and also the +7.5 V line which is stabilized by zener diode D644. The +7.5 V is used as a reference for the -7.5 V line which is a shunt stabilizer circuit consisting of TR637, R659, R666, R667 and R668. R658 compensates for variations in the -13 V line and reduces the effect of supply voltage variations on the -7.5 V line.

3.2 TRIGGER CIRCUIT Figures 3 & 4

This consists of a longtailed pair TR23 and TR25 similar to the Vertical Amplifier input stage but with temperature compensation in its emitter circuit. On the CH2 position the input is connected to CH2 and on EXT X position via C20, C21, C22 and R23 to the TRIG/EXT X socket. On all other positions of

the Time/Div switch the input is connected to S20 which selects either the EXT TRIG Socket, CH1 or CH2 signal. The output from the appropriate collector, selected either by the Polarity switch S21 or the Time/Div switch S1, is connected via diodes D27 or D31 to the emitter of common base stage TR26. The collector of TR26 is connected via D64, D33 and D34 to the input of the Horizontal Amplifier on CH2 and EXT X positions of the Time/Div switch S1. On other positions of the Time/Div switch the collector of TR26 is AC coupled via D32 to the base of TR21, a shunt feedback stage whose output swing is limited by diodes D21, D22 and D23. The output of TR21 is fed to the Schmitt trigger circuit, TR22 and TR24, which provides constant amplitude trigger signal to the timebase and bright line auto circuit on the AC position of S22. On the TV position of S22, TR22 is converted to a sync separator and TR24 on TIME/DIV speeds slower than 100 μ s has a long time constant in the emitter circuit which provides positive differentiated field pulses of much greater amplitude than the line pulses. The timebase therefore triggers on the field pulses. On TIME/DIV speeds faster than 100 μ s, the emitter time constant is reduced by R50 so that the differentiated field and line pulses are of equal amplitude and the timebase therefore triggers at line frequency.

3.3 TIMEBASE, UNBLANKING AND BRIGHT LINE AUTO CIRCUIT Figure 4

3.3.1 The differentiated positive pulse from the trigger circuit is fed via D36 to the base of TR27 which together with TR29 forms a bistable. The positive pulse turns on TR27 which in turn cuts off the clamping transistor TR34. The timebase, a F.E.T. Miller circuit, then runs up linearly charging up the hold-off capacitor via D47 and resetting the bistable via R114. When TR27 cuts off, TR34 conducts and discharges the timing capacitor until D45 conducts and reduces the current in TR34 to the value required by the timing resistor. At this point the flyback stops. During the flyback the hold-off capacitor discharges through R114 until D48 conducts. At this point the action is complete and the timebase can be triggered by the next triggering pulse.

3.3.2 If the Trig level control is in the Auto position and no trigger pulses are present, TR36 and D49 conduct and reduce the potential at the anode of D48. This allows the hold-off capacitor to discharge further and re-trigger the bistable. The timebase then free-runs. If trigger pulses are present at the anode of D43 the positive pulses trigger the monostable TR32 and TR35. When triggered at frequencies above about 10 Hz the average collector current of TR35 is low and D49 is cut off returning the timebase to the normal triggered condition.

3.3.3 The collector current of TR29 which is cut off during the sweep is fed to the input of TR28. The collector of TR28 goes negative at the beginning of the sweep until diode D38 conducts and clamps the collector potential at about 3 V, thus unblanking the sweep. When TR29 conducts at the end of the sweep TR28 collector goes positive blanking the trace. On chop positions of the sweep negative edges from the chop circuit are fed to the base of TR28 to blank the trace during the transitions.

3.4 HORIZONTAL AMPLIFIER Figure 3

This consists of a shunt feedback stage TR31 with switched feedback resistors to give X5 expansion. The sweep and horizontal shift currents are mixed at the input of the shunt feedback stage and the output is fed to a longtailed pair, TR33 and TR37, which feeds the horizontal deflection plates of the CRT. D44 clamps the collector of TR33 and prevents it from bottoming.

On the EXT X and CH2 positions of the Time/Div switch the input of TR31 is switched to the collector of TR26 via D33, D34 and D54 and the X5 feedback resistor is shorted out by diodes D33, D34, D35 and D37. The trace is then deflected horizontally via the EXT X socket or from Channel 2. On these positions the gate of TR36 is connected to the cathode of D47 which clamps the output of the timebase at about +1 V and turns off TR29 thus unblanking the trace.

3.5 CRT CIRCUIT AND POWER SUPPLY Figure 5

The supply voltage is fed via the power ON/OFF switch S401, the fuse FS401 and the voltage selector SK401 to the appropriate primary tapping on T401.

3.5.1 The -13 V line is obtained from a full wave rectifier circuit consisting of D405, D406, C402 and R403.

3.5.2 The +117 V line is obtained from a bridge rectifier D401, D402, D403 and D404 with reservoir capacitor C403 and smoothed by R408 and C408 to provide the +110 V line and by R407 and C406 to provide the +80V line.

3.5.3 The -1050 V line is obtained from a half wave rectifier circuit consisting of D407, C409, C411 and C412.

3.5.4 The +2600 V line is obtained from a voltage doubler circuit consisting of D408, D409, C401 and C404.

3.5.5 The calibrator circuit provides a 0.5 V squarewave at supply frequency. It is produced by a diode switching circuit in which a current derived from the stabilized -7.5 V line is passed through D413 and R408 during negative half cycles of the AC voltage from the 13 V transformer winding. On positive half cycles D413 is cut off and the current passes through D412 and R402. The output voltage is set by R405. The temperature coefficient of the diode D413 is compensated for by the negative temperature coefficient of the output resistor R408 giving an output voltage which is nominally independent of temperature.

3.5.6 The grid voltage of the CRT is derived from a zener diode connected between the CRT cathode and the -1050 V supply. The voltage is varied by the Intensity control R301. The Intensity of the trace may be varied by signals fed via the Z Mod socket SK301 and C301 to the grid of the CRT.

CHAPTER 4

MAINTENANCE AND CALIBRATION

4.1 INTRODUCTION

4.1.1 The solid-state design of the instrument makes frequent adjustment of the internal preset components unnecessary. The appropriate part of the Calibration Procedure should be performed whenever the instrument fails to meet its specification in some particular or whenever a defective component is replaced. The Circuit Description, Chapter 3, will assist in deciding which part of the circuit requires adjustment.

4.1.2 The internal 0.5 V calibrator allows the accuracy of voltage measurement to be checked. The timing accuracy can also be checked with the internal calibrator, though it should be remembered that the frequency and frequency accuracy of the calibrator are those of the A.C. supply line.

4.1.3 To carry out the whole calibration procedure, the following tools and equipment are required:—

Low-capacitance trimming tool (for preset capacitors).

Small screwdriver (for preset potentiometers).

Amplitude Calibrator, providing 1 kHz squarewave, amplitude 50 mV, amplitude accuracy within 0.25%.

Time-mark Generator, providing markers of 1 ms, 1 μ s and, preferably, 0.5 μ s.

Accuracy within 0.1%.

Squarewave Generator, providing outputs of 1 kHz and 10 kHz, 50 mV to 50 V.

Squarewave Generator, providing outputs of 10 kHz, 100 kHz and 1 MHz with rise-time less than 10 ns.

Coaxial cable and terminating resistor for the above.

Monitor Oscilloscope, complete with X10 passive probe, and having a sweep output socket.

Passive Probe, X10 attenuation, suitable for input capacities of 25 to 35 pF.

Test Meter, 20,000 Ω /volt or higher, accuracy within 2% 2.5 V DC to 2500 V DC.

Sinewave Generator, 1 kHz, 10 kHz and 50 kHz.

Coaxial leads allowing the same signal to be connected to Channel 1, Channel 2 and the EXT socket.

4.2 MECHANICAL

4.2.1 ACCESS TO INTERIOR

The cabinet covers are removed as follows:—

1. Disconnect instrument from power supply.
2. Slacken handle-securingscrews.
3. Withdraw cover from the handle ends.
4. Disengage cover from the feet pegs.

4.2.2 CRT REMOVAL

1. Remove cabinet covers as detailed in para. 4.2.1 above.
2. Earth PDA connector with a screwdriver, then disconnect.
3. Remove CRT rear cover, 3 screws.
4. Disconnect rear socket from CRT.
5. Remove the 2 clamp securing screws.
6. Remove left-hand fixing bracket (1 screw) and clamp.
7. Remove the right-hand clamp (1 screw) and move rear of CRT outwards then front end to the left and forward, removing CRT and screen from the instrument.
8. Remove tape.
9. Withdraw CRT from the screen.

4.2.3 CRT FITTING

Reverse the order detailed in para. 4.2.2 above.

4.3 CALIBRATION PROCEDURE

4.3.1 INITIAL SETTING

1. Remove side covers, reference para. 4.2.1. Connect to a suitable A.C. power source and switch the instrument on.
2. Set the front panel controls as follows:—

CH1 and CH2,		
AC-DC-GND	GND	
VOLTS/DIV	.01	
POSITION	Mid-position	
TIME/DIV	1 ms	
Horizontal POSITION	Mid-position, push in	
TRIG LEVEL	Mid-position, out (AUTO)	
±	+	
EXT-CH1-CH2	EXT	
AC-TV	AC	
FOCUS	Adjust for well defined low	
INTENSITY }	brilliance trace	

4.3.2 SUPPLY LINE VOLTAGES (R668)

D.C. supply line voltages should normally lie within the prescribed limits when A.C. power source voltage coincides with the setting of the line voltage selector on the rear of the instrument.

The -7.5 V line is adjustable by means of R668. It should normally only require resetting when TR637 has been replaced. Note, however, that any adjustment of this line necessitates the carrying out of the entire Calibration Procedure as detailed in this Chapter.

Supply Line	Test Point	Limits
-7.5V	CH1 POSITION potentiometer violet-blue wire	-7.3V to -7.7V
+7.5V	CH1 POSITION potentiometer orange-white wire	+7.1V to +7.9V
-13V	Horizontal POSITION potentiometer mauve-white wire	-12.4V to -13.6V
+13V	Test point 3	+11.9V to +12.1V
+80V	Test point 22	+75V to +85V
+110V	Test point 29	+107V to +117V
-1050V	Test point 156/7	-1060V to -1160V
+2500V	Test point 156/K	+2400V to +2500V

4.3.3 ASTIGMATISM AND GEOMETRY (R305 and R307)

1. Set TIME/DIV to 100 μ s and display a 10 kHz sinewave signal on one channel only at 6 divisionsvertical amplitude. Adjust FOCUS and R305 (Astigmatism) for best definition of display. Leave 10 kHz signal connected.
2. Set TIME/DIV to 1 ms. Ensure that AUTO is selected and no signal is connected to EXT. Set EXT-CH1-CH2 switch to EXT so that display becomes an unsynchronised raster. Adjust R307 so that the raster becomes as nearly as possible rectangular. Disconnect 10 kHz signal.

4.3.4 VERTICAL AMPLIFIER

- 1.0 Channel 1 VOLTS/DIV balance (R604 and R608).
 1.1 Check that Channel 1 input switch is set to GND and VOLTS/DIV to 0.01. Turn Channel 1 on, Channel 2 off.
 1.2 Connect test meter between test point C3 and chassis. Adjust R604 for zero reading.
 It should normally be necessary to adjust R604 only when TR601 has been replaced. After adjustment of R604, R613 must be checked and re-adjusted if necessary. See para. 4.3.4 Op. 6. Disconnect test meter.
- 1.3 Switch Channel 1 VOLTS/DIV between 0.01, 0.02 and 0.05 positions. Adjust R608 to eliminate vertical movement of the trace.
- 2.0 Channel 1 position balance (R618).
 2.1 Connect test meter between Channel 1 POSITION potentiometer moving contact (red-blue wire) and chassis. Adjust POSITION for zero reading.
 2.2 Adjust R618 to bring the trace to the centre of the screen. Disconnect test meter.
- 3.0 Channel 2 VOLTS/DIV balance (R704 and R708).
 3.1 Check that Channel 2 input switch is set to GND and VOLTS/DIV to 0.01. Turn Channel 2 on and Channel 1 off.
 3.2 Connect test meter between test point C33 and the chassis. Adjust R704 for zero reading. Disconnect test meter. It should normally be necessary to adjust R704 only when TR701 has been replaced. After adjustment of R704, R713 must be checked and re-adjusted if necessary. See para. 4.3.4. Op. 7.
- 3.3 Switch Channel 2 VOLTS/DIV between 0.01, 0.02 and 0.05 positions. Adjust R708 to eliminate vertical movement of the trace.
- 4.0 Channel 2 position balance (R718).
 4.1 Connect test meter between Channel 2 POSITION potentiometer moving contact (red-blue wire) and chassis. Adjust POSITION for zero meter reading.
 4.2 Adjust R718 to bring the trace to the centre of the screen. Disconnect test meter.
- 5.0 Channel 1 gain (R163).
 5.1 Set Channel 1 VOLTS/DIV to 0.01 and Amplitude Calibrator output to 50 mV. Display Amplitude Calibrator output on Channel 1. Adjust the amplitude of the display to exactly 5 divisions with R613. Disconnect Amplitude Calibrator.
- 6.0 Channel 2 gain (R713).
 6.1 Set Channel 2 VOLTS/DIV to 0.01 and Amplitude Calibrator output to 50 mV. Display Amplitude Calibrator output on Channel 2. Adjust the amplitude of the display to exactly 5 divisions with R713. Disconnect Amplitude Calibrator.
- 7.0 Pulse response (C641, R671 and R653)
 7.1 Set both VOLTS/DIV to 0.01 and display a 1 MHz squarewave signal simultaneously on both channels. (Ensure that the co-axial cable connecting the signal to the instrument is correctly terminated.)
 7.2 Adjust C641 and R671 to optimise squarewave response on both channels. If the response of the channels is not exactly the same, adjust for best compromise.
 7.3 Adjust R653 to minimize the change in squarewave response occurring when either POSITION control is adjusted. Disconnect squarewave signal.

8.0 Attenuators (C902, C903, C904 and C905).

- Channel 1 and Channel 2 attenuators and input selector circuits are electrically identical. Corresponding components in these parts of the two channels carry the same component references.
- 8.1 Set Channel 1 input switch to DC. Display a 10 kHz squarewave of 0.5 V amplitude on Channel 1, using the 0.1 VOLTS/DIV position of the attenuator. Adjust C905 for the best response (square corner without overshoot or undershoot).
- 8.2 Set Channel 1 attenuator to 1 VOLTS/DIV and increase the amplitude of the squarewave to 5 V. Adjust C904 for best response. Disconnect squarewave signal.
- 8.3 Connect a X10 passive probe to the input of Channel 1. Set the Channel 1 VOLTS/DIV to 0.01 and display a 1 kHz squarewave of 0.5 amplitude via the probe. Adjust the probe compensation for the best squarewave response.
- 8.4 Set VOLTS/DIV to 0.1 and increase the amplitude of the squarewave to 5 V. Without altering the probe compensation, adjust C903 for the best squarewave response.
- 8.5 Set VOLTS/DIV to 1 and increase the amplitude of the squarewave to 50 V. Adjust C902 for best squarewave response. Disconnect signal and probe.
- 8.6 Repeat Ops 8.1 to 8.5 for Channel 2.

4.3.5 HORIZONTAL AMPLIFIER**1.0 Output Stage balance (R108 and R113).**

- With TIME/DIV set to 2 ms, display a 1 kHz signal (sine-wave or squarewave) on Channel 1. Adjust the horizontal POSITION control to the point where the left-hand end of the trace does not move when the X5 switch is operated. Without re-adjusting the POSITION control, bring the left-hand end of the trace to the centre vertical graticule line by adjustment of R113.

- 1.2 Position the trace centrally on the screen with the horizontal POSITION control. Adjust R108 for the best horizontal linearity at the right- and left-hand extremities of the CRT screen.

2.0 Pre-amplifier balance (R37, R49 and R80).

- This operation should not be performed until any necessary adjustments to R604, R608, R704 and R708 have been done. See para. 4.3.4 Ops 1 and 3.

- 2.1 Set TIME/DIV to 2 ms, Channel 1 input switch to GND and EXT-CH1-CH2 switch to CH1. Connect test meter between test point H(+) and Chassis (-). Adjust R49 so that the test meter reading is independent of the position of the z switch. Disconnect the test meter.
- 2.2 Set TIME/DIV to 1 ms and adjust the left-hand end of the trace to the left-hand edge of the graticule by means of the POSITION control. Now turn TIME/DIV to CH2 and bring the spot to the centre vertical graticule line by adjusting R80.
- 2.3 Set TIME/DIV to EXT X and bring the spot to the central graticule line by adjusting R37.

3.0 Channel 2 horizontal gain (R104).

- 3.1 Set TIME/DIV to CH2. Set the output of the Amplitude Calibrator to 50 mV and connect to the input of Channel 2. Set Channel 1 input switch to GND, channel 2 input switch to DC and Channel 2 VOLTS/DIV to 0.01. Set horizontal deflection to exactly 5 divisions with R104. Disconnect Calibrator.

4.0 Pulse response (C22, C28, C40 and C45).

- Display a 100 kHz squarewave on the monitor oscilloscope and connect the same squarewave to the D61 Channel 2 input. Connect the sweep output of the monitor oscilloscope to Channel 1 of the D61. Set TIME/DIV to CH2 and Channel 2 VOLTS/DIV to 0.01. Adjust squarewave amplitude and the remaining D61 controls to display a horizontal squarewave of about 4 divisions amplitude on a vertical timebase.

- 4.2 Adjust C40 for best response, then reduce the squarewave frequency to 10 kHz and adjust C45 (twisted wire capacitor) for the best response. Repeat the alternate adjustment of C40 at 100 kHz and C45 at 10 kHz until the response cannot be improved.

4.3 Disconnect the squarewave signal from the Channel 2 input and connect to the EXT socket. Set the TIME/DIV switch to EXT X and adjust the amplitude of the squarewave for a horizontal display amplitude of about 4 divisions.

With squarewave frequency of 10 kHz, adjust C25 (twisted wire capacitor) for the best response. With squarewave frequency at 100 kHz, adjust C22 (twisted wire capacitor) for best response. Repeat alternate adjustment of C22 and C26 until no further improvement is possible. Remove connexions to Channel 1 and EXT input.

4.3.6 TRIGGER AND SWEEP

1. Trigger sensitivity (R31).

Set EXT-CH1-CH2 switch to CH1 and display a 50 kHz sinewave signal on Channel 1. Turn R74 to its anticlockwise limit so that the timebase stops. Examine the signal at test point C66 with the monitor oscilloscope.

Adjust the input signal for an amplitude at test point C66 of about 0.5 V. Adjust the LEVEL control so that the trigger pulses occur symmetrically about the centre of the sinewave. Adjust R31 so that trigger pulses occur 25 mV apart. Disconnect Monitor Oscilloscope.

2. Sweep stability (R74).

Turn R74 clockwise, setting to the centre of the range in which stable triggering occurs. (This can be determined accurately by noting the change of sweep length with R74 setting.) Disconnect sinewave signal.

3. 1 ms/div sweep accuracy (R89).

This adjustment should not be performed until any necessary adjustments have been made to R104. See para. 4.3.5 Op. 3.

Set TIME/DIV to 1 ms and display 1 ms markers from the Time Marker Generator on Channel 1. Adjust R89 so that markers are exactly one major division apart over the centre 8 divisions. Leave Time Marker Generator connected.

4. Sweep Length (R77).

Adjust sweep length to 10.5 divisions with R77. Leave Time Marker Generator connected.

5. 0.5 μ s/div sweep accuracy (C2).

Set Time Marker Generator to 0.5 μ s and TIME/DIV to 0.5 μ s. Adjust C2 (mounted on TIME/DIV switch) so that one marker occurs for each major division over the centre 8 divisions. (Alternatively, set Time Marker Generator to 1 μ s and adjust for one marker every 2 divisions). Disconnect Time Marker Generator.

4.3.7 INTERNAL CALIBRATOR (R405).

The internal calibrator amplitude should be adjusted only after Channel 1 and 2 vertical gain has been checked and corrected. See para. 4.3.6 Ops 6 and 7. Set Channel 1 and 2 input switches to DC, both VOLT8/DIV switches to 0.1 and display internal calibrator signal on both channels simultaneously. Adjust the mean amplitude of the Channel 1 and 2 displays to exactly 5 divisions with R405.

CHAPTER 5

COMPONENTS LIST

Values of resistors are stated in ohms or multiples of ohms; ratings at 70°C are in watts or sub-multiples of watts. Values of capacitors are stated in sub-multiples of farads; ratings at 70°C are in volts or kilovolts.

Whenever possible, exact replacements for components should be used, although locally available alternative may be satisfactory for standard components.

Any order for replacement parts should include:

- | | |
|---|--|
| 1. Instrument type
2. Instrument serial number
3. Component circuit reference | 4. Component part number
5. Component value |
|---|--|

CIRCUIT REFERENCE BLOCKS

The table below gives the blocks of circuit references, so that the reader can relate the items listed in this chapter and their location in the circuitry and printed circuit boards in Chapter 6.

Circuit Reference		Circuit	Fig.
From	To		
1	300	Horiz. Amplifier	3
		Sweep & Time/div Switch	4
301	400	CRT	
401	600	Power Supply	5
601	650	Vertical Input	1A
701	750		1B
651	900	Vertical amplifier	2
901	1000	Volts/div switch	1

ASSEMBLIES

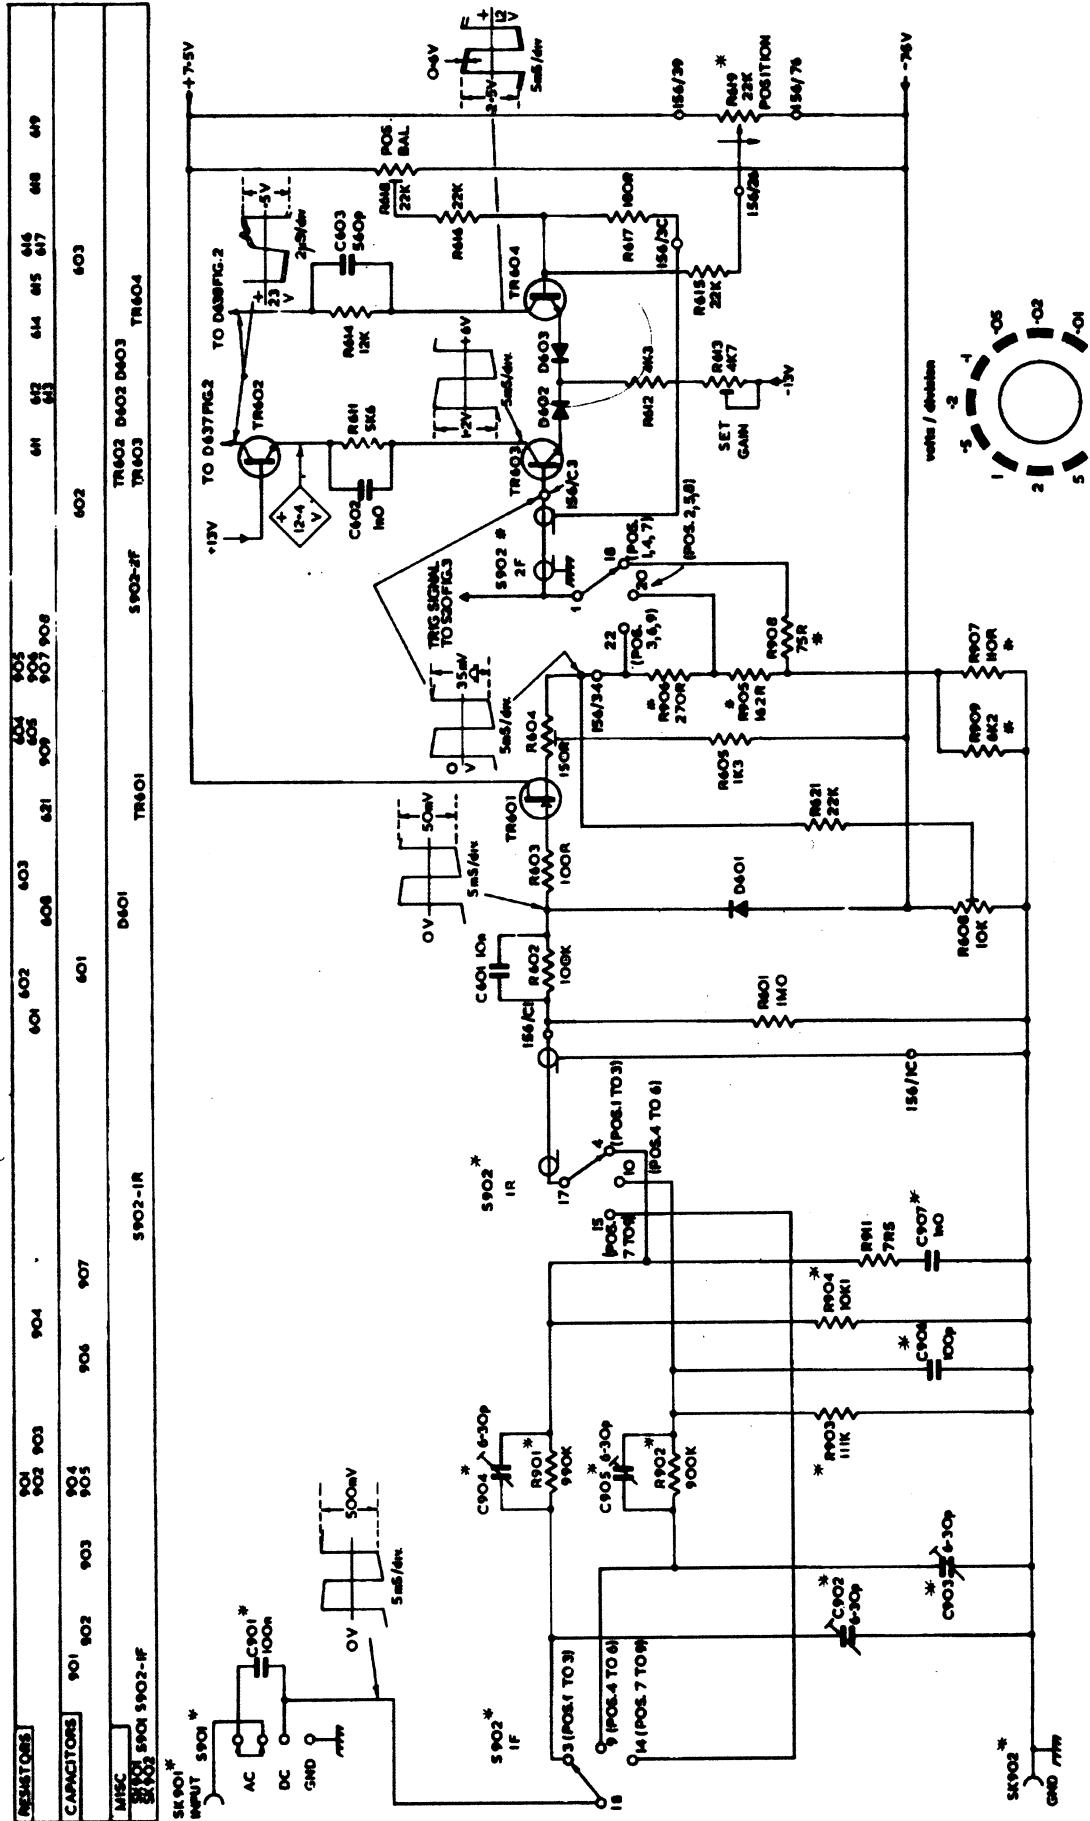

ASSEMBLY	PART NUMBER	INCLUDES CIRCUIT REFERENCES
PC 156	670-2928-00	All components except those* in chapter 6.
Switch AC-TV	262-0971-00	C28, C33, C36, R42, R45, R47, R50, R52, S22.
Switch TIME/DIV	262-0968-00	C1 to C7, R1 to R6, S1.
Switch VOLTS/DIV	262-0967-00	C901 to C907, R901 to R909, S902.

CHAPTER 6

CIRCUIT DIAGRAMS

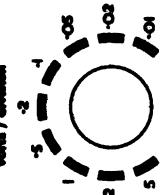

To minimize the risk of misinterpretation of component values on circuit diagrams, the decimal point has been replaced by the multiplier or sub-multiplier of the basic unit. For instance, 2.2 megohms is shown as 2M2 and 1.8 picofarads is shown as 1p8.

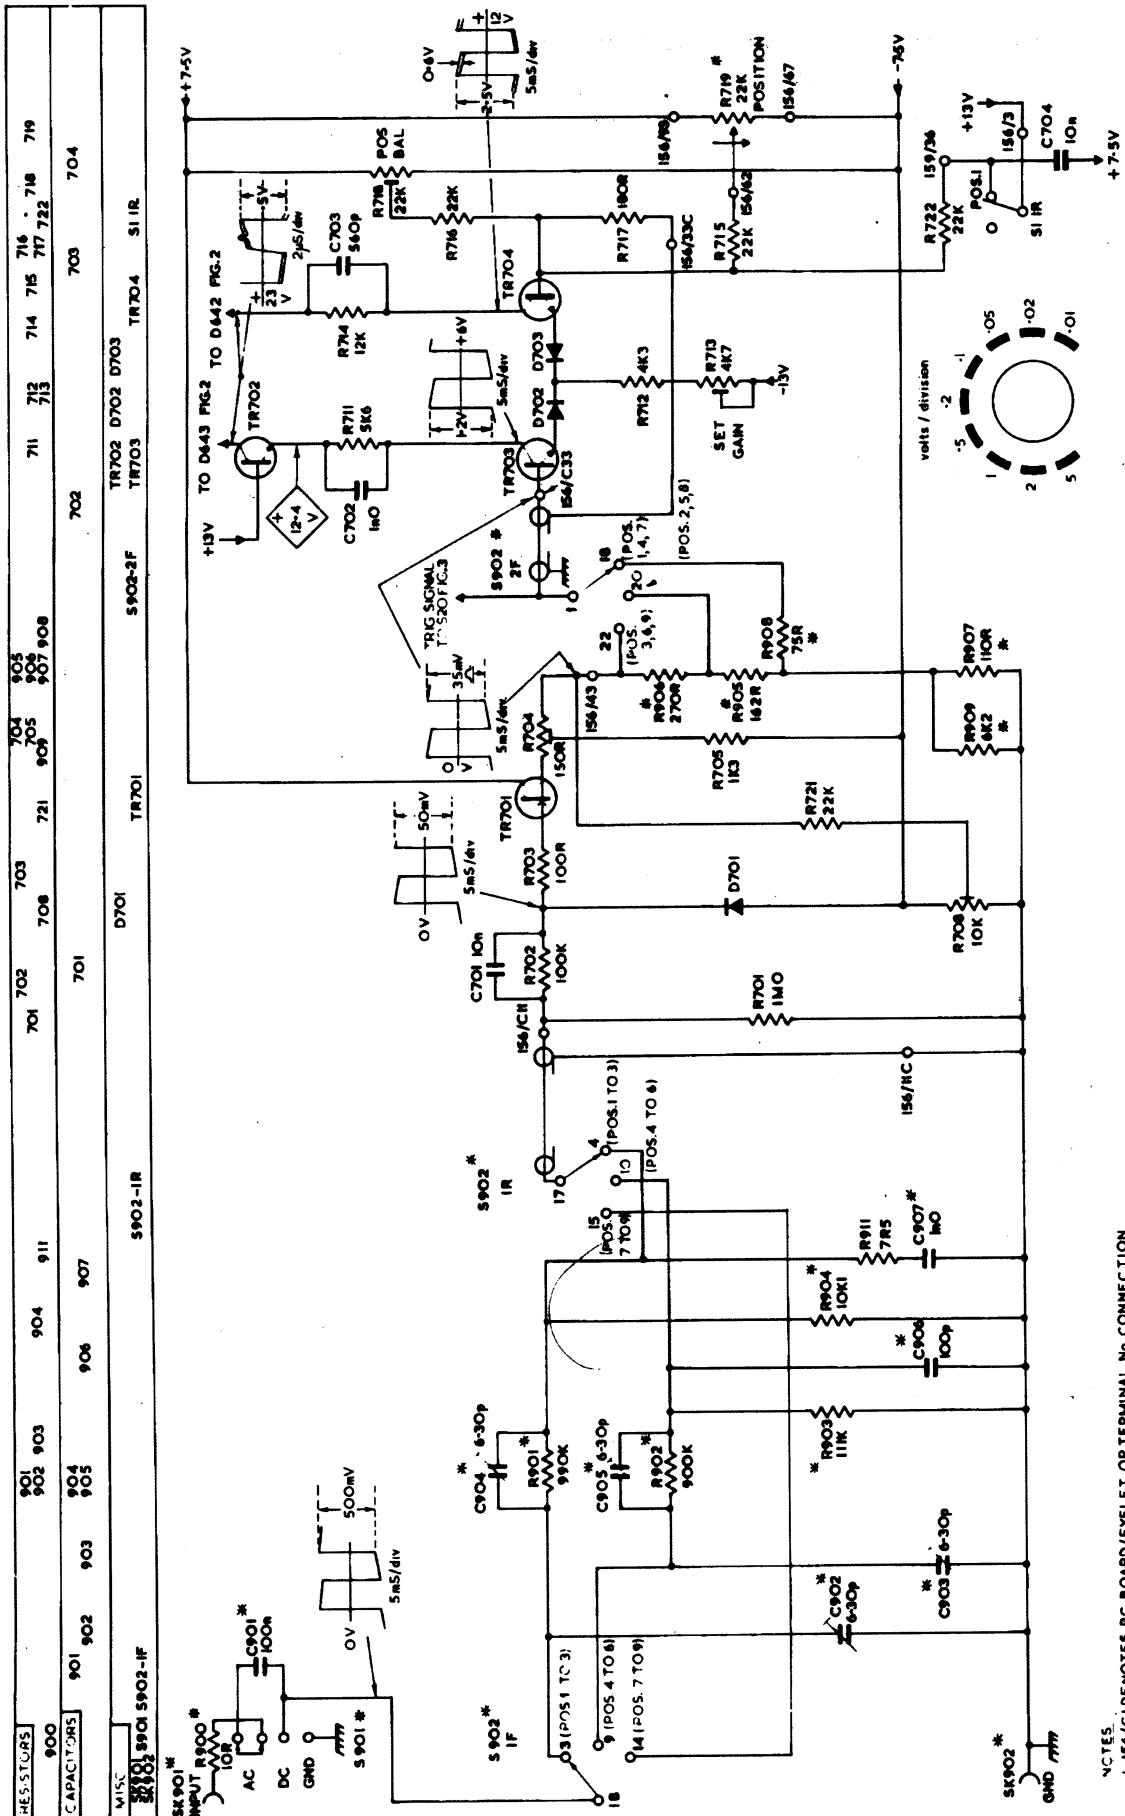

To aid the reader further, in addition to the block Circuit Reference Table in Chapter 5.1, to locate a component in the circuit diagrams, a table is provided at the top of each circuit diagram, in which the circuit reference will appear, where practicable, directly above the component being sought.

Amendment List No. 2

*R601 and †R701 are removed from PC156 (fig. 7) and connected between switch (S902) tag 17 and chassis and the co-ax outer connections to pin 156/1C and 156/11C are removed. Effective Serial number 581901 (change note 1218).

* Amend Fig. 1A

† Amend Fig. 1B

page 5/4 Alterations: Effective Serial number 583601 (change note 1283)

**R20	317-0474-01	470 k	C	5	125 mW
R21	311-1734-01				150 mW
**R24	317-0623-01	62 k			
**R26	317-0333-01	33 k			

** Amend figure 4. Add R20 as shown in sketch below.

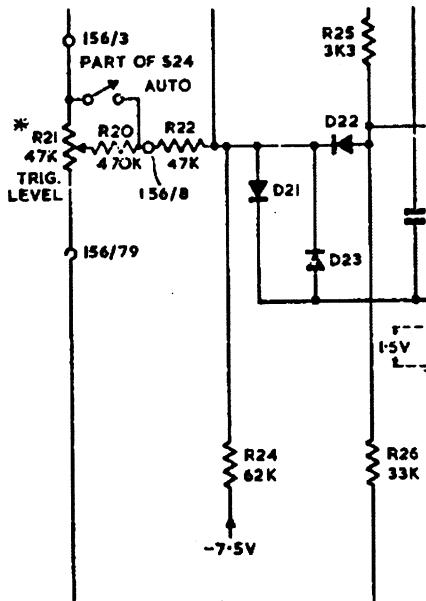

Figure 2 Correction

Cir. Ref. C642 value should be read as 180 p.

Figure 7 (PC156) Corrections

Cir. Ref. C90 should be read as C20.

Cir. Ref. C658 should be read as C653.
