## 8-bit universal shift register; 3-state

## 74HC/HCT299

## FEATURES

- Multiplexed inputs/outputs provide improved bit density
- Four operating modes:
  - shift left
  - shift right
  - hold (store)
  - load data
- Operates with output enable or at high-impedance OFF-state (Z)
- 3-state outputs drive bus lines directly
- Can be cascaded for n-bits word length
- Output capability: bus driver (parallel I/Os), standard (serial outputs)
- I<sub>CC</sub> category: MSI

## GENERAL DESCRIPTION

The 74HC/HCT299 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT299 contain eight edge-triggered D-type flip-flops and the interstage logic necessary to perform synchronous shift-right, shift-left, parallel load and hold operations. The type of operation is determined by the mode select inputs (S<sub>0</sub> and S<sub>1</sub>), as shown in the mode select table.

All flip-flop outputs have 3-state buffers to separate these outputs (I/O<sub>0</sub> to I/O<sub>7</sub>) such, that they can serve as data inputs in the parallel load mode. The serial outputs (Q<sub>0</sub> and Q<sub>7</sub>) are used for expansion in serial shifting of longer words.

A LOW signal on the asynchronous master reset input ( $\overline{\text{MR}}$ ) overrides the S<sub>n</sub> and clock (CP) inputs and resets the flip-flops. All other state changes are initiated by the rising edge of the clock pulse. Inputs can change when the clock is either state, provided that the recommended set-up and hold times, relative to the rising edge of CP, are observed.

A HIGH signal on the 3-state output enable inputs ( $\overline{\text{OE}}_1$  or  $\overline{\text{OE}}_2$ ) disables the 3-state buffers and the I/O<sub>n</sub> outputs are set to the high-impedance OFF-state. In this condition, the shift, hold, load and reset operations can still occur. The 3-state buffers are also disabled by HIGH signals on both S<sub>0</sub> and S<sub>1</sub>, when in preparation for a parallel load operation.

## QUICK REFERENCE DATA

GND = 0 V; T<sub>amb</sub> = 25 °C; t<sub>r</sub> = t<sub>f</sub> = 6 ns

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
t <sub>PHL</sub> / t <sub>PLH</sub>	propagation delay CP to Q <sub>0</sub> , Q <sub>7</sub> CP to I/O <sub>n</sub>	C <sub>L</sub> = 15 pF; V <sub>CC</sub> = 5 V	20	19	ns
t <sub>PHL</sub>	$\overline{\text{MR}}$ to Q <sub>0</sub> , Q <sub>7</sub> or I/O <sub>n</sub>		20	19	ns

C <sub>PD</sub>	power dissipation capacitance per package	notes 1 and 2	10	10	pF
			120	125	pF

## Notes

1. C<sub>PD</sub> is used to determine the dynamic power dissipation (P<sub>D</sub> in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

f<sub>i</sub> = input frequency in MHz

f<sub>o</sub> = output frequency in MHz

∑ (C<sub>L</sub> × V<sub>CC</sub><sup>2</sup> × f<sub>o</sub>) = sum of outputs

C<sub>L</sub> = output load capacitance in pF

V<sub>CC</sub> = supply voltage in V

2. For HC the condition is V<sub>I</sub> = GND to V<sub>CC</sub>  
For HCT the condition is V<sub>I</sub> = GND to V<sub>CC</sub> – 1.5 V

**Note to HCT types**

The value of additional quiescent supply current ( $\Delta I_{CC}$ ) for unit load of 1 is given in the family specifications. To determine  $\Delta I_{CC}$  per input, multiply this value by the unit load coefficient shown in the table below.

INPUT	UNIT LOAD COEFFICIENT
I/O <sub>n</sub>	0.25
D <sub>SR</sub> , D <sub>SL</sub>	0.25
CP, S <sub>0</sub>	0.60
