GENERAL DESCRIPTION

The 74HC/HCT4053 are high-speed Si-gate CMOS devices and are pin compatible with the "4053" of the "4000B" series. They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT4053 are triple 2-channel analog multiplexers/demultiplexers with a common enable input (\overline{E}) . Each multiplexer/demultiplexer has two independent inputs/outputs (nY $_0$ and nY $_1$), a common input/output (nZ) and three digital select inputs (S $_1$ to S $_3$).

With \overline{E} LOW, one of the two switches is selected (low impedance ON-state) by S_1 to S_3 . With \overline{E} HIGH, all switches are in the high impedance OFF-state, independent of S_1 to S_3 .

 V_{CC} and GND are the supply voltage pins for the digital control inputs (S₁, to S₃, and $\overline{E})$. The V_{CC} to GND ranges are 2.0 to 10.0 V for HC and 4.5 to 5.5 V for HCT. The analog inputs/outputs (nY $_0$ and nY $_1$, and nZ) can swing between V_{CC} as a positive limit and V_{EE} as a negative limit. $V_{CC}-V_{EE}$ may not exceed 10.0 V.

For operation as a digital multiplexer/demultiplexer, V_{EE} is connected to GND (typically ground).

QUICK REFERENCE DATA

Notes

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum \{(C_L + C_S) \times V_{CC}^2 \times f_o\} \text{ where: }$$

 f_i = input frequency in MHz; f_o = output frequency in MHz

 $\sum \{(C_L + C_S) \times V_{CC}^2 \times f_o\} = \text{sum of outputs}$

 C_L = output load capacitance in pF; C_S = max. switch capacitance in pF

 V_{CC} = supply voltage in V

2. For HC the condition is $V_I = GND$ to V_{CC}

For HCT the condition is $V_I = GND$ to $V_{CC} - 1.5 \text{ V}$

	plastic mini-pack (SO)		500	mW	above + 70 °C: derate linearly with 8 mW/K
Ps	power dissipation per switch		100	mW	

Note to ratings

To avoid drawing V_{CC} current out of terminals nZ, when switch current flows in terminals nY_n, the voltage drop across the bidirectional switch must not exceed 0.4 V. If the switch current flows into terminals nZ, no V_{CC} current will flow out of terminals nY_n. In this case there is no limit for the voltage drop across the switch, but the voltages at nY_n and nZ may not exceed V_{CC} or V_{EE} .

Notes to the characteristics

- At supply voltages (V_{CC} V_{EE}) approaching 2.0 V the analog switch ON-resistance becomes extremely non-linear.
 Therefore it is recommended that these devices be used to transmit digital signals only, when using these supply voltages.
