## Low-Voltage 1.8/2.5/3.3V 16-Bit D-Type Flip-Flop With 3.6V-Tolerant Inputs and Outputs (3-State, Non-Inverting)

The 74VCXH16374 is an advanced performance, non-inverting 16-bit D-type flip-flop. It is designed for very high-speed, very low-power operation in 1.8V, 2.5V or 3.3V systems. The VCXH16374 is byte controlled, with each byte functioning identically, but independently. Each byte has separate Output Enable and Clock Pulse inputs. These control pins can be tied together for full 16-bit operation.

When operating at 2.5V (or 1.8V) the part is designed to tolerate voltages it may encounter on either inputs or outputs when interfacing to 3.3V busses. It is guaranteed to be over-voltage tolerant to 3.6V.

The 74VCXH16374 consists of 16 edge-triggered flip-flops with individual D-type inputs and 3.6V-tolerant 3-state outputs. The clocks (CPn) and Output Enables ( $\overline{OE}n$ ) are common to all flip-flops within the respective byte. The flip-flops will store the state of individual D inputs that meet the setup and hold time requirements on the LOW-to-HIGH Clock (CP) transition. With the  $\overline{OE}$  LOW, the contents of the flip-flops are available at the outputs. When the  $\overline{OE}$  is HIGH, the outputs go to the high impedance state. The  $\overline{OE}$  input level does not affect the operation of the flip-flops. The data inputs include active bushold circuitry, eliminating the need for external pull-up resistors to hold unused or floating inputs at a valid logic state.

- Designed for Low Voltage Operation:  $V_{CC} = 1.65\text{--}3.6\text{V}$
- 3.6V Tolerant Inputs and Outputs
- High Speed Operation: 3.0ns max for 3.0 to 3.6V  
3.9ns max for 2.3 to 2.7V  
7.8ns max for 1.65 to 1.95V
- Static Drive:  $\pm 24\text{mA}$  Drive at 3.0V  
 $\pm 18\text{mA}$  Drive at 2.3V  
 $\pm 6\text{mA}$  Drive at 1.65V
- Supports Live Insertion and Withdrawal
- Includes Active Bushold to Hold Unused or Floating Inputs at a Valid Logic State
- $I_{OFF}$  Specification Guarantees High Impedance When  $V_{CC} = 0V^\dagger$
- Near Zero Static Supply Current in All Three Logic States (20 $\mu\text{A}$ )  
Substantially Reduces System Power Requirements
- Latchup Performance Exceeds  $\pm 300\text{mA}$  @ 125°C
- ESD Performance: Human Body Model >2000V; Machine Model >200V

$^\dagger$ NOTE: To ensure the outputs activate in the 3-state condition, the output enable pins should be connected to  $V_{CC}$  through a pull-up resistor. The value of the resistor is determined by the current sinking capability of the output connected to the OE pin.
