VIF/SIF signal processor
BA7356S

The BA7356S is a multi-format (M, B/G, D/F, and I) VIF/SIF signal processor for television and VCR applications. It features a built-in sound-trap and band-pass filters, and employs a pulse-count audio detector that does not require adjustment. This IC reduces external component requirements, and allows space savings.

●Applications

TVs and VCRs

●Features

1) Separate-carrier PLL with full synchronous detection. Excellent DG/DP, CS beat (920kHz) and cross color. In addition, by pulling down the SIF input (pin 9) it can be used as an intercarrier.

2) The IF AGC time constant is dual-layered to allow faster speeds.

3) The variable-gain amplifier has excellent linearity to ensure low distortion, and AGC variance and temperature drift have been minimized.

4) Built-in SOUND filter (SOUND trap and SOUND BPF). The MODE switch can be used to switch between M, B/G, I, and D/K (4.5MHz, 5.5MHz, 6.0MHz, and 6.5MHz

respectively). In particular, the SOUND BPF gives a larger attenuation ratio than conventional discrete circuits by using two-layer SIF+500kHz BPFs.

5) The audio detector uses a 500kHz BEAT DOWN pulsecounter detector that does not require adjustment. This eliminates the need for a detector coil and gives better linearity and S/N.

6) Use of pulse-counter detection and the built-in SOUND filter means fewer pins, external components and adjustment locations are required. The IC is available in a 22-pin SDIP package and will enable cost and space savings.

●Block diagram

ROHM
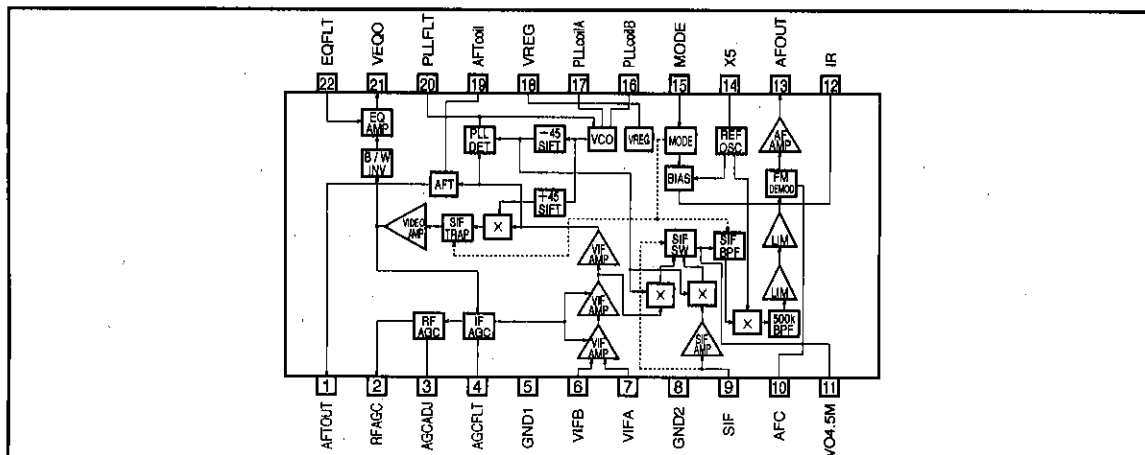

●Absolute maximum ratings (Ta=25℃)

Parameter	Symbol	Limits	Unit
Applied voltage	$V_{CCMax.}$	10.5 [*1]	V
Power dissipation	$Pd_{Max.}$	1250 [*2]	mW
Operating temperature	Topr	−15 ~65	℃
Storage temperature	Tstg	−40 ~150	℃
Pin 2 input voltage	$V_{P2Max.}$	10.5	V

[*1] 27 Ω resistor connected between V_{CC} and V_{REG}.
[*2] When IC is stand alone, reduced by 12.5mW for each increase in Ta of 1°C over 25°C.
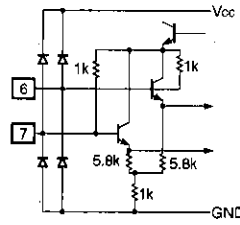

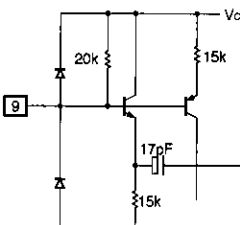

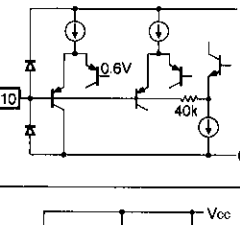

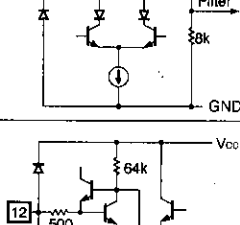

●Recommended operating conditions (Ta=25℃)
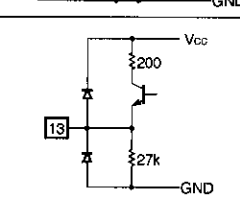

Parameter	Symbol	Limits	Unit
Power supply voltage (9V)	$V_{CC\ 9V}$	8.8~9.2 [*1]	V
Power supply voltage (12V)	$V_{CC\ 12V}$	11.7 ~12.3 [*2]	V

[*1] 27 Ω resistor connected between V_{CC} and V_{REG}.
[*2] 62 Ω resistor connected between V_{CC} and V_{REG}.

●Pin description

Pin No.	Pin Name	IN / OUT	Standard voltage	Equivalent circuit	Function
1	AF - TOUT	OUT	—		AFT output. VREG/GND push-pull output.
2	RF - AGC	OUT	—		RF-AGC output. Open-collector output. Gain can be set using an external resistor (minimum value of the maximum sink current of pin 2 is 0.7mA). Keep the pin 2 voltage at 10.5V or less.
3	AGC - ADJ	—	2.1V (when 100kΩ resistor connected)		RF-AGC delay point adjustment. Connect to GND via a variable resistor (approx. 100kΩ).
4	AGC - FLT	—	5.0V		For filter time constant for VIF AGC.
5	GND1		0V		GND for VIF, AGC and AFT.

ROHM

Pin No.	Pin Name	IN / OUT	Standard voltage	Equivalent circuit	Function
6 7	VIFB VIFA	IN	4.2V		Video IF input. Use with balanced input.
8	GND2	—	0V		SIF and PLL GND.
9	SIF	IN	6.6V		Audio IF input. Can set to intercarrier mode by pulling down via a 2k Ω resistor.
10	AFC	—	2.7V		Holding the audio output DC level fixed. Connect to GND via a 4.7 μF capacitor and to VREG via a 10 μF capacitor to reduce buzz. Set this pin to 0.3V or lower to apply audio/video mute.
11	VO - 4.5M	—	5.2V		2nd SIF output. Connect a trap to this pin to vary the sound filter characteristics. The internal impedance is a high 1k Ω, so connect a buffer to output.
12	IR	—	2.4V		Reference current source for adjusting the internal filter. Use connected to GND via a 24k Ω resistor. Use an accurate resistor with good temperature characteristics (e.g. ±1% metal film).
13	AFOUT	OUT	3.2V		Audio signal output. The standard output in the case of B/G is 520mVrms (when f = 50kHz). Connect to GND via a 10k Ω resistor.

Pin No.	Pin Name	IN / OUT	Standard voltage	Equivalent circuit	Function
14	X5	—	5.0V		For connection to a 5MHz oscillator (when M format is used). Use as a reference oscillator for automatic adjustment of the internal filter, and as the signal for the SIF signal low frequency conversion. (B/G, D/K format: 6MHz, I format: 6.5MHz).
15	MODE	IN	3.4V		Input Trap Filter switch. 0V: M format (4.5MHz) 2.4V: D/K format (6.5MHz) 4.3V: I format (6.0MHz) VREG: B/G format (5.5MHz)
16 17	PLL - COILA PLL - COILB	—	3.6V		For connection of IF detector VCO oscillator coil.
18	VREG	—	6.6V		IF circuit power supply. Pin 18 has a built-in shunt regulator.
19	AFT - COIL	—	3.0V		For connection of AFT coil. To apply AFT defeat, connect to GND via a 1kΩ (approx.) resistor.
20	PLL - FLT	—	3.4V		Time constant circuit for the PLL filter.
21	VEQO	OUT	2.0V (SYNC)		VIDEO output. Output is via the sound trap, B/W noise inverter, and EQ AMP. Connect to GND via a 4.7kΩ resistor.
22	EQFLT	—	5.2V		EQ Filter. Connect to GND via an LCR series resonant circuit. R should be ≧1kΩ

* Vcc and Vcc2 in the equivalent circuit diagrams are connected to the VREG pin (pin 18).

●Operation notes

· Simultaneous audio and video output muting function
It is possible to simultaneously mute the audio and video output by pulling the AFC filter pin down.

· AFT defeat function
AFT defeat can be applied by pulling the AFT coil pin down via a 1kΩ resistor.

· Recommended SIF input range for intercarrier mode
P/S=20 to 30dB (including SAW-FILTER).

· IF input range for RF-AGC switching
60 to 95dB μ.

· Intercarrier mode switching
Intercarrier mode can be set by pulling the SIF pin down via a 2kΩ resistor.

· IR pin external resistor
This resistor sets the filter system reference current, so use an accurate component that has good temperature characteristics.

· Adjustment of the evaluation board
Before performing measurements, adjust the coils as described below.

1. VCO coil
Lower the VIF input level, and apply a voltage of AGCFLT=6V. Monitor the PLL-FIL voltage (V1). Next, input a signal of VIFIN=80dB μ, 38.9MHz, and with the AGCFLT free, adjust the VCO so that the voltage at this time, V2, becomes the same as V1.

2. AFT coil
Input a signal of VIFIN=80dB μ, 38.9MHz, set the AFT defeat switch to open, and monitor the AFT output pin voltage. Rotate the AFT coil, adjust the output voltage to 1/2VREG (Typ. 3.3V) at the point where the output voltage changes steeply.
