Clock Driver

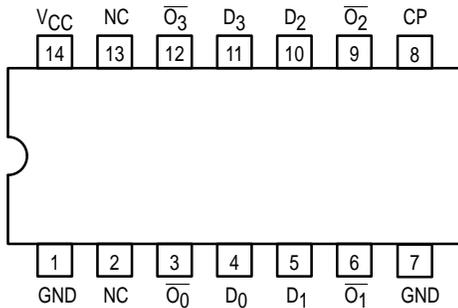

Quad D-Type Flip-Flop

With Matched Propagation Delays

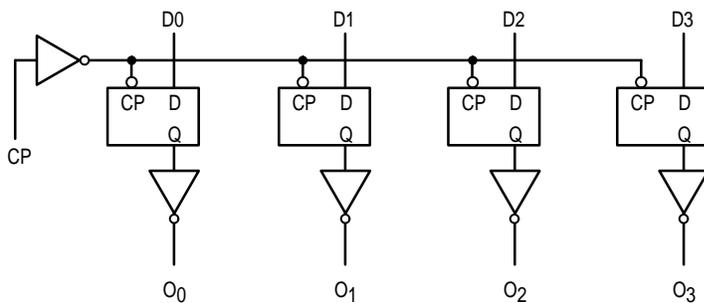

The MC74F1803 is a high-speed, low-power, quad D-type flip-flop featuring separate D-type inputs and inverting outputs with closely matched propagation delays. With a buffered positive edge-triggered clock (CP) input that is common to all flip-flops, the MC74F1803 is useful in high-frequency systems as a clock driver, providing multiple outputs that are synchronous. Because of the matched propagation delays, the duty cycles of the output waveforms in a clock driver application are symmetrical within 2.0 nanoseconds.

FUNCTIONAL DESCRIPTION

The MC74F1803 consists of four positive edge-triggered flip-flops with individual D-type inputs and inverting outputs. The buffered clock is common to all flip-flops and the following specifications allow for outputs switching simultaneously. The four flip-flops store the state of their individual D inputs that meet the setup and hold time requirements on the LOW-to-HIGH Clock (CP) transition. The maximum frequency of the clock input is 70 megahertz and the LOW-to-HIGH and HIGH-to-LOW

propagation delays of the $\overline{O_n}$ output vary by at most, 2.0 nanoseconds. Therefore, the device is ideal for use as a divide-by-two driver for high-frequency clock signals that require symmetrical duty cycles. In addition, the output-to-output skew is a maximum of 2.0 nanoseconds. Finally, the I_{OH} specification at 2.5 volts is guaranteed to be at least -20 milli-amps. If their inputs are identical, multiple outputs can be tied together and the I_{OH} is commensurately increased.

2 Normal test conditions for this device are all four outputs switching simultaneously. Two outputs of the MC74F1803 can be tied together and the I_{OH} doubles.

3 Not more than one output should be shorted at a time, nor for more than 1 second.
