### DESCRIPTION

The **HCC40109B** (extended temperature range) and **HCF40109B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and plastic micropackage. The **HCC/HCF40109B** contains four low-to-high-voltage level-shifting circuits. Each circuit will shift a low-voltage digital-logic input signal (A, B, C, D) with logical 1 =  $V_{CC}$  and logical 0 =  $V_{SS}$  to a higher-voltage output signal (E, F, G, H) with logical 1 =  $V_{DD}$  and logical 0 =  $V_{SS}$ . The **HCC/HCF40109B**, unlike other low-to-high level-shifting circuits, does not require the presence of the high-voltage supply ( $V_{DD}$ ) before the application of either the low-voltage supply ( $V_{CC}$ ) or the input signals. There are no restrictions on the sequence of application of  $V_{DD}$ ,  $V_{CC}$ , or the input signals. In addition, there are no restrictions on the relative magnitudes of the supply voltages or input signals within the device maximum ratings ;  $V_{CC}$  may exceed  $V_{DD}$ , and input signals may exceed  $V_{CC}$ , and  $V_{DD}$ . When operated in the mode  $V_{CC} > V_{DD}$ , the **HCC/HCF40109B**, will operate as a high-to-low level-shifter. The **HCC/HCF 40109B** also features individual three-state output capability. A low level on any of the separately enabled three-state output
