

## 64-STAGE STATIC SHIFT REGISTER

- FULLY STATIC OPERATION : DC to 16MHz (TYP.) @ V<sub>DD</sub> – V<sub>SS</sub> = 15V
- STANDARD TTL DRIVE CAPABILITY ON Q OUTPUT
- RECIRCULATION CAPABILITY
- THREE CASCADING MODES:  
DIRECT CLOCKING FOR HIGH-SPEED OPERATION  
DELAYED CLOCKING FOR REDUCED CLOCK DRIVE REQUIREMENTS  
ADDITIONAL 1/2 STAGE FOR SLOWCLOCKS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- STANDARDIZED, SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100nA at 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TRANSISTOR STANDARD N°. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

### DESCRIPTION

The **HCC4031B** (extended temperature range) and **HCF4031B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package.

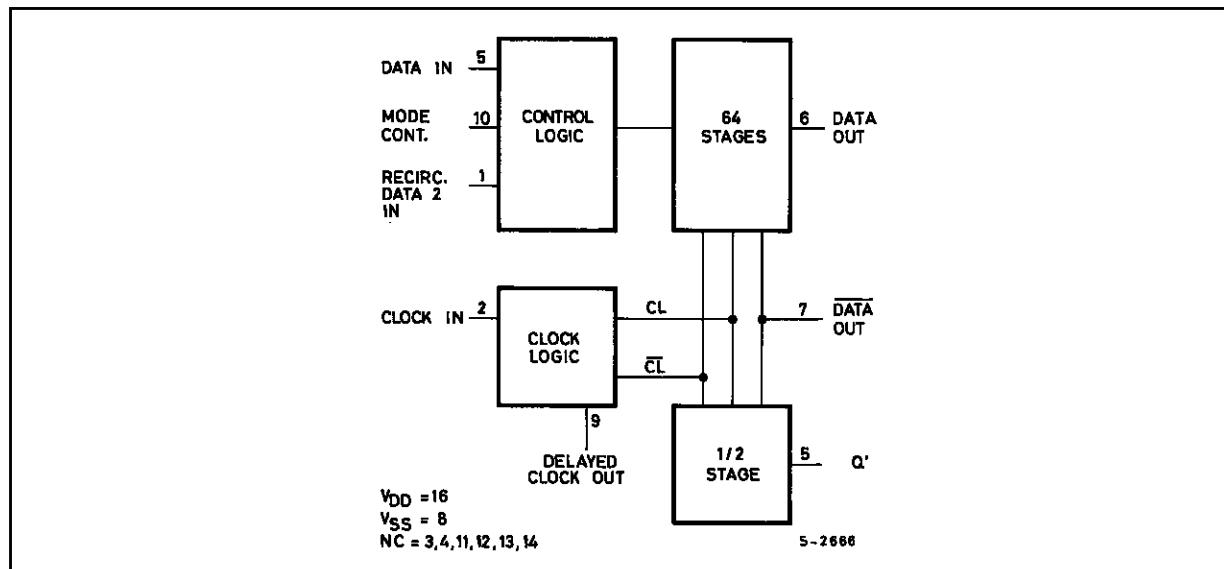

The **HCC/HCF4031B** is a static shift register that contains 64 D-type, master-slave flip-flop stages and one stage which is a D-type master flip-flop only (referred to as a 1/2 stage). The logic level present at the DATA input is transferred into the first stage and shifted one stage at each positive-going clock transition. Maximum clock frequencies up to 16 Megahertz (typical) can be obtained. Because fully static operation is allowed, information can be permanently stored with the clock line in either the low or high state. The **HCC/HCF4031B** has a MODE CONTROL input that, when in the high state, allows operation in the recirculating mode. The MODE CONTROL input can also be used to select between two separate data sources. Register packages can be cascaded and the clock lines driven directly for high-speed operation. Alternatively, a delayed clock output(CL<sub>D</sub>) is provided that enables cascading reg-

ister packages while allowing reduced clock drive fan-out and transition-time requirements. A third cascading option makes use of the Q' output from the 1/2 stage, which is available on the next nega-

tive-going transition of the clock after the Q output occurs. This delayed output, like the delayed clock CL<sub>D</sub>, is used with clocks having slow rise and fall times.

$T_{stg}$	Storage Temperature	– 65 to + 150	°C

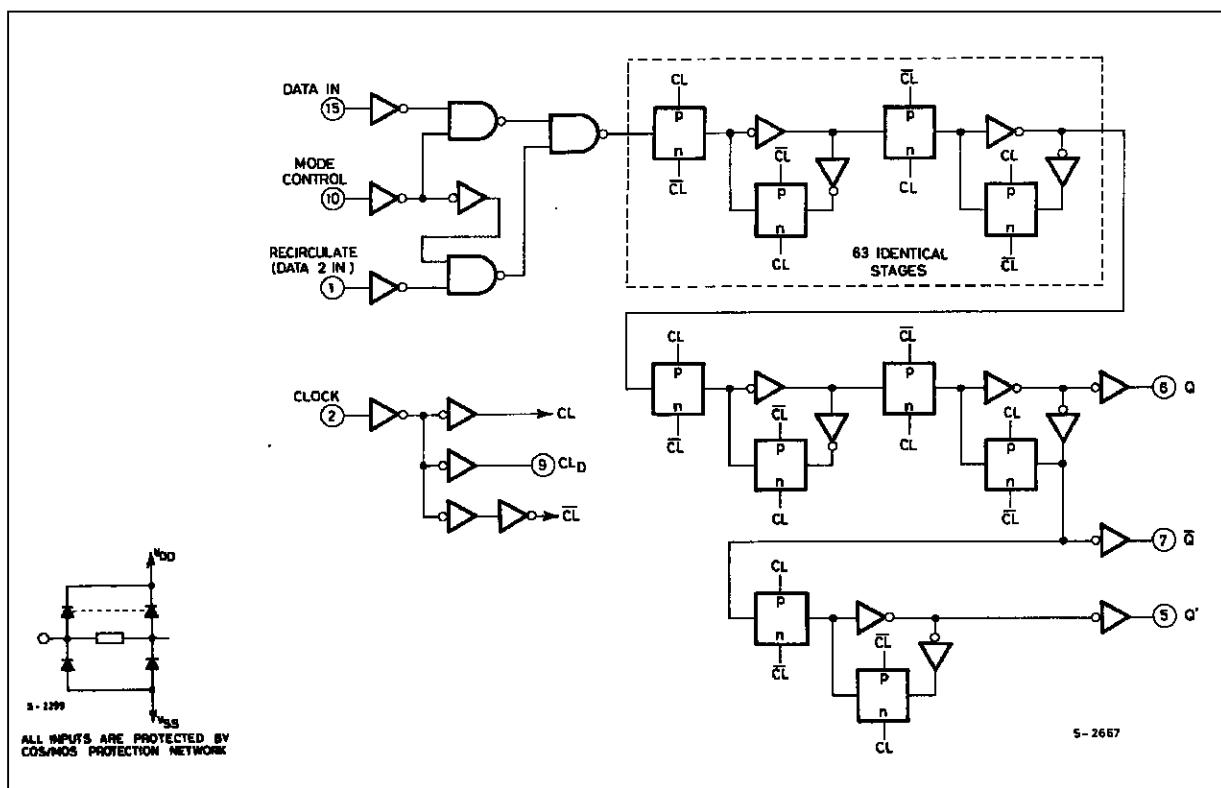

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for external periods may affect device reliability.

\* All voltage values are referred to  $V_{SS}$  pin voltage.

\* If more than one unit is cascaded in the parallel clocked application,  $t_{rCL}$  should be made less than or equal to the sum of the propagation delay at 50pF and the transmission time of the output driving stage.

\*\* Maximum Clock Frequency for Cascaded Units;

a) Using Delayed Clock Feature in Recirculation Mode :

$$f_{max} = \frac{1}{(n-1) CLD \text{ prop. delay} + Q \text{ prop. delay} + \text{set-up time}} \text{ where } n = \text{number of packages}$$

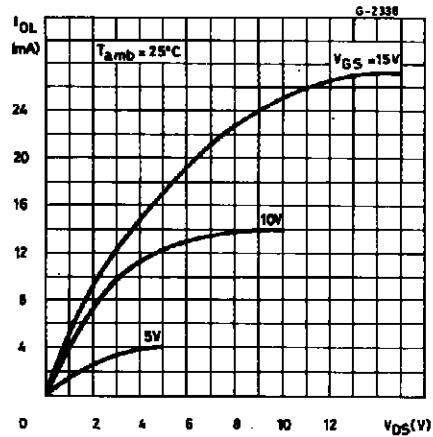

b) Not Using Delayed Clock :

$$f_{max} = \frac{1}{\text{propagation delay} + \text{set-up time}}$$
