**8-bit static shift register****HEF4021B  
MSI****DESCRIPTION**

The HEF4021B is an 8-bit static shift register (parallel-to-serial converter) with a synchronous serial data input ( $D_S$ ), a clock input (CP), an asynchronous active HIGH parallel load input (PL), eight asynchronous parallel data inputs ( $P_0$  to  $P_7$ ) and buffered parallel outputs from the last three stages ( $O_5$  to  $O_7$ ).

Each register stage is a D-type master-slave flip-flop with a set direct/clear direct input. Information on  $P_0$  to  $P_7$  is asynchronously loaded into the register while PL is HIGH, independent of CP and  $D_S$ . When PL is LOW, data on  $D_S$  is shifted into the first register position and all the data in the register is shifted one position to the right on the LOW to HIGH transition of CP. Schmitt-trigger action in the clock input makes the circuit highly tolerant to slower clock rise and fall times.

**PINNING**

- PL parallel load input
- $P_0$  to  $P_7$  parallel data inputs
- $D_S$  serial data input
- CP clock input (LOW to HIGH edge-triggered)
- $O_5$  to  $O_7$  buffered parallel outputs from the last three stages

## Notes

1. H = HIGH state (the more positive voltage)
- L = LOW state (the less positive voltage)
- X = state is immaterial
- ✓ = positive-going transition
- ↖ = negative-going transition
- D<sub>n</sub> = either HIGH or LOW
- n = number of clock pulse transitions
