

## QUAD VOLTAGE REGULATOR WITH INHIBIT AND RESET

ADVANCE DATA

- 4 OUTPUTS: 10V (125mA); 8.5V (250mA); 5V (200mA); 5V (100mA)
- 10V AND 5V (100mA) OUTPUT ARE LOW DROP
- 5V (100mA) ST-BY OUTPUT VOLTAGE
- EARLY WARNING OUTPUT FOR SUPPLY UNDERVOLTAGE (LW)
- THERMAL SHUTDOWN AND CURRENT LIMITATION (FOLDBACK)
- REVERSE BATTERY AND LOAD DUMP PROTECTION
- INHIBIT (ON/OFF) AND RESET FUNCTIONS

**MULTIPOWER BCD TECHNOLOGY**

Multiwatt 11

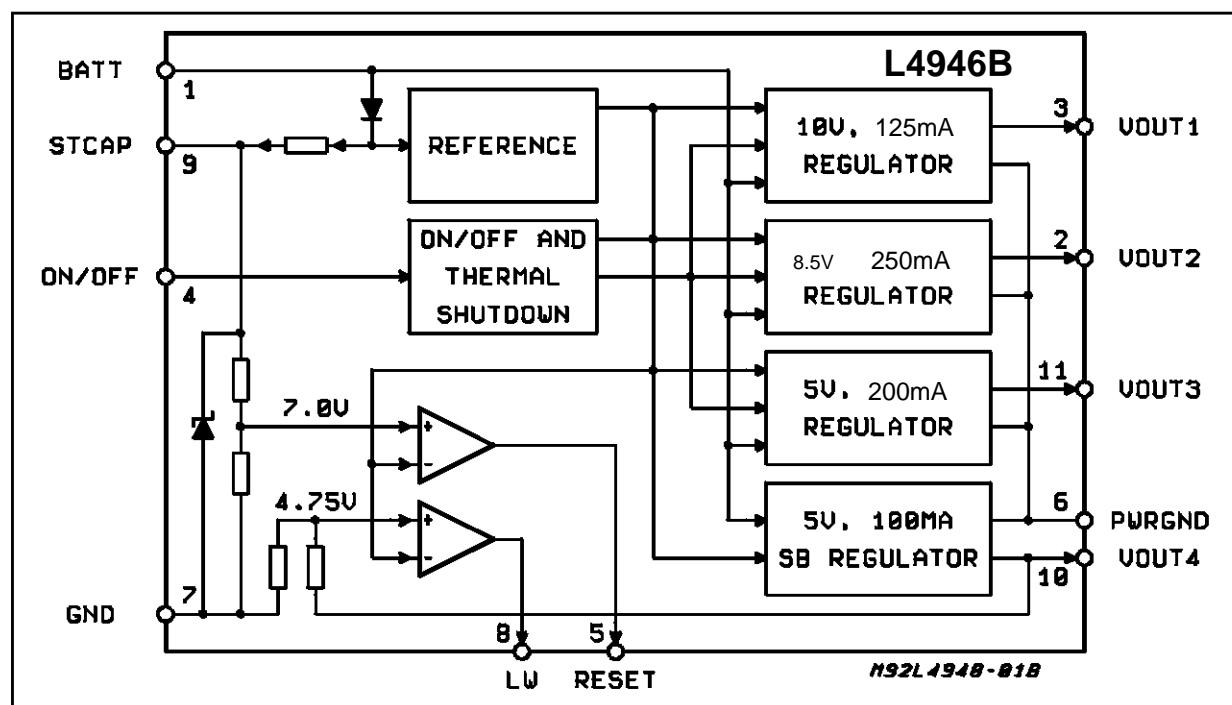

ORDERING NUMBER: L4946B

**DESCRIPTION**

The L4946B is a quad output low drop voltage regulator. The four outputs are a low drop 10V at 125mA ( $V_{O1}$ ), a 8.5V at 250mA ( $V_{O2}$ ), a 5V at 200mA ( $V_{O3}$ ) and a low drop 5V st-by line at 100mA ( $V_{O4}$ ).

The IC includes a monitoring circuit to warn if a low voltage or no voltage condition is occurring.  $V_{O1,2,3}$  are off during st-by mode.

The STCAP pin allows the battery voltage to decay slowly giving the  $\mu$ P time to store data. This IC is designed for supplying microcomputer controlled systems specially in automotive applications.

# L4946

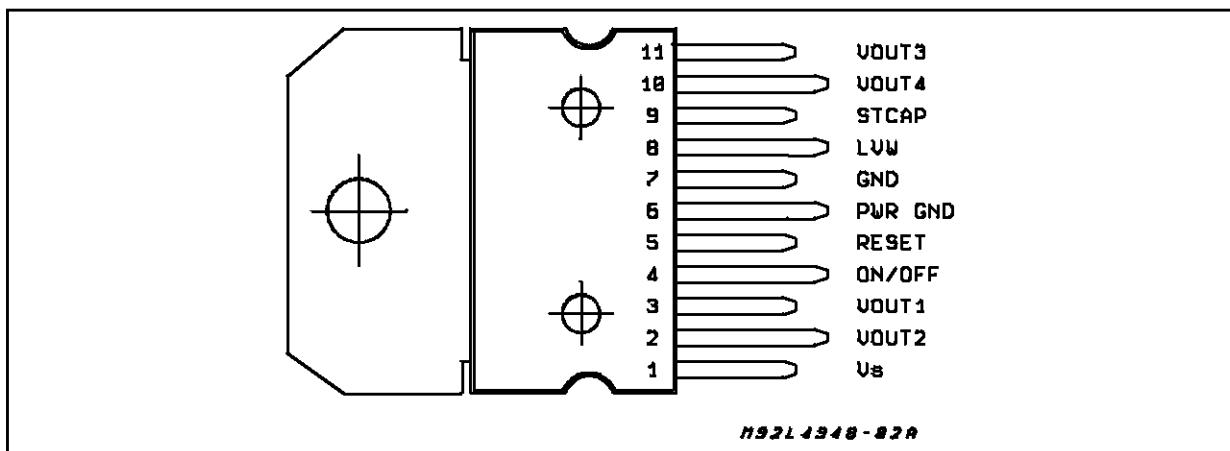

## OPERATING CONDITION

Symbol	Parameter	Value	Unit
$V_S$	Supply Voltage	-13.5 to 26.5	V
$I_L$	Load Current $I_{O1}$	300	mA
	$I_{O2}$	400	mA
	$I_{O3}$	600	mA
	$I_{O4}$	100	mA

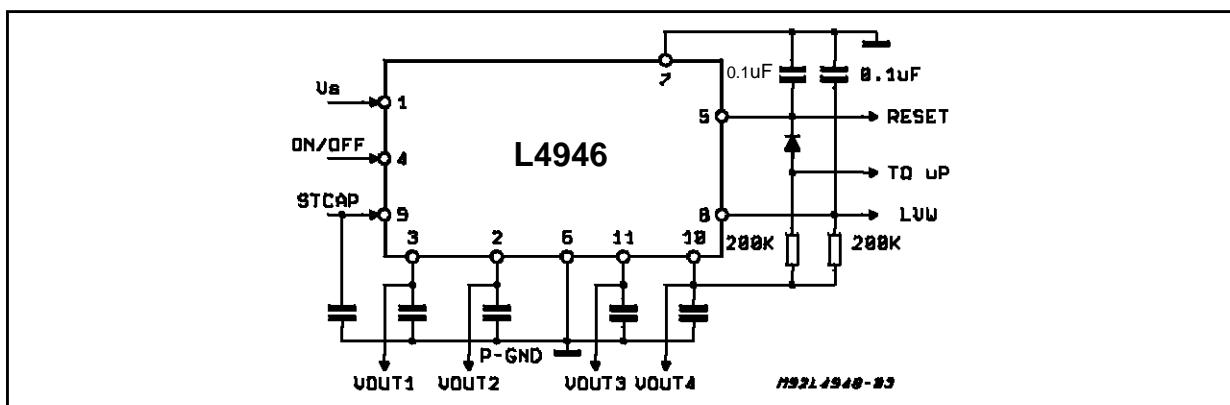

## ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
$V_S$	Supply Voltage	-35 to 60	V
$V_I$	Input Voltage (ON/OFF)	0 to 5	V
$V_O$	Output Voltage (LVW, Reset)	0 to 5	V
$T_{stg}$	Storage Temperature Range	-65 to 150	°C
$T_j$	Junction Temperature Range	max 150	°C
	Load Dump (5ms rise, 115ms decay)	60	V

## PIN CONNECTION

## APPLICATION CIRCUIT

## THERMAL DATA

Symbol	Parameter	Value	Unit
$R_{th(j-case)}$	Thermal Resistance Junction-case	2	°C/W

**Note 1:**

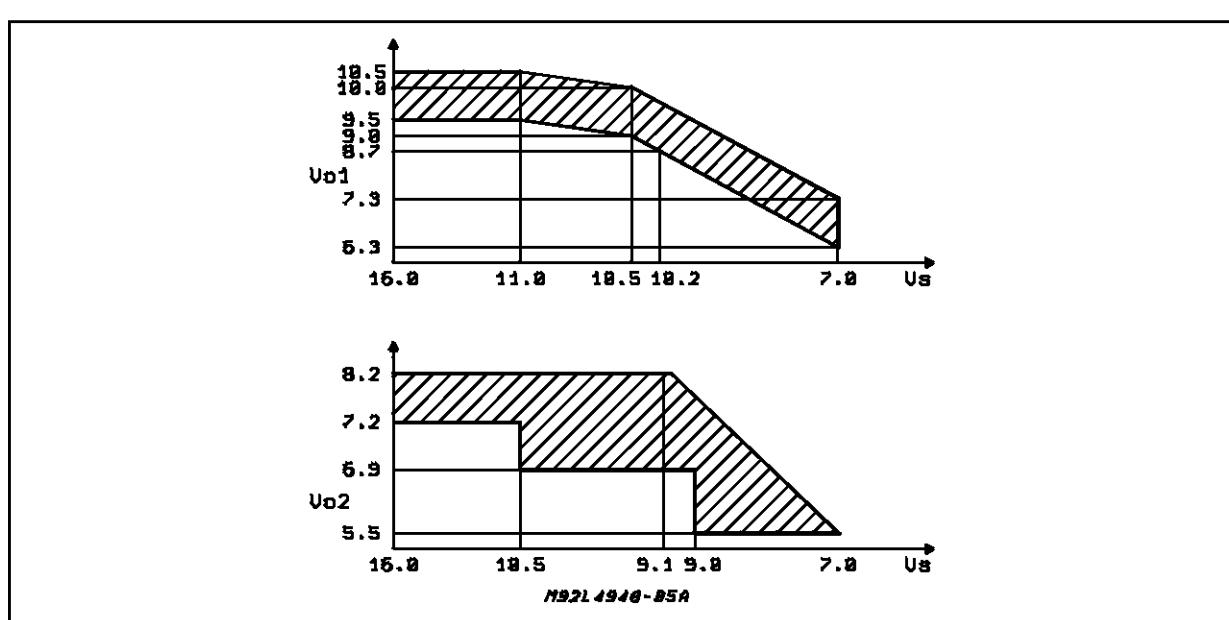

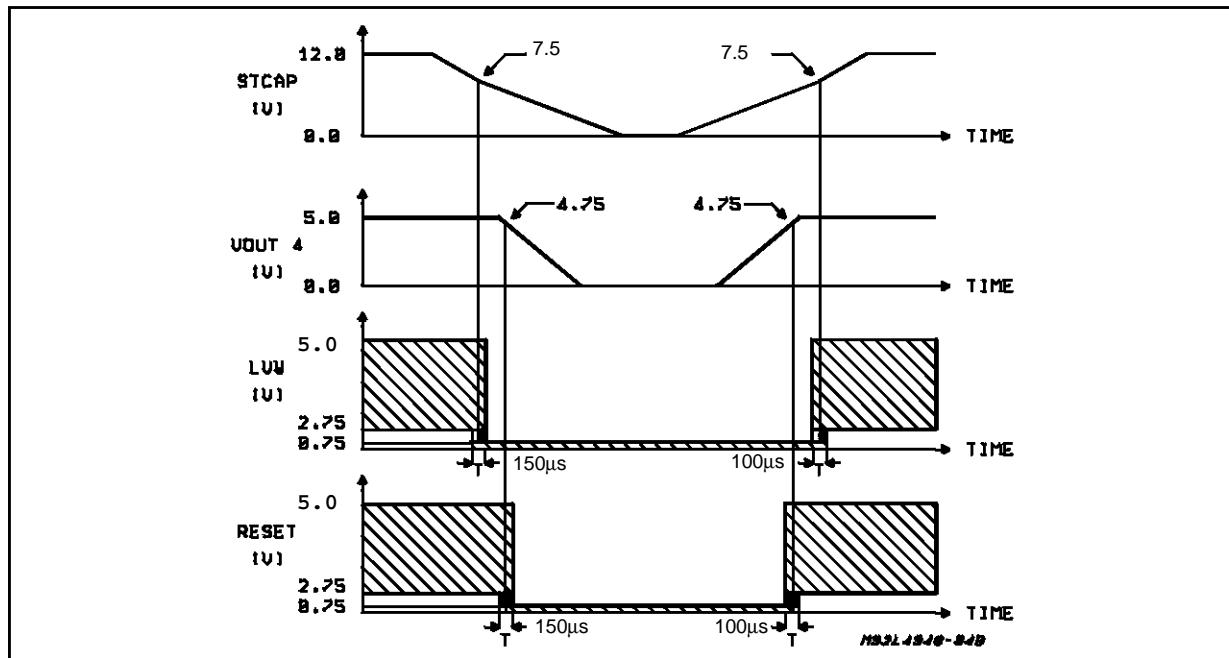

The L4946 has "Foldback" on its outputs during current limiting. As the output loading is increasing the current supplied by the L4946 increases until a threshold is reached. When the current limiting threshold is reached, the L4946 output current will start to decrease as the loading is continuing to increase. The point where the output current starts to decrease is the maximum output current.

## FUNCTIONAL DESCRIPTION

The L4946 includes a monitoring circuit to warn the microprocessor if a low voltage or no voltage condition is occurring. Between 7V and 8V on the STCAP pin, the LVW output will go low. This tells the microprocessor to stop executing code and save vital information. The reset output will go low when  $V_{O4}$  drops 0.15V below its typical reading. A reset will occur between a minimum of 4.5 and a maximum of 5V on  $V_{O4}$ . The reset output will go

low when  $V_{O4}$  drops 0.15V below its typical value. A reset will occur between a minimum of 4.5V and a maximum of 5V on  $V_{O4}$ . When the  $V_{O4}$  drops between 4.5 and 5V the RESET output goes low. It is very important that the RESET output doesn't go above 0.75V until the  $V_{O4}$  output has gone back above 4.75V (typical). The microprocessor looks for a rising edge. So, any spike will tell the microprocessor to start operating. Once the STCAP line passes 7.5V (typical), the LVW output will also return to high state.

## TIMING DIAGRAM

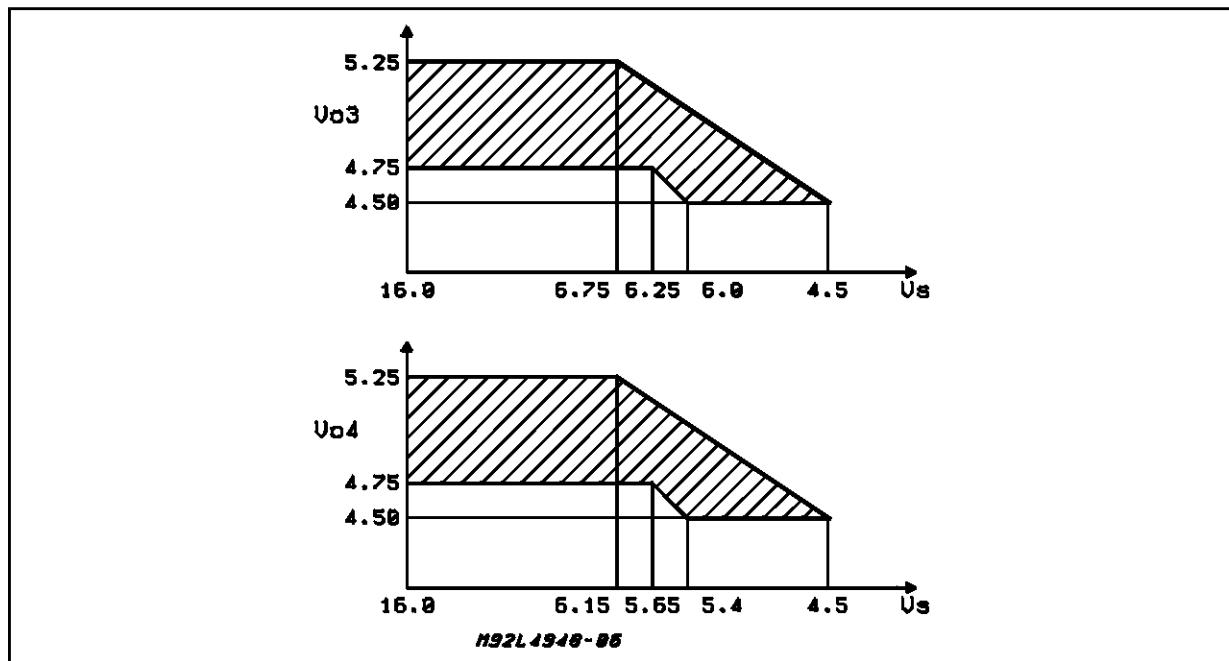

The STCAP pin acts like a delay circuit. Due to the large capacitor ( $470\mu F$ ), the STCAP pin allows the battery voltage to decay slowly giving the microprocessor time to store data. Also, during short low voltage or negative voltage conditions, the STCAP pin protects the 5V st-by output from dropping below the RESET and LVW trip points. The four outputs are expected to follow the battery voltage down to 7V. At 7V typical the LVW tells the microprocessor to stop operation and

save operating data. Below 7V the outputs are expected to stay alive and ready for a return of battery.

The L4946 has a st-by mode to keep the microprocessor and memories alive during an ignition off conditions. The ON/OFF input pin is controlled by the microprocessor. A high on the ON/OFF pin places the part in normal mode. A low on the ON/OFF pin places the part in st-by mode.  $V_{O1}$ ,  $V_{O2}$ ,  $V_{O3}$  will be off during st-by mode.
