## 5 V, 1 A Voltage-regulator ICs with Reset Function

### Overview

The L88R05 Series is a series of low-saturation voltage regulator ICs that are equipped with a function that generates a reset signal when the power supply for a microcontroller system is turned on or off.

### Applications

- Prevents malfunction when the microcontroller power supply is turned on or off.
- Designed to handle malfunction caused by momentary power interruptions.
- Suited for portable electronic equipment, mobile electronic equipment, and other battery-powered equipment with little capacity to handle fluctuation in input voltage; also suited for equipment with large fluctuations in the primary power supply.

### Functions

- Power supply reset generation function; the reset threshold voltages are ranked.  
 L88R05C:  $V_{RT} = 4.5 \text{ V}$   
 L88R05D:  $V_{RT} = 4.2 \text{ V}$   
 L88R05E:  $V_{RT} = 3.9 \text{ V}$
- 5 V, 1 A output characteristics

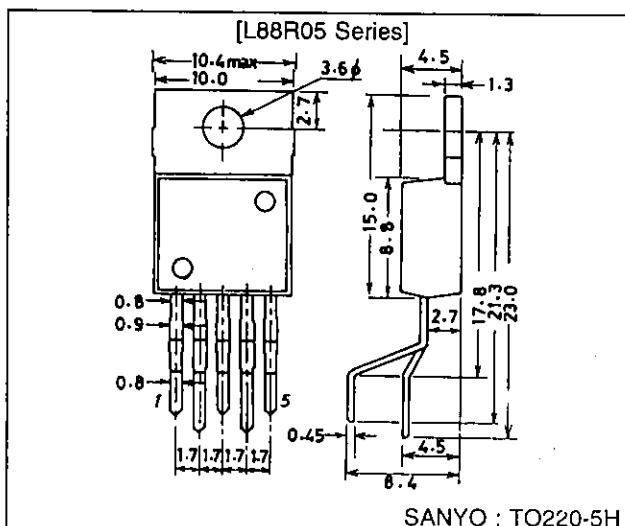

### Features

- Minimum I/O voltage difference is small (0.5 V typ.), making power conservation possible, and makes smaller heatsink and transformers possible.
- External capacitor for reset signal output delay time adjustment.
- Sink/source reset output provides compatibility with logic circuitry that has an internal pull-down resistor. Active pull-up facilitates noise suppression.
- Various types of protective circuits on chip (fold back current limiting, thermal protection).
- The package is the TO220-5H; this package facilitates designs for the radiation of heat during the mounting process.
