Monolithic Linear IC

HIGH-PERFORMANCE QUAD OPERATIONAL AMP

The LA6324M consists of four independent, high-performance, internally phase compensated operational amplifiers that are designed to operate from a single power supply over a wide range of voltages. These four operational amplifiers are packaged in a single package. As in case of conventional general-purpose operational amplifiers, operation from dual power supplies is also possible and the power dissipation is low. It can be applied to various uses in commercial and industrial equipment including all types of transducer amplifiers, DC amplifiers.

Features

- No phase compensation required
- Wide operating voltage range: 3.0 to 30.0V (single supply)
±1.5 to ±15.0V (dual supplies)
- Input voltage range includes the neighborhood of GND level and output voltage range V_{OUT} is from 0 to $V_{CC} - 1.5V$.
- Small current dissipation: $I_{CC} = 0.6mA$ typ/ $V_{CC} = +5V$, $R_E = \infty$
- Mini flat package enabling compactness of sets
